1945. I want to direct your attention to a statement which was handed in to the Commission which sat on Railways in 1856 by Mr. Edwin Hill, of the Inland Revenue, in which he says, "It is needless for me to dilate upon the efficiency of simple but systematic inspection and report in procuring the removal of curable evils. The manifold defects that have been brought to light by our Poor Law Inspectors, Prison Inspectors, Factory and School Inspectors, and others, and that in consequence have been either cured wholly, or at least much amended, are not unknown, although perhaps not so generally understood and borne in mind as might be wished. But that one of the most effectual means of abating injurious practices, and effecting the suppression of abuses, is to expose them to the broad light of publicity, is a matter too generally understood and acknowledged to need argument. All I have to urge, therefore, is the superiority of continuous, systematic, and thorough examination and inquiry conducted by men of ability, and knowledge of the subject, appointed for the purpose, and hence responsible, in their character and position, for its due performance, over depending upon mere fortuitous information, given by persons, perchance, but imperfectly acquainted with the facts, and concerning not so much the habitual observance or neglect of the appointed precautions, as simply the ill-consequences of their non-observance in individual cases. Under such a system of inspection I think I may unhesitatingly aver that such a total neglect of the necessary precautions, explicitly laid down by the directors, as in the case of the late Staplehurst accident, was shown to attach equally to the workmen, the foreman, and the superintending engineers, could not have been concealed." I think your recommendation is in the same direction as that, that it is better to leave the details of management to the railway companies, giving the Board of Trade more power of systematic inspection of the way in which lines are worked?—Yes; quite so. I think that is the proper way to get improvements made. No doubt improvements have gone on progressing from time to time, but not always so fast as they might have done; but the true way to induce railway companies to advance rapidly when they are loath to move is by bringing public opinion to bear upon them, and not by arbitrarily ordering them, either by Act of Parliament, or by the direct interference of the Board of Trade, to do any particular things at particular times.

1946. Do you think that it would be possible to institute a systematic inspection over railways in the same way which holds good in the case of mines and factories?—I do not see any difficulty in organising any system of inspection, or extending any system of inquiry, as far as might be considered desirable to do it; but I think that it would be most mischievous for the Board of Trade, or any other body, or even for Parliament, to determine precisely what is to be done from time to time as regards details on particular railways.

1947. But the dissatisfaction which exists in the public mind at present is that irregularities or imperfections of system are not brought to light until after the mischief is done and the accident has occurred; and it has occurred to many people that if railway companies were placed under authoritative inspection, a great deal of good might result to the public, and that as the result of that inspection, the railway companies should be called upon to carry out the recommendations of the inspectors, or to show cause against doing so?—It will always remain for the companies, under the system which I propose, to carry out the recommendation or not, as they may think best; but if they do not do so, then, under a proper system of publicity, they would be more directly responsible to public opinion, which they never could withstand. Well-directed, well-organised, and well-instructed public opinion no company can stand up against; and I think that the proper function of the Board of Trade is not to direct the management of the railways, which they cannot possibly direct or control with advantage, but to continually instruct the public as to what is required, and leave it to public opinion to work upon the railway companies to get what is required carried out.

1948. Supposing that such a system of inspection were instituted, would you propose that it still be left as it is, to three or four gentlemen, who are now the inspectors of the Board of Trade?—I do not think that it would be desirable to increase the number of inspectors, or to interfere more than is necessary with the working of the railways; any interference is mischievous; and I think the power of inquiry far more important than the power of inspection. If you increase the power of inspection or the number of inspectors, or have periodical inspections of railways, you must throw a certain amount of responsibility upon the inspectors, because there is nothing that an engineer of a company would like better than to be able to say, "This accident has happened, it is true; the permanent way may or may not have been in fault, but the inspector was over it two months ago, and found no fault with the existing state of things; and as he did not find any fault with the existing state of things, we thought it was good enough, upon his high authority."

1949. When you make up your mind that a certain thing is good to be done, do you discuss that particular recommendation with your brother inspectors?—Yes; we sometimes discuss these matters; and I am very glad to have an opportunity of answering that question, because I see that it has been stated in evidence before the Committee that there are great differences of opinion amongst the inspectors. I have often heard that stated before, but I have never been able to discover any case of difference of opinion that is worth speaking of upon these engineering questions. Upon other questions, such as the questions that are now being discussed before the Committee, questions of policy, there may be very wide differences of opinion. Between my colleague, Colonel Yolland, and myself, the Committee will see that there are many differences of opinion as regards questions of policy. But as regards questions of engineering detail, and the recommendations which we make for the adoption of certain improvements upon railways, I may say

Captain *H. W. Tyler.* 30 June 1870.

we are practically entirely in accord with one another. When any question turns up that we have not previously discussed, we do meet, all of us, occasionally together, and discuss that question, and agree amongst ourselves upon it of our own accord; and it is clearly desirable that we should do so from time to time.

1950. Referring to the latest controversy, namely, as to the communication between passenger and guard, was it not a fact that the railway companies requested the Board of Trade to order authoratively the particular communication which they thought best, and that the Board of Trade decline to take the responsibility on themselves?—All I know about that question was, that I was, in the first instance, ordered to investigate it, and I made a very long report upon it, which was laid before Parliament, recommending that the electric system should be adopted; then, I think, I was abroad, or on some other business, and Colonel Yolland took it up in my absence, and he made a similar recommendation, and he is of the same opinion that the electric system, if any, would have been the proper one to adopt. The way in which the present system was adopted I really know very little about, except that certain representatives of the railway companies went to the Board of Trade, and the Board of Trade authorised them to adopt a system which they themselves recommended and thought best, without referring to the inspecting officers concerning it. The President of the Board of Trade appears to have considered that if the companies were pleased with the rope system, and thought it would do, he might let them try it, and the companies did adopt it, and the result, I believe, has not been very happy.

1951. When the Board of Trade through their inspectors, do make any recommendation to the railway companies that such and such improvements should be made, or that such and such alterations should be introduced, the railway companies are to understand that the inspectors are in accord in their recommendation?—They are, practically; it is simply this, the Board of Trade do not make any set recommendations to the railway companies generally to adopt any particular system, but when an accident happens they do make certain recommendations.

1952. They do not do so now, but it is your proposition that they should do so in the future, and that they should have the power consequent upon an authoritative inquiry of directing certain things to be done?—On the contrary, I say that it would be most mischievous that the Board of Trade should direct anything to be done; and that it should only be by the pressure of public opinion, and not by any direct action upon the railway companies.

1953. Mr. *Davison.*] What I understand you to want is this, first of all, that you should institute those inquiries under the authority of an Act of Parliament?—Yes, certainly, that we should not be required to go to an inquiry without the authority of an Act of Parliament.

1954. And that, by means of inquiring, under that authority, you should have an opportunity of sifting all those accidents, and making a recommendation which should be made public as soon as possible?—Just so.

1955. In inquiries under the Merchant Shipping Act, which are held before a magistrate and a board of assessors, before the captain's certificate, or whatever it may be, is returned to him or kept from him, is not the judgment of the assessors given in open court?—Yes, that is so.

1956. And, as a matter of practice, it generally finds its way into the newspapers there and then?—Yes.

1957. When you go into an inquest, are you generally examined before the verdict of the jury is given?—In most cases.

1958. And, in point of practice, the evidence that you give as regards the particular accident is the substance of your subsequent report?—Exactly.

1959. And is made public, in point of fact, as far as the circumstances are concerned in the way which you desire?—Exactly.

1960. In the court of inquiry which you suggest that the Board of Trade should have power to institute, did I understand you to say that the question of damages and compensation for injuries should be included?—What I say is this, that it is only in rare cases, and in some cases of *fatal* accident, that the recommendation made by the inspecting officer comes out before the coroner's jury in that way, and it does not always come out just as he would wish it to come out, because what is recorded in the newspapers is frequently the result of certain questions which are put to him by jurors and others, perhaps by the attorneys for the sufferers in open court, and his meaning is not always caught very plainly, and answers are published as given to questions which are not always intelligible to persons reading the account.

1961. Do not you think that the public are not much more likely to read the evidence of Captain Tyler before a coroner's jury, or a jury sitting on any inquiry, than they would if it were published in a document presented to Parliament?—Certainly, very much more; only I say that it is not put in the best way, and therefore what I have suggested is, that there should be a better inquiry held with the utmost publicity, and that the result should be immediately published, and you would thereby get publicity in a far better shape than you do now by my examination before a coroner's inquest.

1962. Surely there is nothing to prevent the inspector of the Board of Trade preparing his evidence or his report, call it what you like, in the best possible way, and that being made public just as his evidence is before the verdict of the jury?—It is quite true that he may make a report, but he is not always asked to make a report by the coroner, and sometimes he does not attend at all; and when he does, as I say, the way in which his examination is conducted, either by the solicitors for the sufferers or by the jury, does not always conduce to a very clear understanding of what he means.

1963. Would you answer the question which I asked you, whether you propose to leave the question of compensation for personal injury or for loss of life to this court of inquiry to be instituted by the Board of Trade?—It occurred to me, seeing the great dissatisfaction which exists with the present mode of assessing compensation, that if the Board of Trade had a more perfect means of instituting inquiries they could appoint a regular court for the purpose, and you might take advantage of that court, adding, if you like, a medical assessor to it, to consider the questions of compensation for injuries as between individuals and the companies.

1964. Of whom do you contemplate that court to

to consist, if they had to assess the compensation on the injury which persons may have sustained, or the damages in the case of persons killed?—The Board of Trade is in the habit of appointing arbitrators for all sorts of purposes, under all sorts of Acts, at the present time, and I contemplate that they would select any whom they considered fit for any particular inquiry, and I have no doubt that in the end it would get into a certain groove, and certain people generally would be appointed.

1965. Do not you think that the people appointed would get into a groove?—No, I do not see why they should, because their experience would be so excessively varied throughout the whole of the companies, and over a great area, that they would have every thing to keep them out of a groove.

1966. You seem to suggest that the improvement made in the railways are made by pressure from without, and not made so fast as you would desire them to be?—Not only on railways, but in all things improvements generally come from without rather than from within.

1967. Can you give me one illustration of what you mean by that as applicable to railways, except the block system and the continuous breaks?—I could give you a good many; let us instance the locking apparatus at junctions, which is one of the most important things. The Committee, of course, understand what I mean by the expression "locking apparatus." In the first place, at complicated junctions, by means of the locking apparatus you provide mechanically that it is impossible for a signalman who has to work a great number of points and signals, to make one signal which shall conflict with another signal, so that two trains shall come into collision with one another; it is impossible also for him to move a pair of facing points in a wrong direction whilst a train is passing over them, so long as the signal is down to allow the train to pass. That system of locking apparatus has tended, perhaps, more than anything else to the safety of the public in travelling in railway trains; but we have had the greatest difficulty in inducing some companies to adopt these obvious means of safety. I might instance, if you wish, particularly the case of the Midland Company, who for a long time refused absolutely to adopt this locking apparatus; we have a means of compelling them to adopt it, by refusing to open a junction at which it is not provided, when they come to us with a new line to be inspected; and finding the immense advantage of this locking apparatus as a very great means of safety, and the number of accidents that occurred through the want of it, we did compel them to adopt it; and upon that they wrote a letter to the Board of Trade saying that they placed upon us the responsibility of this locking apparatus, which they believed to be more conducive to danger than to safety. That is an instance of pressure from without.

1968. Have there been any instances where the locking apparatus has caused accident?—No, there has been no accident caused by the locking apparatus that we have ever had to report upon, but there have been a very great number of accidents for the want of it.

1969. Why do not the railway companies adopt it universally?—There are a great many reasons why they do not adopt it. In the first place, there is the question of expense, for it is a costly system to apply to railways where it has not previously been applied; it is a costly addition; that is one reason for not adopting it; another reason is that it has unfortunately been the subject of patents and a good deal of squabbling amongst the patentees, and there are many companies who very naturally object to pay the patentees, and that prejudices them against the apparatus. Then, again, there are personal prejudices; there are different systems, and of course every company has a tendency to like the system of its own officers, and there is great difficulty in introducing any particular system upon the lines of different companies.

1970. That is a case in which the Board of Trade have power with regard to new junctions?—Yes, as regards new junctions, when a new line comes before them for inspection they have that power, but not as regards lines already opened for traffic.

1971. Would you like to have that power extended to the old existing systems?—No, I should not, upon the principle that I have stated pretty clearly, that I think it would be mischievous for us to interfere with the details of railway management, but that we should rather show to the public that this locking apparatus (for instance) is a great means of safety, and in that way bring public opinion to bear upon the railway companies. In fact that has been done and is being done; the system is being extended rapidly, and more and more rapidly as it is found to be more and more useful.

1972. You do not want any legislation to help you in that direction?—No, I do not want the Legislature to intervene directly at all.

1973. In fact it comes to what you said before, the less you interfere with the working of the railways the better, because the moment you interfere the responsibility is put, to a certain extent, upon the inspectors?—It is not that I am at all afraid of responsibility, but that I conceive it to be an entirely wrong principle that we, who are not daily watching the events upon each particular railway, should attempt to control the management of them.

1974. The responsibility, you consider, is better upon those who have the actual working of the traffic?—Clearly, it would be ridiculous for anybody to attempt to interfere in the details of the management of a railway who had not the control of that management from day to day. A railway is a thing which requires constant supervision from day to day, from hour to hour, and from minute to minute, and for anybody sitting in Whitehall to attempt to manage the railways of the kingdom would be a perfect absurdity.

1975. That answer would apply to the block system, and also to continuous breaks, because in ordering that to be done you would take upon yourselves a certain amount of responsibility if any accident occurred after it was done?—I should be very happy to take any responsibility for any accident that occurred in consequence of the use of the locking apparatus, or the continuous breaks, or the block system, and I say that those are improvements which it is very desirable to have made, and to bring in to extended use upon railways in the way that I have suggested.

1976. But you do not desire that the Board of Trade should have the power to order them absolutely?—No; I think it would be very mischievous that the Board of Trade should be able to order any particular system, because it is not that the block system is one system, and that the

Captain *H. W. Tyler.*

30 June 1879.

locking apparatus is one system; there are various systems of locking apparatus, and various ways of working the block system. It is quite clear if the Board of Trade say to a company, you shall adopt a particular block system, or a particular locking apparatus, the company might, if they thought proper (though I do not mean to say that they would do so), even cause it to fail, and say that the Board of Trade had ordered a thing to be done which could not possibly succeed.

1977. I dare say you would admit that railway companies, as a rule, are managed with a great deal of ability?—No doubt many railway managers are some of the most able men in the kingdom.

1978. And do you think that those men, when they have good dividends, improve their permanent way and improve their rolling stock to the best of their ability?—I have noticed, curiously enough, that in the case of those companies where the dividends have been least, or even have been nil, improvements have sometimes taken place more rapidly; and that where it has not been necessary (as on more prosperous lines) to eke out an extra quarter per cent. of dividend, more money has been spent upon the permanent way and rolling stock than in the case of some companies that have been richer.

1979. Has that been where the company had been in Chancery?—Not at all.

1980. Mr. *Sherriff.*] Although you have no legal power to institute inquiries into accidents on railways, is it your experience that any difficulties have been placed in your way by railway companies, in instituting inquiries and examining into the causes of accident?—No; I have always met with the greatest courtsey, and every facility, that I have desired in making my inquiries; all I say is that I do not think it a proper principle that a public department should go on for a series of years instituting inquiries which they have no legal power to order.

1981. The public at all events have not suffered from those examinations being incomplete, arising from the unwillingness of railway companies to give you all the information which you desire to have?—No; I do not think the public have suffered at all for the want of information or examination, or in that respect, but I think they have suffered materially in the want of more speedy publicity of the recommendations which are made to the companies. The word "recommendation" has been so often used that I should be glad to be allowed to say here the way in which those recommendations are made. The recommendations are not made directly by the Board of Trade, as a Board, to the railway companies, but they are simply recommendations which are contained in the reports of the inspecting officers to the Board of Trade. The Board of Trade order an inquiry into an accident, the inspecting officer sends to the Board of Trade his report upon the accident, and the Board of Trade simply send that report to the company with little or no comment.

1982. With respect to the use of continuous breaks, do they not require very constant examination to keep them efficient; are not the blocks of continuous breaks very liable to wear irregularly, and must there not be constant supervision so as to alter them that they shall act when required?—No; I think on the contrary, they do not require such constant supervision and inspection as the ordinary breaks, and for this reason, where you have a small proportion of break power in a train, say one or two break vans, or say one break van to a number of carriages, the blocks are worn out far more rapidly, and the wheels are worn into flat places by being skidded, and that break will not last nearly so long as where you employ a system of continuous breaks, in which it is scarcely ever necessary, and never desirable, to skid the wheels at all. There is in the case of continuous breaks very much less wear upon the break blocks upon the wheels and upon the permanent way, and where there is less wear there is increased safety.

1983. My question referred to the irregularity of various blocks all acting at the same time?—With regard to the question of irregularity, I may say that in some of those continuous breaks they are simple means of compensation, and that though the blocks may not wear with perfect regularity, the system of breaks is in no way deteriorated by use on that account, but acts perfectly well, however irregularly the blocks may wear.

1984. Do not you think that the extension of the break power would be better in the hands of the engineman than any where else in the train?—In some respects, yes, and in some, no. There have been several cases in which the guards have not heard the engine driver's whistle, and have not been able therefore to apply their breaks at a critical moment. For that reason it is desirable that the engine driver should himself have the power of applying certainly a very large proportion of the break power, if not the whole of the break power, of the train in a moment of emergency. But on the other hand, that should only be done by giving the engine driver the power of applying breaks at the tail of the train, and not a superabundant break power at the head of the train, because there are many cases of accidents in which perhaps a tyre or an axle may break in the leading part of a train, where it is very necessary not only not to apply the break power at the head of the train, but to keep the steam on, and to keep running on, so as to prevent the carriages from doubling up upon one another, and to allow the breaks at the back of the train only to act in pulling up the train, without doing damage to the carriages and passengers.

1985. But would not a number of continuous breaks in a train, unless all were applied at the same time, have rather a detrimental effect in that case; supposing you had a break attached to an engine and tender, and three continuous breaks to be applied by three guards, if they were not applied all together, would there not be a chance of the very accident occurring which you now speak of?—Not at all; the accident which I am speaking of is with respect to some vehicle in the leading part of the train, where it is desirable that all the break power that is applied should be applied at the tail of the train, in order to save a bad result in the middle of the train, or should be applied, at all events, behind the disabled vehicle. Then, again, there is no disadvantage in three or four guards in a train, in seperate vans, all applying their breaks one after another. And continuous breaks are really safer than having separate breaks in a train, whether you apply them all together, or one set after another in either case.

1986. Speaking of railway companies getting into grooves as respects their permanent way, I did not quite understand your remarks upon that head,

head, but is it not quite true that as regards the permanent way, almost every year shows that there is a great increase in the strength of the way, and in truth in the adoption of heavier rails and steel rails and other means for making a stronger permanent way than has hitherto existed?—Yes, no doubt. As we have gone on, the weight of engines has increased very much, and therefore the strength of the permanent way has increased very much; and the permanent way, I do not hesitate to say, on a number of railways in this country, is in a far more perfect state than it was 10 years ago.

1987. With regard to the inspectors of the Board of Trade having the power, which, I think, in many cases it would be very beneficial if they had, all the inspecting officers of the Board of Trade have not the experience which Colonel Yolland and yourself have in railways; you must get new men at times?—Of course, if one fails or dies you must get a new one.

1988. It would be very difficult, would it not, to put on a new inspector with the same amount of knowledge and experience as those who have been at the Board of Trade for a long time?—No doubt, every inspecting officer must learn his work by degrees.

1989. You would not be inclined to say that the recommendation of a new man should have the same effect as the report of those who have been for many years conversant with railway practice?—No, excepting that a new man in time becomes old.

1990. But it takes time, does it not?—Yes, it takes time; and of course the recommendation of a new man would not be of the same weight, I apprehend, as the recommendation of an old one.

1991. Sir *H. Selwin-Ibbetson.*] I think I understood you to say that the inspectors of the Board of Trade consult together with regard to those questions, and consequently a new man would have the advantage of the experience of the rest of the inspectors in any recommendation that he made?—Yes; he would, if he were wise, always consult with those who have been a long time in the department on any question of difficulty.

1992. Consequently his recommendation would not represent his own imperfect knowledge, but would represent the more perfect knowledge of the inspectors before him in office?—Provided he consulted those officers.

1993. Which you say is the general practice in your office?—Yes. I was asked as to limiting the amount of payment which should be made to sufferers in the case of railway accidents, and I think I said that I thought it desirable that the amount should be limited. Might I suggest that there should be a maximum of 3,000 *l.* for first class, 1,500 *l.* for second class, and 750 *l.* for third class; and that, as the companies complain on the one hand of there being no limit to their liability in the present state of things, it would be only fair to the public that they should, on the other hand, have, if the liability were so limited the improved system of inquiry with publicity which I have endeavoured to suggest; that these should be given to the public as a set-off against the limit of liability which might be given to the companies.

1994. Mr. *Denison.*] With reference to that limitation, may I ask what has led you to the conclusion that those particular amounts would be advisable, 3,000 *l.*, 1,500 *l.*, and 500 *l.*?—I have been considering very carefully what should be the amount; I have heard 1,000 *l.* suggested by some people, and I have heard 5,000 *l.* by others, and so on, and it is only by considering what was too much, and what was too little, that I have arrived at these figures. I have seen it suggested by one of the witnesses that there should be one limit to all classes; but I think it only fair that a man who pays more for better accommodation should have a higher limit than a man who pays less; and I would further say that in the case of those figures, practically the average limit would not be the average between 3,000 *l.* and 750 *l.*, because there are a great many more second and third class passengers carried than first class passengers; therefore the limit of 3,000 *l.* for first class would be very much reduced in calculating what the average limit would be amongst the three classes.

1995. But you have not arrived at those figures from any returns from the railway companies, of the average amount of compensation given in cases of accident?—No, I do not think it would be at all fair to arrive at it from such returns.

1996. Have you made any estimate at all whether the railway companies would be better off under this maximum, or worse off than under the present system?—I apprehend they would be better off, because this is a maximum; it does not follow that every third class passenger should get 750 *l.*

1997. You are aware that two of the judges are of opinion that if a maximum were fixed, the tendency of juries would be to give it in almost every case?—I would not allow this maximum under the present system at all; I am suggesting in connection with this maximum of compensation another system of inquiry, and of assessing money compensation for the sufferers; it all hangs together.

1998. Mr. *Winn.*] You stated, did you not, that there was a difficulty about adopting the locking system, because it was a patent?—I cited that as one of the difficulties.

1999. Has not the patent now expired?—Partially; there are several patents still applicable to it.

Mr. Charles Shapland Whitmore, Q.C., called in; and Examined.

2000. *Chairman.*] I think you are one of Her Majesty's Counsel, and Judge of the County Court of Southwark?—I am.

2001. You have had knowledge, I think, of the circumstances which led to what is called Lord Campbell's Act?—I have.

2002. Will you just state them, for the information of the Committee?—In the year 1845, I was applied to by a client of mine, who was a solicitor at Stourbridge, to assist him in framing a Bill to be introduced into Parliament for the protection, as he stated, of his neighbours, who were concerned in the mines in that part of the country, Staffordshire and Worcestershire, amongst

Mr. *C. S. Whitmore*, Q.C.

30 June 1870.

amongst whom there was a general wish that there should be some measure giving to the survivors of the persons injured, or ultimately killed, perhaps, by something wrong in the construction or the working of mines, and in short, compensating families for the death of somebody concerned in the working of the mines. He said that he was moving in it at their instance, and that Lord Lyttelton, their neighbour, who lives at Hagley, would be good enough to introduce the measure in the House of Lords, if I would assist him in framing it. I was at the moment acting as counsel in a committee room in the House of Commons, and I went out with him into the corridor, and I drew up two or three clauses which, the same evening, I think, were introduced in the House of Lords by Lord Lyttelton. The Bill passed through the House of Lords, and in the House of Commons it dragged a slow length along, until ultimately it was defeated by the veto of the Attorney General of that day. It seemed to the lawyers of that day to offend against first principles, especially against the well-known legal maxim, "*Actio personalis moritur cum personâ*;" and some of the great pillars of our profession stood up resolutely against it, and it was thrown out. In the next year it was re-introduced, with very little change indeed in phraseology, by Lord Campbell, and carried through the House of Lords and through the House of Commons.

2003. Then it was with regard to mining accidents that it was originally suggested?—Entirely. No thought of railway accidents entered into the matter at that time; but the language of the Act, as everyone knows, comprehends every case of death by accident.

2004. It has been suggested to this Committee that the county court judges should act as arbitrators in examining into the amount of compensation to be paid for railway accidents; do you think that that system would work well?—It would throw, of course, a very heavy duty upon the county court judges; but if I may speak from my own experience, I think almost anything would be better than the present system of trial by jury; for once a jury is summoned to try a case against a railway company, anything like fair play can hardly be obtained. I have instances every day almost.

2005. In what way do such instances come before you?—In the familiar way of an action against a railway company for some damage, owing to supposed negligence on the part of the company; the complainants in such a case invariably exercise the option of having a jury, and having a jury, unless the judge is very firm, almost any state of circumstances indeed will be treated as proof of negligence, and if a jury have once hold of such a question as that of negligence or no negligence, they will most unquestionably always find it to be negligence, and give as much as they possibly can. I had a case only the day before yesterday; a traveller by the Metropolitan Railway was kind enough to assist some ladies out of a carriage; they got on to the platform safely, and the porter, in the due exercise of his duty, shut the door as soon as they were safely out; the porter knew nothing of what was going on in the carriage, but it seems that this gentleman in shifting his position had got his arm into the opening of the door, and in shutting the door it caught his arm and gave it a very severe pinch indeed, and he brought an action for the amount over which we have cognisance, namely, 50*l.* for it. There was not the slightest possible evidence of negligence; the porter could not tell what was going on inside the carriage, but if I had not stated that there was no evidence to go to the jury, if I had allowed it to go to the jury, they would undoubtedly have said that there was negligence, and that the claimant was entitled to his 50*l.* compensation. For when I said to them, "Gentlemen, there is no evidence of any negligence," they showed by their expressions and manner that they were very much disappointed that they could not give the man what they thought just redress. And that occurs continually. If I am asked whether the county court judges would be a fit substitute, it would be rather premature to give them such extended powers as that; what may happen to the county court by-and-bye is another question, but I think it would be rather too large a duty for them to undertake now.

2006. Mr. *Davison.*] It would not be a pleasant duty for county court judges to have to deal with those questions of compensation in the numerous instances that occur?—Not at all.

2007. And county court judges, like other people, would naturally get into a groove, and increase their disposition one way or the other?—Quite so.

2008. And it would be an unpleasant duty, would it not?—It would be very unpleasant, no doubt.

2009. One of the learned judges the other day, Mr. Baron Martin, suggested that he thought the judges might have power to withdraw cases from a jury there and then; I mean with reference to a nonsuit, that they might not be so subject to have a nonsuit set aside upon a mere scintilla of evidence; do you agree with that observation?—I have not had the advantage of seeing what has been stated upon the subject, but I cannot help thinking that that would be a move in the right direction. I think too much is left as a question, about which there should be no question at all. I dare say the Committee have heard of many instances by this time; there is the familiar one of the lady passenger who brought an action against a company for a broken leg, I think, because she tripped over a hole in the carpet; that is a well-known case, and that is by no means an extreme case; every day those things are cropping up. The Committee have probably heard instances of how these things are manufactured; but if not I will give one that occurred a month ago in my own court. It was a very simple case, and it is an illustration of how easily it is done. A man who had suffered some little injury or other in one of the railways, had dealings with a young attorney in another matter, and this young attorney said to him, "Do not you think we might have an action against the company for this?" so they put their heads together; it was agreed that there should be an action, and the attorney then said, "Let us see what amount we will claim;" and they agreed that they would be satisfied with 50*l.*, which is the present limit of the county court jurisdiction; and he thereupon said, "I will engage to bring this action in the county court at no cost to you, except in the event of success." On that footing the matter proceeded; but instead of bringing it in the county court the attorney brought it in a superior court, and after he had gone up to the very verge of trial, wanting funds he applied to the injured person for pecuniary assistance. Then he

he said, "What do you want of money? I never authorised any proceedings that would cost me anything, and I resist it." In this action the claim against the defendant, who was the attorney, was for an acknowledged debt of 20 *l.*; the defendant, the attorney, claimed as a set-off the bill of costs in bringing this action, and it transpired, as a further part of the arrangement, that not only should this action be so brought, but that his cousin, who was also his namesake, should be the medical man employed to attend him, and to give evidence on the trial. The whole thing was the most self-evident concoction and speculation that could be conceived, neither more or less. I should not have remembered this case, except that I had preserved the papers in it to show the Judicature Commisssion, of which I am a member, the difference in the scale of costs between proceedings in the superior courts and proceedings in the county courts, so that has fixed it on my memory.

Mr. *C. S. Whitmore*, Q.C.

30 June 1870.

Mr. James Grierson, was called in; and Examined.

2010. *Chairman.*] You are Manager of the Great Western Railway Company, are you not?—I am.

2011. Were you manager of the Shrewsbury Railways?—I was formerly manager of the Shrewsbury Railways before being manager of the Great Western.

2012. Will you state to the Committee the grounds upon which you consider that the present law as to compensation ought to be altered?—One of the grounds is the unlimited liability which railway companies are subjected to. As an instance of that, I would state that in an accident which we had a few years ago, a certain number of passengers, who had paid us 2 *s.* 6 *d.* each for a trip of 135 miles, in the whole amounting to 10 *l.*, were injured, and for that we had to pay 24,790 *l.* In another case, where we charged a certain number of passengers 12 *s.* 6 *d.* each for a trip of about 450 miles, a certain proportion of them were injured, and in that case we received about 87 *l.* and we had to pay 42,230 *l.* I give this further illustration, that if we were carrying a certain number of third class passengers, say from London to Birkenhead, or Manchester or Plymouth, we get for a couple of hundred of those passengers a certain sum of money, but if an accident happened unfortunately, and they were bachelors with none dependent upon them, the claim might be very slight or scarcely anything at all; whereas if they happened to be married men, our experience in several accidents shows that the amount to be paid would be very large. Supposing we had had an accident to the persons whom we carried to Windsor last Friday, and we got about the same amount of money that I assume we would have got for 200 third class passengers, the amount of compensation might be so enormous as to very seriously affect our dividend for 12 months.

2013. Have you anything to say with respect to the character of the tribunal which settles the liability and the amount of compensation?—Yes; if you will allow me, I will very briefly give you a few instances showing the excessive damages, first, which have been paid in actions which we have defended. In the first case the claimant held a third class excursion ticket, for which he paid 2 *s.* 6 *d.* for a journey of 135 miles, and was injured in a collision; he claimed 10,000 *l.*, and at the trial it was represented that he was permanently disabled, and that his business (which was represented to be worth 400 *l.* a year, but his books did not bear out the statement) was totally ruined. The jury awarded him 6,000 *l.*, within a short period claimant was, and is now, attending to his business, which appears in no way to have suffered in consequence of his accident. Case No. 2, claimant (injured in the same accident as before-mentioned) was also a third class excursion passenger, and paid for his ticket 2 *s.* 6 *d.*, also for a journey of 135 miles; he held a situation in the Customs at a salary of 120 *l.* per annum. The medical evidence at the trial was to the effect that his case was hopeless; in fact, it was stated that he was wholly incapacitated from performing his marital duties, and his wife, to whom he had been married but a few weeks, was put into the witness-box to depose to this alleged fact. It was also stated that fits of the most severe nature were the result of the accident, but the company proved at the trial that he had been subject to fits from his childhood. The company's counsel, against the wish of their solicitors, agreed to the question of compensation being referred to two medical men then present, and they awarded the sum of 3,500 *l.*; within a month of the trial, claimant returned to his duties at the Custom House, and was soon after promoted. Within 12 months his wife was delivered of a child, and he is now and has been as well as he was before the accident occurred. Case No. 3, arose out of the same accident. The claimant in this case held a third class excursion ticket, for which he paid 2 *s.* 6 *d.*, the journey being 135 miles. His income was proved to be no more than 60 *l.* a year. Two medical men stated that he would be disabled for life, and the jury gave a verdict for 1,200 *l.* Within a year claimant joined his father in business, he has been seen dancing at balls, and has apparently nothing the matter with him. Case No. 4, claimant was a third class excursion passenger, and paid 12 *s.* 6 *d.* for a journey of 458 miles. Two eminent physicians called by her having stated that claimant, who was a barmaid, had received injuries to the spine of a permanent character, and would never recover, the company were advised that on such evidence a jury would give heavy damages, and accordingly they paid her 700 *l.* compensation, and 300 *l.* expenses. Within seven months claimant was dancing at the Licensed Victuallers' ball, and soon afterwards married. In case No. 5, an action was brought for injuries alleged to have been sustained in a collision. Medical evidence was given at the trial to the effect that the injuries he had sustained were of a permanent character, and would incapacitate him from following his business as a miller and farmer, and the jury gave a verdict of 5,750 *l.* Within a short time of the accident claimant was attending to his business as formerly, and is now to all appearance in perfectly good health. In case No. 6, claimant's wife was injured (it is believed very slightly) in a slight collision

Mr. *J. Grierson.*

Mr. *J. Grierson.*

30 June 1870.

lision during a journey for which she paid 6 *d.* The damages were laid at 4,000 *l.*, and the medical evidence represented the case as being of the most distressing character, and likely to terminate fatally. A most painful scene was got up in court, and the jury awarded 1,250 *l.* The lady has since had one, if not two children, and is believed to have little if anything the matter with her. In case No. 7, the plaintiff, a commercial traveller, received a blow on the shin, in a slight collision; he was not laid up for a single day, but he nevertheless claimed 200 *l.* The company, admitting the liability, allowed judgment to go by default, and the case was remitted to the Sheriff's Court for the damages to be assessed, and the jury gave the plaintiff 300 *l.*, being actually 100 *l.* more than the claimant asked for. Perhaps the Committee will allow me to give one or two cases showing the course adopted by solicitors in getting up actions against companies; we have some very strong cases. In the first case, the claimant was injured in a collision, and claimed 15,000 *l.*; it was represented at the trial that plaintiff had become a "drivelling idiot," and could not be brought into court. The company disbelieved the statement, and application was made to the court for the plaintiff to be examined by a commission, which was granted, and the trial postponed. The solicitor for the claimant, finding that his client was to be examined at his own residence, advanced him 450 *l.* to purchase stock for his shop, to bear out the statements that had been made, that he was in a large way of business, and doing a good trade. Instead of being found an idiot as stated, and unable to move from the bed on which he was lying (which was also alleged), he was found to be in full possession of his senses; he could walk about, and it was quite clear that he had perfectly recovered from the injuries sustained. In another case, a Manchester solicitor employed a tout to get the claimant, who received slight injuries on the railway, to take proceedings against the company, which he succeeded in doing. Claimant falsely represented his injuries to be of a serious character, and the matter was settled out of court, through his solicitor, the company paying 300 *l.* damages, and 26 *l.* 10 *s.* costs. Afterwards, on claimant finding that he had only received half the amount paid by the company, and that the tout and the solicitor had divided the remainder between them, he brought an action against the tout and recovered his share of the money. Baron Martin, who tried the case, commented strongly upon the manner in which the company had been swindled, gave them a copy of his notes, and impounded the documents produced in court; but the company were advised that they had no redress, and the matter was allowed to rest. Another claimant brought an action for a large sum, and the company paid 250 *l.* into court, which sum was accepted in full satisfaction of the claim; claimant only received 20 *l.*, the remaining 230 *l.*, together with his costs, having been appropriated by his solicitor. Another solicitor employed a tout to induce two claimants to bring actions, which he succeeded in doing, and obtained 98 *l.* 10 *s.* compensation. The solicitor then claimed from his clients one-half the amount received from the company. In case No. 5, a claimant was injured by being run over by one of the company's vans; his injuries were represented to be of a very serious character, but they were proved, on inquiry, to have been very much exaggerated. The solicitor (who got the case through a tout) was well known to the company from his conduct, in previous cases, as being a man who induced persons to bring actions for the purpose of making costs, and in this case he offered to "make" his client take 50 *l.* in settlement, provided that thirty guineas was paid to him for his costs, which on taxation could not have been put at more than from 5 *l.* to 7 *l.*; we paid him the 30 *l.* to get the claimant to take 50 *l.* In another case the claimant's wife was stated to have been ruptured in alighting from a carriage, and the damages were laid at 2,500 *l.* At the trial it was sworn that claimant, who was an innkeeper, was in a good way of business, and had saved money, and owned house property. A verdict was given for the company, and when they endeavoured to obtain their costs, the claimant threatened to become bankrupt if pressed, and eventually he was declared bankrupt, and at his examination in bankruptcy he swore that he had no property, that he had been prevailed upon by his medical man to put his case in the hands of his (the doctor's) brother, a solicitor; and he explained that the nature of his arrangement with the solicitor was, that if he did not obtain a verdict against the company, the solicitor should not only charge him nothing, but would also bear the out-of-pocket expenses; but if he succeeded, he was to have 20 per cent. of the damages, and his costs. It transpired in this and other cases that this solicitor and his brother (the medical man) had for a considerable period been playing into each others' hands in cases of this kind for the purpose of running up bills; they were both concerned in several cases against the Great Western and other companies, and it appeared that when the doctor got hold of a case he induced the injured person to consult his brother, the solicitor; an action was brought, and both had to be amply compensated before the case could be settled. In the same way the solicitor induced his clients to allow his brother to attend them with the same object. So frequently had this been done, that the company felt themselves bound to take advantage of the admissions made by the plaintiff in this case, and they applied to the Court to strike the solicitor off the rolls; but the judges stated that as he had had to lose his costs, and it was not clear that he had actually taken the initiative in inciting the claimant to take proceedings (the latter having called upon him and not he upon the claimant), they would not take the extreme course of striking him off the rolls, but to mark their sense of his conduct, they discharged the rule without costs, which had the effect of making him bear his own costs.

2014. Will you tell us what are the views of your company with respect to the alteration which they think ought to be made in the law?—In the first place, we consider that it is a great hardship upon public companies to be subject to unlimited liability to which they are, and while Parliament has limited us in our fares we are not in a position to make a bargain with the passenger; that no matter whatever is done we are not to charge above a certain fare, and at the same time, although the position and circumstances of passengers vary so considerably, our liability is not guarded in any way whatever.

2015. Have you thought what the nature of the limitation of the liability should be?—We have discussed it with the other railway companies, the majority of whom are in favour of the limitation which has been suggested to you by Mr. Blenkinsop,

kinsop, and in which we entirely concur, that some such limit as he has stated, increased of course for the amount at which a passenger may insure, would fairly meet the case both of the passenger and company.

2016. Do you know the amount charged by the Railway Passengers' Assurance Company?—Yes.

2017. It is 3 *d.* for 1,000 *l.*, a first class passenger; that, I suppose, in some respects, is a measure of the risk?—Yes.

2018. You concur in the sums that were mentioned by Mr. Blenkinsop?—Yes. I may state, that in one year the amount which we paid would have taken nearly 5,000,000 passengers at 3 *d.* each to have borne our costs that year.

2019. What have you to say as to the tribunal for settling compensation?—I agree with the last witness, that almost any alteration would certainly be an improvement for the railway companies. Of course companies hold different views upon this subject, and we cannot all have our own way, and therefore we fall in with the suggestions that have been made if the Committee should decide upon recommending the county court judges. The railway companies themselves, as a matter of course, hold different views upon the subject, but the majority were in favour of suggesting that the county court judges should be the tribunal, and if the Committee should so decide we should be very willing to have it tried.

2020. Have you considered that clause in the Regulation of Railways Act, 1868, by which a medical gentleman is appointed by the court?—Yes; and I have been specially requested to read to the Committee a letter from a brother of the late Sir William Lawrence, which it is thought might have some weight with the Committee. It is a letter written by Mr. Lawrence, of Cirencester, to our chairman, dated the 22nd of March 1870, in which he says:—"My dear Sir Daniel,—I have seen in the newspapers some intimations of proposed legislation during this Session on the railway system, and that the companies propose to claim some protection against exorbitant claims in cases of accidents. As in the important post you occupy in one of the principal companies, you will no doubt have something to say on this subject, I think it is a good opportunity to mention to you some observations which I heard repeated more than once by my brother, the late Sir William Lawrence, after having been called on to give evidence on the occasion of accidents on the part of companies, on the trial of action by claimants. He remarked there were too many instances in which he had observed professional men, to say the least of it, too much biassed in favour of the party by whom they had been called; that such cases were injurious to the reputation of the profession, and that it was often very embarrassing both to judge and jury, and often led to injustice. His opinion was, that the professional evidence called should be quite independent of the parties, and named by some public officer, on the same principle as an officer of the Board of Trade is sent down to inquire into the causes of accidents. I thought this so reasonable and practicable a suggestion, that I intended reporting it when any opportunity should present itself for any action on it." That Act of 1868 did provide that a medical referee should be nominated by the court; but in a case in which we required a gentleman to be appointed, the other side objected to his report being put in, and the consequence was that the judge ruled that there was no provision in the Act for the report being received, and that it could not be put in evidence.

2021. As far as you can form an opinion, you think that there is no value to be attached to that provision?—It is valueless at present.

2022. What are the views of your company with respect to workmen's trains; have you any workmen's trains on your lines?—Yes; we are not under compulsion to run any workmen's trains, nor have we a limitation of liability; but we are joint owners of the Hammersmith Railway, which runs through a district where there are a great many workmen's houses, and the workmen having sent a deputation to the Great Western and the Metropolitan Companies, and requested us to run workmen's trains, we have done so as an experiment. We commenced in March last. We have not had much experience as yet. We have run them, as I said before, without being required either by Parliament to do so, or without a limitation of liability, although we did apply for it this Session, but it has not been granted.

2023. What restraint do you place upon the passengers; can anybody get into one of those trains?—We profess that they shall only be for workmen, but I have no doubt that any person who pleases uses them; we have been advised by the solicitor that if we require them to give a declaration they must do so, and that declaration might prevent any person except a workman getting in, and it might also have the effect of limiting our liability, but it is not certain; we do not push it; we have rather a desire to accommodate people if we possibly can, and therefore we have not put any stringent regulations in force.

2024. What is the fare that you charge per mile?—We charge 2 *d.* from Hammersmith to the City, about eight miles, which would be about a farthing a mile.

2025. Have you more than one class in the train?—Only one class.

2026. Do a great number avail themselves of it?—They are increasing.

2027. How many a day do you run?—I think last month we carried about 3,000 passengers by the train in the morning, and they are allowed to come back by any train in the evening; we have not confined them to return trains; we do confine them in the morning to a special train, and that special train takes them to the City in the morning, but we allow them to return by any train after six in the evening.

2028. Carrying any amount of tools?—I do not know that that question has arisen; I have no doubt there has been no difficulty about it, or we should have heard of it.

2029. *Chairman.*] Has it answered up to the present time?—As far as we have tried the experiment, we have carried quite as many people as we expected; of course, we are not in a position yet, only having commenced on the 1st of March, to give any decided view upon it.

2030. Have you had any accident?—None.

2031. What would you recommend as to workmen's trains?—We have no proposal to make, except this, that where we charge such low fares we certainly think that we ought to have a limit of liability.

2032. Do you know the provisions, with respect to workmen's trains, of which other companies

Mr. *J. Grierson.* 30 June 1870.

have availed themselves?—Yes; but those provisions were put in as against those companies, because they had destroyed a certain amount of cottage property, but we have not destroyed any cottage property whatever on the Great Western Railway.

2033. Do you think that you ought to have the same benefit?—We ought to if we give workmen those advantages; we did introduce a clause into a Great Western Bill this Session, and it was passed by Lord Redesdale, but when it came to the House of Commons they struck it out, on the grounds that this Committee were inquiring into the whole question, although otherwise we believe that we should have obtained it, because I was before Lord Redesdale for some time upon the subject, and I am sure that we satisfied him of the reasonableness of it, because he passed the clause, but afterwards it was thought that it had better be dealt with as a general question.

2034. Sir *H. Selwin-Ibbetson.*] You have, to a partial extent, have you not, adopted the block system on parts of the Great Western Railway?—We have.

2035. Was it adopted in consequence of the recommendation of the inspectors of the Board of Trade?—No, we have never adopted the block system on any portion of our line in consequence of the Board of Trade.

2036. Not with regard to the recommendation that was made, I think, in November 1868, about that accident at Bullspill station?—No; I say that we never have put it upon any portion, so far as I remember, from the recommendation of the Board of Trade, or there may be a small portion that we have done in consequence of that.

2037. Are you not able to speak with regard to the accident in which Captain Tyler recommended on the 5th of November 1868, that the block system should be adopted on that part of the line?—Yes, I remember it perfectly; but it has not been adopted.

2038. Notwithstanding that recommendation, and the report of the inspector that the accident was caused from the want of that system being in force, you have not adopted it?—We have not done so; but with regard to that let me explain this; we have been putting the block telegraph on a portion of our line since that time, and that is one of the portions which we have looked at, and included in the list of places where we shall probably put it down; but we have been considering the question as a whole, and our chairman, who is largely connected with the telegraph companies, was requested by me to try and find some gentleman who was informed of all those inventions, an electrician of experience, and who should be quite free and unbiassed; and he has for some time past been making experiments for us with various inventions; therefore we have made very little progress in putting it down on our line.

2039. But your directors are prepared, from what you say, to work the block system as soon as they can on these portions of your line?—On those portions of the line which we consider to want any additional safety, and we are doing it now.

2040. I suppose where the traffic is great, it is a greater advantage than where the trains do not follow each other with great rapidity?—No doubt.

2041. And those are the portions to which you intend to apply the system?—Yes; we have it now through the tunnels, for instance, and upon the inclines; but it is very questionable how far it is desirable to put the block telegraph on those portions of line where the men would not be fully employed, because any system which was not carried out properly, I think, would only be leading us into a trap; however, we are so far in favour of the block that we are trying it as an experiment.

2042. Do you think that on those portions of the line where you have adopted it you have been freer from accident under the block system?—No, I cannot say that, because two of the most serious accidents that we have had have been where the block system was.

2043. Are you referring to the accident in 1869, on which Captain Tyler reported, near to the Cradley station; I was not referring to that one at the time, but that was one where the block system was in operation; the one I was referring to was at Pontypool where the block system was in operation, but where the signalman gave the signal "line clear" when it was not clear, and that led to an accident which, I think, cost us 24,000 *l.* The other occurred between Paddington and Westbourne junction, where it is upon the block, and where the driver ran past a signal.

2044. Those accidents occurred from the negligence of the servants of the company, not from any default in the system itself?—Precisely; it is quite a mistake to suppose that working the railway on the block system would prevent a very large proportion of the accidents which do occur.

2045. It would diminish the number of accidents, you believe, but not prevent a large portion of them?—It ought to diminish them in certain cases of collision.

2046. You are aware that as inventions go on, there is a possibility of even diminishing the number of people who would have the charge of those signals; we had evidence before us the other day that a train can now be made to record, itself, its passage into another block, thereby doing away with the necessity of the signalman, leaving it only to the driver?—I have had no experience of that, but I should say from the experience which I have had, that it would require to be in operation for some considerable time before I should place any reliance upon it.

2047. Have you had any experience upon the Great Western, of the system of continuous breaks, of which we have had some evidence?—We have continuous breaks upon two portions of our line; but our people are very strongly against them.

2048. Can you state any reason why they should be against them?—The principal reason is that they are always out of repair; that is the reason always assigned to me. I was consulting the engineer about it no later than yesterday; he is a very able and practical man, and he certainly has a very strong feeling against them.

2049. I think you heard the evidence that was given by Captain Tyler on the subject of continuous breaks?—I did.

2050. You differ, do you not, from Captain Tyler in saying that they are as likely to keep in repair, in fact more likely, than the other break, because they are more generally applied, and not applied so strongly?—I can only say that our experience is, that it is not so on our line; I cannot say what it is on other railways. Subject to what

what I say, I have been rather anxious to adopt them, if they could be adopted, with advantage.

2051. Your own opinion, then, would be that the continuous break would naturally increase the safety of the passengers, if it could be adopted?—Anything that would enable you to pull up a train quickly when necessary would be an advantage; but in the case of a main line, like the Great Western, where the carriages are broken up at the junctions, our experience is that the continuous break has not the same advantage as it unquestionably has upon the Metropolitan Railway.

2052. At the same time it must materially increase the break power if you have continuous breaks, even at the end of the trains?—Yes, if they will work, and if you can rely upon them. If you put a continuous break upon a train, and it works 19 times out of 20, a man is in the habit of pulling up his train within a short distance during that 19 times, and he calculates on the 20th time that he will pull it it up within the same distance; but those breaks are not to be relied upon, and might cause an accident instead of preventing one.

2053. Have you had sufficient experience of the working of continuous breaks to tell the Committee that they are not to be relied upon in working?—No; I will not go so far as that. I will only say this, that in Shropshire, where we use them on stiff gradients, and also in the Pontypool district, they are very frequently out of order.

2054. Mr. *Sherriff.*] Have you the best kind of continuous breaks?—The breaks that we use are Clarke's breaks, which we have been told are the best breaks. Of course, like every other invention, there are parties who take one side and parties who take the other.

2055. Sir *H. Selwin-Ibbetson.*] With regard to the question of those inventions, a good deal of evidence has been given that different inventions are recommended, and are constantly being brought before the notice of companies by the inspectors of the Board of Trade; in what way are they treated by the directors; do they come before the Board to be considered, or are they left entirely to the officers and the engineer of the company?—The reports of the Board of Trade are always read to the Board.

2056. Supposing they recommend the adoption of such a system as locking the points, or the continuous break, or anything of that sort in their report, is it left then to the decision of the engineer of the line as to whether it should be adopted or not?—The engineer of the line, the locomotive superintendent, and myself would be there, and give information at once to the board, who ask questions upon it, and the board at once decide whether they will adopt it or not. There are very few cases in which the Board of Trade have recommended us to do anything of that kind, that I am aware of.

2057. But are you aware that the Board of Trade do, in their reports, constantly recommend the adoption of those improvements to railway companies?—Yes. As far as the Great Western are concerned, the Great Western Company have always locked their points since ever I knew the line; even on the broad gauge system, all the points are locked by levers, with small disc signals fastened to them. The inventions of recent years are supposed to be improvements upon that; we have been adopting it over our system.

2058. You are adopting modern inventions?—Yes, we have been doing so for some years.

2059. You do not agree with Mr. Forbes, I think it was, who told us that he thought that locking points and signals was anything but to be recommended?—I could not go so far as that.

2060. In fact, by your adopting it on your line it is evident that you agree rather with the inspectors of the Board of Trade, who say that it is an invaluable invention?—At all our principal junctions now we have adopted the locking system.

2061. And with advantage to the working of the line, and to the safety of the public?—My feeling is in favour of locking.

2062. With regard to the appointment of some officer of the Board of Trade, or public officer, to report upon those inventions and recommend them to the companies, do you think there would be any objection to their having power to enforce them if they found that the companies constantly refused to adopt a recommendation which they thought of great value?—I think that, unless you are assuming that the gentleman who was put in that very important position was a man of almost superhuman talent, it would be too great a power to put into the hands of any one man.

2063. At the same time you would be inclined to allow that the inspectors of the Board of Trade, who see the working of all the lines of the country, and who have before them the testing of most of those inventions, are as likely, or more likely, to be fair judges of their value than the particular engineer of the line, who is perhaps wedded to his own old ideas?—There is no doubt that the Government inspectors do gain a very great deal of experience by going over all the lines; but if you put it into the hands of a Government inspector not only to recommend, but to require railway companies to do whatever he thinks is necessary, I think he would be in a position that he would be likely to recommend everything which he thought in the most remote degree would prevent accidents, and he would put the company to very great expense. As you say there are great improvements going on upon railways, and I presume he would be bound to adopt whatever came out, and whenever it did come out to enforce it upon the railways, although very shortly afterwards there might be a very great improvement, which might be permanent and very much more economical.

2064. Do you not think that there would be a great difference between the way in which you put it, that he would be bound to recommend the companies to adopt a system the moment it came out, and the view which I wish to bring before you, namely, that after an alteration in a line had been constantly recommended in the reports of the Board of Trade, reports resulting out of accidents, some power should be given to the central authority, or otherwise, to enforce upon the company, who shall at that time still refuse to adopt it, the adoption of the system?—I must say that I think it would be a power which it would be a very undesirable to put into the hands of a Government officer. I think that the power which the Board of Trade have now is very great indeed, although it is no real power. Whenever they point out that anything is necessary, that an accident has arisen from some want of proper arrangement, that very report is a great lever which other people will apply to the rail-

Mr. *J. Grierson.*

30 June 1870.

way company to require them to do what is necessary.

2065. And yet we find, as a practical result, that those reports are almost invariably neglected, because we have the inspectors constantly calling attention to the fact that it is no use that they should recommend things to the railway companies, because they are not adopted?—No doubt, the Government inspectors recommend railway companies to put the block system on portions of their lines, where a majority of railway officers believe it is unnecessary, and no doubt, in that case, their reports are not acted upon, but as a rule, I think you will find that wherever they point out anything that is reasonable or practicable, it is done; at least that is my experience.

2066. And yet in the early part of your answers you stated that you have not adopted the recommendation on a portion of your line, although you acknowledge that it might be an advantage?—But you are assuming that we do not intend to put it upon that portion.

2067. It is two years since that recommendation was made, was it not?—But we do not consider that portion of our line any more dangerous than any other; that is the reason. We have continued the block system upon other portions of our line since that, and we shall continue it very shortly down to Slough.

2068. You do not think that in questions regarding the alterations of your line, the evidence and knowledge of another man, not of so extremely partial a kind as that of the engineer of the company, would be an advantage not only to the company but to the public?—I did not say that as expressing the opinion that it would not be an advantage, and I did not say that he might not gain information by going all over the railways, which may be a very great advantage, occasionally, to the working of a railway.

2069. Then you would see no objection to the inspectors of the Board of Trade making inspections of the line, and making public their opinions, and stating it, if there was any alteration necessary?—When any case arose which required it, or made it necessary to do so.

2070. For instance, if public attention was called to it by the failing of the system, such as an accident?—That is what he would do now.

2071. His report is merely a report to the Board of Trade itself; it is not a public report?—I have very frequently seen them published in the newspapers, and I do not see any objection to their being published in the newspapers. I may say that very likely the inspecting officer of the Board of Trade does not get as full facilities now, and that there is not so much attention paid to him and to his wishes when he comes over the railway, as if he came with an Act of Parliament in his pocket, but I do not know that he could have any greater moral power than he has now.

2072. And yet there evidently is some greater power wanted, either by publicity or otherwise, in order to get his recommendations enforced?—I am bound to say that I do not quite see that; at least that does not come within my knowledge; and I believe our line is just a fair sample of all other lines.

2073. I am speaking of those reports which are made year after year, and in which continually those statements are made?—I can only say this, that whenever the Government inspector makes a report we enter it in a book, and we put against it on the other side the reports of our officers, and also we require a certificate when a recommendation of the Board of Trade officer has been carried out; in those cases where the recommendation is not carried out, I myself keep the reports of our officers, stating the reasons; and I do not think that more could be done, even if the Board of Trade officer was put in a position of greater authority.

2074. You do not think that a Board of Trade officer is in a position to give a more impartial statement of the case than an officer of the company, who is naturally disinclined, I imagine, to run his company into great expense?—I am bound to say that when it applies to a question of life and death with regard to an accident, if you held the position of general manager, and an accident arose, you would not consider for a moment the question of expense at all; the feeling of a railway officer rather is to go into expense if that will possibly avoid an accident; I am quite certain that, except first of all being satisfied that expense is necessary, as a rule the general managers of railways do not consider expense at all.

2075. I do not want to throw any slur of that sort upon the general managers, but I meant that the officers of the company were rather induced not to adopt fresh inventions, because of the expense, and to repair the old system in preference to entering into a large outlay?—I should be very sorry if that is your opinion with regard to railway officers, or the opinion of the public; I believe that the improvements on railways have all, as a rule, originated with the officers themselves; that they are most anxious to improve their line, and no one, not even the public that travel, nor the directors, have so much interest as the officers in improvements being carried out.

2076. As a great many of the public believe that the block system and one or two other systems are very valuable for the protection of the public, and those recommendations have been constantly made, and as constantly neglected, I am justified in assuming, to a certain extent, that it is the question of expense, or something which deters the officers of the company from recommending that system, when authorities equally able to judge (the officials of the Board of Trade) are so strongly in favour of it?—I do not think that I could give you a better answer than this, when I tell you that, though the block system has been in operation for many years, there is no one system yet which can be pointed out as the best system, and the system which ought to be adopted; no later than three months ago I wrote a note to Colonel Yolland, asking him if he would tell me which he considered the best block system; and the answer I received was that he was then examining some new instruments which had been sent in. That is exactly what we are doing ourselves; therefore I venture to say that at the present moment the Board of Trade officers, if they were put in the position of requiring the railway companies to adopt the block system, are scarcely in a position to say what are the instruments which ought to be used over all the railway systems of England.

2077. The absolute block system is what they recommend?—It is a very large question adopting the block system over all the railways in England, and a very costly one, and you will see that it would be very inadvisable to compel railway companies to use second-class instruments when

when first-class instruments may be obtained. As I said, experiments are being made now by an independent electrician of very great eminence for the Great Western Company, to try and find out which is the best, and we will adopt whichever is the best.

2078. Feeling that the block system does give greater security?—On certain portions of the line undoubtedly; as I said before, I am so far in favour of it, that I have recommended it over certain portions of the line, and I am quite certain that we shall lay it over still further portions of our line.

2079. Mr. *Denison.*] Are you able to tell the Committee what is the relative cost to the railway companies of first class, second class, and third class passengers, and is the extra fare paid by first class passengers more than equivalent for the extra cost of a first class carriage, and the extra space of such a class in the train, and in a general way, for the extra cost of that kind of traffic?—No, I do not think it is; you get a larger number of passengers in a third class than you do in a first, and, therefore, if you could get a full carriage of third class passengers, they are quite as profitable as the first.

2080. Therefore those who argue that a much higher rate of compensation ought to be paid to a first class passenger, by reason of the much higher fare that he pays, are not altogether warranted in the position which they take?—I do not think that they are; but as the law at present is, a third class passenger is really paying towards the large compensation given to first class passengers; because the law gives less compensation to a third class passenger than to a first class, and a very large proportion of the passengers conveyed on railways are third class, and, of course, it is out of that, therefore, that a large portion of the compensation goes to first class passengers.

2081. Have you yourself formed any idea as to the amount of compensation which railway companies might fairly accept as the maximum, supposing the Legislature were disposed to limit their liability?—We hold the views that have been expressed by Mr. Blenkinsop upon that subject, as one of the companies who discussed the question before it was submitted here.

2082. You were in the room, were you not, when Captain Tyler was giving his evidence?—Yes, I was this morning.

2083. Did you hear his latest recommendation, 3,000 *l.*, 1,500 *l.*, and 500 *l.*?—I did not quite hear his answer; I was not quite certain whether that was insured or not insured.

2084. It was uninsured, but to be administered upon a totally different system; that is to say, under the operation of a court of inquiry appointed by the Board of Trade, and doing away with the intervention of juries?—That would be a certain amount of advantage to railway companies, but certainly very inadequate, in my opinion, to what would be fair towards them, because 3,000 *l.* is a very large sum for an uninsured passenger; it would give a latitude for requiring railway companies to pay a larger proportion than what they now pay.

2085. Do you think that railway companies would rather adhere to the present system than submit to a maximum compensation of that kind?—I should not like to express myself hastily upon that point, but my feeling would rather be that we should rather remain as we are than take that. However, it would require some careful calculation upon the accidents which have occurred, and the payments which have been made, before I gave an actual decisive opinion.

2086. Mr. *Sherriff.*] I take it that your evidence goes to this extent; that even after having adopted the best system, and buying the best materials, you are very much at the mercy of the people whom you employ, whether they carry out the rules and regulations that are deliberately made; what sort of means do you take for getting the best servants; how many hours, as a rule, do you employ them; and what are the wages which you generally pay; taking those points one by one, in what way do you select your railway servants, such as the pointsmen, and so on?—The pointsmen, as a rule, are taken from men who have been some time upon the line, or very superior men who have been recommended to us. All the men undergo an examination and training, and the very closest supervision, and I believe we pay such wages as the men can scarcely get in any other sphere, as a rule, at least such a large body of men.

2087. At an important junction (take the case of any of your large junctions), Oxford or Reading, or any of those junctions, how many hours do you employ the pointsmen, as a rule?—At important junctions, where the men's time is fully employed, they are on duty eight hours; at other places, where the duty is light, they are on 12 hours, as a rule, or thereabouts.

2088. Do you hold out any inducements to them to conduct themselves properly by any system of bonuses or allowances for good behaviour in addition to their wages?—We do to a certain class of men; the pointsmen are a very important class of men, and I would say with regard to pointsmen and drivers, probably there is no body of men to be found in England to surpass them; they are a most intelligent, steady class of men. To the drivers and pointsmen we do give a bonus; we give a bonus of 10 *l.* to each driver, and about 5 *l.* to each pointsman, who conduct their duty satisfactorily for 12 months, without complaint against them; we also give a bonus of 2 *l.* to the man in charge of the permanent way, the ganger as we call him, who has charge of two or three men, if there is no complaint against him.

2089. That is your mode of carrying out the discipline of the line, and ensuring yourselves and the public against accidents?—That is an inducement to the men to conduct their duty satisfactorily; but after all, whatever system you adopt, whatever locking gear, or whatever telegraphs you place upon your line, you are to a very large extent in the hands of the men; in fact, the great bulk of the accidents arise from the men neglecting to perform some particular duty.

2090. In the case of an inspector of the Board of Trade recommending an alteration such as was suggested by the honourable Baronet, and an accident occurring from the same cause, I apprehend that in consequence of your not following out the recommendations of the Board of Trade you would be put to great disadvantage with both judge and jury?—I consider that it would put us at a most serious disadvantage in the event of any other accident occurring where that recommendation had been neglected, unless very good reasons could be shown why it was not done as yet, and even the officers would be in a very serious position.

Mr. *J. Grierson.*

30 June 1870.

2091. When you do not follow out the recommendation of the inspector of the Board of Trade, you know that you are placing yourselves at a great disadvantage in any case of any future accident, and you do not place yourselves in that position without having the very best reasons, in your opinion, justifying your pursuing a contrary course to that recommended?—Quite so; we never pass over a recommendation of the Board of Trade without a written report from the officers interested, which written report is preserved and may be referred to afterwards in case the question is raised again; and, as I before stated, whenever any recommendation of the Board of Trade officer is not carried out, those reports, along with the Government inspectors report, are laid before the board and a minute passed upon the subject; so that I consider the Board of Trade officers now have, practically, all the power that could be given to them, except the absolute power of saying that whatever they think is best ought to be done and must be done.

2092. Mr. *H. Palmer.*] Did you not say that it would be impossible, in your view, to have an express enactment applicable to all companies to use the block system at once?—I did not say that, or at least I did not intend to say that.

2093. You think that there might be an enactment compulsory upon all railway companies to adopt the block system?—Of course, as to that, if Parliament passed an order that the block system is to be adopted on all railways in England, of course it must be adopted, the same as we have used the cord communication.

2094. It would be perfectly practicable, I suppose, if such a law were existing?—We should be bound to carry it out, and would carry it out; but we consider that there would be disadvantages in doing it, and we think it unnecessary on many portions of the line. I do not mean to convey that, if there was such an order, it could not be done, because I do not believe in anything being impracticable.

2095. You have alluded to the communication between passenger and guard; what sort of signal do you use under the Act of 1868 on your line; is it the cord system?—The cord system.

2096. And do you find that answer?—Yes; it has only been necessary to use it four times by passengers, and they have so used it. On three occasions it was quite unnecessary to have stopped the train, and on the fourth it might have been necessary, but whether it was so or not I cannot tell.

2097. Do you think it a proper precaution to have?—Quite proper, if it is practicable; however, it has worked so far satisfactorily on our line.

2098. With regard to the tribunal, you were asked about the county courts. Do you mean that the county court judge alone, without a jury, should decide those cases?—They should be decided before a county court judge, without a jury. There is not the slightest doubt about it, that the feelings of a jury are led away as against railway companies, otherwise we should never have had the excessive damages to which we have been subject; in fact, frequently we have had cases in which the jury have actually given a sum merely to carry costs, because in many cases which I could have shown the Committee, they have awarded a very small sum, whereas, if they had believed the evidence of the plaintiffs, they would have been entitled to a very large sum under the present state of the law.

2099. Then you would treat the county court judge as a sort of arbitrator?—Yes; I should prefer that, or one of the judges of the superior courts, to a jury decidedly.

2100. Accidents frequently happen at stations, do they not, by passengers getting out and falling between the carriage and the platform?—They occasionally do; not frequently on country lines, I think.

2101. There was one the other day, was there not, in which a lady got 600*l.* from the South Western Railway Company only this last week, from having fallen between the platform and the step of the carriage?—Yes; those accidents occasionally occur.

2102. Would not it be possible to compel all railways to make the platform level with the carriage?—It would, no doubt, be possible to do it; but there is this disadvantage in it, that where passengers have to cross from one platform to another, the higher the platform of course the greater the descent; say, that I have to get across the line upon the Great Western Railway, our standard height is about 2 feet 9, which just gives one step up into the carriage from the platform.

2103. Then there is a space, is there not, between the platform and the carriage as well?—There is a space; but there would not always be a space, because you have a step in front of the carriage door, and you have no step except a lower step beyond.

2104. But it is much safer if the platforms are on a level with the door of the carriage, is it not?—To a certain extent, no doubt, it would be more convenient to step out on the level with the floor of the compartment; but I must tell you that there is a very great diversity of opinion upon that point; it was discussed, I believe, last year at a meeting of the Institution of Civil Engineers, and there was a very great difference of opinion as to which was the best; I think the Great Northern and one or two companies, and ourselves, have 2 feet 9; I do not remember what the London and North Western have, but I know that there were quite different views that were then expressed upon the subject; I do not know of any on a level with the compartment.

2105. Is not the platform on the Metropolitan on a level with the compartment?—I am not aware.

2106. What should you say to a tribunal of this sort, a Board of Trade inspector with a medical and legal assessor, being a court of inquiry into railway accidents?—As I said before, that would be a very great improvement upon the present tribunal.

2107. That would be quite as good a tribunal, would it not as a county court judge sitting alone?—I daresay it would; upon that point I am not, of course, so able to express an opinion as Mr. Blenkinsop, who is a professional man, but as far as I see that would make a very good tribunal.

2108. And that tribunal ought to be a public investigation, ought it not?—That we could not have the slightest objection to, however public.

2109. Are the stock of carriages and trucks belonging to other companies investigated with the same care as your own, when they are brought on to your line?—To a certain extent they are.

and

and to a certain extent they are not; that is a very difficult question, and it is one which is really at the present time under the consideration of a committee of general managers and the clearing house; in fact, legal questions have been raised as to our powers, and it has been referred to five or six solicitors of the largest companies; I myself, some years ago, moved at the clearing house to appoint a committee for the purpose, and we were met at once by this fact, that although we had certain power to require persons putting trucks upon the line to construct them with the best material, and in fact in the same way as we construct our own trucks, this awkward question arose, whether we had power to do that in respect of all new trucks, unless every truck that is now running is also altered; that, of course, is so utterly impossible, so that we have got into a dead lock upon the subject; but it is so very important a question that it is in hand now.

2110. It is desirable, is it not, that they should be subjected to as rigid an investigation as your own?—No doubt. In fact, not only is it desirable, but it is absolutely necessary; I go so far as to say that. But you must remember that we are dealing with a very large amount of property of a very powerful body, the colliery proprietors, and other parties who own the waggons, and they look very jealously indeed upon every regulation which we make. Upon the Great Western line, when we were a broad gauge system only, we had a very rigid system which we could carry out; but when we became partially narrow gauge, and endeavoured to put those regulations in force, we found that parties would not build their waggons upon our line, they would build them somewhere else, and then they got the label put on of that company on which they were built, and they loaded them to our line; so that we were in this position, that we must stop the traffic of the country, in which case there would be a great outcry, or we must take the waggons, although they did not conform to our own specification.

2111. It would aid you materially, would it not, if there were a law that could be enforced in that respect?—It would, no doubt. If the present state of the law is not sufficiently clear to enable the companies to require it, the law ought most certainly to be altered, to enable them to do so. There have been for many years a bad description of accidents, like that which has arisen lately upon the Great Northern line; it is a description of accident which does frequently arise, although fortunately not under such circumstances.

2112. That would be a very good enactment to be made, would it not?—Yes; if Parliament would give the companies power to do so, it would be a great advantage.

2113. The accident on the Great Northern Railway was caused, was it not, by a waggon not belonging to the Great Northern Company?—It did not in that case belong to the Great Northern.

2114. Did it belong to another railway company?—Yes; I do not mean to say that under the most rigid examination you could have prevented that accident occurring. I am only following up your own question, because there is much less risk with railway waggons than with private waggons.

2115. What sort of test is applied to the axletrees and wheels besides the tapping of the wheels?—If there is anything apparently out of order, the men get under them and examine them closely (they cannot do more while they are in transit), and if there is anything the matter with them, they simply mark them off, which is an occurrence going on every hour of the day, or, I may say, every quarter of an hour; in fact, waggons, whether loaded or unloaded, are simply marked off, and not allowed to run any further.

2116. Would it be possible to define any length of time after which a carriage or truck should not be used, by reason of its becoming impaired in strength?—I am scarcely so competent to answer that question as an engineer would be; but I may say this, that in former years we used to keep a record of the number of miles that every waggon travelled on the Great Western Railway, and of every carriage also; and, as far as I can ascertain, it did not afford any reliable basis for saying how long an axle or a tyre would run.

2117. Whether it was length of time or length of distance?—No, not as far as I could ascertain; because, in the course of the inquiries that we have been making during the last two or three years, I have gone into that matter very carefully, and I cannot find that I could place any reliance upon it.

2118. The Board of Trade never send down an inspector, I believe, unless an accident happens?—No, or upon a representation from the public upon any particular question.

2119. What sort of representation from the public?—For instance, if you are living at any station upon a railway, and you send up to the Board of Trade a communication upon any particular point, they will either send it to the railway company and require them to answer it, or they will send down an officer to inquire into the matter, which is not at all an unfrequent occurrence.

2120. Would it be a practicable thing to have periodical investigations by an inspector, without being put in motion by an accident or by the application of any local resident?—I do not think it would be practicable to carry it out with any advantage; take the case of the Great Western Railway: supposing a Government inspector had to undertake to pass over 1,400 miles of railway, it would take him an enormous length of time to do it. If he had to go to every station and examine the permanent way and examine all the stock, I think he would have to be permanently employed. I know that when we go over the line, which we do by special trains, to examine the state of the stations and the line, and so on, it takes us a very great deal of time; we do not require to go over the whole line of railway because, to a very large extent, we depend upon the railway engineer officers, and so on; but if a Government inspector was going over it for any practical purpose, he would have to go into everything most minutely, and that would take a very long time indeed; he would almost have to be, practically, located upon the line and doing nothing else.

2121. That is a question of the number of inspectors that would be employed?—Yes, quite so; you would have to allocate a certain portion of the country to an inspector doing nothing else; otherwise I am afraid there would be no practical advantage in it.

2122. Would there be any disadvantage if the Board of Trade had power to make orders which should be enforced after having been laid before Parliament for a certain time during the Session?—If

Mr. *J. Grierson.*

30 June 1870.

—If we had an opportunity of being heard against these orders, and giving our reasons why they should not be carried out, and Parliament was then satisfied that they should be carried out, of course there could not be a word said against it.

2123. The railway interest is pretty extensively represented in Parliament, is it not?—As far as the number of gentlemen who are either directors or shareholders in railways is concerned, it is so; but it is astonishing how frequently we find, when we ask them to do something for us, that they will not do it; they think of their constituents, and not of the railway companies.

2124. Still, there would be that check upon the enforcement of such rules?—I should rely upon Members of Parliament without that.

2125. Mr. *Sherriff.*] Can you give the Committee any idea of the number of traders' waggons which are now running on the railways throughout the kingdom?—I could not give you that off-hand.

2126. Is it possible for you to provide the Committee with a return of the number of companies' waggons owned by the railway companies?—We did make a return between two and three years ago, showing the estimated number of waggons belonging to the railway companies throughout the country; and we have also an estimate of the number of private waggons; I could give you that return.

2127. Could you give us, at as recent a date as you possibly can, the number of each?—I could give you that return, and I should add to that a certain per-centage for increase, which would be as near as you could come to it without going into it very carefully.

Mr. *C. W. Eborall.*

Mr. Cornelius Willes Eborall, called in; and Examined.

2128. *Chairman.*] What opportunities have you of becoming acquainted with the subject which is being inquired into by this Committee?—I have had a great deal of experience; I have been General Manager of the South Eastern Railway for 15 years, and I have been connected with railways for 30 years, and during my time of management on the South Eastern we have unfortunately had some serious accidents. There was one, as you will recollect, the Staplehurst accident, which cost the South Eastern Railway Company upwards of 70,000*l.* There were several very large demands made upon the company for compensation. I think Mr. Baron Martin referred to one in his evidence the other day, a claim made at Liverpool by the representatives of a gentleman who had been residing at Bolton, and the claim amounted to something like 50,000*l.*; he was a veterinary surgeon, and he also had some interest in a mill; and the jury assessed the damages at 7,400*l.* or 7,500*l.* We considered it a very heavy verdict, but we did not apply for a new trial, for we thought it was useless, at the time; but we consider that the company was very unjustly used; Mr. —— was killed, and his wife was slightly injured. There were other cases, and I think the average of the compensation paid in that accident, taking the number of persons killed and injured, was 1,000*l.* for each person; of course some claims were very small, and others were very large.

2129. What was the cause of the accident?—The platelayers had a rail up on a bridge, and a train ran into the cavity; it was negligence on the part of a platelayer, and the man who caused the accident was prosecuted, and imprisoned for 12 months if I remember rightly.

2130. What is your opinion with regard to the state of the law upon the subject?—I think that it is most unjust to the railway companies. In 1865 there was a Royal Commission appointed to inquire into the management of railways, and before that Commission I gave some evidence upon the question. I asked whether it was admissible, and I was told by the Chairman that it was, and I believe myself that I was the only person who gave evidence upon the question before that Commission, and the Commission made some recommendations on the subject. I think the law is very unjust to railway companies; that many cases are fraudulent; and that juries are unduly influenced in favour of the public and against the railway companies, and very unfair verdicts are given.

2131. Wherein do you think the injustice consists, in the theory of the law, or in the mode of its administration?—I think in both cases; Lord Campbell's Act was an Act passed years ago, when railway traffic was very different to what it is now; we now carry at much cheaper fares; we carry a very much larger number of passengers than ever was anticipated, and we run at very much higher speeds, and, no doubt, run greater risks.

2132. Do you think that under those circumstances there ought to be a change in the law?—Yes, I do.

2133. What should be the nature of the changes in the law that you would suggest?—I consider myself that the tribunal wants altering, and that juries are not the proper parties to assess the damages; I think the tribunal should be a judge or judges, persons who make themselves fully acquainted with all the peculiarities of railway working, and would be able to understand everything connected with railway management; I should think that it should be one or two judges, who would become in a manner experts.

2134. Supposing a man with 1,000*l.* a year, a professional income which died with him, is killed, on what principle would you assess the damages?—I think that a system of insurance should be adopted.

2135. But without insurance, supposing he was killed or was not killed, on what principle would you assess the damages?—Unless he insures, I think there should be a limitation of the liability.

2136. What would be the limitation which you would propose?—I think it might be the limitation proposed by the railway association, which I think was 500*l.* for a first class passenger, 300*l.* for a second, and 200*l.* for a third.

2137. Would you recommend that the company should be bound to insure a man if he wished to secure a larger sum than this?—Yes, exactly.

2138. Would you make any alteration in the tribunal?—Yes, I think that very important. I do not see myself why some arrangement of this sort should not be made: That the Board of

of Trade inquiry into railway accidents should be made in a more formal manner, that witnesses should give their evidence on oath, and that even the same parties who inquired into the accident, and the cause of it, should be the parties to go into the question of damages.

2139. Have you the block system in use on your line?—Yes.

2140. Is it universal throughout the whole of your line?—Yes, we have had it in operation for upwards of 20 years; in fact, a few years after the opening of the South Eastern Railway, the South Eastern Company adopted the telegraphic system on their line, and they made use of it for the purpose of working their railway, and from that time they adopted the block system all over their railway.

2141. What is your experience of the working of it?—I think that on crowded lines it is indispensable.

2142. What do you say where lines are not crowded?—I do not think it is absolutely necessary, although I think it desirable.

2143. Do you think it is good in all cases?—Yes, I think it is good in all cases.

2144. Would you go so far as to recommend that it should be made compulsory?—No, I should think that that would be a very unwise step indeed.

2145. Are you in favour of having any superior power to control railways, either with respect to the block system, or any other mode of management?—I think that the best thing is to leave the railway companies entirely to themselves. Let them be responsible for all accidents. I am quite sure that they are alive sufficiently to their own interests to adopt every possible precaution in the management of their railways to provide for the safety of the public.

2146. Is there anything else that you would wish to suggest to the Committee?—I only want to show the Committee the importance of my last remark, and to show that the companies are sufficiently punished by the large sums that they have to pay for compensation. In our case, in six years, we have had to pay 137,000 *l.*, which amounts to about 3 per cent. upon the net earnings of the railway, and the average amount of compensation for personal injuries paid for those years, 1864 to 1869, is 22,000 *l.* a year.

2147. What difference would that 22,000 *l.* a year have made in your dividends?—About one-fifth of a £. per cent.

2148. That would make about a difference of 4 *s.* upon every 100 *l.* upon the ordinary stock?—Yes.

2149. Mr. *Sclater-Booth.*] You say 3 per cent. upon the net earnings, but the net earnings are a much larger sum than the payment of the ordinary shareholders, because the debenture and preference stock has to be paid first, and the ordinary shareholders bear the whole loss, do they not?—The ordinary shareholders bear the whole loss, and that reduces their dividend by about one-fifth of a £. per cent.

2150. You have originally stated that the sum paid in compensation was 3 per cent. upon the net earnings of the company?—Yes, and I think you will find that per-centage is correct.

2151. Sir *H. Selwin-Ibbetson.*] You said that 22,000 *l.* a year has been paid in compensation; over what period does that extend?—For 1865, 1866, 1867, 1868, 1869, and 1870.

2152. That is a very strong inducement to the company to conduct their line properly, is it not?—That is what I urge strongly, that it is so.

2153. In proposing to do away with unlimited compensation, and therefore to bring it down to a limited amount and reduce this sum very considerably, do you not conceive that the public are entitled to some equivalent in the way either of additional inspection or additional security for the proper working of the line?—But I think that this is a sufficient inducement to the companies to manage their line properly, and to avoid if possible heavy claims for compensation.

2154. Then assuming it to be the case, as has been often stated, that this large amount of compensation is one of the only efficient securities the public has, if it is proposed now to do away with the security that the public possess, and to limit the amount to some smaller sum, are not the public entitled to something to take the place of this security which they are giving up, some greater direction or greater power over the management of the lines?—I do not think that that is so; they still will be liable to compensation to a large amount.

2155. You admitted, I think, just now, that this heavy compensation was a security to the public, in obliging managers for their own sakes to work their lines properly?—Yes.

2156. That being done away with, are not the public entitled to ask for some equivalent in the way of security?—No, I do not think so; the security still remains; it does not remain, perhaps, to the same extent, but it remains still.

2157. But it remains in a very limited form?—Not in a very limited form.

2158. I think you stated that the block system had worked on your line with very good effect?—Very satisfactorily.

2159. And you yourself do not see why it should not be adopted on other lines?—My own opinion is that other lines will adopt it, and recently in many cases, I think, they have been adopting it largely.

2160. Do not you conceive that that which you think on your own line has produced additional safety to the public might very fairly be enforced upon other lines?—I think other lines will adopt the system without being forced, for their own security.

2161. And you think that the public should be subject to the dangers, if they are dangers, which arise from not adopting the block system on other lines (acknowledging yourself that it is a valuable addition), until such time as the companies awake to the fact that it is a good system?—There are various opinions about the block system; I am an advocate for it, and I myself believe that railway companies, under any circumstances, will gradually adopt it, especially where the lines are crowded with traffic; I do not think it is at all necessary to make it compulsory; railway companies, as I stated before, are quite sufficiently alive to their own interests to adopt anything that will save life or limb in carrying on their business.

2162. How can you reconcile the fact that you, seeing and acknowledging its advantages, have now for a period of 20 years worked your line on it, with the fact that at this moment the general complaint of the inspectors of the Board of Trade, is that other lines in the country, as a whole (not speaking of individuals), do not adopt this system, and do not attend to the constant recommendations in favour of this system?—

Mr. *C. W. Eborall.*

30 June 1870.

But I think you will find that other lines are adopting it; the Midland, the London and North Western, the Great Northern, and the Great Western.

2163. They are adopting it very partially on their lines, and they have stated in evidence that in many parts of those lines they are not prepared to adopt it?—There are some portions of their line where it is not absolutely necessary, and I think it would be very wrong to compel them to put it down if they think so; we have placed it over our railway, but there are parts of our line where I think it might be dispensed with.

2164. At the same time, I understood you to say just now, that although it was not so necessary for the public safety on the parts of a line where the traffic was not so crowded, still you thought it an advantage?—Yes; I think there is an advantage in it.

2165. Do you see any reason why that which is not only a valuable assistance on the parts of your line where the traffic is very constant and frequent, but is an advantage on the parts of your line where it is not so frequent, should not, conducing as it does to the public safety, be adopted on lines generally throughout the country?—For my own part I see no necessity to make it compulsory to adopt it on every part of a long railway; we have done it, not so much that we consider it absolutely necessary on our branches, but we have adopted it as a system; but I am not quite sure whether it is absolutely necessary for the public safety on every portion of our line.

2166. There would be a great advantage, I imagine, in adopting a system of this sort universally, inasmuch as the servants of a company would, when changed from place to place, be always accustomed to working the system?—Yes; but then the question is what system would it be; the question is what system would you adopt; there are various modes of carrying on the block system, and if the Board of Trade took upon themselves to settle the exact mode of operation, I think they would have a difficulty in doing it.

2167. Do you adopt various systems on your line, or only one?—We have one now. We had at one time two; we had Tyer's system, which we gave up, and now we adopt only the system of our own electrical engineer; but there are several systems. The Board of Trade, you will recollect, have not instructed railways as to the mode of communication between passengers and guards, although there is an enactment that it shall be carried out. We have the electrical system on our line, and other companies have the rope system; but the Board of Trade, I think, would have some difficulty in determining as to which system should be adopted. You might just as well ask the Board of Trade to settle what sort of tyres we should use, what sort of axles and what sort of carriages; in fact, to go into the whole management of the detail of railways.

2168. Notwithstanding all those objections, you adhere to your opinion that the block system is really a safeguard to the public, and an advantage to the safe working of a railway?—I do.

2169. Referring to a question of the Right honourable Chairman with regard to the judges being the authority to try cases of compensation for accident, do you see any objection to an authority constituted from the Board of Trade, an authority composed, for instance, of an inspector of the Board of Trade, with a medical and a legal assessor, who should first inspect, and make a report, which should be public, on the accident itself, and should afterwards be the court before whom all claims for compensation should be tried?—No; I see no objection to that.

2170. Do you not think that that perhaps would be even preferable to the county court judges throughout the country as a tribunal?—I think so.

2171. I suppose, as a railway manager, you would allow that that would be far preferable to the present system?—Yes, no doubt.

2172. It would do away, would it not, in a great measure, with conflicting medical and other evidence which at present increases the expense of those trials?—No doubt it is most desirable. I was looking at a case the other day, with reference to the expense, where a woman was hurt on our line, and the compensation she had paid to her was 280 *l.*; and, looking at the costs, with the medical evidence, they were 180 *l.*

2173. Supposing a limitation of compensation to be adopted, the question of amount, 500 *l.*, 300 *l.*, and 100 *l.*, is only a suggestion that has been put forward, it is not a question which the railway companies have decided?—No; we have generally discussed it, but that is the idea that has been put forth.

2174. Are you aware that we have had another statement to-day, from an officer of the Board of Trade, fixing the amount which he thought ought to form an absolute obligation in case of death, at a very much higher figure?—I was not aware of it.

2175. Mr. *Davison.*] I think you said something about the amount of compensation coming up to three per cent. upon your net dividends; did you mean that?—Three per cent. upon the net earnings.

2176. What was the 4 *s.*?—The 4 *s.* was 1-5th of a £. per cent. upon the dividend upon our ordinary stock.

2177. Three per cent. is taking your mortgages and everything?—Yes, three per cent. upon the whole of our net earnings; it is 1-5th of a £. per cent. upon the dividend upon the ordinary stock. I will hand in a Table which shows that result. (*Delivers in the same.*)

2178. Mr. *Sherriff.*] It has been stated to the Committee in evidence, I think, by the representatives of the London and North Western, the Midland, and other companies, that the amount which you have paid is about the average of the compensation upon their lines, and they do not adopt, as I understand you, the block system, whereas you adopt the block system throughout your line?—We do.

2179. Do you lock your points as well?—Yes, we do.

2180. And yet it would appear that you pay as much compensation as the companies who adopt a different course?—It appears to be so.

2181. So that in reality the block system and the locking of points does not in any very material degree alter the per-centage of accidents which happen on railways?—If that be so; I do not know what the per-centage of other railways is.

2182. The great accident which you spoke of arose really from a rail being up, and which the block system did not, and could not, prevent?—The block system could not prevent an accident of

of that sort; it had no reference to the block system.

2183. You agree that the block system is a very desirable thing, and ought, upon all the busy parts of lines to be adopted?—I am quite sure that it ought to be adopted, and I believe it will be adopted without compulsion.

2184. Sir *H. Selwin-Ibbetson.*] Is not your traffic principally passenger traffic?—Principally passenger traffic; we carry about 20,000,000 of passengers a year.

2185. You have no mineral traffic, I believe?—Very little indeed.

2186. Mr. *Winn.*] Your mineral traffic bears a very much smaller proportion, does it not, to your general traffic than is the case on most lines?—Yes, perhaps less than any other, except the Metropolitan or the North London.

2187. Therefore you probably would have many more accidents to passengers in proportion than other companies have?—No doubt.

2188. Mr. *Sherriff.*] Does not the fact of traffic being mixed up, passengers, minerals, and goods, add very materially to the danger of conducting a passenger traffic?—No doubt.

2189. So that in reality your freedom from traffic of a mineral character, allowing your attention to be fixed upon the passenger traffic alone, or nearly so, ought to be a means of security, and not of danger?—Except that you must set against that the large number of trains which we have to run, and the short intervals between those trains.

2190. But if those trains were mixed up, goods, passengers and minerals, the danger to the passenger trains would be increased, would it not?—Yes, no doubt.

2191. Sir *H. Selwin-Ibbetson.*] At the same time your heavy losses, as would appear from your Table, really arise from your carrying a very much larger number of passengers, and therefore more accidents on which payments for damages arise happening?—Yes; I find on taking out the number of accidents in the six years referred to there are only 15, and that in those six years two accidents contributed towards the 137,000 *l.*, about 110,000 *l.* of the whole amount; those were the accidents in the Blackheath tunnel, where the block system was in operation, and the Staplehurst accident; in 1866 and 1867, the compensation paid was 106,000 *l.* in two years; that is 106,000 *l.* out of 137,000 *l.* during six years.

2192. Mr. *H. Palmer.*] The Staplehurst accident happened to a tidal train, did it not?—Yes.

2193. Had you ever any other accident occur to a tidal train?—Never, before or since.

2194. That train travels at great speed, does it not?—Yes, very high speed.

2195. And the precautions taken for the tidal trains are, of course, under the block system?—Yes.

2196. Have you got passenger signals on your trains by the electric system or the rope system?—The electric system.

2197. Do you find that answer?—I do not think it is of any use whatever to anybody. We have had a great number of cases arising from curiosity; we have a peg that has to be pulled down to enable the communication to be made; and to show you what use is made of that, a train was pulled up, one of the mail trains, a week or two ago, and the excuse of the passenger who did it was, that he thought it was a hatpeg.

2198. Then, according to that, the rope system is the best?—My own opinion is that the rope is not the slightest use at all, even for a hatpeg.

2199. Then you think that a passenger signal is a very useless thing?—I think so.

2200. But the Legislature seem to enforce it?—Yes, and I think if they compel companies to adopt the block system, or some block system which they do not define, they will make another mistake.

2201. Mr. *Sherriff.*] You think that was a mistake with regard to the passenger signals?—I think it no use.

2202. Mr. *H. Palmer.*] It is no harm?—No, it is no harm, except that we have had trains pulled up frequently from no proper cause. One passenger was taken by a train that did not stop at the station that he intended to stop at, and he thought he would be too late for dinner, and the train was pulled up by him at his station.

2203. Sir *H. Selwin-Ibbetson.*] Have you no penalty which you can enforce?—Yes; but we adopted the system before the penalty was put in operation.

2204. Mr. *Winn.*] Have you never had a train pulled up for a good cause?—No; not for any proper cause.

2205. Sir *H. Selwin-Ibbetson.*] Since the penalties have been in operation have you had many of those cases?—Yes.

2206. Have you enforced the penalty?—Yes; we have in one case. In some instances passengers have stated that they were ill, and wanted to stop at the next station, or some excuse of that sort; and we found it rather objectionable than otherwise to enforce the penalty.

Monday, 4th July 1870.

MEMBERS PRESENT:

Mr. Dalglish.	Mr. Charles Reed.
Mr. Davison.	Mr. Sclater-Booth.
Mr. Denison.	Sir Henry Selwin-Ibbetson.
Mr. Headlam.	Mr. Sherriff.
Mr. Mowbray.	Mr. Rowland Winn.

THE RIGHT HONOURABLE T. E. HEADLAM, IN THE CHAIR.

Sir JAMES SHAW WILLES, called in; and Examined.

Sir *J. S. Willes.* 4 July 1870.

2207. *Chairman.*] How many years have you been on the Bench?—Fifteen years and a day.

2208. During that time you have had considerable experience of the law concerning compensation paid by railway companies for accidents?—Yes.

2209. We have been told that there is some difference in the theory of the law, though not much in the practice, between the case of a railway company injuring passengers, with whom something in the nature of a contract has taken place, and the case of persons being injured with whom nothing in the nature of a contract has taken place; as for instance a man driving a cart across the line; is it the case that there is not much practical difference between the two cases?—There is very considerable difference as to the circumstances; the cases present very different sorts of questions for the jury, and even in each class of cases the facts differ very much; I am not aware of any legal difference between one and the other.

2210. In the case of injury done to a man with whom there is no contract, does not it rest upon the general law of master and servant?—It rests upon the general law of master and servant; but I take it with respect to people who travel on the line and pay fares, the contract by the company with them as passengers is only that the company through their servants will use ordinary and reasonable care and skill, according to the circumstances. The question is rather one of legal theory; I think, practically, one may say that a person who is guilty of negligence through his servants is answerable, provided that that negligence amounts to want of reasonable care, the want of care that a prudent and skilful man would take under the circumstances.

2211. Supposing an action was brought against a private individual in respect of an accident of this description, that his coachman had driven over a person in the street, and that he proved before a judge and a jury that he had not only exercised ordinary care, but had taken very special and particular care, to get the most careful coachman in London, and had given that coachman every direction to drive as carefully as possible, so that it was no fault on his part individually; would that exonerate him in any way?—No; the question would be whether his servant whom he had put into his place to do the act of driving had been guilty of negligence, that is to say, a want of ordinary care and skill.

2212. So that in reality it really comes to this, that though he is a perfectly innocent man, and has exercised extraordinary care to prevent the accident, still he is ultimately liable?—If his servant has been guilty of negligence.

2213. A small tradesman who has a cart, which is driven by his servant about the streets, is liable to any extent for an accident that may be committed by the negligence of his servant?—He is liable for an accident that may be committed by the negligence of his servant, or in that case one would say want of skill, because the rule that a man is not to take upon himself at the risk of others to do a thing requiring skill unless he has reasonable skill to do it, would apply; that is a case in which not only care has to be exercised, but the exercise of that care involves not taking upon one's self to do the thing unless one has reasonable skill to do it.

2214. Do you think there is any hardship in that state of the law?—No doubt; as there is hardship in very serious results coming upon a man by reason of some small folly or vice; but it is a hardship that is necessary for the public protection; it certainly always has been considered so, and therefore, I believe in every system of law, as a general rule, the master is answerable for the neglect of his servant.

2215. We are told there are refined distinctions to this effect: that, supposing a man has a gamekeeper and a coachman, he is liable if the gamekeeper shoots anybody by carelessness, and, on the other hand, he is liable if his coachman runs over anybody by carelessness; but if the coachman says to the gamekeeper, "You shall exercise the horses this morning, and I will go out shooting, and if, after making that arrangement, the gamekeeper runs over somebody, or the coachman shoots somebody, the master is not liable; is that the state of the law?—I think that would be so; that is an entire departure from the order of the master; he has not employed the gamekeeper to drive, nor the coachman to shoot: the rule is, that a person with a delegated authority cannot delegate that authority; when I say the rule, I must be understood to mean with exceptions and limitations, because there is hardly any rule that you can lay down in law which is as certain as that two and two make four. Under peculiar circumstances exceptions are allowed, and by legislation there are limitations of liability, but the general rule is what I have mentioned—a man is liable for the conduct of his servant in doing the thing he has employed him to do, not otherwise; and I might add, that if the coachman were to get into his master's carriage and drive off at night to see his sweetheart

sweetheart, something entirely out of the scope of his employment, the master would not be answerable for any accident which he might cause on the way.

2216. With respect to the general law of master and servant, do you think there are sufficient reasons for making any alteration in it?—As to the general rule, I see no reason for making any alteration; and I do not think that can be the bent of mind of an English lawyer only, because I have observed that the civil law was so, and that the countries which have adopted in great part the principles of the civil law on the Continent, by their writers lay down the same rule; and in the United States of America, where naturally old rules of law are discussed with greater freedom than they generally are by Europeans, the rule is preserved, and in some respects the rule is more stringent in America as to liability than it is here.

2217. Till recently, I think, the severity of that law, assuming it to be severe, was modified by the doctrine that no action could be brought after death for injury which had occurred during life?—Yes; that was so in this country up to Lord Campbell's Act, which I think was the 9th and 10th of the Queen.

2218. What do you say as to the policy of that Act?—That admits of a good deal of remark. I would illustrate it in this way. There are persons who suffer by a death, as I may say, sentimentally; there are others who suffer by a death pecuniarily. Neither class of sufferers had any remedy before Lord Campbell's Act. I will give an instance of a pecuniary sufferer. I will take the case of an insurance office. I recollect arguing such a case in the Court of Queen's Bench. A man, insured in an office for 1,000 *l.*, is killed by negligence, even by design, he is murdered or killed by negligence; he is killed under circumstances in which the person who kills him is guilty of greater or less fault. The insurance office has to pay 1,000 *l.*, but the insurance office has no action against the person who caused the death. That is the case still, notwithstanding Lord Campbell's Act; the liability to make good pecuniary damage to insurers, creditors, or others, not relations, by reason of the wrongful killing of another did not exist before Lord Campbell's Act, and does not exist now. With respect to persons who have a sentimental claim, coupled, of course, with pecuniary claims of a moral character upon the person who is killed, the law seems to me to stand in a very anomalous position. The laws of some countries allow what is called *solatium*; allow of some amount being given in respect of the hurt to the feelings of the survivor. Our law does not. Our law gives damages in respect, not of *solatium* for the death, but in respect of the pecuniary damage which they can prove that they will probably sustain by reason of the death; and it only gives those damages to persons related within certain narrow limits. If a man were to die who had no wife, no father or mother (including step-parents), grandfather, grandmother, daughter, son (including step-children), granddaughter, or grandson, and the same in the case of a wife who died without those relations and without any husband, he, taking the case of the man, might have very near relations depending on him whom he might have a moral obligation to support; he might have unmarried sisters and such like; and those unmarried sisters, to take them as an instance, would have no remedy whatever, notwithstanding that they could show that he had supported them, and would be sure to have done so, and was in a position to do so, if he had survived. I speak here with reserve, because I have not looked into the late Act, 27 & 28 Vict. c. 95, to see whether it extended the sphere of relationship within which damages can be recovered. I believe the late Act only affected the form of remedy. Certainly Lord Campbell's Act, the 9th and 10th of the Queen, was limited to the degrees of relationship to which I have referred, and so far as my observation has gone, I am not aware of any change in the law since. To begin with, that is a very singular distinction. Thus, in the next place, a man who kills another goes free altogether, unless the man who is killed happens to have a relation or relations within that sphere. Then, again, a man dies, leaving such relations, but if he has not been in the habit of making an allowance to them, or providing for them in any way, they cannot recover anything to speak of. Again, to put an instance (and an instance, perhaps, is the best way of showing how the law operates); I put this instance as a balance to that of the insurance office case which I put just now. Take the case of the action brought against the Great Northern Railway Company some time ago, to which I have no doubt the Committee has been referred, the case of Mr. Pym. Mr. Pym was a gentleman who left, I think, a widow and a large family, many of whom were under age and unprovided for, and he left, if I mistake not, freehold property which, according to the distinction at present existing in our law, would, without a will, go to the eldest son, leaving the younger children unprovided for. That was a case in which very large damages were recovered against the Great Northern Railway Company, and I think they finally stood, I am speaking not from book, at about 10,000 *l.* The younger children had, if I recollect rightly, 1,000 *l.* a piece, and the widow had so much. That case will illustrate what I am saying. Suppose that that gentleman had made his will, and had provided for his wife and his younger children all that they were likely to get from him in the way of pecuniary benefit if he had survived, they would have been in an equally good position, except that they would have lost a father and a husband, a loss which our law does not pretend to compensate, even under the Act, because, as I have mentioned, no *solatium* is allowed. If he had so made his will, they would, in fact, not have suffered any money damage at all. Looking at the thing as a practical question (I speak now as a man of the world, and not as a lawyer, except that a knowledge of the law enables one to see the working of these things), if that gentleman had been a poor man the damages would have been hundreds or tens. If he had not had a small family the damages would have been but trifling. If he had had the wisdom to provide for them by making a will, there would have been small damages only, because only pecuniary damages for what they are deprived of are allowed, and he would have provided for them, in a prudent way, that which the jury provided for them by their verdict. So that in a mere case of breach of contract you arrive at the liability on the part of the company, in respect of the important circumstance of amount, in consequence of a series of remote accidents.

Sir *J. S. Willes.*

4 July 1870.

dents. Now, in respect of the liability of anybody who kills another, but especially the liability of a company with regard to passengers, in respect of a contract; a man pays a sovereign for his ticket, and enters into a contract with the company, that contract being, as I have explained, capable of being expressed, that the company shall warrant that their servants shall not be guilty of negligence.

2219. That is the construction which the law now puts upon the contract, is it, that a man pays his sovereign to be transmitted from A. to B., and the law construes that contract to be a warrant on the part of the railway company that the railway company will transmit him there, and that there shall be no negligence or default on the part of their servants?—With reasonable safety.

2220. Is it with reasonable safety?—In legal language it is the same thing. A contract to carry a passenger safely and securely is not like a contract to carry goods safely and securely. A man who contracts to carry goods safely and securely is bound to carry them so, except he is prevented doing so by the act of God, the Queen's enemies, or the act of the party himself with whom he contracts; but with respect to passengers there is no such absolute liability.

2221. That being the construction the law puts upon the contract, do you think it would be lawful for the company to alter that contract by any express stipulation with a particular individual or by a general notice; supposing they were to say they would be liable to every person to the extent of 500 *l.*, or to the extent of any other sum that might be named for their due transmission to such and such a place, but that they would not be liable for a greater sum than that, unless a special sum were paid in consideration of the special and particular risk, do you think that that would be lawful?—It would be lawful if you could get a jury to find there was a special contract between the company and the passenger, but to say that it could be done by any general notice, would be to say, that which practically a jury would not find; certainly, speaking for myself, I should not look at the ticket to see whether there was any special stipulation upon it.

2222. The circumstance of having it stamped on the ticket would not be considered by the jury as in reality sufficient notice of the variation of the contract?—I do not say the jury might not, in the case of a person habituated to the line, find that there was a special contract under such circumstances; but I must observe, that if the company were put to that, you would throw them back upon the series of decisions before the Carriers Act, relating to the old carriers' notice, which no doubt the Committee have been referred to. By the 11 Geo. 4 & 1 Will. 4 (which relates only to goods, but the law before the Act would in this respect apply to passengers), a man carrying diamonds, and so on, and giving the carriers' notice, is not liable, except for theft by his servants, unless he has been paid an insurance price; which seems to be after all the cardinal point in the matter. That Act makes companies and carriers, who give notice, not liable unless the insurance price has been paid for those very valuable articles, leaving special contracts to take care of themselves. Before that Act, carriers used to give notice that they would not be answerable for anything above 5 *l.*, as to the effect of which there was much litigation.

2223. As I understand you, there is nothing in the theory of the law to render such a contract illegal, but you think that practically the difficulties of the company in making such a variation in the legal construction of their contract would be insuperable?—Practically the difficulties would be very great. If you had asked me 20 years ago whether a company could have made such a stipulation, I should have said I thought not, but I think the course of modern decisions has been that a company might refuse to carry passengers except upon reasonable conditions, and there would be a question of fact whether there was a special contract under the particular circumstances. I do not think conditions as to the carriage of passengers fall within the seventh section of another Act, which you have no doubt also had before you, the 17th & 18th of the Queen, for the regulation of railway and canal companies; but I think it would be considered in fact an unreasonable stipulation to put upon a man the moment he was going upon a journey, to elect whether he would go at all or upon special terms. The difficulty would be to convince a jury that such an assent on his part had been given to such a contract, as would free the company from liability beyond the stated amount.

2224. Evidence has been given before the Committee that there are certain trains called workmen's trains, with respect to which, under the Acts of the companies, the companies are only liable to the extent of 100 *l.*, the Acts also providing that claims arising upon those particular trains shall be submitted to arbitration, and not be tried by a jury; suppose a company were to advertise that they would run an excursion train from A. to B. at a particular time, and at a special fare, but that they would be only liable to the extent of 100 *l.*, and that 100 *l.* would have to be made a subject of arbitration, if a claim were made for it, so that every person who saw the fact that there was to be this excursion train would necessarily see the notice that the company had issued with respect to their liability with respect to the train; do you think that that would be legal?—I think that would fall within the same rule that I have already mentioned. With respect to excursion trains, there are so many people who really are too careless, or too much pre-occupied with their enjoyment to care for reading a mere general notice of that kind, that I do not think a jury would pay the slightest attention to it; and I think they would generally be right in rejecting it.

2225. The same notice which conveyed to the person the intimation that there was an excursion train would convey the intimation that there was a limit on the liability; I am supposing that the same notice which conveyed to the individual the fact that there would be a train running from A. to B. at a certain time, and at a certain fare, would convey to him also the fact that there would be a special and peculiar liability; you think a jury would say that he might get from the notice a knowledge of the time the train started, and the amount of the fare, but that he might disregard, on the other hand, the notice that the liability would be different from the ordinary liability?—I think a jury might do so; they would consider whether people looked to the notice for more than they wanted. A man would not look at all the notice unless it affected him; he would look at the announcement of the excursion train, and go by it, without caring to

jury

read the precise terms; and I should think a jury might act upon that in fixing liability on the company. With reference to Lord Campbell's Act, I wish to add one remark which runs over all I have said, and gives point to it, if it has any point. I said the damages are damages arising out of breach of contract. Now, the damages for breach of contract, according to the notions of all lawyers here and abroad, and also according to common sense, ought to be limited to the proximate consequences, and not extended to the extreme consequences. There is a case in the books of a man whose horse, when he was riding to be married, dropped a shoe; the blacksmith who put on the shoe pricked the horse, and thereby caused the man to get late, whereby he lost an heiress, and he brought his action to recover damages for the loss of the marriage. But whatever may have been the case in former times, it is now settled that a man is not answerable for such exceptional and remote consequences.

2226. Supposing a gentleman of very large fortune is going up to London for the express purpose of signing his will, by which will he is going to leave a million of money to a certain person, and he is killed on his journey up to London, do you think that the person to whom the million would have come would have any claim against the company?—Certainly not; that is one of those remote unusual consequences; there is no claim in that case, and that is a very apt illustration of what appears to me to be the haphazard way in which a company might be made liable under Lord Campbell's Act for what is not the immediate or proximate consequence of the breach of contract. Put the case that a man goes to Southampton to take his passage to one of the colonies, where a handsome appointment awaits him, and that he must arrive on a certain day to take it up, and he misses his voyage, the company ought not to be, and in sound law are not, liable for the value of his appointment.

2227. Do you think that juries do give damages for remote and not proximate consequences, to an extent not quite reasonable?—I think juries are quite honest, but I do not think they always keep their minds exactly upon the proper criterion.

2228. What would you say was the proper criterion?—The proper criterion unquestionably is the pecuniary damage that a man suffers; but if I might coin a word to say what I think is the error into which juries most frequently fall in the case of railway accidents, it is in capitalising the uncertain income which a man is assumed to be prevented from making by reason of his being disabled. They must have gone through the calculation of an annuity in some of the cases in which damages have been given, and for that reason I take pains to tell the jury that they are not to give damages by way of penalty, and would be picking pockets if they did; and, in assessing the damages, not only that they are to limit themselves to the proximate consequences of the accident, but also that the railway company is not to be treated like an insurance office; that they are not to take all the contingencies as against the company, the contingency of his having been in sound and insurable health at the time of the accident, the probability of his surviving to half the age between his present age and 84, the contingency of his continuing in good health and in fashion, the contingency of his business continuing to be the same. In some of the calculations of damages, all or some of those contingencies must, I fancy, have been given against the railway company. I always recommend juries to find a round sum fairly representing, as well as they can, a very considerable injury where a very considerable injury has been received, but to throw all notions of calculating annuities out of their heads. I think lately juries have taken that view, and have given more moderate sums.

2229. The companies complain that it is a great hardship upon them that they should be compelled to have to encounter these great risks incident to the carriage of valuable lives, without receiving any additional sum in respect of them; do you think there is any hardship in that or not?—I think there would be no hardship in it if you allowed railway companies to charge what they pleased; but I think as you limit them to certain charges, there is some hardship in making their liability unlimited.

2230. If they were allowed to charge whatever amount they thought fit, then you think they might be held liable?—Then I should see no reason for not holding them liable like other employers of labour. If they were allowed to charge according to value as by the Carriers Act, the 11 Geo. 4, which seems to me to give the principle, I think then they might be held liable; a passenger is an article that may be like a common stone, or may be like a diamond, in respect of qualities which the company cannot recognise upon inspection, and if he chooses to be paid for as a diamond, if injured, he ought to insure himself.

2231. You think the principle of the Carriers Act a right principle?—I think the principle of the Carriers Act unquestionably right.

2232. You would give therefore a limit without insurance, but you would enable a passenger to insure if he thought fit?—I think so; admitting that that is only a rule of thumb, I think it is a practical way of dealing with it, speaking as a man of the world and not as a lawyer, because the law has nothing to do with that.

2233. You think that the Carriers Act is based upon a sound principle?—I think the Carriers Act is based on a sound principle; it put an end to a vast deal of litigation, and I think very likely to considerable frauds upon carriers.

2234. In the Carriers Act a limit was put upon the value of parcels for which the carrier was to be liable, but the owner of a parcel might insure for the value; you on the same principle would put a limit on the value of the passenger, but you would allow the passenger, if he estimated himself at a higher rate, to pay an additional sum, entitling him to recover that sum in the event of an accident happening to him?—I see nothing unreasonable in that, considering that the railway companies are limited as to the amount they can charge.

2235. Practically they could not vary the price of their ticket to every man according to the value of his life?—I would leave that to himself. It would be a very invidious thing for a railway company to arrest a passenger as it were, and say, we suspect that you have so many thousands a year, and therefore you will have to pay so much more.

2236. The company could not say to the Archbishop of Canterbury or a judge, "Your life is particularly valuable and therefore you must pay double"?—It would be a most lugubrious scene before commencing a railway journey, especially with ladies.

Sir *J. S. Willes.*

4 July 1870.

2237. Railway companies complain that they are very hardly dealt with in this respect; they say they cannot settle their claims out of court, because, whatever they pay into court the juries will always give such a sum as will carry costs, and consequently if rather a sharp practitioner has the conduct of the case the company will have to pay 300 *l.* or 400 *l.* for costs if it is forced into court, and therefore they are obliged to give considerably more than is fair, in order to avoid having the matter litigated, and having to pay the costs of both sides; do you think there is any ground for that complaint?—I think that is a hardship which they suffer in common with other defendants.

2238. Is not it the case that railway companies, being rather wealthy defendants, juries are much more apt to fix them with the costs of both sides than to fix ordinary defendants with such costs?—I do not think that is so now. It certainly was so at first; but I think juries now have come to deal reasonably enough with railway companies, except that considering they are able to pay, I think juries would give more damages against Dives than they would against Pauper.

2239. Supposing a man had suffered an accident, not of a very severe kind, and the company had paid 100 *l.* into court, the evidence that is given to us is that, though the jury thought that a reasonable sum, they would give so much over 100 *l.* as would make the company pay the costs on both sides; do you think that would be the case, that they would take the 100 *l.* as the starting point, and give something over the 100 *l.*, so as to carry costs on both sides?—No doubt it often happens that juries do give larger damages; but I think that may equally result from the company not estimating the injury at quite a sufficient sum. I do not think it follows that juries give a greater amount with the sinister motive of making the company pay the costs. When they do give a greater amount, it does not, that I can recollect, usually amount to a small sum like 40 *s.*, or even 5 *l.* or 10 *l.*, from which the inference would be that they did it with the view of making the company pay the costs, but it amounts to something substantially over the amount paid into court.

2240. You do not think they would take into consideration that that sum had been paid, and award an additional sum for the express purpose of making the company pay the costs?—I have not observed that. In order to arrive at that conclusion it ought to be shown that the exra amount awarded by the jury was a small sum, so as to indicate that they gave it for the purpose simply of out-topping the amount paid into court, and so making the defendant liable to costs. Where the extra amount awarded by the jury is anything considerable, it is obviously given because the jury estimate the damages at more, and not because they think enough has been paid into court, and yet give a little more for the purpose of carrying costs. It is not my experience that juries have given a little more than the sum paid into court; but if there were a great number of cases in which the sum found by the jury was 10 *l.* or less above the amount paid into court, that would seem to indicate that juries had a motive beyond the motive of assessing the damages at a reasonable amount. I am not aware of many such cases. The companies have the means of getting information upon that subject. Statistics could easily be got at showing the number of cases in which juries have given an amount above the amount paid into court, so as to ascertain whether those amounts have been so small so as to show that they were merely given to out-top the amount paid into court, and make the company pay costs. On reference to those statistics, I should think it would be found that juries had given those small sums over the amount paid into court in comparatively few cases.

2241. The companies complain that the costs are very high; probably that has not come within your knowledge?—No doubt the costs are high, but I think there is reason for that. Medical evidence is expensive in the case of injuries. I should not be surprised to learn that the companies keep a staff of medical men to look into those cases for them; and on both sides there is evidence of a scientific character. When a question arises as to an accident like that which happened at Newark the other day, there may be questions as to the character of a tyre, and as to what the proper sort of wheel should be, and what precautions ought to be taken. That would involve the evidence of engineers, which would be expensive.

2242. We have been told that these cases of claims for compensation get into the hands of disreputable practitioners, both medical and legal; has that come within your knowledge?—Yes; that, I am sorry to say, has sometimes happened. I have some cases very distinctly on my mind in which that has happened lately. Last year the Court of Common Pleas, in two cases, interfered with the damages given by a jury, and in one of them certainly there had been very considerable misconduct in the way of misleading the company as to the real history of the plaintiff. I think 4,000 *l.* damages were given in one case. That was an honest case, but the damages, I think, were exaggerated. It ended by our recommending a compromise, the parties agreeing to a smaller amount than was awarded. In another case 3,000 *l.* had been given, and there we set aside the verdict without allowing the plaintiff his costs, and granted a new trial, thinking that the company had been misled by unfair particulars of the state of the man's business. Also, we had a case the other day, a Brighton Railway case, in which the jury *in furore* gave a farthing damages, though judgment had been allowed to go by default. The jury took it upon themselves to do that, conceiving no doubt that the case had been unfairly conducted against the railway company, and thinking they could not trust the plaintiff's case. We may perfectly trust a jury, if any unfair practice is brought before them, to deal out justice. The 12 men will be just as indignant as the man on the bench, and they will have the advantage of being fresh to the matter, whilst he is, so to speak, stale.

2243. Do you think any advantage would be gained by altering the nature of the tribunal; do you think such cases might be tried, by the county court judges, for instance, without juries?—I think that might almost be left for the railway companies to decide. Some of the county court judges are as competent men as you can find anywhere, both as lawyers and men of business. I am not aware that all the county court judges are so; they do not come sufficiently before me as one of the public to enable me to say that I arrive at that conclusion.

2244. Do

2244. Do you think whether it is desirable to have any form of compulsory arbitration on claims of this description?—I doubt that arbitration is often a very expensive thing and dilatory. According to my observation, I think it would be objectionable as between each individual injured person and the company, but it has often crossed my mind that it would be a useful thing when a great accident happened, involving injuries to numbers of people, if there was power to refer the consideration of that to one tribunal, and for this reason; you would first of all have the foundation of the individual claims determined upon one inquiry; there would not be the necessity that there is where each individual brings his case separately before a jury, of going through the cause of the accident over and over again, it may be before different juries, who might arrive at different conclusions as to the negligence. One expense would be incurred, and I should say the great expense, which the companies complain of, results probably from their having to investigate the same class of circumstances to a great extent in each individual case, whereas if there was one reference of the whole, there would be expense saved; but I am rather deterred by this consideration; if you look into the Merchant Shipping Code, which I think the Bill now before the House is called, you will find a series of most promising provisions, by which the Board of Trade is authorised in the case of a number of persons being injured by a vessel, to stop the actions of individuals, and to make the sort of reference to which your question referred; they have power to appoint one person to go into the whole matter with the assistance of a jury, all actions being stayed during the inquiry; then the damages are to be distributed, and a penalty is imposed upon anybody who subsequently brings an action, unless he gets more than double the sum awarded to him in the course of the arbitration. When, in reading that Merchant Shipping Code, I came across that series of provisions I was a little surprised, and I had to look back into the older Act for the purpose of seeing whether they had been in existence before; they have been in existence since 1854, certainly in 17 & 18 Vict. c. 104, ss. 507 to 513, and I am not aware that they have been put in force; you generally see accounts of most interesting Board of Trade inquiries in the papers, but I do not recollect to have seen an account of one of those arbitrations.

2245. Would that be owing to any defect on the part of the Board of Trade in not putting the machinery into the Act?—No, I think not; my impression is, that it shows that shipowners and people having claims on them have not felt satisfied with resorting to that method; they prefer the ordinary proceeding.

2246. Is not it the case probably that though both sides would not agree to refer it in that shape, yet, if it were made compulsory, it would be a good thing for both?—Those provisions seem to be most promising provisions, and if it were thought advisable to adopt the machinery of arbitration, they are worth looking at; those provisions in the Merchant Shipping Code giving authority to set on foot an inquiry, before an assessor and jury, entirely to the Board of Trade. If in any new law which might be passed, similar provisions were inserted with respect to the trial of cases of claims against railway companies, I would allow the company to make application to the Board of Trade to institute an inquiry; it would be like the case of a shipowner who has run down another ship and injured a great quantity of cargo belonging to different owners, desiring to take advantage of the limitation clauses in the Merchant Shipping Act, 17 & 18 Vict. c. 104, ss. 514 and 515. He institutes his proceeding, offering to pay that which he is bound to pay, and offering to distribute it amongst all the persons who have been injured.

2247. In the event of an accident happening on a railway, when, say, half-a-dozen are killed and 20 more or less injured, you would give to the company the power of applying to the Board of Trade to send down an arbitrator, who should investigate the proper sums to be paid both with respect to persons killed and also with respect to persons injured?—Yes, in that case I should call upon the company to admit their liability; I think the interposition of a jury would be proper where the company disputes the liability.

2248. Their applying to the Board of Trade to assess the damage would imply that they admitted the liability?—Yes, it ought to do so; it would also be a matter worth considering whether if the passenger has paid so much for insurance, the sum for which he had insured ought not to be paid without litigation; whether the company ought not to do as the Accidental Death Insurance Company does; pay the amount on the death and render unnecessary any litigation with respect to the amount to be paid under the insurance; whether it should be necessary as a condition precedent where there is an insurance to prove negligence, or whether the production of a ticket like those insurance tickets, which I understand are now issued at railway stations by the Assurance Company, would not be sufficient.

2249. The Royal Commissioners on railways, who reported in the year 1867, have made this recommendation; "We, therefore, recommend that, on the one hand, railway companies should be absolutely responsible for all injuries arising in the conveyance of passengers, except those due to their own negligence; and that, on the other hand, the liability of the railway companies be limited within a maximum amount of compensation for each class of fares;" that, I think, is pretty nearly what you recommend?—I think that is reasonable. The first part of the recommendation involves, as I understand, that the company is to be liable though their servants are not guilty of negligence; that would be putting passengers on the same footing as goods.

2250. I think, with respect to goods, it is an absolute guarantee, except as against fire and the Queen's enemies?—The act of God, and the Queen's enemies. The exception of fire is introduced by Statute, or stipulation.

2251. Then the Commissioners go on to recommend "that any passenger should be entiled to require from the company any additional amount of insurance he may desire, on paying for it according to a fixed tariff;" I understand that is according to your view?—That is according to my view.

2252. Then they recommend "that claims for compensation should not be admitted unless made within a certain period"?—I think that reasonable. There was a claim for compensation in one of the cases I mentioned a while ago, made as long, I think, as two years after the accident, and it was sought to trace serious consequences

Sir *J. S. Willes.*

4 July 1870.

that developed themselves at that time to the accident.

2253. You would not allow a case of that kind?—I think that is too long a time to allow. I think there ought to be, at least, a notice of the claim at an earlier period. A man might very well say, "I have been very much injured; I am told it will be some time before it will appear whether I am permanently injured or not, therefore I do not bring my action at present;" but he ought to be called upon to give notice of his claim within a reasonable period, otherwise it would be impossible that the company could keep a record to which they could refer for the necessary evidence. I ought also to say that I think the Statutes of Limitation generally, all through from one end to the other, ought to be cut down one-half with respect to every claim.

2254. Mr. *Denison.*] Under the present law as it stands, where the company charge the maximum fares, they are bound to carry without any conditions whatsoever as to liability?—Except the condition that the passenger, in order to recover, must prove negligence on the part of the company's servants, and also he must satisfy the jury that he did not contribute, by his own negligence, to the accident; he must "look sharp," which, I think, is the expression one has allowed one's self to use in addressing a jury.

2255. Sir *H. Selwin-Ibbetson.*] With relation to the alteration of the tribunal, Mr. Baron Martin stated, as an objection to the county court judges, that very conflicting decisions would very likely arise, when you had 200 or 300 men giving decisions on cases of claims for compensation; do you think that that liability to a great number of conflicting decisions would be an objection to constituting the county court judges the tribunal for the trial of such cases?—I think there would be a good many objections to the county court judges. That would be one certainly, but I do not feel that so much as some do. With respect to the county court judges their judgments are not reported. Some of the principal decisions of the county courts are put into the weekly "Law Journal," decisions by men of sound judgment, and some of them are exceedingly good, but as a rule they are not reported, and except as far as regards the moral effect in the neighbourhood, I do not know that it would tend to poison the law very much. But there is one objection, I think, to putting this work upon the county court judges: it would interfere very much with their ordinary work. My notion is that this is rather beyond the scope of the small debts court jurisdiction. The cases that would come before them would involve very serious questions, both of law and of fact.

2256. Mr. *Denison.*] Another form of tribunal has been suggested by one of the inspectors of the Board of Trade: he says, "I think that the whole form of inquiry into railway accidents, as well as the compensation to the sufferers, ought to be altered. I think that the form of inquiry is bad, and that the means of assessing the damage to sufferers is bad, and I think that they might both be remedied in some way, by giving to the Board of Trade power to appoint a court of inquiry according to the circumstances of the accident, not necessarily a full court for a very small accident, and that they should have power to refer all cases of compensation to the same court, and to call one after another before that court;" he also proposes that the inspectors or the court should have the power of compelling witnesses to give evidence, and that the companies should be compelled to afford information; would the objections which you entertain to the county court judges apply to courts of that kind also?—No; I do not think any of the reasons I gave for not sending those cases to the county court judges would apply to that tribunal, but what I said just now with regard to a similar proceeding by authority of the Board of Trade under the Merchant Shipping Act would apply. I am rather surprised at finding that that machinery has not, as I understand, been used, or, if used, used to any great extent. With reference to these railway cases, if there be a special tribunal, it ought to be a very good tribunal, well paid. If there is to be a distinct railway tribunal appointed it ought not to be left to people picked up at haphazard, to men who do work generally at the desk, so to speak, and who are sent down accidentally for the purpose of conducting a judicial inquiry. I think they ought to be persons whose judicial powers are considerable, and who are thoroughly well paid for attending to that work, and not people taken from a desk to go into court and conduct a very serious and difficult inquiry, and one requiring very great command, as it appears to me, of judicial resources.

2257. Mr. *Mowbray.*] You said you thought arbitrations were expensive and dilatory; did that remark have reference to arbitrations before barristers, as compared with cases tried at Nisi Prius?—I did not refer to arbitrations before barristers, because if I were asked, I should say that I think a barrister is the very best arbitrator. I think an arbitration before a lay arbitrator is usually more expensive and more dilatory, and his award, as a rule, is more open to have holes picked in it than in the case of an arbitration before a barrister. The barrister keeps the evidence within limits. I will not say barrister only, but lawyer; a lawyer, from his habit of mind, is able to keep the evidence within the proper and relevant limits, and, according to my experience, his award costs less and is less liable to objection; but perhaps this may be regarded as praise of my own profession.

2258. You said you thought arbitrations were dilatory and expensive?—I meant as applicable to individual claims of compensation. If you referred the question of the whole accident, and the claims of everybody arising out of it, to a competent man, in whom everybody had confidence, I should have thought it would be a useful proceeding; but if you are to have an arbitrator for each distinct case, I think the proceedings might be interminable.

2259. Do you know anything of the law with reference to the Railway Passengers Insurance Company; it has been stated here by their secretary, "We have a peculiar privilege under our Act: the right of taking cases into court was so intolerable, when every man had an improper claim that he wished to urge, or an exaggerated claim, used always to say that he would appeal to a jury, so we came to Parliament and obtained power to make arbitration compulsory, and since then we find that we are enabled to deal most satisfactorily with those cases"?—I have had no experience out of court in those cases.

2260. You have had no experience of the working of any arbitration court under that Act?—No. I had a good deal to do with arbitrations when

when at the Bar, and I have had the opportunity of observing different sorts of arbitration on the Bench; but with respect to that particular Act, and the working of it, I am unable to give any information. I think, when an important contested question of law or fact arises, a person who is injured by a railway company ought to have the power of resorting to a public court; and if there be a special court created for the purpose, that special court ought, according to the rules usually followed with respect to railway companies, to be connected with the Board of Trade. If it were a good court, well selected, and the whole matter was referred to it, I think in case of great accidents involving much litigation, it would be a decided improvement. When there was an accident damaging a great number of people it would save a great deal of expense; but with respect to compulsory arbitration in individual cases, I should like to know the person to whom the cases are to be referred before I gave an opinion on that.

2261. Supposing the Legislature could construct a special tribunal armed with proper authority, you think that might be an advantageous substitute for the trial before a judge and jury?—I think so, certainly. If you could spare a judge to go down to the scene of the accident, to sit at the nearest petty sessions court, or the best court that could be got for the purpose, so as to be within the reach of the witnesses; to go down soon after the accident, and hear the whole matter once for all, first deciding as to whether there was a liability on the company, and if then the amounts were to be settled by some person whom he might appoint, or, as would most likely be the case, by arrangement, subject to his interposition in case the parties could not agree upon the amount, there would be a great saving in the expenses; but any of the attorneys of the railway companies, such as my old client Mr. John Young, who, I think, is still the attorney of the Great Western Company, or Mr. Blenkinsop, whom I see in the room, the London and North Western Company's attorney, would be able to give a better opinion upon that, and would be able to speak better to the details of it than I.

Sir *J. S. Willes.* 4 July 1870.

Mr. George Pattison Elderton, called in; and Examined.

2262. *Chairman.*] What are you?—A Labourer in the employment of the East and West India Docks Company.

2263. Where do you live?—At Walthamstow.

2264. Where do you work?—At Crutched Friars.

2265. What is the distance between the place where you live and where you work?—Six miles.

2266. Are you in the habit of travelling between those two places by railway?—Only when it is wet; but then I am compelled to walk all the way from my house to Dalston Junction, which is three and a-half miles, to get a train, and in doing so I have to pass two stations, one the Great Eastern, and the other the North London.

2267. Have you any suggestion to make to the Committee connected with their inquiry?—I see there is a great deal said about compensation. I think the railway companies ought to give us some compensation for the wholesale destruction of houses they have caused in London. The rents have gone up to three or four times the amount they were some years ago: 25 years ago, or a little more, my mother occupied a house, No. 24, Wellington-place, Bethnal Green, the rent of which house was 6 *s.* 6 *d.* a week. When my father died, my mother went into two rooms in that same house, for which she paid 4 *s.* a week, and the rent of that house has gradually gone up, owing to the wholesale destruction of houses in that parish, till the rent of it is now 14 *s.* per week and taxes.

2268. What suggestion have you to make to the Committee?—What I would suggest is this, that the railway companies ought to give us some compensation for the rents we have to pay, and for the confined spaces we have to live in, which is another important thing. Before the railways came into London, every man had his garden, and a good garden.

2269. The rents have gone up over a very large district in London, have they not; and not merely over the districts into which the railways have come?—All over London proper.

Mr. *G. P. Elderton.*

2270. Would you make railway companies pay the difference between the rents now charged and what they were in former times over the whole of London?—No; but what I come to put before the Committee is, that they should carry workpeople a little way out of town by a penny train, as a compensation for what they have done in the way of the destruction of workmen's residences.

2271. You suggest, that in compensation for what they have done, it should be made compulsory upon the railways to carry you for a penny to and from the place at which you may happen to live?—I would not wish to compel them.

2272. You think they ought to carry you from place to place at a lower rate than they charge now?—Yes.

2273. What do they charge now?—The Great Eastern charge 6 *d.* return from Lea Bridge, and 9 *d.* from Walthamstow.

2274. How many miles is that?—It is five and a quarter miles from Lea Bridge to Shoreditch. Then again, there is Leyton, about four and a quarter miles, in which case the return fare is 6 *d.*

2275. You think that the cheap workmen's trains are very valuable for workmen?—They are.

2276. And you would rather encourage them in the country generally?—Yes.

2277. The companies have only limited liability in the case of workmen's trains; they only pay for accidents to the extent of 100 *l.*; do you think the working people are satisfied with that?—No, they do not wish it to be 100 *l.*; they would rather have it settled by arbitration; that is, as I myself suggested, two persons from the railway company, and two persons from the family, with an independent person as umpire to avoid all law expenses, for, as we believe, too much money is swallowed up in law expenses.

Mr. G. P. Elderton. 4 July 1870.

2278. That you think would be satisfactory to working people?—I think it would be satisfactory to them, as far as I am capable of judging from persons whom I have spoken to on the matter.

2279. The companies say they cannot afford to run trains at this low rate if they are liable to a very great amount in case of an accident, and consequently they limit their liability to 100 *l.*; would you rather have dearer trains with unlimited liability, or cheaper trains with 100 *l.* liability?—You cannot expect a poor man to pay for a dear train.

2280. You would prefer the cheap train and limited liability, suppose the choice were between the two?—We ask for both; we do not want the compensation to be put at 100 *l.*, because you cannot value a married man's life at the same amount as a single man's life; 100 *l.* would not be a sufficient compensation in the case of a man with a family of 8 or 10 children.

2281. Suppose the companies say they cannot afford to run a cheap train with a very large liability, but that they can give a cheap train if the liability is limited to 100 *l.*, which would you like the best of the two; a cheap train with limited liability, or a dear train with unlimited liability?—The dear train we could not pay for, therefore we should have to do the same as I do now, walk. I cannot see how the family of a poor man who was killed could accept 100 *l.* as the value of his life.

2282. Mr. *Winn.*] You think 100 *l.* would be too small a compensation in some cases, though in some cases it would be more than enough?—In the case of a single man, his friends would not require 100 *l.*, but in the case of a man with a large family, of course provision ought to be made for the children.

2283. You think 100 *l.* would not suffice in a case of that sort?—No; it would not suffice in the case of a man with a large family. It would answer the purpose of the companies very well to run those workmen's trains at a low rate. Mr. Mansel offered to run a train if we would guarantee him 50 passengers from Dalston to Broad-street. We asked for an earlier train at half-past five, and we guaranteed him 50 passengers, and that train has gone on till it has now 500 passengers. Why should not they go to the next station, Hackney, and the next one past that, Homerton, where they might pick up 500 more? Yet they will not do that.

2284. Mr. *Reed.*] What you say is, that a large body of the working class have been turned out of their houses by the construction of these railways?—Yes.

2285. And you have been unable to get near to your work other houses in which you could live?—Yes; not without giving such a rent that we could not afford to pay.

2286. You, having gone with many others to Walthamstow, cannot travel on the Great Eastern at a less cost than 3*s.* per week?—No; and there is no train in the morning to get me up to my work in time.

2287. What is the first train from Lea Bridge to Shoreditch?—At 25 minutes to 8, and it arrives at Shoreditch at 8 o'clock, one mile from the City.

2288. What time do you begin your work?—At a quarter to 8.

2289. You are obliged to walk because the train will not bring you up in time, and because it charges you too much?—Yes.

2290. You go to Crutched Friars?—Yes.

2291. Your wages are, how much?—They average, I suppose, about a guinea; sometimes they are 22*s.*, and sometimes 23*s.* They are a little more when I work overtime.

2292. To travel every day from the place where you live to your work would take 3*s.* a week from your wages?—Yes; 3*s.* from Lea Bridge; 4*s.* 2*d.* from Walthamstow.

2293. You cannot afford that?—No. If I add that 3*s.* to my rent, which is 5*s.* 3*d.*, that comes to 8*s.* 3*d.*, and then I have my wife and child, and my wife's mother, to keep, and myself.

2294. You consider that you have been greatly injured by the railways coming into London?—Yes.

2295. You say that railways ought, by running cheap trains, to compensate the workmen to some extent for the injury that has been done them in that respect?—Yes.

2296. Are many of your neighbours in the same condition as yourself?—Yes, a number of them.

2297. How do you get to London?—I walk.

2298. How many miles is it?—Six miles each way; that is 12 miles a day. I walk with the exception of when it is wet, and then I go across to Dalston.

2299. As to the North London, you belong to an association for promoting cheap trains for the working classes?—I do.

2300. How did that association originate?—It was started by a number of persons who had to travel from Hackney and Homerton to and from their employment; and they suggested that the North London Company, instead of running their trains empty from Bow down to Broad-street, should take passengers at a penny a journey to Broad-street.

2301. Is there a larger number of working men living at Homerton than at Dalston?—Yes.

2302. There is a very large population of working men there?—Yes.

2303. What is the distance from Homerton to Broad-street?—I should think about 3¼ miles by rail.

2304. What is the distance from Dalston?—Two miles.

2305. They give working men's tickets at Dalston?—Yes; but they give them by the week only.

2306. But they will not give those tickets to working men at Homerton?—No.

2307. Why is that?—That is their own matter; it has something to do with the compensation question.

2308. Are you aware that they are obliged by Act of Parliament to run workmen's trains for the convenience of working men?—Yes; but even that working men's train from Dalston Junction is not altogether convenient for a vast number of men who come to London to seek for employment, perhaps bricklayers or persons having casual work; they cannot travel by that train. I travelled by it one morning at half-past five, and they refused me a penny ticket; they charged me 3*d.* You must take a ticket for a week.

2309. A man cannot take a ticket for the period of his engagement, for two or three days, for instance?—No.

2310. Is

2310. Is there any third class in that train?—There are all second-class carriages.

2311. The only reason why a Homerton man cannot get the advantage that a Dalston man has, is this compensation question?—Yes, as far as Bow is concerned; the tramway runs for a penny from Bow, and the omnibuses run from Bow to the Bank for 2 *d.*

2312. Have you remonstrated with the company in reference to this?—Yes; we have written to them several letters.

2313. The secretary of the company stated that he had had no complaint whatever made to him from the working men of that district; are you in a position to say whether or not that is correct?—There are one or two letters which I might have brought, if I had known that that question was going to be put. This is a letter from Mr. Mansel (*producing it*).

2314. Mr. *Denison.*] What is the date?—23rd of February, 1869, and this (*producing another letter*) affects Hackney.

[*The same were handed in, and are as follows:*—]

"North London Railway,
"General Manager's Office,
"Broad Street Station, London, E.C.,
"Sir, 23 February 1869.

"I HAVE to acknowledge the receipt of your letter of the 19th inst., which differs so materially from the representations previously made as to the hours at which workmen's trains are required, that I am compelled to defer further action in this matter for more definite information. It has hitherto been represented that the main requirement of the labouring classes resident in and about Dalston is an earlier train service, which would enable them to reach the City between 5 and 6 a.m. In answer to this, it was pointed out that hitherto all arrangements made for an early train service have been found to be entirely unremunerative, but that if assurance could be given that any considerable number of workmen, not less than 50 by each train, required such accommodation, my directors would be prepared to afford every reasonable facility in their power. As the above number of passengers would, at the rate of fare, yield only 4 *s.* 2 *d.* per train, and in addition to the cost of running, the company would be put to extra expense in consequence of the several stations being opened an hour and a half earlier than at present, a guarantee or reasonable assurance of this number can hardly be considered unreasonable; certainly, if the number be less, it can hardly be argued that there is any requirement on the part of the public which would call for such an arrangement by the company. Your letter of the 19th instant, however, states that of the number of passengers to be expected, at least 80 per cent. are not required to be at their work before 8 a.m., and if this be so, the assurance as to the number of passengers to be accommodated, which was the essential basis of the suggested arrangement, cannot be considered as fulfilled. I have already explained that the recognition of workmen's tickets cannot be extended to between 7 and 8 a.m., nor between 4 and 6 p.m. on the return journey, as the trains, between those hours, are fully occupied with other traffic. I may also point out that by the Company's City Branch Act of 1861, it is provided that the workmen's trains shall not be run later than seven in the morning, nor earlier than six in the evening.

"Yours faithfully,
"*Robert Mansel,*
"General Manager.

"Mr. Marks,
"3, Churchill-road,
"Hackney, N. E."

Workmen's Trains.

"North London Railway,
"Euston Station, London, N.W.,
"Sir, "12 February 1869.

"IN reply to your letter of yesterday's date, my directors cannot undertake, as already explained to you, to run workmen's trains on any portion of the line, other than between Dalston and Broad-street, until the provisions of the Company's Act, 1867, limiting the liability of the company in respect of passengers conveyed by them, is extended, so as to include the portion of the line over which such trains are run.

"Subject to this limitation of liability, and a satisfactory assurance of the number of passengers to be accommodated (say not less than 50 by each train), my directors will be prepared to afford every reasonable facility for the accommodation of the class of passengers for whom the workmen's trains are intended.

"Yours faithfully,
"*Robert Mansel,*
"Secretary, &c.

"Mr. Henry Marks,
"3, Churchill-road,
"Hackney, N. E."

2315. Mr. *Reed.*] Supposing a working man is killed by an accident in a train, and he has a large family, what is the result, generally speaking, to his family?—If he had only 100 *l.*, and if he had a large family, that would be a little more than 3½ years' purchase at 10 *s.* per week, and if that family was young they would have to go to the parish.

2316. The country would have to pay for the family of a man in that position if the compensation was too small?—Yes.

2317. Do you consider 100 *l.* a fair compensation for a working man who is earning 30 *s.* or 25 *s.* a week?—It would depend on the number of children he had, or whether he had parents to support.

2318. Do you know the feeling of the working men generally on the subject?—Not generally; I have heard the feeling of a great many of them; the feeling in general is against the 100 *l.*

2319. They object to the limit being fixed at 100 *l.*?—Yes. There is an association at the West End, out Kensal Green way, composed of clerks principally; they are willing to accept the trains at any price.

2320. Have you known any working man's family who has had a claim against a railway?—No; but to show that working men are not always inclined to make claims against companies, one morning we were travelling up by an early train, in the winter time, to Broad-street, there were eight or ten in our compartment; we arrived at Broad-street, and it was quite dark; it was very early in the morning. There was not a single light in the station, and one of our men fell out

Mr. *G. P. Elderton.*

4 July 1870.

of the train. Somebody opened the door, and he fell out. I wrote to Mr. Hitch, the traffic manager there, and he wrote me a letter back, stating that if we would let him know this party's medical man they would send their medical man to settle it. We never troubled our heads about it. The man was laid up a fortnight, and with our club we supported him, and made no further trouble about it.

2321. It is very difficult for a poor man to make a claim against a rich company?—It is like a lamb fighting a lion.

2322. Would he be likely to get a solicitor to undertake his cause?—It is very questionable whether he would, if there was any cavilling about the matter.

2323. Would a professional man want money down before he would undertake to take the case into court?—Yes; and I doubt very much whether he could get a loan out of his sick club fund sufficient to pay a lawyer.

2324. He would try to get a loan from his society, if he was in one?—Yes; or the best way he could.

2325. Not being able to get his money, he would have to abandon his claim?—You may depend on it, there are many cases of that sort.

2326. Where fair claims are abandoned from the difficulty of prosecuting them against a great company?—Yes; for the want of means.

2327. Mr. *Sherriff.*] Can you give us any cases of that kind?—No; I know of no cases of that sort; there may not be so many as there used to be; but I believe formerly there were many cases of that description.

2328. Have you ever applied to a lawyer to undertake a case of a claim for compensation, and where he has declined to undertake it?—No; my family had enough of the lawyers; they ruined them; I do not care about them.

2329. Mr. *Denison.*] Where do you work?—At a tea warehouse.

2330. You have said a great deal which leads one to believe that you look upon these railway companies as a sort of insurance companies in the event of accident; you think they ought to value a man's life in the same way as an insurance company would value them?—No; they take your money to carry you a certain distance, and they ought to use all the care possible to carry you there; and being great capitalists (and some of them are better off than others), they ought to give some compensation in a proper manner to working men, as well as anybody else.

2331. You say that a married man ought to be paid at a higher rate than a single man or woman?—Yes.

2332. That might be a proper consideration for an insurance company to take into account, but if you go about your ordinary business you are exposed to all the accidents of life; you cannot guarantee your life against accident, whether you travel by railway or whether you travel by coach, or tramway or omnibus; you contend that there ought to be a different mode of arriving at the compensation in the case of travelling by railways to what there should be in the case of travelling in any other way?—Yes; suppose a man with only 100 *l.* has a cab, and that man knocks you down and kills you, what could you expect out of that cabman; not 50 *l.*

2333. You think because companies are an association of small capitalists, perhaps widows and others of small means, who club their money together, which makes a great capital in the aggregate, they are to be looked upon as wealthy people, who ought to compensate their neighbours at a much higher rate than other people?—Some of them are wealthy; but I think if they were to drop the 100 *l.* and run trains to carry workmen at a penny, a good many of them would pay a dividend where they do not now.

2334. *Chairman.*] Would you make a working man pay any increased fare for an increased compensation?—With the rate of wages at what it is, and with house rent at what it is, a penny a journey is quite sufficient.

2335. Do you find that in buying your loaf the rate of your wages enters into the question of what you ought to pay for it?—As far as provisions are concerned, the case is different; with the expenses of living and house rent, and one thing and another, I do not see how a working man can afford to pay more.

2336. Mr. *Sherriff.*] What is the difference between the rate of house rent in the city and in the suburbs; what could you get a house in the city for with the same accommodation that you get outside?—We pay for our office, a little room, 6 *s.* a week. I have a good garden and house, four rooms, water laid on, and kitchen, for 5 *s.* 3 *d.* There are 3,000 houses to let at present, with 100 feet of garden, at Woolwich and Plumstead; there are 2,000 houses at Canning Town, and those two railway companies are so stupid as not to carry working men there.

2337. Mr. *Winn.*] How long have you lived at Walthamstow?—Ten years.

2338. You pay now 5 *s.* 3 *d.* a week for four rooms, a washhouse, water laid on, and a good garden at the back?—Yes.

2339. What sized garden?—Eighty feet long.

2340. How wide?—I suppose about 18 or 19 feet; four feet wider than the house.

2341. Where did you live before you went to live there?—Alongside the Regent's Canal in Hackney.

2342. What rent did you pay there?—Seven and sixpence for a house, not half so good as mine.

2343. Any garden?—Yes; a small piece, about 30 feet, but the stench from the canal was enough to kill anybody.

2344. The 5 *s.* 3 *d.* you now pay includes a garden?—Yes, and there are no taxes; and there are several houses which my landlord is building at the present time, with bay windows, and everything complete at 5 *s.* 6 *d.* a week, and no taxes.

2345. Mr. *Sherriff.*] They are not let?—No.

2346. Mr. *Reed.*] If working men could get cheap fares, they would go to that district?—Yes; they come there and stay the summer, and get back again in the winter, because they cannot stand the winter.

2347. Mr. *Sherriff.*] If it was easy to get to this quarter, do not you think that the competition for houses would get the rent up?—They tell me there are 60,000 houses to let in the suburban district. If we were to fill them we should improve the social and moral condition of the working men, and immediately raise a competition between house rent in the suburban district, and house rent in London.

Mr. FREDERICK ROSE, called in; and Examined.

2348. *Chairman.*] YOU are a member of the firm of Baxter, Rose, & Norton?—Yes.

2349. Solicitors to the London, Brighton, and South Coast Railway Company?—Yes.

2350. Have you had the management of a great many accident cases?—Yes, I am sorry to say, a great many.

2351. Can you mention the most notable of them?—The principal accident I have had to do with, is the New Cross accident, in connection with which accident we have had to deal with several cases of fraud. The first one was the case of a man named Dickenson. I think he was quite a poor man; he had no difficulty in finding a lawyer to take up his case; he brought an action against the company for an alleged rupture. We let judgment go by default, believing that he was in the train, and he got 250 *l.* damages. Some time afterwards one of his accomplices split on him, and told me that he was never in the train at all. In consequence of that, he was tried at the Old Bailey, and he is now serving two years in the House of Correction at Wandsworth. Then there was the case of Dinah Harris. She was the daughter of a publican, and was his barmaid. She alleged that she had received frightful injuries, and in court, when the case came on, the evidence went to show that she might possibly have been slightly hurt; but that she had been tickling her throat with a feather to make herself sick, and no doubt brought herself into a state of serious ill-health. In that case the doctor's charges were 230 *l.*, a most extravagant sum, and large amounts were charged for each visit. However, the jury saw through the case and returned a verdict for the defendants. Another case in connection with the New Cross accident was that of Mr. Smith; he was a publican at Norwood, and it appeared to me suspicious that a man living at Norwood should be at 11 o'clock going by a train the other way. I found out from a neighbouring publican that he had been at the station at the time of the accident, or a porter saw him at the station at the time of the accident; but he had never been in the train at all; he had been in London on business, and hearing of the smash, he palmed himself off as one of the sufferers, and brought an action against the company. We, however, got a verdict in that case. Another case was that of a man who brought an action against us, and laid his damages at 300 *l.* His injuries were stated to have been of a most serious nature; he obtained an order afterwards to increase the damages to 2,000 *l.*, making an affidavit that his injuries had assumed a very serious aspect, and that he would never be well again. The case was brought out, and the jury luckily found there was an immense deal of fraud in the evidence; that there were a great many untruths in the particulars delivered under the judge's order, and in the evidence, and they visited him with a farthing damages. That was the case mentioned by Mr. Justice Willes just now. I have several more cases on my list of a similar character to the last mentioned.

2352. Have you any reason to complain of juries?—I think we have very good reason to complain of juries.

2353. On what ground?—On the ground that they give excessive damages in many cases. I have another list of cases in which, as we believe, the damages have been very excessive.

2354. In *bona fide* cases?—Yes, where the injury has been *bona fide*.

2355. With respect to frauds, you are liable to them in common with the rest of the community; that is a matter which the law cannot deal with specially in your case?—Yes, but we are more liable than other people to these frauds, particularly as regards exaggeration of the injuries received. In the case of the New Cross accident, 400 claims were sent in within two days of the accident. It was open to anyone who was on the platform at the New Cross Station, when the accident occurred, to say he was in the train, and there was the greatest difficulty in distinguishing those who were in the train from those who were not, for almost all those who claimed had lost their tickets. We can hardly ever get their tickets from them as evidence that they have been in the train, and when you come to deal with 400 or 500 cases, and you find fraudulent cases among them, it gives rise to suspicion.

2356. They give no proof that they were in the train?—Only their oath; but if they are capable of concocting a story that they were in the accident, they will not stick at an oath. Sometimes they will bring friends with them, and it is possible for those friends to perjure themselves; for instance, in the case of Dickenson, a man who came to give evidence that he had been with Dickenson at the time of the accident in the train, was a watchman at a night-house in the Haymarket, and he was never near the place.

2357. What change in the law would remedy that?—I do not know how you can remedy the frauds that are perpetrated upon us, but I think all the companies are agreed, that by reducing the damages to a certain maximum in each class, we should be saved from those very heavy damages in cases where we believe *bona fide* injuries have been sustained, but where, as things now stand, juries give very exaggerated damages.

2358. In that way you think you might diminish the temptation to fraud?—Yes, to a certain extent.

2359. Have you had any evidence of improper conduct on the part of professional men, either legal or medical?—I am sorry to say we have had several cases, both in the legal and the medical professions. One attorney had about eight or nine cases against us. He wished to send them all to arbitration. We agreed to send them to arbitration, but at the last moment he said he must first make a stipulation that we should either pay him untaxed costs, or pay him a very heavy sum, which would have been quite out of proportion to the services he had rendered. I set my face steadily against any such proceeding, and the cases all went to trial eventually. I had evidence that this same attorney, for a discharged clerk told me so, had been round the hospitals touting for cases; and another attorney, who had also been touting for cases, actually preferred a claim on behalf of one man who repudiated it afterwards. The man told me he had been round, and asked him to give his authority to bring forward his case, which he had refused, and notwithstanding that, the man had put in a claim, and was going to bring an action

Mr. *F. Rose.*

4 July 1870.

against us. Then, in the medical profession, we have had several cases of improper conduct. There was one man, named Jolland, who appeared in two trials, the Victoria accident, and also the New Cross accident. He gave evidence that he was a duly qualified medical man in the first trial. We found out that he was not a medical man at all; that he was a student, but had never passed his examination. He swore that he was carrying on business with another medical man, who was duly qualified. At the second trial I was able to confront him with the death of his partner, which had happened nine months before, which considerably astonished him. Then a man named Docking, I think, was in about eight cases against us; he had been called in merely as a sort of legal medical man; he had never advised the patients in any way, or given them the slightest assistance to restore them to health, but had been merely called in to assist litigation, and he had charged enormous sums in the particulars for those services, whatever they were. He was with a solicitor, and he went round to all those people, and put in the particulars of the extent of their injuries, which were all most fraudulent in the cases which we brought to light; utterly untrue in every respect.

2360. What class of cases do those medical men take up?—They do not take up a very high class of cases; it is more cases where the injuries are of that character that it is almost impossible to see them, cases where there are no bruises.

2361. In what sort of position of life are the complainants generally?—The most I have had to do with have been licensed victuallers.

2362. Was that the case in the New Cross accident?—A great number were licensed victuallers.

2363. You think both the medical men and the attorneys go into those cases for the purpose of getting business?—Yes; I could not give you legal proof, but we know as well as possible the porters are in the pay of those attorneys, who come down immediately an accident happens; they are on the spot in an instant.

2364. Do they even make stipulations about their costs with the plaintiffs?—Yes; this discharged clerk of the attorney told me that in each case which the attorney brought before the court, he had made a stipulation with the plaintiff that he was to receive 100*l.* out of the costs; I can only give it on the authority of this man.

2365. According to the Lands Clauses Consolidation Act, there is a power of tendering a certain amount?—That is in the case of claims for land compensation: the person who has a claim on the company sends in a claim, which he makes against the company. If the company dispute that, it may go to arbitration or a jury. There is a provision in the 34th section with regard to an arbitrator, and in the 51st section with regard to juries, that if the amount obtained by the claimant is only equal to or under the amount tendered by the company, in that case half the costs of the arbitration, or of the jury, shall be paid by the claimant, and the other half by the company, and each party is to pay his own costs.

2366. Do you think some clause to that effect would be desirable in respect to compensation for accidents?—Yes; I cannot illustrate it better than this; suppose a man is injured in a railway collision, and he has a bruise over his eye, it is a moral certainty that the jury will give him over 10*l.*, he knows that perfectly well. In an accident like the New Cross accident, he knows we shall not dispute the liability, and he then can demand 1,000*l.* or 5,000*l.*; he knows that the liability not being disputed, the company is certain to pay the costs eventually, and he can bring forward any claim, knowing that his costs will be eventually borne by the company. In my opinion it would be a fair thing if the claims in respect of compensation for accidents were put on the same basis as claims for compensation for land. A man has a claim on the company for unliquidated damages; he knows what that claim is, and he can make his claim; and further, the man should be bound to make the claim on the company within a certain time; I would not bind him to too short a time; he should have a sufficient time to enable him to find out the extent of his injuries, and then he should be required to make a claim on the company, very much in the nature of the particulars delivered in an action. Then the company, if they could not dispute their liability, would be at liberty to tender a sum which they considered was a fair sum. I would suggest that the sum should be kept a secret from the jury, and that the offer should be made entirely without prejudice on both sides, and if the jury found a smaller sum, or a sum equal to the sum that was tendered by the company, the plaintiff should be called upon to pay his own costs for substantiating that claim, because the company were ready in the first instance to give that amount.

2367. Would you give costs against him?—The costs of his own side; the costs for substantiating a claim which was exaggerated.

2368. You would not make him pay the costs of the company?—No, I would not suggest that; but there would be cases in which it would be fair to make him pay the costs of the company. In one case, where a claim was made for 3,000*l.* against the company, a verdict was given by the jury for 10*l.*, simply because the jury found that there was fraud in the case. Our costs must have been 300*l.* to fight that case.

2369. To put your recommendation into a precise form, as I understood you just now, if the sum given by the jury was less than the sum tendered by the company, then the plaintiff should have to pay his own costs?—Yes.

2370. Then, as I understand you, you would go further than that, and, in some cases, you would make it incumbent upon him to pay the costs of the company; will you define the cases in which you would make it incumbent on him to pay the costs of the company?—I am hardly prepared to say that I would recommend such a thing as that; I would say, if the company offered a certain sum, and he did not obtain half what was offered by the company, which would be generally on account of fraud, it might be a question how far he should be called upon to pay the costs which the company were put to in defending their position?—I have known a case where a claim for 5,000*l.* was made, and a verdict was given for 300*l.*, and it cost us 400*l.* to fight that case. Of course, we are obliged to bring forward our case with the very greatest care, when such a heavy claim is made, if we suspect there is any fraud in it.

2371. Do you think the effect of such a provision would be to diminish exorbitant claims?—It would diminish exorbitant claims on the one hand,

hand, and on the other hand the company would wish in all cases to tender what was, in their opinion, a fair and liberal compensation to the plaintiff.

2372. There would not be any difficulty in preventing the jury from being acquainted with this offer made without prejudice?—I do not anticipate any difficulty in that respect. The judges would not permit it.

2373. It would be contrary to the rules of practice; no counsel would do it?—No.

2374. Sir *H. Sewin-Ibbetson.*] Is not it the practice for some of those large claims to be made larger at first in consequence of the belief that the company will offer a smaller amount, and that the result will be the two parties meeting half-way?—I think in some cases it may be said to be so, but not in all.

2375. A man perhaps may think he is entitled to 100*l.*, but he asks 200*l.*; probably the company, then, offers 50*l.*, and eventually agrees to give 100*l.*?—The claim that the claimants put in the declaration is generally a very large sum indeed. I ask them the lowest sum they will take, and very often that is a tenth of the sum in the declaration.

2376. You stated that in your opinion the claims on the company should be made within a limited time; do not you think that cases of shock to the nervous system originating in an accident, are not often developed, say, within a year, or two years?—I am not a medical man, and I should not like to give an opinion on that subject; but I have often spoken to medical men, and I believe there are such cases; but in a very great majority of cases, if there are serious injuries, there are serious symptoms immediately following.

2377. Would it not meet the views of the companies if people who were injured in an accident, or thought they were likely to suffer injury eventually, gave notice of their intention of claiming damages supposing any injury resulted to them?—I think they should do so.

2378. Having the power of bringing an action afterwards?—Yes; a claim has just come in in respect of the accident in the Clayton tunnel nine years ago.

2379. Mr. *Reed.*] In the case of an accident like that, could not you take the names of all the persons in the train at the time of the accident?—That would be utterly impossible. We did as much as we could at the New Cross accident in the way of taking down the names of those who were in the train, but we could not insist that people had not been in the train merely because we had not got down their names; though there were 600 people in the train at the New Cross accident, we only got about 100 names.

2380. Would not it be in the interest of the railway companies to allow a considerable time for the making of claims?—I think it would tell fairly both ways, because some people might get much better, and possibly others might get worse.

2381. Mr. *Sherriff.*] You think that notice should be given by any person who has been injured, though he may not bring his action at the time, in order that you may have an opportunity at the time of ascertaining whether he was in the train or not?—Yes, and also sending our medical attendants to see him.

2382. Mr. *Reed.*] You said you had a case before a jury where the claim having been 3,000*l.*, the jury brought it down to 50*l.*?—To 10*l.*, because they could not have done otherwise; the fraud was too gross.

2383. Wherever there was evidence of extortion or simulation, the judge would detect it, and direct the jury accordingly, would he not?—The cases do not always come before the judges; there are so many cases where the company does not care to fight the cases in the superior courts, and they let the judgment go by default, and then a writ of inquiry is executed by the sheriff, and he has not the same power to direct the jury as the judge has.

2384. The sheriff would be as good an authority as the county court judge in such a case?—I am hardly prepared to say whether he would or not.

2385. Do you object to juries altogether?—I object to juries without you can show fraud; I think they are very apt to lean to the side of the plaintiff.

2386. Sir *H. Selwin-Ibbetson.*] What would you think of a tribunal such as has been suggested to take the place of the present jury, namely, an official from the Board of Trade, with a medical assessor, and if necessary a legal assessor, who should make a public inquiry into the accident at the time, the medical assessor taking as much cognisance as possible of the cases of injury; and that that court should be the court before whom all cases with regard to that accident, and all claims for damages with respect to it, should be heard?—I think it would operate very much to the benefit of both parties; it would stop a great deal of fraud, no doubt, because if the same judge and jury were to try all the cases connected with the one accident, they would see the fraud if there were any. If in the first case the attorney and the doctor had got together, and had brought forward a lot of cases, supporting them by fraud, and if the jury found that out in the first case, they would go more carefully into the other cases. In a case where it was agreed to try several cases by one jury, the jury saw through the fraud in the first case, and they found against all the other plaintiffs, because they found the same fraud permeating through the other cases.

2387. The evidence would probably be the same in all the other cases?—No; if there had been another jury, they would have been able to keep a great deal of it back, and we should not have had the advantage of the jury having the first case in their minds. The first case happened to be the most fraudulent, and they found it out.

2388. Mr. *Denison.*] Have the costs in respect of the New Cross accident been very heavy, taking all the cases?—They have been very heavy, though we have spent an enormous sum of money in costs. I believe the line we adopted of litigating an enormous number of those cases, has been beneficial to the company, and will save it an enormous sum of money.

2389. If a court of arbitration had been in existence, would not it have saved you an enormous sum of money in costs?—Thousands of pounds.

2390. Both medical and legal?—Both medical and legal. The medical costs we find the heaviest of all.

2391. In fact, you have to try each case *de novo*?—In each case we have to start from the beginning, and go to the end of it.

2392. With

Mr. *F. Rose.*

4 July 1870.

2392. With very often the same witnesses?—Continually, the same witnesses.

2393. Have you had much experience of sheriffs' juries?—Yes; a good deal.

2394. As compared with other juries, what is your opinion of them?—I like a sheriff's jury better than a special jury at Nisi Prius.

2395. You have no objections to urge as to the manner in which sheriffs' juries are summoned?—I have not gone into that point.

2396. Is not it the fact that the same individual serves over and over again?—Yes; the sheriff gets to know a lot of people in the district who will attend juries, and they get summoned over and over again; I often see the same faces.

2397. They get paid a guinea per day?—Yes, for they are mostly good juries, which is the term used for special juries in the Sheriff's Court.

2398. They make a regular business of it?—Yes.

2399. Mr. *Reed.*] That applies to all cases of compensation other than railways, does it not?—Yes, all trials before the sheriff.

2400. Mr. *Denison.*] Is it the fact that plaintiffs do not get anything like the sums awarded to them?—That is a most common thing. We have been punished very heavily, but the plaintiffs equally have been punished heavily; the only persons who have got anything have been the doctor and the lawyer. When there has been a verdict for 100 *l.* there has been nothing for the man.

2401. The costs have more than eaten up the compensation?—Yes.

2402. It is in those particular cases in which the costs exceed the amount of the compensation given, that the railway companies are worst used, and the plaintiffs are worst used too?—Yes.

Mr. Henry Blackmore, called in; and Examined.

Mr. *H. Blackmore.*

2403. *Chairman.*] What is your employment?—Passenger Superintendent on the Lancashire and Yorkshire Railway.

2404. The Lancashire and Yorkshire runs from Leeds to Liverpool?—Yes, and from Manchaster to Fleetwood.

2405. Have you had any experience of the continuous break system?—Yes.

2406. What is your opinion upon it?—I consider it a very good system.

2407. Is it in operation throughout the whole length of your line?—Throughout the whole length.

2408. Is the break much more effective than the ordinary break which exists on other lines of railway?—There is double and treble the power; in some cases the whole of our carriages are provided with the continuous break.

2409. A break upon every carriage?—Yes, generally; ours are coupled together in sections.

2410. Is there any difficulty in working the continuous break?—Not the slightest.

2411. Do you use it upon every stoppage, or only upon special occasions when you want to stop particularly quickly?—We use it for ordinary purposes; we use it at every station.

2412. Are you able to stop much more sharply than the trains on other lines?—We can do so if desirable.

2413. Do you do so usually?—When we have occasion to pull up quick.

2414. Do you find any evils arising from it?—Not the slightest; a great deal of benefit.

2415. Sir *H. Selwin-Ibbetson.*] What are the gradients on your line; they are severe on parts of the Lancashire and Yorkshire, are not they?—They are on some parts of the Lancashire and Yorkshire severe.

2416. By the common break power you would hardly be able to have control over the train?—No.

2417. Do you find any difficulty in working the break power from the break wearing out unevenly?—We have two sets in operation; in one set we have not any difficulty.

2418. No difficulty at all?—No difficulty whatever; it requires no adjusting.

2419. You would agree with a witness who has stated that, from the application of the break being less violent, it does not wear out so soon as the ordinary old-fashioned break?—I believe it does not; but it depends on the quality of the wood employed for the break.

2420. That is to say, there is a continuous break which can be adopted, where you would get the advantage of economy in its not wearing out so soon, and greater power?—I believe so.

2421. On your line have you to break up your trains very frequently?—Very often.

2422. Do you see any difficulty in applying continuous breaks when you have to break up trains frequently?—We put on our breaks accordingly; we break them up in sections to answer for the various branches we branch off to.

2423. Does the adoption of the system at all diminish the accommodation in your train by obliging you to have a greater number of break carriages?—Not at all.

2424. That is not necessary?—No; there are sections where we run loose carriages; we have no breaks to those.

2425. The continuous break is a great advantage, is it not, in cases of accident, where an accident happens to any carriage in the front of the train, by preventing other carriages running over it?—Yes.

2426. It also is a great safeguard to the public, from its increased power, by enabling the engine drivers on foggy days, or when they have not observed from carelessness or otherwise the danger signal and run past it, to pull up when they see an obstruction on the line itself?—Yes; we either pull the train up, or break the train asunder. At present the continuous breaks are under the guards' control solely, but I recommend that they be put under the control of the drivers as well.

2427. Which would be utterly impossible with the present break, in such a distance?—It could not be done.

2428. On the Lancashire and Yorkshire Railway, are there any parts of the line on which you use the block system?—In short distances where the traffic is heavy.

2429. Have you found in working that system that it is a protection against accident?—I have.

2430. You find no difficulty in working the block system on those portions of your line on which it is adopted?—Not at all.

2431. Can you state any reason why it should not

not be applied generally to the line?—Not at all.

2432-3. You think it would be equally applicable to the other parts of your line as it is to the parts where the trains are frequent? — Yes; giving longer distances for the spaces.

2434. It would be simply a question of a little additional expense at first in creating the stations and the staff?—That is the only point.

2435. What amount of traffic is there on your line?—Very large; we carried nearly 900,000 passengers in Whitsun week.

2436. You find no difficulty whatever in applying the block system to your line?—We have the block system on the most crowded part where there are trains every three minutes; we find no difficulty whatever in working it.

2437. You see no objection to applying it to longer distances where stations would have to be more distant?—It is only a question of expense.

2438. It materially increases the safety of the public?—I believe so.

2439. Do you see any objection to it on the ground that it very much diminishes the feeling of responsibility on the part of the servants of the company; that an engine driver is apt to trust entirely to the block system, and therefore not to exercise the same amount of caution he would do under the old system?—I see no objection on that score.

2440. You have not found any cases of that sort?—Only once; before we adopted it we certainly had no accident; but just after we established the block system a driver disregarded the block he came to, and he ran past and caused a slight accident.

2441. You have not had any recurrence of that after the servants of the company had got experience in the working of the block system?—We have not.

2442. Can you tell the Committee how long you have adopted the block system upon your line?—Not more than two or three years.

2443. A sufficient time to have tested its working power?—We are about to extend it on two or three of the more crowded parts of the line.

2444. You have had it in operation a sufficient time to ascertain with certainty almost that it does diminish the possibility of accidents?—I believe so.

2445. And, therefore, is a great safeguard to the public?—Yes.

2446. Would you see any objection to being obliged to apply it generally to the line, apart from the question of expense?—I would not.

2447. If it protects the public on the crowded parts of your line, it would be a great safety to the public on the whole of your line?—I believe so.

2448. Mr. *Winn.*] Are there sharp curves on the Lancashire and Yorkshire?—We have sharp curves, and very heavy gradients.

2449. And you see no objection to the continuous break system on the parts of the line where those sharp curves exist?—Not the slightest. We have them on all our heavy gradients. We have them on every set of carriages that runs out of the stations over the whole system.

2450. Do you apply them on the trains to Normanton?—Yes.

2451. The traffic at Normanton is enormous?—Yes, it is very heavy, but it is more so in Lancashire, Accrington, and Liverpool, and those parts.

2452. As to facing points; we have had evidence before the Committee that there are a great many places in the kingdom on different lines where facing points exist without signals to them. Have you any facing points upon your line that are not protected by signals?—We have signals or indicators to show the engine driver where facing points are.

2453. Is not it possible to avoid having facing points altogether; is not there a way of putting in junctions in such a way as to avoid the points of crossing facing an approaching train?—It is possible to be done, but it causes a great deal of delay and increases danger.

2454. What is the objection to it?—You would have to draw up and back your train before you could get into the right road, and so cause delay and danger.

2455. You think there would be a practical difficulty in adopting it?—Yes; there is no danger in facing points where you have the locking apparatus.

2456. Wherever there are facing points, you think the locking apparatus ought to be adopted?—I do, on the main line.

2457. Mr. *Denison.*] How many breaks have you in an ordinary passenger train; say a train of 15 or 16 carriages?—In a train of 15 or 16 carriages we should have six carriages coupled with two sets of breaks.

2458. Sir *H. Selwin-Ibbetson.*] One in the front, and one at the back?—Yes.

2459. Mr. *Denison.*] What proportion of your rolling stock is fitted with break power?—I cannot say; a very fair proportion. We have sufficient carriages, fitted with break power, to work all our trains with one set or two sets. If it is a double train we have two sets; if it is a single train, one set.

2460. You mentioned that there were two kinds of breaks; one that never got out of order, and another of an inferior description?—We have two sets; one Newall's and the other Fay's; Fay's breaks require no adjusting till the breaks are worn out; the others require adjusting.

2461-2. Is there any tendency in the break to get out of order for want of use?—We have had no complaints on that score.

2463. You have said that there would be no difficulty in extending the block system all over your line; is there no fear of signals which are not constantly in use being forgotten, and the signal men making mistakes?—I think not if there is a man appointed for that purpose, and every man does his duty.

2464. The evidence that has been given to us, is this, that in crowded parts of the line where the traffic is very thick, and those signals are in almost momentary use, they afford the greatest possible safety; but it is urged that if they were extended all over the lines at intervals, say of five miles where the trains are not very frequent, there would be danger of the signal man forgetting the signals?—I do not anticipate that such a thing would occur. We have them at most of our stations at present all over the line; they are not five miles asunder. When a station is occupied, the distant signals are put on.

2465. Do you think the introduction or extension of those mechanical improvements might safely be left to the companies themselves, or do

Mr. *H. Blackmore.*
4 July 1870.

you think it advisable for the Board of Trade to have the power of enforcing them?—I think it may be fairly left to the companies themselves. Our company do not hesitate to adopt anything that is suggested that would be an improvement or that would afford greater safety to the public.

2466. Have you ever had occasion to dispute recommendations made by the inspectors of the Board of Trade?—No; I have not.

2467. Do you, as a rule, give immediate attention to the recommendations emanating from the inspectors?—Anything that is feasible to be carried out; we generally discuss those things over when they come down to investigate any accidents.

2468. Mr. *Winn.*] Have you known anything proposed by them that was not feasible to be carried out?—I cannot say that I have, as far as my experience goes.

2469. Mr. *Sherriff.*] Is it not the case that when a driver knows that he has this additional break power on his train he presumes a little on it and runs faster than he would have done if the ordinary break power had been applied?—At the commencement of the application of the continuous break system to our line we found it to be the case, but we have had no experience of that sort lately.

2470. It was so at the beginning?—Yes.

2471. You have had accidents on the line from collisions even since you used these continuous breaks?—We have had some.

2472. You say one break is self-adjusting, and therefore not liable to get out of order; knowing what you do, that one is a good break and the other is not so good, you still retain both; I say both are good breaks as far as power is concerned, but the question was as to self-adjusting, and in that respect one is preferable to the other?—Yes we do; one is retained on the East Lancashire section, and the other is retained on the Lancashire and Yorkshire section.

2473. Newall and Fay, if I recollect rightly were both officers of the Lancashire and Yorkshire Company?—And they are at present.

2474. I mean they were when the breaks were introduced?—They were; they were two very good breaks, no doubt, and the company did not hesitate to employ them both.

2475. Are all your facing points through the entire Lancashire and Yorkshire system locked?—No, they are not; but, if my memory serves me right, the board has passed an order that at all new junctions, in all new works, the facing points are to be locked.

2476. The principle of locked points is that the signals shall indicate whether the point is open or shut?—Yes.

2477. And they cannot move the one without moving the other?—No, neither can they move the point in a contrary direction.

2478. So that there is not any doubt in your mind, as a practical man, and with your experience, that locked points are really a beneficial thing?—No.

2479. Sir *H. Selwin-Ibbetson.*] Are you aware that the inspectors of the Board of Trade are constantly recommending the adoption of the system of locking points?—Yes.

2480. Have any of those recommendations been made to your company?—Yes; we are just carrying out one now. In an inquiry which Captain Tyler held, he recommended some facing points to be locked, and we have put them in.

2481. There are points on your line still which are not locked?—Yes.

2482. Would not it be advisable that the locking of facing points should be generally adopted throughout all lines, if it is such a safeguard?—I believe it to be a good thing.

2483. Rather than wait till an accident occurs, you think they ought to be universally adopted?—It is a question of expense.

2484. The public, in the matter of safety, would benefit by the adoption of them generally?—I believe that it would be better if all those facing points were locked.

2485. You are extending the lock system?—Yes.

Mr. John Peake Knight, called in; and Examined.

Mr. *J.P.Knight.*

2486. *Chairman.*] You are General Manager of the London, Brighton, and South Coast Railway?—Yes.

2487. You had something to do with the origin of the block system?—Yes. Previous to joining the Brighton Railway, I was, for a period of 16 or 17 years, traffic superintendent of the South Eastern Railway. I found when I joined the South Eastern Railway they had a crude system of signalling trains by a telegraph bell between station and station, an arrangement of rather a simple and primitive character, widely different from the block system of the present day; this was about 17 years ago. The gentleman who invented it, and who may claim to be the originator, was Mr. Walker, the electrical engineer of the South Eastern Railway; he adopted this arrangement for some of the lines within a certain distance of London; that is to say, on the Metropolitan section of the South Eastern Railway, embracing an area of perhaps 10 or 15 miles. It was introduced merely as an experiment, not being altogether believed in at that time as an arrangement to be carried out generally. It was introduced perhaps as much as anything to give information as to the whereabouts of the trains.

2488. Has it answered very well?—It has answered very well.

2489. Is it in operation on your line?—Not throughout the line, but upon a large section of it.

2490. You have found it most valuable upon the parts of the line where the traffic is most dense?—Yes; there are some portions of the line, that is to say the open districts in the country, and near the coast where we have not many trains; there you may very well do without it.

2491. Do you think it better in any case to do without it, because we have had evidence to the effect that where the traffic is not great upon a line, there is some risk of the signalmen neglecting the signals, when their attention is not being constantly directed to them so as to make the block system a cause of danger rather than a cause of safety?—No, that is not my opinion; you may do without it upon certain parts of the line where the traffic is very small, but even if you have it there, it is an auxiliary, which is useful

useful in working the traffic; as, for instance, for the purposes of record and for keeping the men to their duty.

2492. Would you have it on a small remote line where there are only half a dozen trains in the course of the day?—That would depend upon the character of the line.

2493. You would not lay it down as an absolute rule, that it should be adopted in all cases?—No, I would not lay it down that it should be adopted as a matter of necessity on a short line in an open country.

2494. Have you any knowledge of the extent to which it is in operation at the present time throughout the country?—No, I cannot say what proportion of the mileage of the United Kingdom has the block system; but I should think a considerable proportion.

2495. Is it extending?—It is gradually extending.

2496. Do you think it better to leave the extension of it to the discretion of the railway directors, or to give the Board of Trade power to enforce the extension of it?—I think that it should be left to the railway directors, for this reason: there are many places where the sudden introduction of the block system would be attended with risk; the companies have a large number of men who have been accustomed to the original system of working traffic, and it takes time to educate them to a new system. I should, therefore, be of opinion, that the gradual introduction of the system would be very much better than any compulsory power upon the railways to carry it out at a short notice.

2497. Sir *H. Selwin-Ibbetson.*] You state that it is not a necessity, though it is an advantage upon lines where there is not a great amount of traffic, but is not there, to a certain extent, an advantage also, in having one system throughout a line?—Yes, I admit that a uniformity of system is very desirable.

2498. If the system of working on all parts of the line were the same it would probably lead to fewer mistakes?—Yes.

2499. You see no disadvantage which would result from the introduction of the system, even on those parts of the line where you say that there is not an absolute necessity for its introduction?—Certainly not; I am quite in favour of having the block system everywhere, but upon portions of the railway, where from the nature of the line there is not a real necessity for it, you can work safely without it.

2500. You stated that you were not aware of the exact amount of mileage upon which the block system is in operation; we have it in evidence before the Committee, that it is about 2,500, out of the 12,000 or 13,000 miles in the country?—I should have thought that it would have been a little more. I am aware that of late it has been much extended.

2501. Whilst you do not think that it should be introduced suddenly on all lines, you think that it might be beneficially adopted on all within a short period?—It would certainly be an advantage to have it extended; but at the same time I think that it should be left to the railway companies to carry it out themselves. In our case we are applying it gradually to all parts of our system. We have commenced with the portions of the line which we consider require the greatest care in working; where there are tunnels, and where the traffic is considerable; it would be a very serious and inconvenient cost to us to carry it out everywhere all at once, but I have no doubt that in the course of time we shall have it on all parts of the Brighton system, both in the country and London districts.

2502. You do not think it advisable that there should be any power in the Board of Trade to enforce it upon lines which were not so willing to adopt improvements as you are, and who refused, notwithstanding its advantages, to adopt it at all?—I think that it should be left to the companies themselves; there is every appearance that all lines will eventually adopt it. I am of opinion that the block system will be generally adopted in course of time. Several companies who were once strongly against it, are now carrying it out.

2503. At present there are 26 lines on which it is not adopted?—Many of those, I take it, are insignificant lines as regards passenger traffic; they no doubt comprise some of the Welsh railways and also northern railways, which convey only mineral traffic.

2504. On 12 of the principal lines in the country, are you aware that it is only applied in the proportion of one-sixth of their mileage?—I am aware that it is only applied to a limited extent on some of the principal lines; but I am given to understand that they are gradually applying it to the other parts of their system.

2505. You think, though it is evidently a material security to the public in the way of protection against accident, there is no necessity to press it upon companies who do not adopt it?—Yes; I am of that opinion. I think that it would be much better for several reasons to allow it to come into gradual use.

2506. Have you any experience with regard to the subject upon which the last witness gave evidence, namely, continuous breaks?—Yes.

2507. Have you used them at all upon your line?—I am not aware that we have had them on the Brighton Line; I think not. I have had experience of them on the South Eastern Line.

2508. Did you use them constantly?—We used them for several years; we had, some years ago, several suburban trains working with them, and our opinion was that, although continuous breaks had their advantages, at the same time they had their disadvantages.

2509. You would not deny that a continuous break applied to a train gives greater power to the people in charge of that train, both for arresting the train in case of accident, and also preventing such an accident as carriages overrunning each other?—Yes; I admit that the more break power you have on a train running at great speed, the better it is.

2510. In the case of one train coming too close to another from disregard of signals, it is an immense advantage to have sufficient break power, not only to check the speed of the train, but principally to arrest it before a collision could take place?—Certainly.

2511. A power which you would not possess under the old system of breaks?—The train service in our southern districts, of which I have a more daily acquaintance, consists, so far as I know, of adequate break power, though the southern companies do not use continuous breaks,

Mr. *J. P. Knight.*

4 July 1870.

still the trains have a proper proportion of the ordinary breaks, that is to say, a proper proportion for the number of vehicles in each train.

2512. Would those breaks which you say are a proper proportion in a train, arrest a train within the same space as the continuous breaks would if applied to that train?—Yes; assuming of course that you have the guards for the breaks, I will take a train, say of 18 or 20 vehicles, you would have three or four guards, three guards would be the minimum for 20 vehicles on our line; I should for my own part rather trust to a train of that weight with three or four ordinary breaks, and the same number of guards, than to a heavy train made up of continuous breaks with only one guard.

2513. A train made up as you say of three or four breaks, with the same number of guards, implies that there are a certain number of break carriages in it?—Quite so.

2514. To that extent, the same objection raised by the honourable Member for the West Riding of Yorkshire, as applying to continuous breaks, that you would lose accommodation in the train, because you would have to increase the number of break carriages, would apply to your system of single breaks; you would have a certain number, and therefore would diminish your carrying power in the train?—I do not think that the carrying space need be much reduced; for you may have in the case of ordinary breaks, break passenger carriages and not luggage break vans, so that your accommodation for passengers in the train is really not reduced to any serious extent.

2515. Cannot you apply the continuous breaks to the passenger carriages in the same way as to break vans?—Yes.

2516. Therefore the accommodation need not be diminished any more with the continuous break than with the ordinary break?—No; but there would be great inconvenience, in my opinion, in having continuous breaks upon main-line trains, consisting of sets of carriages running through to various places; there would be much time lost at the various junctions in attaching and detaching, and, at the same time, I think some risk; for whenever there is complication there is, of necessity, some risk in case of a something being omitted. The simpler you have a train in its formation and working, the better. With regard to the continuous breaks which we had on the South Eastern Railway, an honourable Member has just now reminded me of one reason why we gave them up, namely, that we found that the firemen were in the habit of trusting too much to the continuous break, and that they neglected their own tender-break, and the result was, in one or two instances, we very nearly had a collision; and so impressed was I at the time with the risk attending the working of the continuous breaks we had then in use, that I recommended Mr. Eborall, the general manager of the South Eastern, to give them up.

2517. Are you aware, at the same time, that the previous witness has stated that on one of the lines carrying the greatest amount of traffic in the country, they have found none of the objections to continuous breaks which you have stated?—I have heard his evidence; that may be so; there may have been some improvements since the time I am speaking of; but no doubt even now the fireman may trust too much to the guard's continuous break, and too little to his own.

2518. Mr. *Winn.*] Are there any facing points on your line unprotected by signals?—None.

2519. Do you think in all cases where facing points exist the locking system ought to be adopted?—I think so.

2520. On your line is the locking system adopted?—The locking system is in very general use on our line. The firm who introduced the locking system, Saxby and Farmer, were originally in the service of the company. Mr. Saxby was formerly a skilled workman in the Brighton Company's shops, and consequently we had the advantage of an early introduction of the locking system upon our line.

2521. You have continued to adopt it?—Yes.

2522. Is not there a way of putting in the points, so as to avoid facing points altogether?—It would involve shunting, which, in many cases, would be more dangerous than encountering the facing points. You would have to shunt back to get on the other line. It would, in many cases, involve a greater risk than having the facing points themselves.

2523. Mr. *Denison.*] What is the ordinary establishment at a road-side station on your line?—A clerk in charge, two porters, and a boy.

2524. The proposal is that the block system should be introduced on all lines at every station; at a road-side station, where ordinarily there is a clerk in charge, two porters, and a boy, the introduction of the necessary signal would necessitate the employment of how many men?—At some places perhaps one, at others two; assuming it to be only a day station one might do; if the station was open day and night it would probably require two. At other places it might require three, if the traffic at the place was considerable, and for the thing to be done efficiently. I may mention that between London and Brighton, in a distance of 50 miles, we have 48 signal stations, that is, including traffic stations and intermediate block stations, and we have about 140 signal men and boys, giving nearly a signal station for every mile, and nearly three men for every mile.

2525. You were one of the original inventors of this block system, were you not?—Yes; I was one of several who introduced the system many years ago, I did not, however, absolutely invent it, but I improved upon it. I found a signalling arrangement of a somewhat experimental kind in work, which we gradually developed, and perfected, and eventually carried out as the present block system.

2526. Have you known instances of danger or accident arising from neglect of the signals on the block system?—Yes, I have known several serious accidents occur from working on the block system; but that has been from inattention or neglect of the signalman, or other servant, and not from the system itself.

2527. That signalman having no other work but to attend to the signal?—Yes, the signalman having nothing more to do than to attend to the signal. On the South Eastern a collision occurred several years ago from that cause between a goods train and a passenger train, and at a part of the line where the block system was in operation. One of the trains stopped in a tunnel; the signalman forgot it was in the tunnel and he gave "clear"

"clear" to the other end, and the other train ran into it.

2528. Do you find that the multiplication of signals tends to make the drivers rely more on the signals than on their own acuteness?—You may have too many signals; the less signals you can work a line with the better; but the signalling of railway traffic has become so much a system at the present day, that every driver is educated to it; he does not qualify for a driver till he has passed a certain time as fireman, and during that time he must have acquired a perfect knowledge of the whole of the signals upon the line.

2529. Do you find occasionally that your engine drivers and firemen neglect the signals?—We have occasionally had such instances, and that too, where the block system is in force, they have made a mistake and run past the signals; in some instances this has been owing to not having the train under proper command, and at other times to a bad look out, and to other causes. In the New Cross accident, for example, the driver ran past three conspicuous glaring "Stop" signals.

Mr. *J. P. Knight.* 4 July 1870.

2530. Block signalling was not responsible for that accident?—No, it was due to other causes.

APPENDIX.

Appendix, No. 1.

PAPERS handed in by Captain *Tyler*, 27 June 1870.

CIRCULAR.

Board of Trade (Railway Department), London, S.W.,
19 May 1869.

Sir,

I AM directed by the Board of Trade to forward, for the consideration of your directors, the Reports of the inspecting officers of the Board of Trade upon the accidents which occurred during the last half of the year 1868, and to request their careful consideration to the extracts therefrom, which are collected in a separate paper sent herewith, having reference to the use of what is known as the Block Telegraph system.

Your directors will perceive from these extracts that the railway inspectors report that many of the accidents which occurred through collision, some of them attended with most disastrous loss of life and property, might have been avoided had the block system been in use, and that they are unanimously of opinion that this system should now be generally applied.

I am further directed to remind your directors that in the year 1861 the Board of Trade addressed a circular letter to the railway companies on the subject of the collision in the Clayton tunnel of the London, Brighton, and South Coast Railway, recommending to them the use of the telegraph as the surest means of avoiding such lamentable collisions. The experience of subsequent years has strongly confirmed the opinion then expressed; but although the block telegraph system has been applied by several companies either wholly or in part to their lines, and especially by the Metropolitan Railway Companies, with the best possible result, it cannot as yet be said to be in general use.

3.

Although the Board of Trade have, with rare exceptions, refrained from interfering with railway companies, or even advising them, as to the regulation of their traffic and the management of their business, being unwilling to diminish the responsibility which rests upon directors to conduct their traffic in the safest and most efficient manner, yet, having regard to the experience of the last few years, to the great proportion of accidents which occur through collisions, and to the repeated expressions of opinion from the inspectors that such accidents, or many of them, might have been avoided by the adoption of the block system, they think it again their duty, in the interest of the public, to call the most serious attention of your directors to this subject. They are of opinion that, in view of the considerations already stated, a grave responsibility will rest upon railway directors if, without sufficient reason, they refrain from adopting this system.

I am directed, therefore, to ask from your directors, at their earliest convenience, a statement showing over what portion, if any, of their line the block system is not now in use, and the reasons which actuate them in refraining from the adoption of a system which has on other lines been attended with so much advantage to the public.

It will, of course, be understood that the foregoing observations do not apply to cases in which a railway is worked with only a single engine in steam at any one time.

I am, &c.
(signed) *G. Shaw Lefevre.*

Appendix, No. 1.

ACCIDENTS WHICH MIGHT HAVE BEEN PREVENTED IF THE BLOCK SYSTEM HAD BEEN ESTABLISHED.

Inspectors' Reports on certain Accidents which occurred during the last Half-year of 1868.

Extract from Captain *Tyler*'s Report of 27th November, on the Collision on the Great Western Railway (South Wales Section), near Newnham, on the 5th November.

"The principal object in view should, however, be to prevent the collisions from occurring rather than to enable the drivers to sustain such collisions from a position of greater safety. And looking at the subject in this light, the more important lesson which the present, in common with the more fatal accident at Abergele, and with many other previous cases of collision, tends to enforce, is the necessity for a more extensive use of the telegraph for ensuring a clear course, and a line safe from dangers and obstructions in the path of these fast trains. A mere interval of *time*, whether it be 10 minutes or 20 minutes, or any other given quantity, affords no true margin of safety between goods trains, the progress of which is uncertain, which consume more or less time in shunting, and the servants in charge of which are placed in straits and difficulties that lead them to run almost unavoidable risks in many cases, and fast passenger or mail trains which may or may not be late, and which run at nearly the same speed, whether the atmosphere be clear or foggy, and whether the line be straight or the view obstructed by curves and cuttings, bridges or tunnels. An interval of *space* is the only true remedy for such a state of things, and it matters not what the distance between the trains may be, whether four miles or two miles, or half a mile, so long as it is strictly preserved. On certain railways in this country trains are continually following one another in quick succession at half-mile intervals from year to year, under what is called the 'block system' of working by telegraph, with comparative safety, while on others continual risk is incurred for want of an extension of the telegraph system, although with more perfect arrangements a sufficient interval of space might without difficulty be secured.

"In this particular instance an interval of time of no less than 22 minutes proved to be of no avail. A powerful engine was unequal, in a slippery condition of the rails, to the task imposed upon it. A too heavy goods and cattle train could not be propelled at sufficient speed to keep it out of the way of a following mail train, but travelled too fast to admit of the guard's dropping off and providing for its protection, and at a speed greater than that—six miles an hour—at which he was required by his regulations to take such a precaution. On a curve, which was not sharp, but on which the view was obstructed, the three lamps, which burned brilliantly, as all admit, behind it, became practically useless. The engine-driver of the mail train, catching sight of it at a distance of 150 yards, had time to do no more than prepare to receive the shock in the best attitude into which he could hurriedly throw himself for his own safety, while travelling at a speed probably of 40 or 45 miles an hour; and the passengers in the mail train were only saved from serious consequences by the fact that the force of the collision was expended in the destruction of a portion of the cattle train and its unfortunate inmates.

"It is desirable that this section of the line should be protected from such an accident in future by the adoption of a block system of telegraph working between the Awre junction and Bullo Pill, which are only two miles apart, by day as well as by night, and no train being allowed to leave or pass the Awre junction until the preceding train has been announced by telegraph to have passed or been shunted out of the way at Bullo Pill, and *vice versâ*; and I would take the opportunity of adding that the same system may, with great advantage, be extended more especially over portions of this and other lines on which the view is obstructed, and with regard to trains which run at high rates of speed and do not make frequent stoppages."

Extract from Colonel *Rich*'s Report of 3rd October, on the Accident on the London and North Western Railway (Chester and Holyhead Section), near Abergele, on the 20th August.

"The block telegraph should be put strictly in force on the Abergele and Llandulas section, and on all other parts of the line that are in any way similar to it. If the block telegraph system had been in use and strictly carried out, this accident could not have occurred."

Extract from Colonel *Hutchinson*'s Report of 4th November, on the Collision on the London and North Western Railway, at the Holywell Station, on the 16th September.

"I would strongly urge upon the London and North Western Company the importance of establishing, in connection with the above-mentioned improvements they are about to carry out, the block telegraph system, so that an interval of *space*, far more valuable than one of *time*, may be maintained between their trains. Had it been in operation it might very possibly have prevented the present accident."

EXTRACT from Captain *Tyler*'s Report of 12th December on the Collision on the London and North Western Railway, at Hillhouse, on the 2nd December.

"The London and North Western Company should lose no time in providing, at Huddersfield and Hillhouse, improved and elevated cabins, from which the points and signals may be conveniently worked, with locking apparatus, and telegraph communication between the signalmen. And it is exceedingly desirable that this portion of the line should be worked on the 'block system,' so that no pretence should be made of keeping up intervals of time which cannot in practice be preserved between the engines and trains; and intervals of space, which may always, under proper arrangements, be maintained, should be substituted for them."

EXTRACT from Colonel *Yolland*'s Report of 15th January 1869, on the Collision on the London and North Western Railway, at Euxton Junction, on the 18th December 1868.

"I strongly advocate the introduction of the electric telegraph as a means of preserving an interval of space between two following trains on the same line; but this London and North Western system is neither one thing nor the other; the usual time interval has been reduced from five to three minutes, during which the signal is directed to be kept at danger; but the engine-drivers are taught to disregard these signals when thus at danger, and are told to go ahead. As carried out, it wants the security afforded by the absolute block system, and does not probably fall far short of the cost which the latter would require if it were adopted.

EXTRACT from Colonel *Yollond*'s Report of 29th January 1869, on the Collision on the London and North Western Railway, at Hyde Road, on the 29th December 1868.

"It is my duty to recommend, although with little expectation that the recommendation will be attended to, that this permissive block system be abandoned, and that where the telegraph is made use of in the working of traffic it should be for the purpose of preserving an interval of space between following trains, as adopted with complete success on the various metropolitan systems of railway and elsewhere.

"Very little additional cost would have to be incurred for its introduction between Manchester and Stockport. Two, or at most three, additional telegraph stations only would be required."

EXTRACT from Colonel *Rich*'s Report of 18th November 1868, on the Collision on the Manchester, Sheffield, and Lincolnshire Railway, at the Deep Car Station, on the 16th October.

"The block telegraph system should also be adopted."

EXTRACT from Colonel *Yolland*'s Report of 24th of November, on the Collision on the Midland Railway, at Wigston Junction, on the 31st October.

"The Midland Railway Company are working their traffic in the immediate vicinity of London, on their newly opened line to St. Pancras, with the assistance of the electric telegraph and on the block system, because, I am told, it is safer. It is, in my opinion, to be regretted, either that Parliament does not render the introduction of this system compulsory, or give the Board of Trade power to order its adoption when circumstances require it."

EXTRACT from Colonel *Yolland*'s Report of 4th January 1869, on the Collision on the North Eastern Railway, at the Arthington Station, on the 19th December 1868.

"If this section of the line had been worked with the assistance of the telegraph, and on the block system, this collision would not have occurred."

REPLIES, by Railway Companies, to Circular of the Board of Trade, of the 19th May 1869, relative to the Block Telegraph System of working Railway Trains.

RAILWAY COMPANY.	Total Length of Railway.	Length upon which the Block Telegraph System is used.	Observations (in reply) of the Directors, or their Reasons for refraining from the adoption of the Block Telegraph System.
ENGLAND AND WALES.	*Miles.*	*Miles.*	
Anglesey Central	18 single.	–	No reply has been received.
Aylesbury and Buckingham	12 single.	–	As only one engine in steam at a time is employed on the line, the block system is not at present applicable.
Bishop's Castle	10 single.	–	"The railway being worked with only a single engine in steam at any one time, the block telegraph system has not been adopted."
Blackpool and Lytham	8 single.	–	The line is worked with one engine only, and under no circumstances is more than one train run on the line at once.
Blythe and Tyne	27 double, 11 single.	–	"The block telegraph system is not in use on any portion of this railway," and "the directors are of opinion that its introduction is not necessary on this line as there are no express trains run on it; the stations are all in close proximity to each other, the greatest distance between any two of them being only 2½ miles, and several of them are within a mile of each other, and the trains are not frequent. No accident has ever occurred on any part of the line which would have been prevented by the block telegraph system."
Bodmin and Wadebridge	14 single.	–	This is principally a mineral line.
Brecon and Merthyr Tydfil	6 double, 54 single.	32	The portions of the company's single line between Brecon and Deri Junction and between Pontsticill Junction and Merthyr Tydfil are worked by the "block telegraph system." The portion of single line between Rhymney and Bassaleg Junction is worked by the "train staff and ticket system," sanctioned by the Board of Trade.
Bristol and Exeter	77 double, 58 single.	135	The block telegraph system has been adopted for some years and is in practical use over the whole of this company's lines, all its trains being worked on that system.
Bristol and Portishead Railway and Pier.	10 single.	10	"Block system in operation."
Bristol Port Railway and Pier	6 single.	–	This line is almost invariably worked with a single engine in steam at one time, but when there is occasion for working two engines the pilot board system is adopted.
Cambrian	9 double, 167 single.	–	No reply has been received.
Carmarthen and Cardigan	20	20	The line is worked by the block telegraph system in addition to the "train staff."
Carnarvonshire	16 double, 1 single.	–	Worked by London and North-Western Railway Company under their usual train staff regulations.
Cheshire Lines Committee	30 double, 4 single.	–	No reply has been received.

REPLIES, by Railway Companies, to Circular of the Board of Trade, of the 19th May 1869, &c.—*continued.*

RAILWAY COMPANY.	Total Length of Railway.	Length upon which the Block Telegraph System is used.	Observations (in Reply) of the Directors, or their Reasons for refraining from the Adoption of the Block Telegraph System.
	Miles.	*Miles.*	
Cockermouth, Keswick, and Penrith.	32 single.	–	The line is worked by the train staff. The greatest distance between any two stations is five miles; there are only 9 up and 10 down trains, and the traffic is very inconsiderable; the expense of adopting the block telegraph system would be out of all proportion to the earnings, as an additional wire would be required, additional instruments, and an additional man at each station.
Colne Valley and Halstead -	19 single.	–	"This company's trains are worked under the train staff regulations, the line being single, and the train service but small.
Cornwall - - - - -	4 double, 62 single.	62	The block telegraph system is in full operation on this railway.
Cowes and Newport - -	5 single.	–	"The block telegraph system is not used nor required; there is never more than one engine at work and never more than one in steam, and in no instance has there been two trains on the line at the same time."
Denbigh, Ruthen, and Corwen -	19 single.	–	"This railway is worked altogether by the train staff and ticket system."
Festiniog - - - - -	14 single.	—	
Furness - - - - - -	32 double, 56 single.	10	The block telegraph system is in use on those portions of the line where the trains were frequent, viz., between Furness Abbey and Ulverston, and Roose and Piel Pier. On other parts of the line the trains are so few that, in the opinion of the directors, the block telegraph is not required.
Great Eastern - - - -	414 double, 392 single.	36	The block telegraph system is in operation on various portions of the railway to the extent of 36 miles. The course followed has been to lay down the train telegraph on those portions of the line where the trains are numerous, and the attention of the directors will be given to extend its use as the circumstances of the traffic seem to demand it.
Great Northern - - - -	419 double, 109 single.	68	The block telegraph system is in operation between London and Hitchin, in the immediate neighbourhood of Peterborough station, generally through all the tunnels on the railway, from Grantham to junction with the Ambergate line, through the Doncaster yard; and on the railways of the company in the West Riding of Yorkshire, wherever the traffic on the line increases to such an extent at any particular place as to render the block system desirable, the directors will doubtless establish it. It is not at present the intention of the company to erect this block system of telegraph over the less thronged portion of their railway, many parts of which are through agricultural districts, where the traffic is very light, and the trains few and far between. But the directors will not neglect anything they consider essential for ensuring safety on their railway.
Great Western - - - -	846 double, 541 single.	368	"The Great Western Company have, as an experiment, adopted the block system on particular portions of their railway, and they have now under consideration the desirability of extending it to certain other portions, where owing to the extent of the traffic, or the nature of the gradients or curves, the working may be improved by its adoption, and they would be quite prepared from time to time to extend its use as may be found desirable." Of the 978 miles not worked on the block system 118 miles are worked on the "precautionary system," and on 72 miles the block telegraph is fixed, but not yet working.

REPLIES, by Railway Companies, to Circular of the Board of Trade, of the 19th May 1869, &c.—*continued.*

RAILWAY COMPANY.	Total Length of Railway.	Length upon which the Block Telegraph System is used.	Observations (in Reply) of the Directors, or their Reasons for refraining from the Adoption of the Block Telegraph System.
	Miles.	*Miles.*	
Hexham and Allendale - -	12	—	
Hoylake - - - - -	5	–	The reasons for not adopting the block telegraph system are, the short length of the railway, and that, with few exceptions, there is but one train used on the line.
Isle of Wight - - - - -	12 single.	–	No reply has been received.
Lancashire and Yorkshire -	386 double, 25 single.	26⅕	The system has already been adopted at certain points (altogether about 27 miles in length), and has been introduced from time to time as the circumstances affecting the traffic at these places appeared to the directors to make it desirable. The directors state, "that they have not failed to give very careful attention to the report of Colonel Yolland on the collision which took place between a passenger train and a goods train near the Salford Station, on the 28th of May last, in which Colonel Yolland reports that the collision would not have occurred if the traffic had been worked on the absolute block system." "They observe that that collision was not caused by any deficiency in the signal arrangements, but resulted from the driver of the passenger train having disregarded the danger signals, and it is obvious no system of signalling, block or otherwise, can prevent accidents of this kind, arising from the misconduct of engine-drivers. "On a careful consideration of the subject, and of the extracts from the reports of the inspecting officers of the Railway Department forwarded to them, the directors are of opinion that it is not desirable to adopt the block system generally on this railway, as they consider that such a proceeding would lead to much inconvenience and delay, without giving additional security to the working of the traffic, and they propose in future to keep themselves, as heretofore, well-informed as to any special circumstances affecting the traffic of each portion of the line; and should it appear at any time that they are such as to make it desirable to apply the block telegraph system at any point, they will not fail to adopt it."
Llanelly - - - - - -	72 single.	72	Block system adopted on all those portions of the railway upon which passenger trains are run.
Llynvi and Ogmore - - -	30 single.	3¾	Block system adopted between Tondu Junction and Cefn only. The system has not been adopted more generally, as the traffic of the railway consists chiefly of minerals, and a large portion of the line is worked with only a single in steam at one time.
London and North Western -	1,042 double, 330 single.	69½	Although the trains are not worked upon what is known as the absolute block system, with certain exceptional cases a considerable portion of the line has been for some years worked with the aid of the electric telegraph, the posts being within short distances of each other, and at each of which engine-drivers are warned of any preceding train on the length between that and the next telegraph post, and informed of the period of time the trains are in advance. This mode has been found to work well, and the application of the principle is now being extended to other portions of the main line. The length worked on the absolute block system is - - - - - - - - - 69½ miles. The length worked on the permissive block system by telegraph - - - - - - - 370½ „ The length worked under special regulations other than the two above systems - - - - - 168¾ „

REPLIES, by Railway Companies, to Circular of the Board of Trade, of the 19th May 1869, &c.—*continued.*

RAILWAY COMPANY.	Total Length of Railway.	Length upon which the Block Telegraph System is used.	Observations (in Reply) of the Directors, or their Reasons for refraining from the Adoption of the Block Telegraph System.
	Miles.	*Miles.*	
London and South Western -	388 double, 238 single.	174	The block system for the electric signalling of trains is in use on 88 miles of railway in the neighbourhood of London, and also in one shape or other on 86 miles of railway in the country districts. Very many of the lines of this Company, upon which the block system has not been adopted, have very few trains running upon them, and although that system can be efficiently worked where trains run frequently, and consequently the attention of the signalman is constantly required, it is considered to be doubtful whether the system would be found equally efficient if it had to be worked by servants whose exclusive attention could not be given to it, or in cases where so few trains run during the day that the signalman's attention would be relaxed for considerable periods of time.
London, Brighton, and South Coast.	273 double, 69 single.	127¾	The directors "have considered that the precautions hitherto adopted of extending and improving, from time to time, without regard to cost, the ordinary signal arrangements have been sufficient to meet the requirements of the traffic and the safety of the public, but that recently they have ordered steps to be taken for the application of the block system to all parts of the company's railways.
London, Chatham, and Dover -	135 double, 9 single.	144	From the opening of this railway throughout, the system of maintaining by means of the telegraph an interval of space between trains running on the line has been in operation, and, in the opinion of the general manager, the public safety has been greatly enhanced in consequence. Looking at the peculiar circumstances of the traffic upon this railway, and the multiplicity of trains, he is sure that the directors would not feel that they were justified in dispensing with the use of the block system, although it is easy to understand that on some lines the circumstances are so different, and the trains so much less frequent, as to make its use less desirable.
Londonderry (Seaham to Sunderland).	6 double, 1 single.	–	The line being only six miles, the average number of trains being 20 mineral, and 8 passenger per day, none of which exceed 20 miles an hour.
London, Tilbury, and Southend	41 double, 3 single.	—	
Manchester and Milford - -	41	–	No reply has been received.
Manchester, Sheffield, and Lincolnshire.	216 double, 43 single.	–	No reply has been received.
Manchester South Junction and Altrincham.	9 double.	—	
Maryport and Carlisle - -	28 double, 11 single.	–	The directors have not considered it necessary to adopt the block system on any portion of their line, as the whole of the passenger trains stop at every station, and as all the goods trains stop at intermediate stations, many of them stopping at every station, and as the stations average only three miles apart.
Metropolitan - - - -	11 double,	15	These railways, including the Hammersmith and City Railway, are all worked upon the block telegraph system.
Metropolitan and St. John's Wood.	2 single.		
Metropolitan District - -	2 double.		

REPLIES, by Railway Companies, to Circular of the Board of Trade, of the 19th May 1869, &c.—*continued.*

RAILWAY COMPANY.	Total Length of Railway.	Length upon which the Block Telegraph System is used.	Observations (in Reply) of the Directors, or their Reasons for refraining from the Adoption of the Block Telegraph System.
	Miles.	*Miles.*	
Midland	730 double, 175 single.	85	The block system is already in operation on this company's line between Bedford and London, and between New Mills and Ambergate. It is intended, with as little delay as possible, to have it in use on all those portions of railway where the traffic is of sufficient magnitude to justify the outlay of the first cost, and the very heavy annual expense attendant upon its working and maintenance.
Midland Counties and South Wales.	4 single.	—	
Mid-Wales	48 single, 26	48 —	Worked by the "block telegraph system." The company also work 26 miles of single line belonging to the Hereford, Hay, and Brecon Railway Company by train staff, which system the company found in operation, and having had experience of its safety, it was considered inadvisable to substitute the block telegraph system.
Monmouthshire	33 double, 18 single.	—	"The block system is not now in use on any portion of this company's railway where there are two lines." The directors state "that they have not deemed the adoption of the block system necessary, because during the last 16 years but three collisions attended with personal injury have occurred, which would not have occurred under the block system; also, because the traffic of the district is chiefly in goods and minerals, and the trains of all descriptions travel at a lower rate of speed than on those railways where the passenger traffic predominates."
Mowddwy	7 single.	—	
Neath and Brecon	33 single.	—	The line is worked on the "staff system," which has been found satisfactory; to change it to the "block system" would involve the cost of the necessary instruments, &c.
Newport Pagnell	4 single.	—	
North and South-Western Junction.	5	5	"The block system of telegraph is in operation on the whole of this company's system."
North-Eastern	776 double, 478 single.	—	No reply has been received.
North London	12 double.	12	"The block system of telegraph is in operation on the whole of this company's system."
North Staffordshire	118 double. 40 single.	157	"The directors of this company, long since convinced of its value, have, for some years past, established the block telegraph system throughout their railways."
Oldham, Ashton-under-Lyne, and Guide Bridge.	6	—	
Pembroke and Tenby	27	—	
Potteries, Shrewsbury, and North Wales.	30 single.	—	There is no telegraph on any portion of this company's railway at present, therefore the "block system" is impracticable.
Preston and Longridge	8	—	"The block system has not been considered necessary." "From Mandland to Deepdale the line is double, but worked as single lines; and from Deepdale to Longridge it is a single line, traversed by one engine only."

REPLIES, by Railway Companies, to Circular of the Board of Trade, of the 19th May 1869, &c.—*continued.*

RAILWAY COMPANY.	Total Length of Railway.	Length upon which the Block Telegraph System is used.	Observations (in Reply) of the Directors, or their Reasons for refraining from the Adoption of the Block Telegraph System.
	Miles.	*Miles.*	
Preston and Wyre	20 double, 8 single.	–	"The block telegraph system has not been put in operation on this line, as the ordinary traffic is light, with the trains running at wide intervals, except during the excursion season, when the platelayers are engaged to act as signalmen, remaining on duty until all specials have been worked off the line."
Rhymney	3 double, 22 single.	25	The block system is in use on this railway.
Sirhowy	16 single.	1½	The short distance, between Tredegar and Bedwelty, is worked on the block system, the other portions are worked on the "staff and ticket system," unless in cases of emergency. The company have block instruments at all the stations. The directors state that it would be impossible to conduct the traffic of the line on the block system, their trains in some cases starting within 10 minutes of each other, where the distance between the trains occupies five minutes.
Somerset and Dorset	66 single.	66	The block telegraph system has been in use over the whole of this company's railway for some years past.
South Devon	34 double, 78 single.	112	The block telegraph system is in full operation on this company's railway.
South-Eastern	299 double, 13 single.	312	The block telegraph system has been in use on this company's line for some time.
Stafford and Uttoxeter	13	–	No reply received.
Stamford and Essendine	4 double, 8 single.	–	"This railway is worked as a single line by the ticket and staff system as approved."
Swansea Vale	20 single.	–	"This line has always been worked on the block system, and up to the present time we have not had one accident."
Taff Vale	51 double, 22 single.	–	No reply received.
Talyllyn	7 single.	–	"Only one engine-driver employed, and only one engine working on one day."
Tees Valley	7½ single.	–	The line is worked under the train staff system.
Torbay and Brixham	–	–	No reply received.
Tottenham and Hampstead Junction.	–	–	"This line is worked entirely by the Great Eastern Railway Company."—*See* "Great Eastern."
Trent, Ancholm, and Grimsby	14	–	No reply received.
West Cornwall	42 single.	42	The block telegraph system is in full operation on this company's railway.
West Somerset Mineral	12 single.	–	"There is no telegraph upon this company's line, and as there is only one engine in steam upon it at the same time, the block telegraph system is unnecessary."

REPLIES, by Railway Companies, to Circular of the Board of Trade, of the 19th May 1869, &c.—*continued.*

RAILWAY COMPANY.	Total Length of Railway.	Length upon which the Block Telegraph System is used.	Observations (in Reply) of the Directors, or their Reasons for refraining from the Adoption of the Block Telegraph System.
	Miles.	*Miles.*	
Whitehaven, Cleator, and Egremont.	4 double, 15 single.	4	The double line of rails on this railway is worked on the block system.
Willoughby D'Eresby's (Edenham and Little Bytham).	4 single.	—	
Wrexham, Mold, and Connah's Quay.	16 single.	–	The directors, while acknowledging the advantages of the adoption of the block telegraph system where a heavy traffic exists, say that the staff system has hitherto been found to be sufficient protection, with a strict observance of other rules, upon this railway. The directors would, however, adopt the block system upon their railway, but the present financial condition of the company prevent them making that outlay.
SCOTLAND.			
Caledonian - - - - -	430 double, 281 single.	3 double, 7 single, 10 up-line, 4½ down-line.	The directors state that the block telegraph system has been adopted on certain short portions of their railway, but they do not consider it necessary or desirable at the present time to adopt that system upon any other portion of the railway. The subject will, however, have their careful consideration with a view to apply the extension of the system wherever and whenever it appears to them it can be applied advantageously; but to apply it to the whole of their railway would entail upon the company a very large expenditure, which the directors believe they would not be justified in incurring, either on the ground of safety or efficiency.
Forth and Clyde Junction -	30 single.	30	The train telegraph arrangements of this company approximates very nearly to the block telegraph system. In no case are two separate engines or trains allowed to be on the line at one time between stations.
Glasgow and South Western -	176 double, 78 single.	7	"The telegraph block system has not been established on this company's line, with the exception of the portion between Glasgow and Paisley which is the joint property of this company and the Caledonian. "The directors have not considered it necessary to adopt it on any other portion of their system, no accident having yet occurred which, in their opinion, would have been prevented by its adoption. "Only three accidents to passenger trains have been caused by collision on this line since the opening of the railway in 1840, and in each of those instances the accidents have occurred solely in consequence of the engine-drivers disregarding the company's rules and neglecting their signals." "In the cases referred to, the directors do not conceive that had the block system been in operation the accidents would have been prevented, as the drivers might equally have disregarded the signals under that system." "The directors are nevertheless anxious to adopt a plan which is considered desirable by the Board of Trade, although it may entail considerable expense on the company; and they propose to inquire into the best means of working such portions of the company's line on the block system as may be considered expedient in consequence of the number of trains or any special circumstances."
Great North of Scotland - -	6 double, 284 single.	290	"The whole of the lines belonging to or worked by the company are worked on the block system."
Highland - - - - -	7 double, 261 single.	268	"The Highland Railway is now, and has been since it was opened, worked by the block telegraph system."

REPLIES, by Railway Companies, to Circular of the Board of Trade, of the 19th May 1869, &c.—*continued.*

RAILWAY COMPANY.	Total Length of Railway.	Length upon which the Block Telegraph System is used.	Observations (in Reply) of the Directors, or their Reasons for refraining from the Adoption of the Block Telegraph System.
	Miles.	*Miles.*	
Leven and East of Fife - -	20 single.	–	No reply has been received.
North British - - - -	368 double, 408 single.	91 (of which 63 miles have been established between May 1867 and May 1869.)	"The North British Railway, for a great portion of its length, runs through a hilly and sparsely populated country, where trains are few and far between, and where, therefore, the use of the telegraph would be unnecessary. "In other parts of the line, within the vicinity of large towns, and along the main routes of traffic, trains are more numerous, and here the aid of the telegraph has been freely made available." The "Directors have frequently had their attention directed to this subject, and their practice has been to use the telegraph wherever the necessities of the case have appeared to them, upon the report of their officers, to demand it." (A statement showing the portions of railway upon which the block system is in force has been received.) "To apply the block telegraph over the whole system, irrespective of local conditions and circumstances, would, the directors are advised, be quite unnecessary, and therefore productive of more harm than good."
IRELAND.			
Belfast and County Down -	44 single.	–	"Owing to the traffic of this line being so limited, and the speed of the trains so slow, it is, in the opinion of the directors, at present unnecessary to incur the expense of working the trains on the block system."
Belfast and Northern Counties	7 double, 144 single.	–	The directors "are of opinion that with the comparatively limited traffic, the length of time between the trains, and other considerations affecting the general working, they see no necessity for the adoption of the block telegraph system on this line of railway."
Belfast, Holywood, and Bangor	13 single.	–	The block telegraph system is not in work on this line, but the ticket and staff system is in use. In daylight the trains can be seen for a distance of 4½ miles. So soon, however, as circumstances will admit, the block telegraph system will be adopted. There has been no accident resulting from its absence, nor any inconvenience.
ork and Bandon - - -	31 single.	–	No reply has been received.
Cork and Macroom - -	25 single.	–	"The block telegraph system is not used." "The line is a single one, where trains do not pass each other."
Cork, Blackrock, and Passage -	6 single.	–	"As the traffic of this line is worked by a single engine in steam at the time, there is no necessity for adopting the block telegraph system."
Dublin and Belfast Junction -	56 double, 7 single.	–	"The block telegraph system is only partially applied on the line; the long intervals between the trains running in the same direction rendering it unnecessary." *See* company's letter for detail of the working of the trains, from which it appears that "the telegraph is in daily use for the passing of trains, and when delays or any stoppages take place it is used to protect the disabled train until the line is cleared for the next train."
Dublin and Drogheda - -	32 double, 43 single.	–	"The traffic on the lines of this company is very limited, and not such as would require the expenditure which such system would involve."
Dublin and Meath - - -	35 single.	–	No reply has been received.

REPLIES, by Railway Companies, to Circular of the Board of Trade, of the 19th May 1869, &c.—*continued.*

RAILWAY COMPANY.	Total Length of Railway.	Length upon which the Block Telegraph System is used.	Observations (in Reply) of the Directors, or their Reasons for refraining from the Adoption of the Block Telegraph System.
	Miles.	*Miles.*	
Dublin Wicklow, and Wexford	18 double, 89 single.	–	No reply has been received.
Great Southern and Western -	191 double, 246 single.	–	The directors, while admitting the value of the "block system" for telegraphing trains, and the advisability of adopting it on lines with large traffic, do not consider that it is called for upon a line with the limited traffic of the Great Southern and Western Railway; and having regard to the fact that the adoption of the block system on this railway would necessarily involve a large outlay, and considerable annual expense, they do not feel they would be warranted in adopting it generally upon their line. It has, however, been in operation some years on their railway in the vicinity of Dublin and Cork.
Irish North-Western - -	9 double, 186 single.	–	No reply has been received.
Londonderry and Lough Swilly	15 single.	–	"As there is only one engine in steam on this line at any one time, it is unnecessary to adopt the block telegraph system, or any similar precaution against collisions, as they cannot possibly occur."
Midland Great Western - -	115 double, 240 single.	–	No reply has been received.
Newry and Armagh - -	21 single.	–	"From Goragh Wood to Armagh the line is divided into two sections, and worked by 'train staff.'" From Goragh Wood to Newry the exchange of traffic is regulated by telegraph, which the secretary and manager presumes is equivalent to the block system referred to in Board of Trade Circular.
Newry, Warrenpoint, and Rostrevor.	6 single.	–	The railway having but a single line of rails, worked with only one engine under steam at a time, the directors do not consider that there is any necessity for it.
Parsonstown and Portumna Bridge.	12 single.	–	No reply has been received.
Ulster - - - - - -	49 double, 73 single.	–	The subject of working the railway according to the block telegraph system is at present under consideration by the directors.
Waterford and Central Ireland -	59 single.	–	The line is worked under the "train-staff" system; there are only four trains each way daily; there is no telegraph on the line. The block system could not be carried out without a large outlay and considerable expense.
Waterford and Limerick - -	23 double, 128 single.	–	No reply has been received.
Waterford and Tramore - -	8 single.	—	
West Cork - - - - -	17 single.	–	No reply has been received.

TO

REPORT

FROM THE

SELECT COMMITTEE

ON

RAILWAY COMPANIES.

Ordered, by The House of Commons, *to be Printed,*
7 *July* 1870.

ANALYSIS OF INDEX.

ALPHABETICAL and CLASSIFIED LIST of the PRINCIPAL HEADINGS in the following INDEX, with the Paging at which they will be respectively found.

PAGE

Act 9 & 10 Vict. c. 93 (Lord Campbell's Act) - - 199
Damages - - 209
Liability - - 217

Arbitration - - 201
Costs - - 208
County Court Judges - - 208
Tribunal - - 230

BLOCK SYSTEM:
1. *Evidence of Railway Officials as to the partial Adoption of the Block System, of Working, its Advantages and Disadvantages, and as to the Inexpediency of its general Adoption being Compulsory* - 203
2. *Views of Colonel Yolland in favour of the Compulsory Adoption of the System* - 204
3. *Dissent of Captain Tyler from the foregoing Conclusion* - - 204
4. *Letter from the Board of Trade in 1869, urging the Adoption of the System* - - 204
5. *Enumeration of Accidents in 1868 which the System would have prevented* - - 204
6. *Details supplied by the Companies as to the Extent of Adoption of the System* - 205
7. *Importance attached to the System by the Committee* - - 205

BOARD OF TRADE:
1. *Evidence of Railway Officials opposed to Compulsory Powers in the Board of Trade* - - 205
2. *Conflicting Views of Colonel Yolland and Captain Tyler on the question of Compulsory Powers* - - 205
3. *Attention paid by the Companies to the Reports and Recommendations by the Inspectors* - - 206
4. *Question as to the Inspectors concurring on the Subject of Improvements* - - 206
5. *Want of Legal Powers in the Board to hold Inquiries and to enforce Evidence* - - 206

INDEX.

[*N. B.*—In this Index the *Figures* following the Names of the Witnesses refer to the Questions in the Evidence; those following *App.* to the Pages in the Appendix; and the Numerals following *Rep.* to the Pages in the Report.]

A.

ABERGELE ACCIDENT. Attempted fraud upon the London and North Western Company by a person who falsely said he was at the Abergele accident, *Blenkinsop* 9——Deception of the doctors in this case, *ib.*——Detection of the fraud just as witness was going to hand over 1,000 *l.* as compensation, *ib.*——The man was subsequently prosecuted for conspiracy and received eighteen months' imprisonment, *ib.*

Statement in Report of Colonel Rich that if the block system had been in use and strictly carried out the accident near Abergele on the 20th August 1868 could not have occurred, *App.* 182.

Act 9 *&* 10 *Vict. c.* 93 (*Lord Campbell's Act*). Anomaly, previously to Lord Campbell's Act, in there being no liability to compensation for a person killed by accident, whilst there was such liability in the case of a person injured, *Blenkinsop* 3–8——Object of Lord Campbell's Act further adverted to as facilitating compensation claims on the part of persons killed, *ib.* 22, 23——Non-objection to the principle introduced by the Act, whereby in case of death by accident the nearest relatives may claim, *ib.* 179–181.

Practical inoperativeness of the provision in Lord Campbell's Act that claims can only be made to the extent of the interest of the claimants, *O'Brien* 488–490——Very harsh and unjust operation of the Act in many cases, *Brown* 1121.

Witness is not aware of any instance of injustice under the provisions of Lord Campbell's Act, as regards claims by heirs of persons killed, *Sir J. Hannen* 1763.

Explanation as to Lord Campbell's Act having originated with reference to accidents in mines, witness having in the first instance been called upon to frame clauses, *Whitmore* 2000–2003——Respects in which the Act is quite inapplicable to the present circumstances of railways, *Eborall* 2131.

Considerations as to the extended liability of companies since the passing of Lord Campbell's Act; expediency of the damages being limited to the proximate consequences of breach of contract, *Sir J. S. Willes* 2217, 2218. 2225, 2226.

Reference by the Committee to the change effected by Lord Campbell's Act as not having arisen from anything in connection with railway accidents in particular, *Rep.* iii.

See also *Damages.* *Liability.*

Administration of the Law. Conclusion of the Committee that there are objections to the present administration of the law of liability, of which the companies have reason to complain, *Rep.* iv.——*See* also *Damages.* *Juries.* *Liability.*

Allport, James. (Analysis of his Evidence.)—Is general manager of the Midland Railway, and has had large experience in dealing with compensation cases, 571–574. 599——Great hardship to railway companies in being compelled to carry at the same fares passengers whose lives vary immensely in value, 575. 577. 690, 691. 802–804——Expediency of extending to railway companies the same principle of limitation of liability which has been applied in the case of goods, and of horses and cattle, 575. 585–589. 644–653. 749–757.

Conclusion as to the unfairness of the companies being compelled to pay compensation without reference to the fare received, 575–577——Evidence in support of the proposition submitted by Mr. Blenkinsop for limiting the liability to 500 *l.* for first-class passengers, to 300 *l.* for second class, and to 200 *l.* for third class, with a right of insurance beyond those amounts, 577–584. 715. 738–741. 749–757. 787–792——Better posi-

Allport, James. (Analysis of his Evidence)—*continued.*

tion of omnibus companies than of railway companies in regard to compensation payments, 578, 579——Inability of railway companies to protect themselves by specifying on the tickets that they would not be liable beyond a certain sum, 580, 581.

Total of 143,000 *l.* paid by the Midland Company in the last five years, nearly 19,000 *l.* of which was for costs, 590-592——Difficulty in stating the amount in respect of goods, 593, 594——Circumstance of the legal expenses being frequently in excess of the compensation paid, 594. 676——Uselessness of payment into court, 595. 654-656——Frequent payment of sums known to be excessive and unfair, rather than incur the heavy charge for costs, 595-598——Comment upon the systematic action of a class of lawyers in persuading people not to settle privately with the companies, 598. 694.

In illustration of the great abuses under the present system, and in proof of the very excessive payments exacted, as well as of the frauds perpetrated, witness submits details of numerous cases of accident and of compensation claims which have passed through his hands as manager of the Midland Railway, 599-614. 639-643. 700.

Difficulty of the companies in the case, more especially, of alleged internal injury or shock to the nervous system; frequent instances of abuse and extortion, 599 *et seq.*——Approval of the cases being tried by the county court judges on certain conditions, 618. 682, 683. 718——Suggestions with a view to the reference of disputed cases to arbitration, 618, 619. 674. 695——Great bulk of the claims from third-class passengers, 620. 692. 714——Expediency of limiting the time within which claims may be made, six months being ample, 621, 622. 701-703.

Great loss to the companies when accidents occur, irrespectively of the loss through compensation; equal care taken if there were no liability on the latter ground, 623——Information relative to the use of the block system on parts of the Midland Railway, the system being a valuable protection against certain accidents, but being disadvantageous in some respects, and not securing immunity from accidents, 624-637. 689. 818-830——Grounds for objecting strongly to power in the Board of Trade to enforce the adoption generally of the block system, 637. 709, 710. 719-724. 818-835——Exception taken to the compulsory action of the Board of Trade, in regard to the interlocking of signals and points, 637.

Very little demand for workmen's trains on the Midland line; expediency of the liability being limited to a small sum in the case of such trains, 638——Enhanced compensation given when cases go before the sheriff and a jury, 655-660——Excessive damages, owing chiefly to the sympathies of the juries for the injured, many jurymen also having strong prejudices against the companies, 658. 681. 699. 742. 758-763——Difficulty through the companies being unable to ascertain the income or profits of the persons injured, 661-665.

Exorbitant character of the claims sometimes sent in by the advice of the solicitors, 666-670——Advantage of retaining the action of the judges, if the liability is not to be limited by law; check thereby upon the juries, 671-674. 681-683. 742——Improbability of many fraudulent claims, or of many cases going into court, if the liability were limited to the sums already named, 674-676. 695. 743-748. 793-801——Instances of witness's company having been made liable for accidents at stations to persons not travelling by the line, 677-681.

Reference to the medical witnesses for the plaintiffs, as being frequently advocates rather than witnesses, 685——Bad accidents sometimes with excursion trains, 686-689——Great facility with which claims may be made by poor men, there being no difficulty about solicitors or medical witnesses, 693-698——Absence of remedy to the companies if, after paying the compensation, it is discovered that the alleged injuries had no good foundation, 706-708——Anticipated loss to the company at the rates of insurance proposed, as explained by Mr. Blenkinsop, 716, 717.

Exception taken to compulsory action for the provision of means of communication between the guard and driver, and the passengers and guard, 725-734——Approval of the present arrangements in regard to the doors being locked on the off side, 735-737——Due care taken by witness's company to secure efficient servants; improper recommendations often made to the companies, 738. 764-768.

Much greater liability to accident in England than in countries where the traffic is small and the trains slow and infrequent, 769-773——Difficulty as to the companies taking the initiative in the settlement of claims, 774, 775——Interested motives of the lawyers and doctors for the plaintiffs in bringing cases into court, 776, 777. 801.

Impression as to the willingness of the companies to admit negligence in all cases, if the liability be limited, 778-786——Claim of railway companies to a limitation of liability, not merely upon the ground of fraudulent claims, but because their treatment is exceptionally unfair, as compared with omnibus companies, shipowners, and others, 801-817—— Considerable value attached to the reports of the Board of Trade inspectors when accidents occur, 835-838.

Report, 1870—*continued.*

Arbitration. Suggestions with a view to the reference of disputed cases to arbitration, *Allport* 618, 619. 674. 695——Great importance of a reference of compensation claims to arbitration by the Board of Trade, or some other department, instead of to a jury, *Laing* 1009. 1052-1057; *Forbes* 1173. 1175. 1247-1251. 1285. 1288-1291——Evidence in favour of a medical arbitration, with suggestions as to the mode of carrying it out, *Pemberton* 1458-1468. 1486.

Approval of the system of arbitration through the Board of Trade, as in the case of workmen's trains; expediency of an extension of the system, *Yolland* 1541-1545. 1649, 1650——Power of the Railway Passengers Insurance Company to make arbitration compulsory; exceedingly beneficial operation of the arrangements in this respect, *Vian* 1804-1809——Great improvement if compensation claims were dealt with by arbitrators appointed by the Board of Trade; suggestions on the subject, *Tyler* 1865-1868. 1963-1965.

Suggestions with a view to the adoption of provisions similar to those in the Merchant Shipping Code, whereby the Board of Trade is empowered to appoint an arbitrator, *Sir J. S. Willes* 2244-2247. 2256——Contemplated admission of liability in all cases, if the system of arbitration be adopted, *ib.* 2247, 2248.

See also *Costs. County Court Judges. Tribunal.*

B.

Blackmore, Henry. (Analysis of his Evidence.)—Is Passenger Superintendent of the Lancashire and Yorkshire Railway, 2403, 2404——Supplies sundry particulars relative to the continuous break system, as used over the whole of the railway; great value attached thereto as a means of preventing accidents, 2405-2427. 2448-2451. 2457-2462. 2469-2474——Adoption of the block system on the line where the traffic is heavy; advantages of this mode of working, the extension of which is very desirable, 2428-2447. 2463, 2464.

Expediency of an adoption of the locking apparatus wherever there are facing points; practice hereon on witness's line, 2452-2456. 2475-2485——Opinion that the introduction or extension of improvements may fairly be left to the companies, and that the compulsory interference of the Board of Trade is not required, 2465-2468.

Blenkinsop, James. (Analysis of his Evidence.)—Is solicitor to the London and North Western Railway Company; has been connected with the company for thirty-three years, 1, 2——Anomaly, previously to Lord Campbell's Act, in there being no liability to compensation for a person killed by accident, whilst there was such liability in the case of a person injured, 3-8——Witness represents not only the London and North Western Company, but the companies generally north of the Thames, 9.

Very excessive damages given by juries under the present system; sundry instances of this, 9-11. 78-81——Comment upon the action of a class of medical men and of lawyers who lay themselves out for compensation cases, 9. 19, 20. 66——Especial difficulty in resisting excessive damages for nervous shocks, though the persons injured are sometimes soon at work again, 9. 156-158. 195-198——Large sums paid to Post Office clerks; moiety borne by the Post Office, 9. 80-82. 112——Attempted fraud upon witness's company by a person who falsely alleged he was at the Abergele accident, 9——Approximation to fraud in many of the cases where large damages are demanded, 10.

Statement as to there being no principle in arriving at the amount of compensation, the juries never being certain, and no two cases being alike, 11. 17, 18——Admission of the liability, save when the accident arises from causes over which the company has no control, 12-16——Trial of the cases, as a rule, before the judges, 21——Object of Lord Campbell's Act further adverted to as facilitating compensation claims on the part of persons killed, 22, 23.

Moderate damages given by juries when persons are killed or injured through the fault of private individuals, increased damages being given against companies, 24, 25. 84, 85——Limitation of liability for damages in the case of shipping accidents, 26——Entire absence of proportion between the consideration given to the railway companies for the conveyance of passengers and the risk run, 27. 30-32. 181.

Proposition that the companies be compelled to insure any passenger who wishes it, up to 3,000 *l.*, first-class; 2,000 *l.*, second-class; and 1,000 *l.*, third-class, at the rate of 3 *d.* per 1,000 *l.*, 28, 29. 56-62. 107, 108——Suggestion that under compulsory insurance the liability in case of death be absolute, and be limited to 500 *l.*, first-class; 300 *l.*, second-class; and 200 *l.*, third-class, 28. 68-73. 166-168.

Reference to the Carriers' Act as containing the principle of limited compensation and compulsory insurance contended for by witness, 33-36. 86——Limitation under Mr.

Report, 1870—*continued.*

Blenkinsop, James (Analysis of his Evidence)—*continued.*

Cardwell's Act as regards the liability in the case of horses and cattle, 35, 36. 86—— Limit of liability also in the case of workmen's trains in the metropolis, 37–41. 87—— Belief as to the liability in some of the American States being limited to 5,000 dollars, 42–45.

Recommendation by the Royal Commission of 1866 and 1867 for limiting the amount of compensation, in conjunction with arrangements for compulsory insurance, 46–48. 51, 52——Views expressed by some of the judges in favour of limitation of liability, 49 —— Suggestion that if the liability be limited, as proposed by the companies, the cases might be decided by the county court judges, or by medical arbitrators, 50. 68.

Very similar Bill prepared by witness for the Railway Association, four or five years ago, to that now proposed; loss of the former Bill, the Government having opposed it, 53–56——Difficulty of regulating the insurance with reference to the length of the journey, 57. 209, 210——Contemplated annual insurance tickets in the case of persons travelling daily or frequently, 58. 169. 210.

Practice of juries to concur in the medical testimony on the part of those injured, and to disregard the medical evidence for the companies, 65–67. 104——Improbability of much litigation if the compensation be limited as proposed by witness, 69, 70——Grounds for the conclusion that the management of the railways would in no wise be less careful, if the element of compensation for accidents were withdrawn, 74–77. 136–139. 162–165. 170. 205, 206.

Enhanced liability of the companies in its being now held that the compensation should have reference to the future prospects of the person killed or injured, 83. 179——Objection of the Accidental Insurance Company to insure at the rate of 3*d.* per 1,000*l.*; 88, 89——Average of 60,000*l.* to 80,000*l.* a year paid by witness's company in compensation to passengers; the amount last year was 73,000*l.*; 90–96.

Very heavy amount of the costs, these almost invariably falling upon the companies, 97–103——Large fees charged by the plaintiffs' medical witnesses, who act rather as medical advocates, 103. 189–194——Very little difficulty experienced by the companies as regards medical examination of the persons injured, 104, 105. 120–128——Tendency of the compensation payments to keep up the fares, 106 ——Probability of long-journey passengers largely availing themselves of a compulsory insurance clause, 109, 110.

Settlement by witness's company of about three-fourths of the claims without litigation, 113——Practice to contest only the amount of compensation, the question of negligence and liability being rarely disputed, 114–117——Worse position of the companies than of private individuals in having verdicts found against them, 118, 119.

Expediency of a reasonable limit of time during which notice of claims should be given, 129–134. 174, 175——Further statement as to the disposition of juries to give excessive damages, their feelings and sympathies unduly influencing them, 135. 159–161. 182–184. 213——Compulsion upon railway companies as to the insurance of goods, 140–142.

Large proportion of compensation payments made to third-class passengers, 145–147 —— Facility with which the poorer class of travellers find lawyers to take up their case, the costs charged by the latter being often very exceptionable, 148–155——Practice of witness's company as to retaining local medical men who act at once when an accident occurs, 156——Difficulty as to insurance where the fares are very low, 169——Cause of the higher fares in England than on the Continent and in America, 171.

Very few persons injured without claiming compensation, 172, 173——Effect of the fear of heavy compensation in checking the running of excursion and other cheap trains, 176–178——Non-objection to the principle introduced by Lord Campbell's Act, whereby in case of death by accident the nearest relatives may claim, 179–181——Instances of judges endeavouring to moderate the views of the juries as to damages, 182–185—— Further comment upon the exceptionable part taken in compensation cases by a certain class of attorneys, 186–188.

Instances of fraudulent claims being successfully urged, and afterwards detected and punished, 197, 198——Several instances of injury and of compensation under circumstances in which neglect or blame should not fairly be attached to the companies, 199–204—— Fallacy of the idea that railway directors do not take sufficient interest in the prevention of accidents, 207, 208.

Expediency of the same principle of liability which applies to goods and cattle being extended to passengers, 211, 212——Fairness generally of the awards of juries in respect of injuries to goods, there being no sympathy or feeling in these cases, 213, 214.

Report, 1870—*continued.*

Block System:

1. *Evidence of Railway Officials as to the partial Adoption of the Block System of Working, its advantages and disadvantages, and as to the inexpediency of its general Adoption being compulsory.*
2. *Views of Colonel Yolland in favour of the Compulsory Adoption of the System.*
3. *Dissent of Captain Tyler from the foregoing conclusion.*
4. *Letter from the Board of Trade in* 1869, *urging the adoption of the System.*
5. *Enumeration of Accidents in* 1868 *which the System would have prevented.*
6. *Details supplied by the Companies as to the extent of Adoption of the System.*
7. *Importance attached to the System by the Committee.*

1. *Evidence of Railway Officials as to the partial Adoption of the Block System of Working, its advantages and disadvantages, and as to the inexpediency of its general Adoption being compulsory:*

Information relative to the block system as adopted on portions of the Great Northern line, the system being very effectual in preventing accidents between stations, but not at stations where accidents generally occur, *Oakley* 256–265. 277–285. 293–306——Impracticability of immunity from accidents under the block system, or any other system; circumstances under which the former may aggravate accidents, *ib.* 293–296.

Disadvantage of the block system, as inducing carelessness on the part of drivers and others, *Oakley* 300, 301; *O'Brien* 402. 404, 405. 432; *Forbes* 1169, 1170. 1172. 1236–1239; *Mason* 1412–1415.

Evidence as to the partial adoption of the block system on the North Eastern Railway, and as to its advantages and disadvantages; inexpediency of compelling the company to adopt it over the whole line, *O'Brien* 392–409. 428–432. 437——More accidents per mile where the block system exists on the North Eastern line than where it does not exist, *ib.* 397–400——Little if any effect which the block system would have had in preventing the accidents which have occurred on the North Eastern line, *ib.* 403. 458——Peculiar facilities in the case of the Metropolitan Railway for applying the block system, the circumstances being altogether different in the case of the North Eastern Railway, *ib.* 442–444.

Further statement of witness's objections to an indiscriminate application of the block system, though the principle of the system is perfect, *O'Brien* 445–459——Apprehension of increased complication in respect of signals, *ib.* 446–454——Conclusion that a general adoption of the system would not have the slightest effect in mitigating the compensation awarded when an accident occurs, *ib.* 460–463.

Tendency of the block system to induce carelesness as to signals; several accidents under the system on the North London line, *Mansel* 550–555.

Information relative to the use of the block system on parts of the Midland Railway, the system being a valuable protection against certain accidents, but being disadvantageous in some respects, and not securing immunity from accidents, *Allport* 624–637. 689. 818–830——Aggravated results of accidents happening under the block system, *ib.* 628——Great expense incurred by the Midland Company in adopting block signals, *ib.* 629——Grounds for objecting strongly to power in the Board of Trade to enforce the adoption generally of the block system, *ib.* 637. 709, 710. 719–724. 818–835.

Sundry details in explanation of the block system, as carried out on the South Eastern line, the system possessing important advantages, but not securing immunity from accident, and tending to render drivers less careful, *Sir E. W. Watkin* 912–932. 939–945. 954–960. 980–986——Objection to the adoption of the system being compulsory upon the companies, though its advantages are great upon a crowded line, *ib.* 912–914. 926–932. 959. 983–986——Advantages attached to the block system of working, as now adopted on the Brighton line, *Laing* 1011–1017.

Evidence relative to the block system as adopted on the London and Chatham Railway, the result being a great additional security in working the traffic, accidents being very rare, *Forbes* 1166–1170. 1194–1204. 1235–1245——Grounds for objecting to the Board of Trade, or any other Government department, enforcing the adoption of the system generally, *ib.* 1171, 1172——Statement as to the system not being urgently required, save where the traffic is very heavy and the trains are frequent, with the stations close together, *ib.* 1172. 1197–1204. 1235. 1277–1281. 1306–1314——Instances of accidents on the London and Chatham line under the block system, *ib.* 1240–1245——Necessity of the block system in working the Metropolitan Railway, whilst it is not required and would be less safe in the case of railways in the country, *ib.* 1306–1314.

Adoption of the block system on part of the North British Railway; particulars hereon to the effect that the system has great advantages, but does not secure freedom from accident, *Mason* 1374–1382. 1384, 1385. 1394, 1395. 1412–1415——Decided objection

Report, 1870—*continued.*

Block System—continued.

1. *Evidence of Railway Officials as to the partial Adoption, &c.*—continued.

to the block system on mineral lines, as not being required, and as being attended with ruinous expense; illustration in the case of the North British and Glasgow and South Western Companies, *Mason* 1377. 1389–1393. 1416——Inexpediency of the block system being made compulsory on the companies, *ib.* 1382——Greater liability to the neglect of signals under the block system, *ib.* 1384. 1412–1415——Occurrence of two accidents on the North British line under the block system, *ib.* 1395. 1412–1415——Gradual adoption of the system on the Glasgow and South Western line, *ib.* 1416.

Explanation as to the extent to which the block system has been adopted on the Great Western line; decided objection to its universal adoption being rendered compulsory, *Grierson* 2034–2041. 2065–2067. 2076–2078. 2092–2094——Liability to accident under the system; instances on witness's line, *ib.* 2041–2046——Recent uncertainty at the Board of Trade as to the best instruments to be used in carrying out the system, *ib.* 2076.

Use of the block system for many years over the whole of the South Eastern Railway, witness having a high opinion as to its value, especially where the traffic is heavy, *Eborall* 2139–2143. 2158–2168——Grounds for objecting to the enforced adoption of the system on all lines, *ib.* 2144. 2158–2167. 2200——Statement as to the relative amount of compensation paid by witness's company and by companies who only adopt the block system partially, *ib.* 2178–2195.

Adoption of the block system on the Lancashire and Yorkshire line, where the traffic is heavy; advantage of this mode of working, the extension of which is very desirable, *Blackmore* 2428–2447. 2463, 2464.

Witness, who was formerly connected with the South Eastern Railway, took part in the introduction of the block system, *Knight* 2487. 2525——The system is in operation upon a large section of the Brighton line, and is exceedingly useful in the prevention of collisions, but its universal adoption is not essential, and should not be enforced upon the companies, *ib.* 2488–2505. 2523, 2524.

2. *Views of Colonel Yolland in favour of the Compulsory Adoption of the System:*

Evidence in detail in support of the conclusion that the block system of working is most effectual in the prevention of collisions, and that its compulsory adoption throughout the country is very essential, *Yolland* 1522 *et seq.*——Adoption of the system mainly by small companies; names of these, *ib.* 1524. 1718——Adoption of the system over only sixty-eight miles of the Great Northern Railway, *ib.* 1525——Varying cost per mile in applying the system, *ib.* 1526, 1527——Opinion that it would be no grievance to the large companies in compelling them to adopt the absolute block system over the whole of their lines, *ib.* 1528. 1655.

Advantage if the adoption of the block system were enforced by Act of Parliament, rather than by the Board of Trade, *Yolland* 1529–1531. 1535. 1630, 1631——Absolute necessity of the block system on the Metropolitan and other lines where the traffic is heavy, *ib.* 1534——Impression that 90 per cent. of collisions would be prevented, *ib.* 1562——Practicability of applying the system where there are long intervals between the station, *ib.* 1589–1591.

Pecuniary gain to the companies by adopting the block system, as the cost would be more than covered by the expensive accidents prevented, *Yolland* 1592–1594——Dissent from the view that the block system causes engine-drivers to be less vigilant, *ib.* 1623–1625. 1628, 1629. 1641–1643——Valuable effect of the system as regards accidents at stations, as well as elsewhere, *ib.* 1626, 1627.

Further statement as to the expediency of power in the Board of Trade to compel the general adoption of the block system, *Yolland* 1655–1659——Great value of the system, even though the signals by which worked may occasionally get out of order, *ib.* 1660–1663——Excellent manner in which the system is now worked, though under it accidents may doubtless arise from exceptional causes, *ib.* 1707–1715.

3. *Dissent of Captain Tyler from the foregoing conclusion:*

Important advantages of the block system, though on some lines there is no necessity for it, and it is very inexpedient to make its general adoption compulsory, *Tyler* 1849–1856. 1874, 1875. 1922. 1945–1947. 1971–1976.

4. *Letter from the Board of Trade in* 1869, *urging the adoption of the System:*

Circular letter from the Board of Trade to the railway companies, dated 19th May 1869, impressing upon the companies the advantages of the block telegraph system, and the responsibility incurred through its non-adoption, *App.* 181.

5. *Enumeration of Accidents in* 1868 *which the System would have prevented:*

Extracts from reports of the inspectors of the Board of Trade, relative to accidents which occurred during the last half year of 1868, and which might have been prevented if the block system had been established, *App.* 182, 183.

6. *Details*

Report, 1870—*continued.*

Block System—continued.

6. *Details supplied by the Companies as to the extent of Adoption of the System:*

Information supplied by the several railway companies to the Board of Trade, as to the extent of adoption of the block system, and the reasons in each case for not extending the system over the whole line, *App.* 184–192.

7. *Importance attached to the System by the Committee:*

The committee recommend the evidence in favour of the block system to the careful consideration of boards of directors, *Rep.* vi——The adoption of the system has materially conduced to the safety of the public, *ib.*

Board of Trade:

1. *Evidence of Railway Officials opposed to Compulsory Powers in the Board of Trade.*
2. *Conflicting Views of Colonel Yolland and Captain Tyler on the question of Compulsory Powers.*
3. *Attention paid by the Companies to the Reports and Recommendations by the Inspectors.*
4. *Question as to the Inspectors concurring on the subject of Improvements.*
5. *Want of Legal Powers in the Board to hold Inquiries and to enforce Evidence.*

1. *Evidence of Railway Officials opposed to Compulsory Powers in the Board of Trade:*

Grounds for objecting to increased powers in the Board of Trade to enforce the recommendations of its inspectors as to improved modes of working, *Oakley* 324–333——Examination in support of the conclusion that it would be a great evil if the Board of Trade were empowered to enforce the adoption of its inspectors' recommendations, *O'Brien* 363. 388 *et seq.*——Importance of the direct responsibility of the companies and their officials not being interfered with by a central department, *O'Brien* 363. 423, 424; *Mason* 1383; *Eborall* 2145.

Non-objection to power in the Board of Trade to enforce its recommendations, if it were not for the consequent division of responsibility, *Laing* 1022–1028. 1035, 1036. 1039–1044. 1058, 1059. 1066–1068——Circumstance of the Board of Trade not having originated any improvements in working, *ib.* 1066–1068.

Unsatisfactory operation in Holland and Prussia of the detailed control exercised by Government officials over the working of the railways, *Forbes* 1171. 1205——Evidence opposed to compulsory powers in the Board of Trade, not only as regards the adoption of the block system, but of any other improvement or invention; probability of wrong conclusions being arrived at by the inspectors of the Board, *ib.* 1206–1227——Foregone conclusions frequently arrived at by the inspectors when accidents occur, *ib.* 1225. 1227.

Grounds for objecting to power in the Board of Trade or the inspectors to enforce, instead of to recommend; great weight already carried by the recommendations of the board, *Grierson* 2062–2078. 2090–2094——Non-objection to orders by the Board of Trade, if required to be laid before Parliament before they could be enforced, *ib.* 2122–2124.

Opinion that the introduction or extension of improvements may fairly be left to the companies, and that the compulsory interference of the Board of Trade is not required, *Blackmore* 2465–2468.

2. *Conflicting Views of Colonel Yolland and Captain Tyler on the Question of Compulsory Powers:*

Advantage of compulsory powers of interference in the Board of Trade, the responsibility of the companies not being diminished thereby, *Yolland* 1534–1540. 1601–1607. 1630–1632. 1670–1675——Examination as to the qualifications and experience of the inspectors, and of the members of the Board of Trade, with reference to the question of empowering the latter to enforce the adoption of particular appliances and precautions, *ib.* 1664. 1698–1706——Approval of power in the companies to be heard in objection to any appliances ordered by the Board of Trade, *ib.* 1674–1676——Want of increased pressure upon the companies to adopt improvements, but not by means of direct control in a public department, *ib.* 1848.

Dissent from the opinion of Colonel Yolland that the Board of Trade should exercise compulsory powers over railway companies, *Tyler* 1844–1848. 1873——Further evidence opposed to a power in the Board to compel the adoption of its recommendations, or to control the detailed management of the railways, *ib.* 1922. 1945–1947. 1952. 1971–1976——Disapproval alike of the compulsory adoption of the locking apparatus, as of continuous break or any other improvement, *ib.* 1970–1976.

Report, 1870—*continued.*

BOARD OF TRADE—continued.

3. *Attention paid by the Companies to the Reports and Recommendations by the Inspectors:*

Natural desire of witness's company to carry out the recommendations of the Board of Trade, as relieving the former from responsibility, opposite conclusions being only arrived at after investigation, *O'Brien* 439-441——Careful consideration given by the company to the inspectors' reports on accidents, *ib.* 438, 439——Considerable value attached to the reports of the Board of Trade inspectors where accidents occur, *Allport* 835-838—— Careful attention paid by the companies to the reports and recommendations of the Board of Trade inspectors, *Forbes* 1225, 1226. 1304, 1305—— Due consideration always given by witness's company to the reports of the Board of Trade, *Grierson* 2055-2057. 2064-2073. 2091.

Constant neglect by the companies to adopt improvements or precautions recommended in the inspectors' reports, *Yolland* 1595-1601. 1607—— Less weight to be attached to the recommendations of a newly-appointed inspector than of those experienced in office, *Tyler* 1987-1993.

4. *Question as to the Inspectors concurring on the subject of Improvements.*

The Board of Trade officers do not agree amongst themselves, *Forbes* 1208.

Inaccuracy of the statement as to the Board of Trade not agreeing as to the improvements desirable, *Tyler* 1949. 1951.

5. *Want of Legal Powers in the Board to hold Inquiries and to enforce Evidence:*

Absence of power in the Board of Trade or the inspectors to call witnesses at the inquiries as to compel the companies to supply information, *Yolland* 1513-1517—— Expediency of legal power of inquiry in the Board of Trade, *Tyler* 1857. 1872——Absence of any legal power of inquiry by the Board of Trade further adverted to; this should at once be remedied, *ib.* 1916-1918. 1933-1938. 1953. 1980——Great readiness evinced by the companies to supply information when accidents are being inquired into, *ib.* 1980, 1981.

See also *Communication between Passengers and Guard. Continuous Breaks. Insurance. Responsibility. Tribunal.*

Bramwell, Sir George William W. See *Martin, Sir Samuel, &c.*

Brown, Joseph, Q.C., F.G.S. (Analysis of his Evidence.)—Has studied and written upon the law relating to compensation for accidents, and explains the liability of railway companies in the case of accidents to passengers and to non-passengers respectively, 1084-1091. 1116, 1117——Submits that the companies have good grounds for their complaints, and that the law acts as a great encouragement to fraud and imposture, 1092 *et seq.*

Conclusions as to the injustice of the present law of master and servant, witness contending that the master should not be responsible to an unlimited extent when he has taken the greatest care in the selection of his servants, and when the latter act contrary to his orders, 1093-1102——Proposed exemption from liabity when an accident happens to a stranger owing to negligence on his part, 1100, 1101. 1109, 1110——Approval of the suggestion for a fixed maximum of liability, coupled with a right of passengers to insure, 1102, 1103. 1115.

Great obstruction caused by railway compensation cases to the business generally of the courts, 1105, 1106——Immense increase in the number of actions, accidents having doubtless much increased, 1106-1108——Effect of a diminution of liability in diminishing litigation and costs, 1111-1114——Serious expense on account of medical witnesses, 1113.

Numerous instances of railway companies and others being held liable for accidents, though negligence on their part cannot be proved, 1118, 1119——Anomaly of the exemption under the criminal law, and the unlimited liability under the civil law, 1120——Very harsh and unjust operation of Lord Campbell's Act in many cases, 1121——Unfairness in the companies having no previous knowledge of the value of the life of any passenger, 1121, 1122——Absence of proportion between the amount of damages and the degree of negligence, 1122.

Impolicy of the present law as tending to prevent cheap travelling, and to check the making of railways, 1122. 1125. 1128-1130——Little, if any, advantage of the law as regards the adoption of precautions and improvements in working, 1123, 1124. 1143-1147——Objections to trial by jury in accident cases, although the jury system is one which gives much satisfaction to the public, 1126, 1127——Suggestions for the constitution of a special tribunal for railway cases, 1126.

More heavy damages given against railway companies than against individuals, in similar cases, 1131-1135——Expediency of a Parliamentary limitation of liability, rather than

Report, 1870—*continued.*

Brown, Joseph, Q.C., F.G.S. (Analysis of his Evidence)—*continued.*

than of power in the companies to apply a limitation when issuing tickets, 1136-1138 —— Doubt as to the advantage of a medical referee; difficulty in dispensing with medical evidence on each side, 1139-1142. 1153-1155——Undue sympathy of special juries as well as of ordinary juries in their award of damages, 1148-1152. 1156.

C.

Campbell, Lord (Act of). See *Act* 9 & 10 *Vict. c.* 93.

Carriers Act. Reference to the Carriers Act as containing the principle of limited compensation and compulsory insurance, contended for by witness, *Blenkinsop* 33-36. 86 ——Companies are not liable for valuables beyond 10*l.*, unless insured, *ib.* 33.

Approval of the principle of the Carriers Act, as involving a limitation of liability, but allowing a right to insure in excess of such liability; this principle might fairly be applied to railway passengers, *Sir J. S. Willes* 2230-2236. 2249-2251.

Limitation of the liability of carriers for the conveyance of goods and parcels, adverted to by the Committee, *Rep.* iv.

Claims. Few, if any, persons injured who fail to claim through want of means; facility with which claims may be made even by the poorer classes, *Blenkinsop* 148-155; *Allport* 693-698; *Sir E. W. Watkin* 974——Very few persons injured without claiming compensation, *Blenkinsop* 172, 173——Statement as to workmen not having proper facilities for proceeding with claims for compensation, *Elderton* 2320-2328——Very large sums generally claimed, much smaller sums being often accepted, *Rose* 2374, 2375.

See also *Damages. Lawyers. Notice of Claim.*

Communication between Passengers and Guard. Belief as to the companies readily adopting a plan of communication between passengers and guard, and between guard and driver, on proof of its clear utility, and irrespectively of the recommendations of the Board of Trade, *O'Brien* 433-436——Exception taken to compulsory action for the provision of means of communication between the guard and driver, and the passengers and guard, *Allport* 725-734——Advantage of passenger communication with the guard by means of a rope, as on the Brighton line, rather than by the electric system, *Laing* 1078-1083 ——Uselessness of plans of communication between the driver and the guard, *Forbes* 1206-1208——Mode of communication between passenger and guard adopted on the North British line, *Mason* 1408-1411.

Statement as to the inspectors not having been consulted on the question of communication between passengers and guard, *Yolland* 1537. 1565, 1566——Doubt as to the efficiency of the plans of communication between passengers and guard, save on the South Eastern line, *ib.* 1667-1669——Explanation that Colonel Yolland and witness were in accord as to the best plan of communication between passengers and guard, *Tyler* 1950, 1951.

Satisfactory working of the cord plan of communication between passengers and guard on the Great Western line, *Grierson* 2095-2097——Adoption on the South Eastern line of the electric system of passenger signals; its uselessness, *Eborall* 2196-3106——Uselessness also of the rope plan of communication, *ib.* 2198.

Compensation. See *Damages.*

Compulsory Powers. See *Board of Trade.*

Continuous Breaks. System of breaks in use on the Great Northern line; obstacles to an extended use of continuous breaks, *Oakley* 266-273——Doubt as to the advantage of continuous breaks being such as to justify their compulsory adoption, *Laing* 1036-1039. 1069; *Forbes* 1219-1224.

Consideration of the question of break power, witness contending that continuous breaks afford a valuable check upon collisions, *Yolland* 1615-1623. 1683-1697—— Evidence as to the great advantage of continuous breaks, with suggestions for the more extended application of this improvement, *Tyler* 1893-1903. 1982-1985.

Use of continuous breaks on portions of the Great Western line; liability to their getting out of repair, and thus becoming dangerous, *Grierson* 2047-2054——Sundry particulars relative to the continuous break system, as used over the whole of the Lancashire and Yorkshire Railway; great value thereof as a means of preventing accidents, *Blackmore* 2405-2427. 2448-2451. 2457-2462. 2469-2474——Result of witness's experience of continuous breaks on the South Eastern Railway; though possessing important advantages, they are not free from disadvantages, *Knight* 2506-2517.

The Committee recommend the evidence in favour of continuous breaks to the careful consideration of boards of directors, *Rep.* vi.

Coroners' Inquests (Railway Accidents). Exceptions taken to the system of inquiry by the coroner, *Tyler* 1860. 1940-1942. 1957-1962.

Report, 1870—*continued.*

Costs:

Very heavy costs in contested cases, the medical and legal charges on the side of the plaintiffs being excessive, and almost invariably falling upon the companies, *Blenkinsop* 97–103; *Oakley* 222–224. 313——Instance of payment of 100 *l.* to a washerwoman, the greater part of which was absorbed by her lawyer, *Oakley* 224. 286, 287——Average, as regards the North Eastern Company, of about 300 *l.* per case as the amount of costs on both sides, the costs falling as a rule upon the company, *O'Brien* 358–360——Large proportion of the compensation payments which goes into the pockets of plaintiffs' professional men, *ib.* 365——Very heavy amount of the medical and legal expenses, *Mansel* 508–512.

Circumstance of the legal expenses being frequently in excess of the compensation paid, *Allport* 594. 676.——Frequent payment of sums known to be excessive and unfair, rather than incur the heavy charge for costs, *ib.* 595–598——Uselessness of payment into court, *ib.* 595. 654–656——The costs invariably fall upon the companies, *ib.* 675.

Excessive amount generally paid by the companies in costs; respect in which the amount is unduly enhanced owing to the witnesses called by the companies, *Mr. Baron Martin* 870——Invariable practice of juries to give larger damages than the amount paid into court, *Mr. Baron Martin and Mr. Baron Bramwell* 870, 871——Suggestion that the amount paid into court be kept secret from the jury, *Mr. Baron Bramwell* 870. 872–874——Opinion as to the uselessness of attempting to withhold from the jury the amount paid into court, *Mr. Baron Martin* 870——Beneficial check upon dishonest claims if the claimant did not get his costs unless he recovered a larger sum than was offered by the company, *ib.* 871.

Very heavy costs when cases go into court, the plaintiffs having frequently to pay large fees to the medical and legal men over and above the taxed costs paid by the companies, *Laing* 1003. 1060–1065——Immense grievances of the London and Chatham Company, and of the companies generally, on account of the excessive costs which they have to pay, even when claims break down or only nominal damages are given; instances of this, *Forbes* 1288–1291——Instance of the costs having been 220 *l.* when a fine of only 40 *s.* was awarded against the company, *ib.* 1290.

Intention in Scotland that the amount tendered by the company shall not become known to the jury; advantage of more effectual precautions for withholding such knowledge, *Mason* 1365, 1366. 1396–1404.

Suggestion as regards costs that the amount of compensation tendered and paid into court be kept secret from the jury, *Sir J. Hannen* 1740–1742——Doubt as to juries frequently awarding a sum slightly in excess of the amount paid into court, in order merely to saddle the companies with the costs, *Sir J. S. Willes* 2237–2240——Expensive character of the evidence on each side, so that the costs are necessarily high, *ib.* 2241.

Suggestion that the sum tendered by the companies and paid into court be kept secret from the jury, and that when the damages awarded are less than such sum the claimants be required to pay their own costs, *Rose* 2365–2373——Fairness, in extreme cases, of compelling the claimants to pay the companies' costs as well as their own, *ib.* 2368. 2370——Frequency of the damages awarded being liable to large deduction for payments to doctors and lawyers; the compensation is, in fact, sometimes swallowed up in costs, *ib.* 2400–2402.

Recommendation by the Committee that the costs should in all cases, when the claimant recovers damages, be borne by the company, except when the company should have tendered a sum equal to or larger than the sum recovered, in which case the costs should be in the discretion of the Court, *Rep.* v.

See also *Arbitration.* *Lawyers.* *Litigation.* *Medical Witnesses, &c.*

County Court Judges. Suggestion that if the liability be limited, as proposed by the companies, the cases might be decided by the county court judges, or by medical arbitrators, *Blenkinsop* 50. 68——Advantage if cases were submitted to the county court judges, who might be aided by medical assessors, *Oakley* 239–244——Satisfaction to be given to the companies by a reference of claims to the county court judges, *O'Brien* 368; *Grierson* 2019. 2098, 2099——Approval of the cases being tried by the county court judges, on certain conditions, *Allport* 618. 682, 683. 718.

Doubt as to the expediency of referring the cases to the county court judges, *Mr. Baron Martin and Mr. Baron Bramwell* 885, 886——Grounds for objecting to the county court judges being called upon to determine claims to compensation in respect of railway accidents, *Whitmore* 2004–2008; *Sir J. S. Willes* 2243. 2255.

Coupling Chains. Instances of accident or danger through carriages becoming uncoupled; nature of the precautions adopted in such case, *Forbes* 1328–1334.

Criminal Law. Anomaly of the exemption under the criminal law and the unlimited liability under the civil law, *Brown* 1120——Opinion that there is no necessity for rendering the criminal law more severe as regards negligence on the part of railway servants, *Sir J. Hannen* 1768.

D.

Damages (Compensation):

Very excessive damages given by juries under the present system; sundry instances of this, *Blenkinsop* 9–11. 78–81. 135. 159–161. 182–184. 213; *O'Brien* 354–358. 373–381; *Allport* 658. 681. 699. 758–763; *Grierson* 2012, 2013——Instance of 5,250 *l.* having been awarded to a young clergyman with a stipend of 250 *l.* a year, who was badly injured, *Blenkinsop* 9——Statement as to there being no principle in arriving at the amount of compensation, the juries never being certain, and no two cases being alike, *ib.* 11. 17, 18——Moderate damages given by juries when persons are killed or injured through the fault of private individuals, increased damages being given against companies, *ib.* 24, 25. 84, 85. 118, 119.

Instance of the Great Northern Company having had to pay 9,000 *l.* to the relatives of a person killed, the costs amounting to another 2,000 *l.*, *Oakley* 229——Obstacle to the companies ascertaining the actual profits made by men who send in claims, *ib.* 248, 249——Instance of trifling injury to a sailor, who had paid a fare of 4 *d.*, and who was awarded 400 *l.*, *O'Brien* 376–379——Much larger portion of compensation payments made in cases where death does not result, the latter cases however, though few in number, involving large amounts, *ib.* 466–469.

Frequency of speedy recovery after the compensation is paid, *Mansel* 515——Difficulty through the companies being unable to ascertain the income or profits of the persons injured, *Allport* 661–665.

Conclusion as to the hardship consisting in dishonest claims being brought and dishonest or unfair verdicts given, *Mr. Baron Bramwell* 858——Absence, as a rule, of excessive damage where injury is proved, *Mr. Baron Martin and Mr. Baron Bramwell* 866. 869. 882, 883——Higher damages given against railway companies than under similar circumstances against individuals, *Mr. Baron Martin and Mr. Baron Bramwell* 869; *Brown* 1131–1135——Origin several years ago of the high scale of damages since in force, *Mr. Baron Martin* 869.

Instances of very excessive damages, *Sir E. W. Wathin*, 894——Liability of the companies to excessive damages so long as the existing law is maintained, *Laing* 1045, 1046. 1048——The damages are constantly made the subject of the grossest exaggeration, *Brown* 1092.

Great injustice in the system of compensation for railway accidents, *Tyler* 1858, 1859——Concurrence in the view as to there being great injustice to the companies under the present system, excessive damages being constantly given by juries, and fraudulent claims being often made, *Whitmore* 2004, 2005. 2009——Witness contends that the present law of compensation is very unfair to the companies, and that in the administration of the law very unfair and excessive verdicts are given by the juries, *Eborall* 2130–2133.

Excessive damages given by juries, the railway companies being dealt with as if they were insurance companies, and the damages being calculated on a wrong principle, *Sir J. S. Willes* 2227, 2228——Belief that of late juries have given more moderate sums, *ib.* 2228.

See also *Act* 9 & 10 *Vict.* 93. *Arbitration. Carriers' Act. Costs. Excursion Trains. Fraud. Great Northern Railway. Great Western Railway. Insurance. Judges. Juries. Lawyers. Liability. London and North Western Railway. Management of Railways. Manchester, Sheffield, and Lincolnshire Railway. Midland Railway. Negligence. Nervous Shocks, &c. New Cross Accident. North London Railway. Post Office Clerks. Private Settlement of Claims. Sheriff. Special Juries. Staplehurst Accident. Third Class Passengers. Tribunal. Workmen's Trains.*

E.

Eborall, Cornelius Willes. (Analysis of his Evidence.)—Has had large experience in railway management, chiefly on the South Eastern Line, 2128——Submits some particulars relative to the Staplehurst accident, and the immense loss entailed upon the company by compensation cases, 2128, 2129. 2192–2195——Contends that the present law of compensation is very unfair to the companies, and that in the administration of the law very unfair and excessive verdicts are given by the juries, 2130–2133.

Improvement if accidents were inquired into by a court composed of a Board of Trade inspector, with a medical and a legal assessor, and if the same court dealt with the question of damages, 2133. 2138. 2169–2172——Approval of the limitation of compensation suggested by Mr. Blenkinsop, there being at the same time a right to insure, 2134–2137. 2173, 2174.

Report, 1870—*continued.*

Eborall, Cornelius Willes. (Analysis of his Evidence)—*continued.*

Use of the block system for many years over the whole of the South Eastern Railway, witness having a high opinion as to its value, especially where the traffic is heavy, 2139–2143. 2158-2168——Grounds for objecting to the enforced adoption of the block system on all lines, 2144. 2158–2167. 2200——Inexpediency of central control which should interfere with the responsibility of the companies for accidents, 2145.

Great cost imposed on the South Eastern Company for compensation since 1865; ample inducement for the adoption of all possible precautions, even though the compensation be limited, 2145–2157. 2175-2177. 2191——Statement as to the relative amount of compensation paid by witness's company, and by companies who only adopt the block system partially, 2178-2195——Adoption on the South Eastern line of the electric system of passenger signal; its uselessness, 2196–2206——Uselessness also of the rope plan of communication between passenger and guard, 2198.

Elderton, George Pattison. (Analysis of his Evidence.)—Is a labourer, living at Walthamstow, and working at Crutched Friars, which is six miles distant, 2262-2265——Complaint as to the absence of cheap workmen's trains between Walthamstow and the City, and also between Homerton and the City; short-sighted policy of the railway companies in the matter, 2266 *et seq.*——Claim of the working classes to compensation, in the shape of penny trains, for the wholesale destruction of small houses by the railway companies and the consequent advance in rents, 2267-2276. 2284–2298.

Objection by workmen to the limit of 100 *l.*, as the liability of the companies in case of accident by the cheap trains; expediency rather of the compensation being settled by arbitration, 2277–2283. 2315-2319. 2329–2335——Refusal of the North London Company to run workmen's trains save between Dalston and Broad-street, on account of their liability not being limited; communications from the Secretary on the subject, 2299–2314.

Statement as to workmen not having proper facilities for proceeding with claims for compensation, 2320–2328——Moderate rent of witness's house at Walthamstow; immense number of small houses for workmen at low rents a little way out of London, 2336–2347.

Excursion Trains. Effect of the fear of heavy compensation in checking the running of excursion and other cheap trains, *Blenkinsop* 176–178——Bad accidents sometimes to excursion trains, *Allport* 686-689——Discontinuance of excursion trains by witness on account of the risk incurred, *Sir E. W. Watkin* 996.

Discontinuance of excursion trains on the Glasgow and South Western line on account of the liability for damages, *Mason* 1373——Disapproval of excursion trains of unwieldy length, *Yolland* 1720, 1721——Circumstance of eighty-seven persons having had insurance tickets in the case of the excursion train which recently met with an accident; enhanced premium charged for insurance by these trains, *Vian* 1786-1790.

F.

Facing Points. Great number of facing points still unprotected by signals, it being desirable to empower the Board of Trade to enforce the placing of signals, *Yolland* 1533. 1634–1640——Great delay to trains if facing points were done away with, *Blackmore* 2453, 2454——Objection to dispensing with facing points, as involving the necessity of shunting, *Knight* 2522.——*See* also *Locking Apparatus.*

Fares. Entire absence of proportion between the consideration given to the railway companies for the conveyance of passengers, and the risk run, *Blenkinsop* 27. 30–32. 181——Tendency of the compensation payments to keep up the fares, *ib.* 106——Cause of the higher fares in England than on the Continent and in America, *ib.* 171.

Tendency of the present heavy liability to check reduction of fares, and to bear more upon the poorer than the richer travellers, *Oakley* 232–234——Great hardship to railway companies in being compelled to carry at the same fares passengers whose lives vary greatly in value, *Allport* 575–577. 690, 691. 802–804——Conclusion as to the unfairness of the companies being compelled to pay compensation without reference to the fares received, *ib.* 575-577.

Injurious effect of the law in restricting cheap travelling for the working classes, *Sir E. W. Watkin* 892. 910. 911. 937. 961–963. 975–982. 987, 988. 996——Reduced fares and greater travelling facilities if the liability were limited, *ib.* 937. 961–963. 975–982, 987, 988. 996—— Expediency of a limitation of liability as tending to cheapen fares and the running of workmen's trains, *Laing* 1010. 1047–1049.

Anomaly in the unlimited liability of the companies, without reference to the fare received, *Forbes* 1185——Effect of the present system in preventing reduction of fares, *ib.* 1186—— Hardship in the liability being unlimited whilst the fares are limited, *Grierson* 2014; *Sir J. S. Willes* 2229, 2230.

Opinion

Report, 1870—*continued.*

Fares—continued.

Opinion that, with the protection of the block system, the present fares are high enough to cover the liability, *Yolland* 1546. 1553.

See also *Workmen's Trains.*

Forbes, James Staats. (Analysis of his Evidence.)—Is general manager of the London, Chatham, and Dover Railway, and has also had official experience in connection with the Great Western and Dutch Rhenish Railway, 1157–1161——Statement of the law in France, Germany, and Holland as to the liability for railway accidents; provision as to the question of damages being left to the court, instead of to a jury, 1162——Complaint by railway companies on the Continent as to their liability, though there is some protection against excessive damages in the matter resting with the judges, 1163–1165.

Evidence relative to the block system, as adopted on the London and Chatham Railway, the result being a great additional security in working the traffic, accidents being very rare, 1166–1170. 1194–1204. 1235–1245——Disadvantage of the block system, as inducing carelessness on the part of drivers and others, 1169, 1170. 1172. 1236–1239——Grounds for objecting to the Board of Trade, or any other Government department, enforcing the adoption generally of the block system, 1171, 1172.

Unsatisfactory operation in Holland and Prussia of the detailed control exercised by Government officials over the working of the railways, 1171. 1205——Statement as to the block system not being urgently required, save where the traffic is very heavy and the trains are frequent, with the stations close together, 1172. 1197–1204. 1235. 1277–1281. 1306–1314.

Details relative to the workmen's trains on the London and Chatham line, showing the beneficial operation of the arrangement by which the liability for each passenger was limited to 100 *l.*, the amount to be determined by arbitration, 1173–1178. 1188–1193. 1246–1252. 1282–1285——Great importance of a reference of compensation claims to arbitration by the Board of Trade, or some other department, instead of to a jury, 1173. 1175. 1247–1251. 1285. 1288–1291.

Strong objection to any obligation upon railway companies to run workmen's trains at cheap fares, irrespectively of a limitation of liability, 1178–1184. 1282–1284. 1292–1303——Anomaly in the unlimited liability of the companies, without reference to the fare received, 1185——Effect of the present system in preventing reduction of fares, 1186——Concurrence in the proposal as to passengers insuring their lives up to a certain sum, 1187.

Evidence opposed to compulsory powers in the Board of Trade, not only as regards the adoption of the block system, but of any other improvement or invention; probability of wrong conclusions being arrived at by the inspectors of the Board, 1206–1227——Uselessness of plans of communication between the driver and the guard, 1206–1208——Absence of improvement by the adoption of the locking apparatus, 1209–1211.

Advantage of the plan of a hasp below the handle of the door, though it would be a great annoyance to the passengers, 1212–1214. 1275, 1276——Great difficulty in preventing passengers leaving the carriages before the train has stopped, frequent accidents arising from this cause; expediency of further legislative control of passengers in this and other matters, 1212–1218. 1252–1255. 1267–1276——Doubt as to the advantage of continuous breaks being such as to justify their compulsory adoption, 1219–1224.

Careful attention paid by the companies to the reports and recommendation of the Board of Trade inspectors, 1225, 1226. 1304, 1305——Exception taken to a statement that the rules adopted by the companies are constantly neglected by their servants, and that the latter are not properly punished for breach of rules, 1228–1234——Instances of accidents on the London and Chatham line under the block system, 1240–1245.

Due investigation made whenever trains are late in arriving at stations, and are much behind time in reaching their destination, 1256–1262——Limitation of liability in some of the American States, 1263–1265——Expediency of the maximum of liability not being placed too high, 1266——Unwillingness of the travelling public in England to submit to restrictions calculated to prevent accident, whilst on the Continent this difficulty does not arise, 1267–1276——Other metropolitan companies, besides the London and Chatham, to whom the principle of limited compensation for workmen has been applied, 1286, 1287.

Immense grievance of the London and Chatham Company, and of the companies generally, on accounts of the excessive costs which they have to pay, even when claims break down or only nominal damages are given; instances of this, 1288–1291——Utter fallacy of the notion that a limitation of liability would lead to laxity of administration, 1305——Very large expenditure by witness's company in the adoption of appliances for the safety and comfort of the passengers, *ib.*

Necessity of the block system in working the Metropolitan Railway, whilst it is not required and would be less safe in the case of railways in the country, 1306–1314——Advantage in the platforms being on the same level as the carriages; difficulty and

Report, 1870—*continued.*

Forbes, James Staats. (Analysis of his Evidence)—*continued.*

expense in now carrying out this arrangement, 1315-1321——Systematic and detailed examination of railway plant and rolling stock, in order to detect any flaw or defect which might give rise to accident, 1322-1327. 1346-1348.

Instances of accident or danger through carriages becoming uncoupled; nature of the precautions adopted in such case, 1328-1334——Obstacle to carrying on railway traffic without owners' waggons as well as companies' waggons; belief as to the more perfect character of the latter, 1335-1340——Very ample records kept of the composition of each train, whilst there is a complete history of its progress, 1341-1343——Value of the station masters' daily reports, 1343.

Belief as to the greater efficiency of the administration of the railways by the companies, than would result from Government administration; illustration on this point in Prussia, 1344, 1345——Careful history kept of waggons, engines, &c., so as to ensure an effectual renewal of axles, &c., 1346-1348——Much greater facilities given to the travelling public in England than on the Continent, the risk of accident being consequently greater in this country, 1349-1356——Conclusion as to the fairness of the public bearing some portion of the risk incurred through the pressure for increased facilities, 1356-1358.

Foreign Countries. Much greater liability to accidents in England than in countries where the traffic is small, and the trains slow and infrequent, *Allport* 769-773——State of the law in France, Germany, and Holland, as to liability for railway accidents; provision as to the question of damages being left to the court instead of to a jury, *Forbes* 1162 —— Complaint by railway companies on the Continent as to their liability, though there is some protection against excessive damages in the matter resting with the judges, *ib.* 1163-1165.

Fraud. Approximation to fraud in many of the cases where large damages are demanded, *Blenkinsop* 10——Instances of fraudulent claims being successfully urged, and afterwards detected and punished, *ib.* 197, 198——Cases of attempted fraud upon the Great Northern Company, but without success, *Oakley* 228——Instance of the encouragement given by the law to unscrupulous persons to demand compensation, *ib.* 235, 236.

Particulars of a case of fraud, in which a man claimed 8,000 *l.*, and was awarded 88 *l.* by the jury, *O'Brien* 380——Recent claim against the Brighton Company for 3,000 *l.*, the jury returning a verdict for one farthing, *Mansel* 513, 514——Absence of remedy to the companies, if after paying the compensation, it is discovered that the alleged injuries had no good foundation, *Allport* 706-708.

Absence of fraud in the great majority of cases; instances, however, of gross fraud, *Mr. Baron Bramwell and Mr. Baron Martin* 877-879. 883 —— Particulars of a case of gross fraud against the Midland Company, *Sir S. Martin* 877——Frequent occurrence of fraudulent actions, as well as in the case of railways, *ib.* 878, 879.

Demoralising effect of the law as shown by the contradictory evidence in disputed cases, as well as by the readiness with which persons claim excessive damages, *Sir E. W. Watkin* 893, 894——Instances of fraud against the companies with which witness is connected, *ib.* 894——Several instances of fraudulent claims against the Brighton Company, *Laing* 1005——Several instances of fraudulent claims against witness's Company, *Forbes* 1290.

Large number of fraudulent claims, and of extortionate exactions; several instances in witness's experience, *Pemberton* 1429-1453——Statement as to there being not only numerous cases of exaggerated damages, but very many cases of actual fraud, under the present system, *Sir J. Hannen* 1738, 1739. 1745——Frequent instances of persons being awarded large sums for alleged injuries, whilst after a time they seem as well as ever, and carry on business as usual, *Grierson* 2013——There are many fraudulent cases, *Eborall* 2130.

Great Northern Railway. Outline of the course adopted by the Great Northern Company when accidents occur to travellers on their line; private compensation arrangements being made in the great majority of cases, in order to avoid litigation, *Oakley* 218—— Instances of witness's company denying its liability, *ib.* 225-227.

Complaint as to compensation being sometimes awarded where accident has arisen through the plaintiff's neglect; instance of this in the award of 1,500*l.* to a lady who was injured

Report, 1870—*continued.*

Great Northern Railway—continued.

injured by a fall caused by her foot catching in a hole in the carpet, *Oakley* 315–318. 334–337——Practice of witness's company often to agree to a fixed sum for costs, *ib.* 320, 321.

Opinion as to the fairness of the claim for compensation in the case of a lady injured by a fall in consequence of a hole in the carpet, *Mr. Baron Bramwell* 863, 864.

See also *Block System*, 1. *Fraud.*

Great Western Railway. Several instances of the great hardship and injustice suffered by the Great Western Company, on account of the unlimited liability in case of accidents, *Grierson* 2012, 2013——Instance of 24,790 *l.* paid by the company in respect of an accident to a train, the receipts from fares having been about 10 *l.*, *ib.* 2012——Further instance in which the fares came to 87 *l.*, and the payments to 32,230 *l.*, *ib.*

See also *Block System*, 1. *Workmen's Trains.*

Grierson, James. (Analysis of his Evidence.)—Manager of the Great Western Railway; was previously manager of the Shrewsbury Railways, 2010, 2011——Several instances of the great hardship and injustice suffered by the Great Western Company on account of their unlimited liability in case of accidents, 2012, 2013——Frequent instances of persons being awarded large sums for alleged injuries, whilst after a time they seem as well as ever, and carry on business as usual, 2013——Illustrations of the improper practices of some solicitors in fomenting unfounded or excessive claims, for the sake of costs, *ib.*

Great hardship in the fare being limited whilst the liability is unlimited, 2014——Concurrence in the suggestions of Mr. Blenkinsop as to the actual limitation desirable, 2015. 2081——Approval also of the proposed right of insurance in excess of the maximum liability, 2015–2018——Satisfaction to be given to the companies by a reference of claims to the county court judges, 2019. 2098, 2099.

Importance of the medical evidence being provided by the court; views of the late Sir William Lawrence to this effect, 2020——Uselessness of the provision in the Act of 1868 as to a medical referee being nominated by the court, 2020, 2021.

Experience of the Great Western Company on the subject of workmen's trains; claims to a limitation of liability on account of the cheap fares charged, 2022–2033——Explanation as to the extent to which the block system has been adopted on the Great Western line; decided objection to its universal adoption being rendered compulsory, 2034–2041. 2065–2067. 2076–2078. 2092–2094——Experiments being made in order to determine the best mode of extending the system on the Great Western line, 2038. 2077. 2078.——Liability to accident under the block system; instances on witness's line, 2041–2046.

Use of continuous breaks on portions of the line; liability to their getting out of repair, and thus becoming dangerous, 2047–2054——Due consideration always given by witness's company to the reports of the Board of Trade, 2055–2057. 2064–2073. 2091——Steps taken by the company in regard to the locking of points and signals, 2056–2061——Grounds for objecting to power in the Board of Trade or the inspectors to enforce instead of to recommend; great weight already carried by the recommendations of the Board, 2062–2078. 2090–2094.

Disregard of expense by railway authorities if accidents can be prevented thereby, 2074, 2075——Recent uncertainty at the Board of Trade as to the best instruments to be used in carrying out the block system, 2076——Doubt as to first class passengers having good claim to a much higher rate of compensation than should be given to third class passengers, 2079. 2081——Exception taken to the maximum compensation proposed by Captain Tyler, 2082–2085.

Care evinced by the Great Western Company in the appointment and treatment of their servants; system of bonus for good conduct, 2086–2089——Occurrence of accidents chiefly through neglect on the part of the company's servants, 2089——Satisfactory working of the cord plan of communication between passengers and guard on the Great Western line, 2095–2097——Frequent instances of the feelings of juries being improperly led away as against the companies, 2098.

Disadvantage as well as advantage in having the platforms level with the carriages; diversity of professional opinion on this point, 2100–2105——Approval of a court of inquiry comprising a Board of Trade inspector with a legal and a medical assessor, 2106–2108——Advantage of additional powers and facilities in the companies for the examination of carriages and trucks belonging to colliery proprietors and others, 2109–2114——Careful test applied to axle-trees and wheels, 2115–2117.

Objection to a periodical inspection of the lines and plant by the Board of Trade inspectors, irrespectively of accidents, 2118–2121——Non-objection to orders by the Board of Trade, if required to be laid before Parliament before they could be enforced, 2122–2124——Means of arriving at an approximate estimate of the number of traders' waggons on the different railways, 2125–2127.

Report, 1870—*continued.*

H.

Hannen, Sir James. (Analysis of his Evidence.)—Has had considerable experience in the trial of compensation claims for railway accidents, 1722-1724——Dissent from the proposition that railway companies should not be liable for compensation because they take every possible precaution in the way of efficient servants and good administration, 1725-1729——Hardship in the liability of the companies being unlimited; witness approving of a fixed maximum of liability, though he is not prepared to make detailed suggestions on the subject, 1730-1737. 1752-1765.

Approval of passengers having the option of insuring, if the liability of the companies be limited, 1733. 1759, 1760. 1766——Expediency of liability for some damages, as a check upon laxity of administration, 1733. 1761, 1762——Statement as to there being not only numerous cases of exaggerated damages, but very many cases of actual fraud, under the present system, 1738, 1739. 1745——Suggestion as regards costs, that the amount of compensation tendered and paid into court be kept secret from the jury, 1740-1742——Instances of cases taken up by a low class of practitioners, 1746, 1747.

Statement as to the degree of negligence on the part of the companies not being taken into consideration in the assessment of damages, 1748-1751. 1768——Suggestion that railway servants may be induced to take more care if they be allowed to share in the profits from insurance, 1767. 1769, 1770——Opinion that there is no necessity for rendering the criminal law more severe as regards negligence on the part of railway servants, 1768.

Hitchin Accident. Reference to this accident as having cost the Great Northern Company about 20,000 *l.*, it having arisen through the fault of a signal-man whose previous services were unexceptionable, *Oakley* 230.

Horses and Cattle. Limitation under Mr. Cardwell's Act as regards the liability in the case of horses and cattle, *Blenkinsop* 35, 36. 86.

I.

Inspection. Advantage of the system of Government inspection, and of the publicity in connection with accidents, *O'Brien* 363. 389, 390——Disapproval of any extended system of inspection which should lessen the responsibility of the companies and their officers, *Tyler* 1945-1948——Objection to a periodical inspection of the lines and plant by the Board of Trade inspectors, irrespectively of accidents, *Grierson* 2118-2121.

See also *Board of Trade.* *Publicity.* *Responsibility.*

Insurance:

Proposition that the companies be compelled to insure any passenger who wishes it, up to 3,000 *l.* first class, 2,000 *l.* second class, 1,000 *l.* third class, at the rate of 3 *d.* per 1,000 *l.*, *Blenkinsop* 28, 29. 56-62. 107, 108——Impracticability of varying the insurance with reference to the distance travelled, *Blenkinsop* 57. 209, 210; *Vian* 1815-1817——Contemplated annual insurance tickets in the case of persons travelling daily or frequently, *Blenkinsop* 58. 169. 210.

Objection of the Accidental Insurance Company to insure at the rate of 3 *d.* per 1,000 *l.*, *Blenkinsop* 88, 89——Probability of long journey passengers largely availing themselves of a compulsory insurance clause, *ib.* 109, 110——Compulsion upon railway companies as to the insurance of goods, *ib.* 140-142——Difficulty as to insurance where the fares are low, *ib.* 169.

Concurrence in the proposal as to passengers insuring their lives up to a certain sum, *O'Brien* 399-372; *Forbes* 1187; *Grierson* 2015-2018——Evidence in support of the proposition submitted to Mr. Blenkinsop for limiting the liability, with a right of insurance beyond those amounts, *Allport* 577-584. 715. 738-741. 749-757. 787-792——Anticipated loss to the company at the rates of insurance proposed, as explained by Mr. Blenkinsop, *ib.* 716, 717.

Suggestion that passengers might have the option of insuring against negligence by payment of an extra 1 *d.*, and that failing such payment to the company, the latter should not be liable, *Mr. Baron Bramwell* 858——Concurrence of opinion as to the public having no right to complain, if the liability of the companies beyond a certain fixed amount depended upon their being paid a reasonable sum for insurance, *Mr. Baron Martin* and *Mr. Baron Bramwell* 859-861——Approval of passengers having the option of insuring, if the liability of the companies be limited, *Sir J. Hannen* 1733. 1759, 1760. 1766.

Very small proportion of railway passengers who insure, there being little inducement to do so on account of the liability of the railway companies being unlimited, *Vian* 1785. 1792-1795.

Report, 1870—*continued.*

Insurance—continued.

1792–1795. 1832——Sufficiency of a charge of 3 *d.* for an insurance of 1,000 *l.*, in order to cover expenses and leave a small profit; that is, if there were business enough, *Vian* 1810–1812. 1820–1822.

Suggestion that in case of insurance, the amount be paid without litigation being allowed, *Sir J. S. Willes* 2248.

Recommendation by the Committee that if limitation of liability be conceded, the public should have power of insuring with the companies for an additional sum, *Rep.* v ——The amount insured for might be limited to 3,000 *l.* for the first class, 2,000 *l.* for the second class, and 900 *l.* for the third class, *ib.*——The charge should not exceed 3 *d.* for 1,000 *l.* first class, 2 *d.* for 500 *l.* second class, and 1 *d.* for 300 *l.* third class, *ib.*

See also *Carriers' Act.* *Liability.* *Railway Passengers' Assurance Company.*

Interlocking of Points and Signals. See *Locking Apparatus.*

J.

Judges. Trial of the cases, as a rule, before the judges, *Blenkinsop* 21——Views expressed by some of the judges in favour of limitation of liability, *ib.* 49——Instances of judges endeavouring to moderate the views of the juries as to damages, *ib.* 182–185——Advantage of retaining the action of the judges if the liability is not to be limited by law; check thereby upon the juries, *Allport* 671–674. 681–683. 742.

Liability to conflicting decisions as to damages, there being seventeen different judges before whom cases go, *Mr. Baron Martin* 866. 886——Endeavours of witness to keep the damages moderate, *ib.* 866. 882——Suggestion as to more power being given to the judge, without the facility for a new trial on the ground of misdirection, *ib.* 883, 884.

Advantage if the cases were tried by a judge without a jury, as in France and Prussia, *Sir E. W. Watkin* 897, 898——Improvement if there were a power in the judges to withdraw cases from juries, *Whitmore* 2009.

Juries:

Statement as to the disposition of juries to give excessive damages, their feelings and sympathies unduly influencing them, *Blenkinsop* 9–11. 78–81. 135. 159–161. 182–184. 213——Effect produced upon the feelings of juries by the production of the injured passengers in court, *ib.* 9——Difficulty of judges in restraining the juries from giving excessive damages *ib.* 9. 78, 79. 135——Fairness generally of the awards of juries in respect of injuries to goods, there being no sympathy or feeling in these cases, *ib.* 213, 214.

Unduly large payments made by the Great Northern Company, rather than run the risk of a jury, *Oakley* 218——Partial action of juries in generally believing the evidence for the plaintiffs instead of for the companies, *ib.* 288–292. 307–312——Conclusion as to juries being led away by their feelings, and being in the habit of giving excessive damages; several instances of this in the case of witness's company, *O'Brien* 354–358. 373–381——Instances of individual jurymen actuated by vindictive feelings against witness's company, *ib.* 361.

Excessive damages owing chiefly to the sympathies of the juries for the injured, many jurymen also having strong prejudices against the companies, *Allport* 658. 681. 699. 742. 758–763——Prejudicial effect upon the companies through the sympathies of juries with the persons injured, *Sir E. W. Watkin* 897——Special importance of a change of the tribunal, the jury system operating very unjustly, *Laing* 1008, 1009——Objections to trial by jury in accident cases, although the jury system is one which gives much satisfaction to the public, *Brown* 1126, 1127.

Satisfactory settlement if it were known that cases were not to be decided by a jury, *Pemberton* 1498, 1499——Tendency of juries to give too much rather than too little, *Sir J. Hannen* 1745——Frequent instances of the feelings of juries being improperly led away, as against the companies, *Grierson* 2098——Tendency of juries to give excessive damages, unless fraud can be shown; improvement when the matter rests with a sheriff's jury, *Rose* 2352–2354. 2382–2385. 2393–2399.

Complaints by the companies as to the working of the jury system adverted to by the Committee, *Rep.* iv——Opinion of the Committee that trial by jury does not work satisfactorily in cases of compensation, and that a different tribunal is required, *ib.* v.

See also *Costs.* *Damages.* *Special Juries.* *Tribunal.*

Report, 1870—*continued.*

K.

Knight, John Peake. (Analysis of his Evidence.)—Is general manager of the London and Brighton Railway, 2486——Was formerly connected with the South Eastern Railway, and took part in the introduction of the block system, 2487. 2525——The system is in operation upon a large section of the Brighton line, and is exceedingly useful in the prevention of collisions, but its universal adoption is not essential, and should not be enforced upon the companies, 2488-2505. 2523, 2524.

Result of witness's experience of continuous breaks on the South Eastern Railway; though possessing important advantages, they are not free from disadvantages, 2506-2517——Very general use of the locking apparatus on the Brighton line; its advantages in all cases where there are facing points, 2518-2521——Objection to dispensing with facing points, as involving the necessity of shunting, 2522.

L.

Laing, Samuel. (Analysis of his Evidence.)—Is chairman of the Brighton Railway; has also had considerable experience formerly through his connection with the railway department of the Board of Trade, 997-999——Supplies sundry particulars in connection with the New Cross accident, as forcibly illustrating the extreme hardship of the present system of compensation; total cost of about 65,000 *l.* in respect of this accident, the passengers' fares having been under 20 *l.*, and no blame having attached to the company for want of care, 1000-1003. 1010. 1020, 1021.

Very heavy costs when cases go into court, the plaintiffs having frequently to pay large fees to the medical and legal men, over and above the taxed costs paid by the companies, 1003. 1060-1065——Incentive to litigation owing to the nature of the tribunal, 1004——System of professional touting for accident cases, the recovery of costs from the companies being almost a certainty, 1004, 1005——Several instances of fraudulent claims against the Brighton Company, 1005.

Concurrence in the proposal for limiting the liability for accidents, it being at the same time open to the public to insure beyond such limit, 1006. 1008. 1050-1052——Special importance of a change of the tribunal, the jury system operating very unjustly, 1008, 1009——Conclusion favourable to the trial of all cases by a permanent commission or body of arbitrators, 1009. 1052-1057.

Expediency of a limitation of liability as tending to cheaper fares and the running of workmen's trains, 1010. 1047-1049——Advantages attached to the block system of working as now adopted on the Brighton line, 1011-1017——Punishment of servants on the line for infraction of rules, 1018-1021.

Non-objection to power in the Board of Trade to enforce its recommendations, if it were not for the consequent division of responsibility, 1022-1028. 1035, 1036. 1039-1044. 1058, 1059. 1066-1068——Difficulty of the question as to the doors being unlocked on each side; probability of more accidents thereby, 1028-1035. 1070-1075——Doubt as to the expediency of the compulsory adoption of continuous breaks, these being unsuited for some lines, 1036-1039. 1069.

Liability of the companies to excessive damages so long as the existing law is maintained, 1045, 1046. 1048——Necessity of fixing a maximum liability at a reasonably low sum, else the companies would be losers rather than gainers by the change, 1051-1077.——Opinion that the same maximum should apply to all classes of passengers, 1076, 1077——Advantage of passenger communication with the guard by means of a rope, as on the Brighton line, rather than by the electric system, 1078-1083.

Lancashire and Yorkshire Railway. See *Block System*, 1. *Continuous Breaks. Locking Apparatus.*

LAWYERS:

Comments upon the exceptionable part taken in compensation cases by a certain class of attorneys, *Blenkinsop* 9. 19, 20. 66. 186-188——Facility with which the poorer class of travellers find lawyers to take up their case, the costs charged by the latter being often very exceptionable, *ib.* 148-155——Low class of attorneys frequently employed in preferring claims, *Oakley* 219-221——Condemnation of the part taken by a class of attorneys and medical men in trading upon compensation cases; instances of this, *O'Brien* 365-367; *Mr. Baron Martin* 872. 875, 876——Difficulty in settling claims in cases chiefly where a low class of professional men are employed, this being a growing evil, *O'Brien* 491-493.

Comment upon the systematic action of a class of lawyers in persuading people not to settle privately with the companies, *Allport* 598. 694——Exorbitant character of the claims

Report, 1870—*continued.*

LAWYERS—continued.

claims sometimes sent in by the advice of the solicitors, *Allport* 666-670——Great facility with which claims made be made by poor men, there being no difficulty about solicitors or medical witnesses, *ib.* 693-698——Interested motives of the lawyers and doctors for the plaintiffs in bringing cases into court, *ib.* 776-778. 801.

Instance of the improper part taken by attorneys in getting up cases, *Mr. Baron Bramwell* 876——Excessive amount of costs for the legal and medical men employed, this class being interested in the continuance of the present system, *Sir E. W. Watkin* 895, 896——System of professional touting for accident cases, the recovery of costs from the companies being almost a certainty, *Laing* 1004, 1005——Difficulty of settlement when legal advisers interfere on the part of the plaintiffs, *Pemberton* 1497.

Instances of cases taken up by a low class of practitioners, *Sir J. Hannen* 1746, 1747——Illustrations of the improper practices of some solicitors in fomenting unfounded or excessive claims, for the sake of costs, *Grierson* 2013——Instances of cases having got into the hands of disreputable practitioners; refusal of juries to give damages or costs in some of these cases, *Sir J. S. Willes* 2242——Several instances of improper conduct on the part both of legal and medical practitioners, *Rose* 2359-2364.

LIABILITY:

1. *Explanations by the Judges as to the present Law of Liability as regards Railway Accidents.*
2. *Inability of the Companies to limit their Liability by means of Notice.*
3. *Practice almost invariably to admit Liability.*
4. *Complaints as to the present System, the Liability being practically unlimited.*
5. *Suggestions for a Limitation of Liability.*
6. *Exception taken by Colonel Yolland to the proposed Limitation.*
7. *Conclusions and Recommendations of the Committee.*

1. *Explanations by the Judges as to the present Law of Liability as regards Railway Accidents;*

Question considered as to the operation of the law in regard to railway companies being held liable for the acts of their servants, though negligence cannot be proved: explanations hereon in connection with the ordinary law of master and servant, *Mr. Baron Martin* and *Mr. Baron Bramwell* 849-857. 888——Opinion that there is no hardship to the railway companies in the law making them responsible as carriers, though hardship may arise in the application of the law, *Mr. Baron Martin* 858——Difficulty in determining where the liability of a company ends, *ib.* 864.

Conclusion that there is no reason for any difference between the liability of a railway company for the act of its servants, and that of any other employer of labour, *Mr. Baron Bramwell* 888——Dissent from the proposition that railway companies should not be liable for compensation because they take every possible precaution in the way of efficient servants and good administration, *Sir J. Hannen* 1725-1729——Information relative to the liability under the general law of master and servant, and its operation, showing how far it differs from the liability under the law of compensation to railway passengers; contract in the latter case to carry with reasonable safety, *Sir J. S. Willes* 2209-2220.

2. *Inability of the Companies to limit their Liability by means of Notice:*

Absence of power in railway companies to protect themselves by specifying on the tickets that they would not be liable beyond a certain sum, *Allport* 580, 581——Consideration of the question whether railway companies have any legal power to limit their liability, or any right to vary the fare with reference to the value of the life of the person carried, *Mr. Baron Martin* and *Mr. Baron Bramwell* 842-848——Power of the companies to refuse to carry any person, but not to limit their liability if they do carry him, *ib.*——Doubt as to any real protection to the companies if empowered to limit their responsibility by means of notice, as in the case of ordinary carriers, *Mr. Baron Martin* 888——Opinion as to it not being lawful for the companies to stipulate by notice on the tickets that their liability was limited, *Sir J. S. Willes* 2221-2225.

3. *Practice almost invariably to admit Liability:*

Admission of the liability, save when the accident arises from causes over which the company has no control, *Blenkinsop* 12-16——Practice to contest only the amount of compensation, the question of negligence and liability being rarely disputed, *ib.* 114-117.

Report, 1870—*continued.*

LIABILITY—continued.

4. *Complaints as to the present System, the Liability being practically unlimited:*

Hardship in the liability being practically unlimited whilst the fare is limited, and bears no proportion to the risk run, *Blenkinsop* 27. 30-32. 181; *Allport* 575-577. 802-804; *Forbes* 1185; *Grierson* 2014; *Sir J. S. Willes* 2229, 2230 —— Enhanced liability of the companies in its being now held that the compensation should have reference to the future prospects of the person killed or injured, *Blenkinsop* 83. 179.

Hardship in no consideration being given to the fact that the companies takes the best possible means to prevent accidents, by using the best materials, and by employing competent servants, *Oakley* 229-231 ——Ignorance of the companies as to their obligation, when booking a traveller, *ib.* 229 ——Claim of railway companies to a limitation of liability, not merely upon the ground of fraudulent claims, but because their treatment is exceptionally unfair, as compared with omnibus companies, shipowners, and others, *Allport* 801-817.

Witness submits that the present law of compensation for railway accidents is on several grounds impolitic, *Sir E. W. Watkin* 891, 892——Unfair position of railway companies as compared with other carriers, in being compelled to carry all persons presenting themselves, and in being practically precluded from any voluntary contract, *ib.* 902, 903.

Witness, who has studied and written upon the law relating to compensation for accidents, explains the liability of railway companies in the case of accidents to passengers and to non-passengers respectively, *Brown* 1084-1091. 1116, 1117——Witness submits that the companies have good grounds for their complaints, and that the law acts as a great encouragement to fraud and imposture, *ib.* 1092 *et seq.*——Unfairness in the companies having no previous knowledge of the value of the life of any passenger, *ib.* 1121, 1122.

5. *Suggestions for a Limitation of Liability:*

Proposition that under compulsory insurance the liability in case of death be absolute, and be limited to 500 *l.* first class, 300 *l.* second class, and 200 *l.* third class, *Blenkinsop* 28. 68-73. 116-168——Expediency of extending to railway companies the same principle of limitation of liability which has been applied in the case of goods and of horses and cattle, *Blenkinsop* 211, 212; *Oakley* 309-312. 322, 323; *Allport* 575. 585-589. 644-653. 749-757.

Concurrence of witness's directors in the proposal submitted by Mr. Blenkinsop for a limitation of liability and for a compulsory insurance system, *Oakley* 237, 238. 275, 276——Belief that by the proposed limitation of liability no injustice would accrue to persons injured, and that by insuring they would get more than at present, *O'Brien* 364, 365. 382-387.

Concurrence of evidence in support of the proposition submitted to Mr. Blenkinsop for limiting the liability to 500 *l.* for first-class passengers, to 300 *l.* for second-class passengers, and to 200 *l.* for third-class, with a right of insurance beyond those amounts, *Allport* 577-584. 715. 738-741. 749-757. 787-792; *Grierson* 2015. 2081; *Eborall* 2134-2137. 2173, 2174.

Probability of the maximum limit being always awarded against the companies under the proposed limitation, *Mr. Baron Martin* 859——Opinion favourable to the same limited sum for all classes of passengers, without reference to fare, *Sir E. W. Watkin* 907, 908. 991-995; *Laing* 1076, 1077——Concurrence in the proposal for limiting the liability for accidents, it being at the same time open to the public to insure beyond such limit, *Laing* 1006. 1008. 1050-1052——Necessity of fixing a maximum liability at a reasonably low sum, else the companies would be losers rather than gainers by the change, *ib.* 1051. 1077.

Approval of the suggestion for a fixed maximum of liability, coupled with a right of passengers to insure, *Brown* 1102, 1103. 1115; *Tyler* 1861——Suggestion that the amount of liability might bear some proportion to the profits, *Brown* 1115——Expediency of a Parliamentary limitation of liability, rather than of power in the companies to apply a limitation when issuing tickets, *ib.* 1136-1138.

Expediency of the maximum of liability not being placed too high, *Forbes* 1266——Just claim of railway companies to a limitation of liability for accidents, *Mason* 1368.

Hardship in the liability of the companies being unlimited, witness approving of a fixed maximum of liability, though he is not prepared to make detailed suggestions on the subject, *Sir J. Hannen* 1730-1737. 1752-1765——A liability up to 1,000 *l.* would be quite sufficient to prevent laxity, *ib.* 1733——Tendency of juries to give the maximum if a limit be adopted, *ib.* 1765.

Suggestion that the liability be limited to 3,000 *l.* for first-class passengers, 1,500 *l.* for second-class, and 750 *l.* for third-class, *Tyler* 1993-1996——Explanation that in making the foregoing suggestion, witness concludes that the assessment of damages is to be carried out by an entirely new tribunal, *ib.* 1997.

Doubt

Report, 1870—*continued.*

LIABILITY—continued.

5. *Suggestions for a Limitation of Liability*—continued.

Doubt as to first-class passengers having good claim to a much higher rate of compensation than should be given to third-class passengers, *Grierson* 2079. 2081——Exception taken to the maximum compensation proposed by Captain Tyler, *ib.* 2082–2085——Valuable protection to the companies if their liability were limited, *Rose* 2357, 2358.

6. *Exception taken by Colonel Yolland to the proposed Limitation:*

Objection to any limitation of liability, unless further powers be vested in the Board of Trade, *Yolland* 1608–1610.

7. *Conclusions and Recommendations of the Committee:*

Explanation by the Committee as to the present law of liability of railway companies for accidents, *Rep.* iii.——Consideration of complaints relative to the injustice involved in the unlimited liability of the companies in respect of the acts of their servants, *ib.* iii, iv.——Well-grounded character of some of the complaints by the companies as to the administration of the law, *ib.* iv.——Impracticability of the companies diminishing their liability by means of notice to the passengers, *ib.*

Conclusion favourable to a limit being placed upon the liability of the companies, with suggestions as to the amount of such limit, *Rep.* iv, v.——Explanation that it is not proposed to alter the present system of unlimited liability if a different tribunal be established, *ib.* v.

Suggestion that if trial by jury be continued the liability be limited as follows: 1,000 *l.* for first class passengers, 500 *l.* for second class, and 300 *l.* for third class, *Rep.* v.

See also *Act* 9 *&* 10 *Vict. c.* 93. *Carriers Act. Damages. Excursion Trains. Fares. Horses and Cattle. Insurance. Juries. Litigation. Management of Railways. Negligence. Railway Extension. Railway Passengers Assurance Company. Railway Servants. Royal Commission on Railways. Shipping Accidents. United States. Workmen's Trains.*

Limitation of Liability. See *Liability.*

Litigation. Much less probability of litigation if the liability as to compensation were fixed and reduced, as proposed by the companies, *Blenkensop* 69, 70; *Oakley* 242–247——Tendency of a limitation of liability to check litigation, and to discourage the interference of professional harpies, *O'Brien* 383–385——Improbability of many fraudulent claims or of many cases going into court if the liability were limited to the sums already named, *Allport* 674. 676. 695. 743–748. 793–801.

Statement as to the companies never defending a case if they can help it, *Mr. Baron Bramwell* 870——Incentive to litigation owing to the nature of the tribunal, *Laing* 1004.

Great obstruction caused by railway compensation cases to the business generally of the courts, *Brown* 1105, 1106——Immense increase in the number of actions, accidents having doubtless much increased, *ib.* 1106–1108——Effect of diminution of liability in diminishing litigation and costs, *ib.* 1111–1114.

See also *Costs. Damages. Lawyers.*

Local Inquiry. Contemplated power of inquiry on the spot in cases of accident, *Rep.* v.

See also *Board of Trade*, 5.

Locking Apparatus. Advantages of a plan of locking points and signals, and also of wedging points, this being sure to come into use without enforcement by the Board of Trade, *O'Brien* 418, 419——Exception taken to the interlocking of signals and points, *Allport* 637——Absence of improvement by the adoption of the locking apparatus, *Forbes* 1209–1211.

Importance attached to the interlocking of points and signals, especially in connection with the block system, *Yolland* 1567–1569. 1601. 1652–1654——Statement as to the locking apparatus at junctions not having been adopted to the desired extent, many accidents having occurred through this default; difficulty on account of the expense and the existence of patents, *Tyler* 1967–1969. 1998, 1999——Comment upon the refusal of the Midland Company for some time to adopt the locking apparatus at junctions, *ib.* 1967.

Steps taken by the Great Western Company in regard to the locking of points and signals, *Grierson* 2056–2061——Expediency of an adoption of the locking apparatus whenever there are facing points; practice hereon on witness's line, *Blackmore* 2452–2456. 2475–2485——Very general use of the locking apparatus on the Brighton line; its advantage in all cases where there are facing points, *Knight* 2518–2521.

The Committee recommend the evidence relative to the interlocking of signals and points to the careful consideration of boards of directors, *Rep.* vi.

Report, 1870—*continued.*

Locking of Doors. Conclusion as to the inexpediency of compelling the companies to leave the doors on each side unlocked, witness however approving of this practice, and of its being done voluntarily, *O'Brien* 410–417. 425–427——Approval of the present arrangements in regard to the doors being locked on the off side, *Allport* 735–737.

Difficulty of the question as to the doors being unlocked on each side; probability of more accidents thereby, *Laing* 1028–1035. 1070–1075——Advantage of the plan of a hasp below the handle of the door, though it would be a great annoyance to the passengers, *Forbes* 1212–1214. 1275, 1276.

Doubt as to the advantage of a hasp in addition to the present handles to the doors, *Yolland* 1646–1648——Objection to compulsory orders by the Board of Trade as to the opening and shutting of doors, *ib.* 1716, 1717.

Suggestions relative to locking doors of railway carriages, witness proposing that the doors be not locked on either side, and approving of the plan of a hasp or additional fastening, as on the continent, *Tyler* 1885–1892.

London, Brighton, and South Coast Railway. See *Block System*, 1. *Fraud. Locking Apparatus. New Cross Accident.*

London, Chatham, and Dover Railway. Very large expenditure by witness's company in the adoption of appliances for the safety and comfort of the passengers, *Forbes* 1305.

See also *Block System*, 1. *Workmen's Trains.*

London and North Western Railway. Average of from 60,000 *l.* to 80,000 *l.* a year paid by witness's company in compensation to passengers; the amount last year was 73,000 *l.*, *Blenkinsop* 90–96——Settlement by the company of about three-fourths of the claims without litigation, *ib.* 113.

Return of the number of accidents, amount of compensation, and number of persons killed and injured during the years 1868 and 1869, *App.* 193, 194——Statement of the number of persons to whom compensation has been paid in 1868 and 1869, and the amounts paid, *ib.* 194——Particulars relative to the number of servants killed and injured in 1868 and 1869, *ib.* 195.

M.

Management of Railways. Grounds for the conclusion that the management of the railways would in no wise be less careful, if the element of compensation for accidents were withdrawn, *Blenkinsop* 74–77. 136–139. 162–165. 170. 205, 206—— Great loss to the companies when accidents occur, irrespectively of the loss through compensation; equal care taken if there were no liability on the latter ground, *Blenkinsop* 74–77. 136–139. 162–165; *Allport* 623——Fallacy of the idea that railway directors do not take sufficient interest in the prevention of accidents, *Blenkinsop* 207, 208.

Ample pressure upon the companies to guard against accidents, irrespectively of the expense of compensation, *O'Brien* 351, 352. 363——Doubt as to any means of improving the present system as regards the pressure upon the companies to adopt the safest modes of working, *ib.* 362, 363. 388–391——Adoption of all possible improvements without reference to the amount paid in compensation, *ib.* 476.

Excellent arrangements adopted for the safety of passengers, there being rarely, if ever, any culpable negligence, and the servants being very efficient, *Mr. Baron Martin* and *Mr. Baron Bramwell* 860. 862. 865. 867. 868——Conclusion that a limitation of the companies liability would have no effect in lessening the precautions taken, *ib.* 887.

Ample inducement to the companies to guard against accidents, irrespectively of the liability to compensation, *Sir E. W. Watkin* 939——Little, if any, advantage of the law as regards the adoption of precautions and improvements in working, *Brown* 1123, 1124. 1143–1147——Utter fallacy of the notion that limitation of liability would lead to laxity of administration, *Forbes* 1305——Belief as to the greater efficiency of the administration of the railways by the companies than would result from Government administration, illustration on this point in Prussia, *ib.* 1344, 1345.

Constant omission of the companies to adopt improvements until the want of them is shown by accidents on their own lines, *Yolland* 1532, 1533. 1607——Expediency of liability for some damages, as a check upon laxity of administration, *Sir J. Hannen* 1753. 1761, 1762——Circumstance of improvements being sometimes adopted most readily on the less profitable lines, *Tyler* 1977–1979——Disregard of expense by railway authorities if accidents can be prevented thereby, *Grierson* 2074, 2075.

See also *Block System*, 1. *Board of Trade. Plant. Railway Servants.*

Manchester, Sheffield, and Lincolnshire Railway. Payment of 27,000 *l.* in compensation, exclusive of expenses, by the Sheffield Company in three years, the gross passenger traffic being about 400,000 *l.* a year, *Sir E. W. Watkin* 938. 946, 947.

Mansel,

Report, 1870—*continued.*

Mansel, Robert Stanley. (Analysis of his Evidence.)—Is manager of the North London Railway 494, 495——Submits a return relative to the accidents on the line, the compensation paid, &c., in each of the years 1866–69; total of eleven accidents and of 18,196 *l.* paid in compensation and expenses, 496–498——Very low fares on the whole, though there are only first and second class passengers, 499–501. 548, 549——Working of the line on the block system, the trains being supplied with continuous breaks, 502, 503.

Great difficulty of railway companies in resisting claims for compensation, more especially when the injuries are in the shape of an internal shock, 405–507 —— Very heavy amount of the medical and legal expenses, 508–512 —— Recent claim against the Brighton Company for 3,000 *l.*, the jury returning a verdict for one farthing, 513, 514 ——Instance of a passenger by the North London line, whose fare was 4 *d.*, having recovered 2,300 *l.* for injuries, 515——Frequency of speedy recovery after the compensation is paid, *ib.*——Examination as to the facilities offered by the North London Railway to the labouring classes, and as to the fares charged, 516, *et seq.*

Limit of liability to 100 *l.* in case of trains between Dalston and Broad-street, 524 —— Explanation in regard to workmen's trains not being run from Homerton, there being no limit of liability in case of accident, and it being doubtful whether such trains would pay, 523–542. 569, 570——Unremunerative character of the penny trains now run over part of the line, 542. 565–568.

Tendency of the block system to induce carelessness as to signals; several accidents under the system on the North London line, 550–555——Sufficiency of porters for attending to the trains on arrival at the stations, 556–558——Similar level, of the platforms at some of the stations and of the carriage doors; advantage of this arrangement, 559–565.

Martin, Sir Samuel, Knight, and Sir George William W. Bramwell. (Analysis of their Evidence.)—Have had large experience in the trial of claims for compensation on account of railway accidents, 839–841——Consideration of the question whether railway companies have any legal power to limit their liability, or any right to vary the fare with reference to the value of the life of the person carried, 842-848——Power of the companies to refuse to carry any person, but not to limit their liability if they do carry him, 842.

Question considered as to the operation of the law in regard to the companies being held liable for the acts of their servants, though negligence cannot be proved; explanations hereon in connection with the ordinary law of master and servant, 849–857. 888.

(*Mr. Baron Martin.*) Opinion that there is no hardship to the railway companies in the law making them responsible as carriers, though hardship may arise in the application of the law, 858——(*Mr. Baron Bramwell*). Conclusion as to the hardship consisting in dishonest claims being brought, and dishonest or unfair verdicts given, *ib.*—— Suggestion that passengers might have the option of insuring against negligence by payment of an extra 1 *d.*, and that failing such payment to the company the latter should not be liable, *ib.*

(*Mr. Baron Martin and Mr. Baron Bramwell.*) Concurrence in opinion as to the public having no right to complain if the liability of the companies beyond a certain fixed amount depended upon their being paid a reasonable sum for insurance, 859–861 ——(*Mr. Baron Martin.*) Probability of the maximum limit being always awarded against the companies under the proposed limitation, 859——(*Mr. Baron Martin and Mr. Baron Bramwell.*) Excellent arrangements adopted for the safety of passengers, there being rarely if ever any culpable negligence, and the servants being very efficient, 860. 862. 865. 867. 887.

(*Mr. Baron Bramwell.*) Opinion as to the fairness of the claim for compensation in the case of a lady injured, after the journey was over, by a fall in consequence of a hole in the carpet, 863, 864——(*Mr. Baron Martin.*) Difficulty in determining where the liability of a company ends, 864——Liability to conflicting decisions as to damages, there being seventeen different judges before whom cases go, 866. 886——Endeavours of witness to keep the damages moderate, 866. 882——(*Mr. Baron Martin and Mr. Baron Bramwell.*) Absence as a rule, of excessive damages, where injury is proved, 866. 869. 882, 883.

(*Mr. Baron Martin.*) Instance of excessive damages in the case of a person killed in the Staplehurst accident, 866——(*Mr. Baron Bramwell.*) Mistake of the companies in having cases tried before special juries, *ib.*——Abuse on account of the juries not finding that the negligence often rests with the persons injured, 866. 883, 884 ——(*Mr. Baron Martin.*) Statement as to its being open to the companies to prove negligence in the plaintiffs, and to obtain a verdict on that ground, 867, 868.

(*Mr. Baron Martin and Mr. Baron Bramwell.*) Higher damages given against railway companies than, under similar circumstances, against individuals, 869——

Report, 1870—*continued.*

Martin, Sir S., Knight, and Sir G. W. W. Bramwell. (Analysis of his Evidence)—*contd.*

Question as to the damages being higher against railway companies than against steamboat companies or omnibus companies, *Mr. Baron Martin and Mr. Baron Bramwell* ——Invariable practice of juries to give larger damages than the amount paid into court 870, 871——(*Mr. Baron Martin.*) Excessive amount generally paid by the companies in costs; respect in which the amount is unduly enhanced owing to the witnesses called by the companies, 870.

(*Mr. Baron Bramwell.*) Suggestion that the amount paid into court be kept secret from the jury, 870. 872–874——Statement as to the companies never defending a case if they can help it, 870——(*Mr. Baron Bramwell and Mr. Baron Martin.*) Concurrence in the suggestion that when there are numerous claims arising out of the same accident, they be all submitted to the Board of Trade, and be dealt with by one tribunal; great saving thereby in the costs, 870, 871. 881——(*Mr. Baron Martin.*) Opinion as to the uselessness of attempting to withhold from the jury the amount paid into court, 870—— Beneficial check upon dishonest claims if the claimant did not get his costs unless he recovered a larger sum than was offered by the company, 871.

Impression as to a certain class of medical men, and of lawyers trading in compensation cases, the bills sent in by the former being sometimes very excessive, 872. 875, 876 ——(*Mr. Baron Bramwell.*) Instance of the improper part taken by attornies in getting up cases, 876——(*Mr. Baron Bramwell and Mr. Baron Martin.*) Suggestion that medical experts should not be called on the nomination of either plaintiff or defendant; they might be appointed by the Board of Trade, 876. 880.

Statement as to the difficulty of arriving at the truth in concussion cases, 877, 878—— Absence of fraud in the great majority of cases; instances, however, of gross fraud, 877–879. 883——(*Mr. Baron Martin.*) Frequent occurrence of fraudulent actions as well as in the case of railways, 878, 879——Advantage if more power could be given to the judge, without the facility for a new trial on the ground of mis-direction, 883, 884——Doubt as to the necessity of any alteration of the time within which claims may be made, 884.

(*Mr. Baron Martin and Mr. Baron Bramwell.*) Statement of cases in which the injuries complained of arose through the negligence of the plaintiffs rather than of the companies, 884——Doubt as to the expediency of referring the cases to the county court judges, 885, 886—— Conclusion that a limitation of the companies' liability would have no effect in lessening the precautions taken, 887.

(*Mr. Baron Martin.*) Explanation as to its being now the law that railway companies are not liable for accident or injury to their servants, 888——(*Mr. Baron Bramwell.*) Conclusion that there is no reason for any difference between the liability of a railway company for the acts of its servants, and that of any other employer of labour, *ib.*—(*Mr. Baron Martin.*) Doubt as to any real protection to the companies if empowered to limit their responsibility by means of notice, as in the case of ordinary carriers, *ib.*

Mason, Samuel Lack. (Analysis of his Evidence.)—Is manager of the North British Railway; represents also the Glasgow and South Western Railway, 1359–1361—— Statement as to the plaintiffs, in accident cases in Scotland, being liable for the costs of both sides if the jury return a smaller amount of damages than the amount tendered by the companies in settlement, 1362–1364. 1396——Intention that the amount tendered by the company shall not become known to the jury; advantage of more effectual precautions for withholding such knowledge, 1365, 1366. 1396–1404——Satisfactory composition of the juries in Scotland for deciding compensation cases, 1367. 1405–1407.

Just claim of railway companies to a limitation of liability for accidents 1368—— Tendency of a limitation of liability in Scotland to encourage the running of workmen's trains, 1369–1372. 1386–1388——Discontinuance of excursion trains on the Glasgow and South Western line on account of the liability for damages, 1373.

Adoption of the block system on part of the North British Railway; particulars hereon to the effect that the system has great advantages, but does not secure freedom from accident 1374–1382. 1384, 1385. 1394, 1395, 1412–1415——Decided objection to the block system on mineral lines, as not being required, and as being attended with ruinous expense; illustration in the case of the North British and Glasgow and South Western Companies, 1377. 1389–1393. 1416——Inexpediency of the block system being made compulsory on the companies, 1382.

Exceptions taken to the action of the Procurator Fiscal in Scotland in connection with railway accidents, 1382, 1383. 1395——Importance of the direct responsibility of the companies and their officials not being interfered with, 1383——Disregard of expense in the management of the North British line as regards safety 1384——Very few accidents on the line, 1394, 1395——Mode of communication between passenger and guard adopted on the line, 1408–1411——Gradual adoption of the block system on the Glasgow and South Western line, 1416——Reference to the inquiry by the Procurator Fiscal in Scotland as being secretly conducted, there being no coroner's inquiry, 1417–1419.

Master and Servant, Law of. Conclusions as to the injustice of the present law of master and servant, witness including that the master should not be responsible to an unlimited extent

Master and Servant, Law of—continued.

extent where he has taken the greatest care in the selection of his servants, and when the latter act contrary to his orders, *Brown* 1093–1102.

Consideration by the Committee of the general law of liability as regards master and servant; conclusion adverse to any alteration, *Rep.* iii, iv.

See also *Liability.*

Medical Witnesses and Referees. Comment upon the action of a class of medical men and of lawyers who lay themselves out for compensation cases on account of the costs, *Blenkinsop* 9. 19, 20. 66; *O'Brien* 365–367; *Allport* 693–698. 776–778. 801; *Sir E. W. Watkin* 895, 896; *Rose* 2359–2364——Practice of juries to concur in the medical testimony on the part of those injured, and to disregard the medical evidence for the companies, *Blenkinsop* 65–67. 104——Large fees charged by the plaintiffs' medical witnesses who act rather as advocates, *ib.* 103. 189–194.

Very little difficulty experienced by the companies as regards medical examination of the persons injured, *Blenkinsop* 104, 105. 120–128——Practice of witness's company as to retaining local medical men who act at once when an accident occurs, *ib.* 156.

Reference to the medical witnesses for the plaintiffs as being frequently advocates rather than witnesses, *Allport* 685.

Great expense in respect of medical witnesses on both sides, *Mr. Baron Martin* 870——Impression as to a certain class of medical men, and of lawyers trading in compensation cases, the bills sent in by the former being sometimes very excessive, *ib.* 872. 875, 876——Suggestion that medical experts should not be called on the nomination of either plaintiff or defendant; they might be appointed by the Board of Trade, *Mr. Baron Bramwell and Mr. Baron Martin* 876. 880.

Very heavy amount of the medical charges of costs, *Laing* 1062–1065; *Brown* 1113——Doubt as to the advantage of a medical referee; difficulty in dispensing with medical evidence on each side, *Brown* 1139–1142. 1153–1155.

Comment upon the action of a class of medical men in supplying testimony in support of exaggerated or unfounded claims; unwillingness on the other hand of many medical men of eminence to appear in these cases, *Pemberton*, 1428–1430. 1443. 1482–1490. 1503–1508——Importance of the action of a medical referee as a check upon the medical evidence for the plaintiffs, *ib.* 1503–1508.

Importance of the medical evidence being provided by the court; views of Sir William Lawrence to this effect, *Girerson* 2020——Uselessness of the provision in the Act of 1868 as to a medical referee being nominated by the court, *ib.* 2020, 2021.

See also *Costs. Nervous Shocks, &c. Tribunal.*

Mellor, Mr. Justice. Views of Mr. Justice Mellor in favour of a limitation of the liability of railways in case of accidents, *Blenkinsop* 49.

Midland Railway. Total of 143,000 *l.* paid by the Midland Company, in compensation cases in the last five years, nearly 19,000 *l.* of which was for costs, *Allport* 590–592——Difficulty in stating the amount in respect of goods, *ib.* 593, 594.

In illustration of the great abuses under the present system, and in proof of the very excessive payments exacted, as well as of the frauds perpetrated, witness submits details of numerous cases of accident and of compensation claims, which have passed through his hands as manager of the Midland Railway, *Allport* 599–614. 639–643. 700——Instances of witness's company having been made liable for accidents at stations to persons not travelling by the line, *ib.* 677–681.

See also *Block System,* 1.

N

Negligence. Several instances of injury, and of compensation under circumstances in which neglect or blame should not fairly be attached to the companies, *Blenkinsop,* 199–204——Impression as to the willingness of the companies to admit negligence in all cases if the liability be limited, *Allport* 778–786.

Abuse on account of the juries not finding that the negligence often rests with the person injured, *Mr. Baron Bramwell,* 866. 883, 884——Statement as to its being open to the companies to prove negligence in the plaintiffs, and to obtain a verdict on that ground, *Mr. Baron Martin* 867, 868; *Sir J. S. Willes* 2254——Statement of cases in which the injuries complained of arose through the negligence of the plaintiffs rather than of the companies, *Mr. Baron Martin and Mr. Baron Bramwell* 884.

Proposed exemption from liability when an accident happens to a stranger, owing to negligence on his part, *Brown* 1100, 1101. 1109, 1110——Numerous instances of railway companies, and others being held liable for accidents, though negligence on their part cannot

Report, 1870—*continued.*

Negligence—continued.

cannot be proved, *Brown* 1118, 1119——Absence of proportion between the amount of damages and the degree of negligence, *ib.* 1122.

Great difficulty in preventing passengers leaving the carriages before the train has stopped, frequent accidents arising from this cause; expediency of further legislative control of passengers in this and other matters, *Forbes* 1212–1218. 1252–1255. 1267–1276.

Frequent instances of accidents through culpable negligence, *Yolland* 1573–1575—— Difficulty in preventing accidents through fault of the passengers in leaving the trains too hurriedly, *ib.* 1644–1646.

Statement as to the degree of negligence on the part of the companies not being taken into consideration in the assessment of damages, *Sir J. Hannen* 1748–1751. 1768—— Advantage of the liability, if limited, not being affected by the question of negligence, *Tyler* 1862–1864.

See also *Liability. Master and Servant, Law of. Railway Servants.*

Nervous Shocks and Internal Injuries. Especial difficulty in resisting excessive damages for nervous shocks, though the persons injured are sometimes soon at work again, *Blenkinsop* 9. 156–158. 195–198—— Difficulty of the companies in the case more especially of alleged internal injury, or shock to the nervous system; frequent instances of abuse and extortion, *Oakley* 225. 235. *Mansel* 504–507; *Allport* 599 *et seq.* 684, 685. 700—— Instances of heavy damages paid by the North Eastern Company in respect of so-called nervous shocks and of trifling injuries; very small fare paid to the company in some of these cases, *O'Brien* 371–381—— Payment of 1,800 *l.* to a clergyman whose fare was 1 *s.* 6 *d.*, and who does not seem any the worse for the shock of which he complained, *ib.* 374, 375.

Statement as to the difficulty of arriving at the truth in concussion cases, *Mr. Baron Bramwell* and *Mr. Baron Martin* 877, 878—— Great suspicion with which witness looks upon cases of alleged injuries from concussion, *Sir E. W. Watkin* 934. 969, 970—— Dissent from the view that serious nervous shocks are often slow in showing themselves, *Pemberton* 1469–1476——Inability of medical witnesses for the companies to contend with cases of alleged nervous shocks, *ib.* 1500–1502.

See also *Damages. Fraud.*

New Cross Accident. Sundry particulars in connection with the New Cross accident, as forcibly illustrating the extreme hardship of the present system of compensation; total cost of about 65,000 *l.* in respect of this accident, the passengers' fares having been under 20 *l.*, and no blame having attached to the company for want of care, *Laing* 1000–1003. 1010. 1020, 1021.

Details relative to several fraudulent claims which arose out of the New Cross accident; several instances also of very excessive damages, *Rose* 2350–2356——Within two days of the accident 400 claims were sent in, *ib.* 2355.

North British Railway. Disregard of expense in the management of the North British line as regards safety, *Mason* 1384——Very few accidents on the line, *ib.* 1394, 1395.

See also *Block System*, 1.

North Eastern Railway. Large amount of compensation paid by witness's company, the amount fluctuating greatly in different years, and depending entirely upon chance, *O'Brien* 343–350——Settlement of the great majority of cases without incurring the risk of a jury and of heavy costs, *ib.* 380.

Particulars relative to the full investigation by officials and directors whenever an accident occurs on the North Eastern line; careful consideration given on such occasions to the report by the officer of the Board of Trade, *O'Brien* 438, 439.

See also *Block System*, 1.

North London Railway. Witness submits a Return relative to the accidents on this line, the compensation paid, &c., in each of the years 1866–69; total of eleven accidents, and of 18,196 *l.* paid in compensation and expenses, *Mansel* 496–498——The total fare received from the claimants amounted to 3 *l.* –*s.* 6 *d.*, or an average of 6 *d.* per head, *ib.* 497——Very low fares on the whole, though there are only first and second class passengers, *ib.* 499–501. 548, 549—— Working of the line on the block system, the trains being supplied with continuous breaks, *ib.* 502, 503——Instance of a passenger by the North London line, whose fare was 4 *d.*, having recovered 2,300 *l.* for injuries, *ib.* 515——Sufficiency of porters for attending to the trains on arrival at the stations, *ib.* 556–558.

See also *Block System*, 1. *Workmen's Trains.*

Notice of Claims. Recommendation by the Royal Commission that claims should not be admitted unless made within a certain period, *Blenkinsop* 46—— Want of a reasonable limit of time during which notice of claims should be given, *ib.* 129–134. 174, 175——Expediency of limiting the time within which claims may be made, six months being ample, *Allport* 621, 622. 701–703.

Doubt

Report, 1870—*continued.*

Notice of Claims—continued.

Doubt as to the necessity of any alteration of time within which claims may be made, *Mr. Baron Martin* 884.

Illustration of the want of limit upon the time after an accident within which notice should be served upon the company; witness does not propose any limit of time for actual claims, *Sir E. W. Watkin* 894, 895. 901. 933, 934. 948–953. 969–973.

Approval of its being necessary to give notice of claim within a certain period, *Sir J. S. Willes* 2252, 2253——Expediency of notice of injury or of intended claim being given within a short time after the accident, *Rose* 2376–2381.

Recommendation by the Committee that notice of possible or probable claims should be given within a limited specified time from the date of the accident, and that in default thereof no claim should be established, *Rep.* v.

Number of Accidents. Preparation by witness of a table showing the accidents in 1867, 1868, and 1869; this table delivered in, *Volland* 1519–1521——Much greater number of persons injured than are reported by the Board of Trade, *Vian* 1821. 1823, 1824—— Occurrence of many small accidents which are not worth reporting to the Board of Trade, *Tyler* 1943.

O

Oakley, Henry. (Analysis of his Evidence.)—Secretary to the Great Northern Railway Company; has had considerable experience of compensation claims, 215–217—— Outline of the course adopted by the company when accidents occur to travellers on their line, private compensation arrangements being made in the great majority of cases, in order to avoid litigation, 218——Unduly large payments made rather than run the risk of a jury, *ib.*——Low class of attorneys frequently employed in preferring claims, 219–221—— Very heavy costs in contested cases, the medical and legal charges on the side of the plaintiffs being excessive, 222–224.

Facilities for exaggerated claims, more especially when there is alleged injury to the nervous system, 225. 235——Instances of witnes's company denying its liability, 225–227——Cases of attempted fraud upon the company, but without success, 228—— Ignorance of the company as to its obligation when booking a traveller, 229——Hardship in no consideration being given to the fact that the company takes the best possible means to prevent accidents, by using the best materials and by employing competent servants, 229–231.

Tendency of the present heavy liability to check reduction of fares, and to bear more upon the poorer than the richer travellers, 232–234——Instance of the encouragement given by the law to unscrupulous persons to demand compensation, 235. 236——Concurrence of witness's directors in the proposal submitted by Mr. Blenkinsop for a limitation of liability, and for a compulsory insurance system, 237, 238. 275, 276.

Advantage if cases were submitted to the county court judges, who might be aided by medical assessors, 239–244——Much less probability of litigation if the liability as to compensation were fixed and reduced, as proposed by the companies, 242–247——Obstacle to the companies ascertaining the actual profits made by men who send in claims, 248, 249.

Information relative to the block system as adopted on portions of the Great Northern line, the system being very effectual in preventing accidents between stations, but not at stations, where accidents chiefly occur, 250–265. 277–285. 293–306——System of breaks in use on the Great Northern line; obstacles to an extended use of continuous breaks, 266–273——Partial action of juries in generally believing the evidence for the plaintiffs instead of for the companies, 288–292. 307–312.

Impracticability of immunity from accidents under the block system or any other system; circumstances under which the former may aggravate accidents, 293–296—— Witness concurs generally in the evidence of Mr. Blenkinsop, 307, 308. 319——Protection of the companies if the same law of liability were applied to passengers as to goods 309–312. 322, 323—— Frequent instances of excessive charges on the part of professional witnesses against the companies, 313——Instances of cases taken up as mere speculations, 314.

Complaint as to compensation being sometimes awarded where accident has arisen through the plaintiff's neglect; instance of this in the award of 1,500*l.* to a lady who was injured by a fall caused by her foot catching in a hole in the carpet, 315–318. 334–337 —— Practice of witness's company often to agree to a fixed sum for costs, 320, 321—— Grounds for objecting to increased powers in the Board of Trade to enforce the recommendations of its inspectors as to improved modes of working, 324–333.

Report, 1870—*continued.*

O'Brien, Captain William. (Analysis of his Evidence.)—Long experience of witness as general manager and secretary of the North Eastern Railway, 338, 339 ——Concurrence in the evidence of Mr. Blenkinsop and Mr. Oakley, 340–342——Large amount of compensation paid by witness's company, the amount fluctuating greatly in different years, and depending entirely upon chance, 343–350—— Ample pressure upon the companies to guard against accidents, irrespectively of the expense of compensation, 351, 352. 363.

Effect of excessive damages in leading to an excessive punishment of railway servants, 352, 353——Conclusion as to juries being led away by their feelings, and being in the habit of giving excessive damages; several instances of this in the case of witness's company, 354–358, 373–381 ——Average of about 300*l.* per case as the amount of costs on both sides, the costs falling as a rule upon the company, 358–360——Instances of individual jurymen actuated by vindictive feelings against the company, 361.

Doubt as to any means of improving the present system as regards the pressure upon the companies to adopt the safest modes of working, 362, 363. 388–391 ——Advantage of the system of Government inspection, and of the publicity in connection with accidents 363. 389, 390——Importance attached to the views of the Royal Commissioners of 1867 as to the expediency of the present system of management, whereby the responsibility rests entirely with the companies, 363. 423, 424——Belief that by the proposed limitation of liability no injustice would accrue to persons injured, and that, by insuring, they would get more than at present, 364, 365. 382–387.

Comment upon the part taken by a class of attorneys and medical men in trading upon compensation cases; instances of this, 365–367——Large proportion of the compensation payments which goes into the pockets of the plaintiff's professional men, 365 ——Advantage if disputed cases were tried and settled by a county court judge, 368 ——Satisfactory results anticipated if it were compulsory upon the companies to insure the life of each passenger, if required, 369–372.

Instances of heavy damages paid by the North Eastern Company in respect of so-called nervous shocks and of trifling injuries; very small fare paid to the company in some of these cases, 373–381——Particulars of a case of fraud, in which a man claimed 8,000*l.* and was awarded 88*l.* by the jury, 380——Settlement of the great majority of cases, without incurring the risk of a jury and of heavy costs, *ib.*——Tendency of a limitation of liability to check litigation, and to discourage the interference of professional harpies, 383–385.

Examination in support of the conclusion that it would be a great evil if the Board of Trade were empowered to enforce the adoption of its inspectors' recommendations, 388 *et seq.*——Evidence as to the partial adoption of the block system on the North Eastern Railway, as to its advantages and disadvantages, and as to the inexpediency of compelling the company to adopt it over the whole line, 392–409. 428–432. 437.

Conclusion as to the inexpediency also of compelling the companies to leave the doors on each side unlocked, witness however, approving of this practice and of its being done voluntarily, 410–417. 425–427——Advantages of a plan of locking points and signals, and also of wedging points, this being sure to come into use without enforcement by the Board of Trade, 418, 419 ——Belief as to the companies adopting a plan of communication between passengers and guard and between guard and driver on proof of its clear utility and irrespectively of the recommendations of the Board of Trade, 433–436.

[Second Examination.]—Particulars relative to the full investigation by officials and directors whenever an accident occurs on the North Eastern line; careful consideration given on such occasions to the report by the officer of the Board of Trade, 438, 439 ——Natural desire of the company to carry out the recommendations of the Board of Trade, as relieving the former from responsibilty, opposite conclusions being only arrived at after careful investigation, 439–441.

Peculiar facilities in the case of the Metropolitan Railway for applying the block system, the circumstances being altogether different in the case of the North Eastern Railway, 442–444——Further statement of witness's objections to an indiscriminate application of the block system though the principle of the system is perfect, 445–459 ——Conclusion that a general adoption of the block system would not have the slightest effect in mitigating the compensation awarded when an accident occurs, 460–463.

Much larger portion of compensation payments made in cases where death does not result, the latter cases however, though few in number, involving large amounts, 466–469 ——Reference to the accidents to railway servants, and the compensation or gratuities given voluntarily in such cases, 471–476——Adoption of all possible improvements without reference to the amount paid in compensatian, 477.

Occurrence of accidents owing rather to negligence of servants than to fault of management, the greatest care being nevertheless taken to secure efficient servants, 478, 479. 486, 487——Varying hours per day for which railway servants are employed, it being essential greatly to curtail the labour in certain positions, 480–483.

Practical

Report, 1870—*continued.*

O'Brien, Captain William. (Analysis of his Evidence)—*continued.*

Practical inoperativeness of the provision in Lord Campbell's Act that claims can only be made to the extent of the interest of the claimants, 488-490——Difficulty in settling claims in cases chiefly where a low class of professional men are employed, this being a growing evil, 491-493.

Omnibus Companies. Better position of omnibus companies than of railway companies as regards compensation payments, *Allport* 578, 579——Question as to the damages being higher against railway companies than against steamboat companies or omnibus companies, *Mr. Baron Martin* and *Mr. Baron Bramwell*, 869.

P

Pemberton, Oliver. (Analysis of his Evidence.)—Large experience of witness in compensation claims for railway accidents, he having been professionally employed for several years by the Midland and London and North Western Companies, and by the Railway Passengers Assurance Company, 1420–1423. 1491–1495——Absence generally of litigation in cases of serious and clearly-ascertained injury, the companies being able to settle the compensation, 1424, 1425. 1496——Large number of fraudulent claims and of extortionate exactions; several instances in witnesss's experience, 1426–1453.

Comment upon the action of a class of medical men in supplying testimony in support of exaggerated or unfounded claims; unwillingness on the other hand of many medical men of eminence to appear in these cases, 1428–1430. 1443. 1482–1490. 1503–1508——Statement as to the nature of the claims upon the Railway Passengers Assurance Company, and the beneficial effect of the limited liability undertaken by the company, 1446–1457——Evidence in favour of a medical arbitration, with suggestions as to the mode of carrying it out, 1458. 1468.

Dissent from the view that serious nervous shocks are often slow in showing themselves, 1469–1476——Probable effect of railway accidents in aggravating previous diseases, and in bringing them to a crisis, 1477–1481——Explanation as to the practice in the medical examination of persons injured, and as to the mode of handing over the compensation when cases are settled out of court, 1482–1496. 1486.

Difficulty of settlement when legal advisers interfere on the part of the plaintiffs, 1497——Satisfactory settlement if it were known that cases were not to be decided by a jury, 1498, 1499——Inability of medical witnesses for the companies to contend with cases of alleged nervous shocks, 1500–1502——Importance of the action of a medical referee as a check upon the medical evidence for the plaintiffs, 1503–1508.

Plant. Diminution of accidents, through the greater perfection of engines, carriages, &c., *Sir E. W. Watkin* 915. 988, 989——Liability to accident from imperfection of servants rather than from imperfect plant, the latter being now very efficient, *ib.* 989, 990.

Systematic and detailed examination of railway plant and rolling stock, in order to detect any flaw or defect which might give rise to accident, *Forbes* 1322–1327. 1346–1348——Obstacle to carrying on railway traffic without owner's waggons as well as companies' waggons; belief as to the more perfect character of the latter, *ib.* 1335–1340——Very ample records kept of the composition of each train, whilst there is a complete history of its progress, *ib.* 1341–1343——Careful history kept of waggons, engines, &c., so as to ensure an effectual renewal of axles, &c., *ib.* 1346–1348.

Improvements effected from time to time in the permanent way, *Tyler* 1904. 1986——Advantage of additional powers and facilities in the companies for the examination of carriages and trucks belonging to colliery proprietors and others, *Grierson* 2109–2114——Careful test applied to axletrees and wheels *ib.* 2115–2117——Means of arriving at an approximate estimate of the number of trader's waggons on the different railways, *ib.* 2125–2127.

Platforms. Similar level of the platforms at some of the stations on the North London line and of the carriage doors; advantage of this arrangement, *Mansel* 559–565——Advantage in the platforms being on the same level as the carriages; difficulty and expense in now carrying out this arrangement, *Forbes* 1315–1321——Disadvantage as well as advantage in having the platforms level with the carriages; diversity of professional opinion on this point, *Grierson* 2100–2105.

Post Office Clerks. Large sums paid to Post Office clerks, who are very liable to accident from their duties in the Post Office railway vans; moiety borne by the Post Office, *Blenkinsop* 9. 80–82. 112——Fair information given in accident cases by the Post Office solicitor; witness can hardly say the same of the medical officer, *ib.* 80–82.

Report, 1870—*continued.*

Previous Disease. Frequent instances of claims for injuries due to previous disease *Pemberton* 1430–1442. 1498, 1499——Probable effect of railway accidents in aggravating previous diseases, and in bringing them to a crisis, *ib.* 1477–1481.

Private Settlement of Claims. Difficulty as to the companies taking the initiative in the settlement of claims, *Allport* 774, 775——Fair terms on which the companies are always prepared to settle voluntarily, *Sir E. W. Watkin* 974——Absence generally of litigation in cases of serious and clearly ascertained injury, the companies being able to settle the compensation, *Pemberton* 1424, 1425. 1496——Explanation as to the practice in the medical examination of persons injured, and as to the mode of handing over the compensation where cases are settled out of court, *ib.* 1482–1496.

Public, The. Unwillingness of the travelling public in England to submit to restrictions calculated to prevent accident, whilst on the continent this difficulty does not arise, *Forbes* 1267–1276.

Publicity. Proposition for an amended system of inquiry by a court appointed by the Board of Trade, and for greater publicity being given to the recommendations of the inspectors; valuable pressure thereby upon the companies, *Tyler* 1869–1872. 1876–1881——Tendency upon some lines to continue in the same groove and not to introduce improvements with sufficient promptitude, pressure from without being very desirable, *ib.* 1905–1915. 1945. 1966, 1667.

Statement in further explanation of the prompt and increased publicity proposed to be given to the official inquiries into accidents as well as to the official recommendations resulting from the inquiries; great advantage anticipated from the public opinion thus brought to bear upon the companies, *Tyler* 1922 *et seq.*

R.

Railway Association. Very similar Bill prepared by witness for the Railway Association four or five years ago, to that now proposed; loss of the former Bill, the Government having opposed it, *Blenkinsop* 53–56.

Railway and Canal Traffic Act (1854). Adoption by this Act of the principle of limitation of liability, *Rep.* iv.

Railway Extension. Impolicy of the present law of compensation, as tending to prevent cheap travelling, and to check the making of railways, *Brown* 1122. 1125. 1128–1130.

Railway Passengers Assurance Company. Statement as to the nature of the claims upon the Railway Passengers Assurance Company, and the beneficial effect of the limited liability undertaken by the company, *Pemberton* 1446–1457.

Insurance granted by the company not only against railway accidents, but against accidents generally, the former branch bearing but a small proportion to the business of the company, *Vian* 1773–1775. 1785. 1792–1794——Particulars as to the rates charged by the company for railway insurance, the maximum amount insured being 1,000 *l.* for a first-class passenger, *ib.* 1776–1784. 1791.

Practice as to the issue of insurance tickets, and as to the persons who insure keeping their tickets or sending them to their friends; facilities in this respect, *Vian* 1796–1826. 1828–1840——Non-liability of witness's company in the event of accident through negligence in the assured, *ib.* 1797–1800——Frequency of exaggerated claims against the company, *ib.* 1801.

Necessity of claims being made within fourteen days, save in case of death, *Vian* 1802, 1803—— Allowance of 10 per cent. of the receipts to the booking clerks who issue the tickets, *ib.* 1831——It is entirely false that the company gives a premium to persons who bring them tickets after an accident, *ib.* 1839.

See also *Arbitration.*

Railway Servants. Effect of excessive damages in leading to an excessive punishment of railway servants, *O'Brien* 352, 353——Reference to the accidents to railway servants on the North Eastern line, and the compensation or gratuities given voluntarily in such cases, *ib.* 471–476—— Occurrence of accidents owing rather to negligence of servants than to fault of management, the greatest care being nevertheless taken to secure efficient servants, *ib.* 478, 479. 486, 487——Varying hours per day for which railway servants are employed, it being essential to curtail the labour in certain positions, *ib.* 480–483——Cases of negligence constantly occur on the part of servants who have for years been most careful, *ib.* 486, 487.

Due care taken by witness's company to secure efficient servants; improper recommendations often made to the companies, *Allport* 738. 764–768.

Explanation

Report, 1870—*continued.*

Railway Servants—continued.

Explanation as to its being now the law that railway companies are not liable for accident or injury to their servants, *Mr. Baron Martin* 888.

Punishment of servants on the Brighton line for infraction of rules, *Laing* 1018–1021 ——Exception taken to a statement that the rules adopted by the companies are constantly neglected by their servants, and that the latter are not properly punished for breach of rules, *Forbes* 1228–1234—— Due investigation made on witness's line whenever trains are late in arriving at stations, and are much behind time in reaching their destination, *ib.* 1256-1262.

Frequent want of discipline in enforcing obedience to rules on the part of the company's servants; instance in the matter of passing signals, *Yolland* 1611–1614. 1677–1682.

Suggestion that railway servants may be induced to take more care if they be allowed a share in the profits from insurance, *Sir J. Hannen* 1767. 1769, 1770.

Inquiry sometimes made by the Board of Trade in cases of accident to the companies' servants, *Tyler* 1944—— Care evinced by the Great Western Company in the appointment and treatment of their servants; system of bonus for good conduct, *Grierson* 2086–2089——Occurrence of accidents chiefly through neglect on the part of the companies' servants, *ib.* 2089.

See also *Liability.*

Responsibility. Importance attached to the views of the Royal Commissioners of 1867 as to the expediency of the present system of management, whereby the responsibility rests entirely with the companies, *O'Brien* 363. 423, 424——Inexpediency of central control which should interfere with the responsibility of the companies for accident, *Laing* 1022–1028. 1035, 1036. 1039–1041. 1058, 1059. 1066–1068; *Mason* 1383; *Eborall* 2145 ——Mischievious effect of interference with the responsibility of the companies, *Tyler* 1844–1848. 1873. 1922. 1945–1948. 1971–1976.

See also *Block System. Board of Trade. Insurance. Management of Railways. Publicity.*

Risk. Much greater facilities given to the travelling public in England than on the Continent, the risk of accident being consequently greater in this country, *Forbes* 1349–1356 —— Conclusion as to the fairness of the public bearing some portion of the risk incurred through the pressure for increased facilities, *ib.* 1356–1358.

See also *Damages. Liability. Insurance.*

Rose, Frederick. (Analysis of his Evidence.)—Is member of the firm of Baxter, Rose & Norton, solicitors to the London and Brighton Railway Company, 2348, 2349—— Submits particulars of several fraudulent claims which arose out of the New Cross accident; several instances also of very excessive damages, 2350–2356——Tendency of juries to give excessive damages unless fraud can be shown; improvement when the matter rests with a sheriff's jury, 2352-2354. 2382–2385. 2393-2399——Valuable protection to the companies if their liability were limited, 2357, 2358.

Several instances of improper conduct on the part both of legal and medical practitioners, 2359-2364——Suggestion that the sum tendered by the companies and paid into court be kept secret from the jury, and that when the damages awarded are less than such sum the claimants be required to pay their own costs, 2365–2373——Fairness, in extreme cases, of compelling the claimants to pay the companies' cost as well as their own, 2368–2370——Very large sums generally claimed, much smaller sums being often accepted, 2374, 2375.

Expediency of notice of injury or of intended claim being given within a short time after the accident, 2376-2381——Great improvement if all claims were dealt with by a tribunal consisting of a Board of Trade inspector, aided by a legal assessor and a medical assessor, 2386-2392——Frequency of the damages awarded being liable to large deduction for payments to doctors and lawyers; the compensation is in fact sometimes swallowed up in costs, 2400–2402.

Royal Commission on Railways. Recommendation by the Royal Commission of 1866 and 1867 for limiting the amount of compensation, in conjunction with arrangements for compulsory insurance, *Blenkinsop* 46-48. 51, 52——Concurrence in the proposal of the Royal Commissioners in 1867 for a limitation of liability, *Sir J. S. Willes* 2249.

Views of the Royal Commissioners adverted to by the Committee as favourable to the principle of limitation of liability, *Rep.* iv, v.

S.

Scotland. Statement as to the plaintiffs, in accident cases in Scotland, being liable for the costs of both sides if the jury return a smaller amount of damages than the amount tendered by the companies in settlement, *Mason* 1362–1364. 1396——Satisfactory composition of the juries in Scotland for deciding compensation cases, *ib.* 1367. 1405–1407——Exceptions taken to the action of the Procurator Fiscal in Scotland in connection with railway accidents, *ib.* 1382, 1383. 1395——Reference to the inquiry by the Procurator Fiscal as being secretly conducted, there being no coroner's inquiry, *ib.* 1417–1419.

Sheriff. Enhanced compensation given when cases go before the sheriff and a jury, *Allport* 655–660.

Shipping Accidents. Limitation of liability for damages in the case of shipping accidents, *Blenkinsop* 26.

Size of Trains. Advantage of trains being kept to a moderate size, and being provided with sufficient break power, *Yolland* 1690–1697. 1721.

Sleeping Carriages. Suggestion that Parliament might require the provision of sleeping carriages, as of smoking carriages, *Tyler* 1856.

South Eastern Railway. Great cost imposed on the South Eastern Company for compensation since 1865; ample inducement for the adoption of all possible precautions even though the compensation be limited, *Eborall* 2145–2157. 2175–2177. 2191.

See also *Block System*, 1. *Staplehurst Accident.*

Special Juries. Mistake of the companies in having cases tried before special juries, *Mr. Baron Bramwell* 866——Undue sympathy of special juries as well as of ordinary juries in their award of damages, *Brown* 1148–1152. 1156.

Speculative Claims. Instances of cases taken up as mere speculations, *Oakley* 314.

See also *Costs.* *Lawyers.*

Staplehurst Accident. Instance of excessive damages in the case of a person killed in the Staplehurst accident, *Mr. Baron Martin* 866——Reference to the Staplehurst accident as having occurred under the block system, *Sir E. W. Watkin* 939–944——Witness submits some particulars relative to the Staplehurst accident and the immense loss entailed upon the South Eastern Company by the consequent compensation cases, *Eborall* 2128, 2129. 2192–2195.

Station Masters' Reports. Value of the station masters' daily reports, *Forbes* 1343.

Steamboat Companies. More unfavourable position of railway companies than of steamboat companies, the latter not being liable in respect of the passengers, *Sir E. W. Watkin* 964–968.

T.

Third-Class Passengers. Large proportion of compensation payments made to third-class passengers, *Blenkinsop* 145–147——Great bulk of the claims from third-class passengers, *Allport* 620. 692. 714.

TRIBUNAL:

Concurrence in the suggestion that when there are numerous claims arising out of the same accident they be all submitted to the Board of Trade, and be dealt with by one tribunal; great saving thereby in the costs, *Mr. Baron Bramwell* and *Mr. Baron Martin* 870, 871. 881——Approval of all cases arising out of the same accident being tried by some one judge or tribunal, *Sir E. W. Watkin* 899, 900. 935, 936.

Conclusions favourable to the trial of all cases by a permanent commission or body of arbitrators, *Laing* 1009. 1052–1057; *Forbes* 1173. 1175. 1247–1251. 1285. 1288–1291——Suggestions for the constitution of a special tribunal for railway cases, *Brown* 1126.

Advantage if the court of inquiry under the Board of Trade were so constituted that it might also deal with compensation claims and assess the damages, *Tyler* 1881–1884——Suggestions in detail in further elucidation of witness's proposal for empowering the Board of Trade to appoint a court of inquiry according to the circumstances of the accident, full power being given to the court to call evidence, *ib.* 1921 *et seq.*

Approval of a court of inquiry comprising a Board of Trade inspector with a legal and medical assessor, *Grierson* 2106–2108; *Rose* 2386–2392——Improvement if accidents

Report, 1870—*continued.*

TRIBUNAL—continued.

dents were inquired into by a court composed of a Board of Trade inspector, with a medical and a legal assessor, and if the same court dealt with the question of damages, *Eborall* 2133. 2138. 2169-2172.

Advantage if all claims arising out of any one large accident were dealt with by the same tribunal, *Sir J. S. Willes* 2244——Efficient tribunal necessary if all claims are to be referred to it for arbitration; suggestions as to its constitution, *ib.* 2256-2261.

Recommendation by the Committee that a court should be established for the trial of cases of railway accidents, without a jury, which would be sufficiently strong to secure the confidence of the public, and which should possess adequate legal experience, and be assisted by engineering and medical advice, *Rep.* v——Should the proposed tribunal be established, the Committee see no reason for altering the present system of unlimited liability, *ib.*

See also *Arbitration. County Court Judges. Judges. Juries.*

Tyler, Captain Henry Whatley. (Analysis of his Evidence.)—Has had seventeen years' experience as an inspector of the Board of Trade, 1841-1843——Dissent from the opinion of Colonel Yolland that the Board of Trade should exercise compulsory powers over railway companies, 1844-1848. 1873——Want of increased pressure upon the companies to adopt improvements, but not by means of direct control in a public department, 1848——Important advantages of the block system, though on some lines there is no necessity for it, and it is very inexpedient to make its general adoption compulsory, 1849-1856. 1874, 1875.

Expediency of legal power of inquiry in the Board of Trade, 1857. 1872——Great injustice in the present system of compensation for railway accidents, 1858, 1859——Objectionable character of the inquiry before the coroner, 1860——Approval of a limitation of liability, with an option in passengers to insure for an additional sum, 1861——Advantage of the liability, if limited, not being affected by the question of negligence, 1862-1864.

Great improvement if compensation claims were dealt with by arbitrators appointed by the Board of Trade, 1865-1868——Proposition for an amended system of inquiry by a court appointed by the Board of Trade, and for greater publicity being given to the recommendations of the inspectors; valuable pressure thereby upon the companies, 1869-1872. 1876-1881——Advantage if the court of inquiry under the Board of Trade were so constituted that it might also deal with compensation claims and assess the damages, 1881-1884.

Suggestions relative to locking the doors of railway carriages, witness proposing that the doors be not locked on either side, and approving of the plan of a hasp or additional fastening, as on the Continent, 1885-1892.

[Second Examination.] Evidence as to the great advantage of continuous breaks, with suggestions for the more extended application of this improvement, 1893-1903. 1982-1985——Improvements effected from time to time in the permanent way, 1904. 1986——Tendency upon some lines to continue in the same groove, and not to introduce improvements with sufficient promptitnde, pressure from without being very desirable, 1905-1915. 1945. 1966, 1967.

Absence of any legal power of inquiry by the Board of Trade further adverted to; this should at once be remedied, 1916-1918. 1933-1938. 1953. 1980——Suggestions in detail in further elucidation of witness's proposal for empowering the Board of Trade to appoint a court of inquiry according to the circumstances of the accident, full power being given to the court to call evidence, 1921 *et seq.*——Further evidence opposed to a power in the Board to compel the adoption of its recommendations, or to control the detailed management of the railways, 1922. 1945-1947. 1952. 1971-1976.

Statement in further explanation of the prompt and increased publicity proposed to be given to the official inquiries into accidents, as well as to the official recommendations resulting from the inquiries; great advantage anticipated from the public opinion thus brought to bear upon the companies, 1922 *et seq.*——Exception further taken to the system of inquiry by the coroner, 1940-1942. 1957-1962——Occurrence of many small accidents which are not worth reporting to the Board of Trade, 1943——Inquiry sometimes made by the Board in cases of accident to the companies' servants, 1944.

Disapproval of any extended system of inspection which should lessen the responsibility of the companies and their officers, 1945-1948——Inaccuracy of a statement as to the Board of Trade not agreeing as to the improvements desirable, 1949. 1951——Explanation that Colonel Yolland and witness were in accord as to the best plan of communication between passengers and guard, 1950, 1951.

Further suggestions with a view to compensation claims being dealt with by arbitrators appointed by the Board of Trade, 1963-1965——Statement as to the locking apparatus at junctions not having been adopted to the desired extent, many accidents having occurred through this default; difficulty on account of the expense and the existence of

Report, 1870—*continued.*

Tyler, Captain Henry Whatley. (Analysis of his Evidence)—*continued.*

patents, 1967–1969. 1998, 1999——Disapproval alike of the compulsory adoption of the locking apparatus, as of continuous breaks or any other improvement, 1970–1976.

Circumstance of improvements being sometimes adopted most readily on the less profitable lines, 1977–1979——Great readiness evinced by the companies to supply information when accidents are being inquired into, 1980, 1981——Less weight to be attached to the recommendations of a newly-appointed inspector than of those experienced in office, 1987–1993.

Suggestion that the liability be limited to 3,000 *l.* for first-class passengers. 1,500 *l.* for second-class, and 750 *l.* for third-class, 1993–1996——Explanation that in making the foregoing suggestion witness concludes that the assessment of damages is to be carried out by an entirely new tribunal, 1997.

U.

United States. Statement as to the liability of railway companies in some of the American States being limited to 5,000 dollars, *Blenkinsop* 42–45; *Sir E. W. Watkin* 903–910; *Forbes* 1263–1265.

V.

Vian, William John. (Analysis of his Evidence.)—Has been secretary for nineteen years to the Railway Passengers Insurance Company, 1771, 1772——Insurance granted by the company, not only against railway accidents, but against accidents generally, the former branch bearing but a small proportion to the whole business of the company, 1773–1775. 1785. 1792–1794——Particulars as to the rates charged by the company for railway insurance, the maximum amount insured being 1,000 *l.* for a first-class passenger, 1776–1784. 1791.

Very small proportion of railway passengers who insure, there being little inducement to do so on account of the liability of the railway companies being unlimited, 1785, 1792–1795. 1832——Circumstance of eighty-seven persons having had insurance tickets in the case of the excursion train which recently met with an accident; enhanced premium charged for insurance by these trains, 1786–1790——Practice as to the issue of insurance tickets, and as to the persons who insure keeping their tickets, or sending them to their friends; facilities in this respect, 1796. 1826. 1828–1840——Non-liability of witness's company, in the event of accident through negligence of the assured, 1797–1800.

Frequency of exaggerated claims against the company, 1801——Necessity of claims being made within fourteen days, save in case of death, 1802, 1803—— Power of the company to make arbitration compulsory; exceedingly beneficial operation of the arrangements in this respect, 1804–1809——Sufficiency of a charge of 3*d.* for an insurance of 1,000 *l.*, in order to cover expenses, and leave a small profit; that is if there were business enough, 1810–1812——Impracticability of varying the insurance with reference to the distance travelled, 1815–1817——Much greater number of persons injured than are reported by the Board of Trade, 1821. 1823, 1824.

W.

Watkin, Sir Edward William. (Analysis of his Evidence.)—Is connected with the South Eastern, the Sheffield, and the Great Eastern Companies, 889, 890. 975——Submits that the present law of compensation for railway accidents is on several grounds impolitic, 891, 892——Injurious effect of the law in restricting cheap travelling for the working classes, 892. 910, 911. 937. 961–963. 975–982. 987–988. 996——Demoralising effect of the law, as shown by the contradictory evidence in disputed cases, as well as by the readiness with which persons claim excessive damages, 893——Instances of very excessive damages, as well as of personal fraud, 894.

Illustration of the want of limit upon the time after an accident within which notice should be served upon the company; witness does not propose any limit of time for actual claims, 894, 895. 901. 933, 934. 948–953. 969–973——Excessive amount of costs for the legal and medical men employed, this class being strongly interested in the continuance of the present system, 895, 896.

Prejudicial effect upon the companies through the sympathies of juries with the persons injured, 897——Advantage if the cases were tried by a judge without a jury, as in France and Prussia, 897, 898——Approval of all cases arising out of the same accident being tried by some one judge or tribunal, 899, 900. 935, 936.

Unfair

Report, 1870—*continued.*

Watkin, Sir Edward William. (Analysis of his Evidence)—*continued.*

Unfair position of railway companies, as compared with other carriers, in being compelled to carry all persons presenting themselves, and in being practically precluded from any voluntary contract, 902, 903——Circumstance of the liability of railway companies in the United States being limited, the limit in Massachusetts being 1,000 dollars, 903–910——Opinion favourable to the same limited sum for all classes of passengers, without reference to fare, 907, 908. 991–995.

Sundry details in explanation of the block system, as carried out on the South Eastern line, the system possessing important advantages, but not securing immunity from accident, and tending to render drivers less careful, 912–932. 939–945. 954–960. 983–986——Objection to the adoption of the block system being compulsory upon the companies, though its advantages are great upon a crowded line, 912–914. 926–932. 959. 983–986——Diminution of accidents, through the greater perfection of engines, carriages, &c. 915. 988, 989.

Payment of 27,000*l.* in compensation by the Sheffield Company in three years, the gross passenger traffic being about 400,000*l.* a year, 938. 946, 947——Ample inducement to the companies to guard against accidents, irrespectively of the liability to compensation, 939——Reference to the Staplehurst accident as having occurred under the block system, 939–944.

More unfavourable position of railway companies, than of steamboat companies, the latter not being liable in respect of the passengers, 964–968——Very few injured persons who fail to claim through want of means, 874——Fair terms on which the companies are always prepared to settle voluntary, *ib.*——Liability to accident, from imperfection on the part of servants, rather than from imperfect plant, the latter being now very efficient, 989, 990.

Whitmore, Charles Shapland. (Analysis of his Evidence.)—Explanation as to Lord Campbell's Act having originated with reference to accidents in mines, witness having in the first instance been called upon to frame clauses, 2000–2003——Grounds for objecting to the county court judges being called upon to determine claims to compensation in respect of railway accidents, 2004. 2008——Great injustice to the companies under the present system, excessive damages being constantly given by juries, and fraudulent claims being often made, 2004, 2005. 2009——Improvement if there were a power in the judges to withdraw cases from juries, 2009.

Willes, Sir James Shaw. (Analysis of his Evidence.)—Considerable experience of witness in regard to the law of compensation for railway accidents, 2207, 2208——Information relative to the liability under the general law of master and servant, and its operation, showing how far it differs from the liability under the law of compensation to railway passengers; contract in the latter case to carry with reasonable safety, 2209–2220——Considerations as to the extended liability of companies since the passing of Lord Campbell's Act; expediency of the damages being limited to the proximate consequences of breach of contract, 2217, 2218. 2225, 2226.

Opinion as to it not being lawful for the companies to stipulate, by notice on the tickets, that their liability was limited, 2221–2225——Excessive damages given by juries, the railway companies being dealt with as though they were insurance companies, and the damages being calculated on a wrong principle, 2227, 2228——Belief that of late juries have given more moderate sums, 2228.

Hardship in the liability being unlimited, whilst the fares are limited, 2229, 2230——Approval of the principle of the Carriers' Act, as involving a limitation of liability, but allowing a right to insure in excess of such liability; this principle might fairly be applied to railway passengers, 2230–2236. 2249–2251——Doubt as to juries frequently awarding a sum slightly in excess of the amount paid into court, in order merely to saddle the companies with the costs, 2237–2240.

Expensive character on the evidence on each side, so that the costs are necessarily high, 2241——Instances of cases having got into the hands of disreputable practitioners; refusal of juries to give damages or costs in some of these cases, 2242——Objections to the county court judges as the tribunal for dealing with compensation claims, 2243. 2255——Probability of much expense and delay by referring each separate claim to an arbitrator, 2244. 2257, 2258.

Suggestions with a view to the adoption of provisions similar to those in the Merchant Shipping Code, whereby the Board of Trade is empowered to appoint an arbitrator, 2244–2247. 2256——Contemplated admission of liability in all cases, if the system of arbitration be adopted, 2247, 2248——Suggestion also that in case of insurance the amount be paid without litigation being allowed, 2248.

Approval of its being necessary to give notice of claim within a certain period, 2252, 2253——Necessity of the claimants proving that there was negligence on the part of the company, 2254——Efficient tribunal necessary if all claims are to be referred to it for arbitration; suggestions as to its constitution, 2256–2261.

Report, 1870—*continued.*

Workmen's Trains. Limit of liability in the case of workmen's trains in the metropolis, *Blenkensop* 37–41. 87——The large displacement of workmen's houses by the railways was the origin of these trains, *ib.* 40.

Examination as to the facilities offered by the North London Railway to the labouring classes, and as to the fares charged, *Mansel* 516 *et seq.*——Explanation in regard to workmen's trains not being run from Homerton, there being no limit of liability in case of accident, and it being doubtful whether such trains would pay, *ib.* 523–542. 569, 570——Limit of liabily to 100 *l.* in case of trains between Dalston and Broad-street, *ib.* 524——Unremunerative character of the penny trains now run over part of the line, *ib.* 542. 565–568.

Very little demand for workmen's trains on the Midland line; expediency of the liability being limited to a small sum in the case of such trains, *Allport* 638.

Details relative to the workmen's trains on the London and Chatham line, showing the beneficial operation of the arrangement by which the liability for each passenger is limited to 100 *l.*, the amount to be determined by arbitration, *Forbes* 1173–1178. 1188–1193. 1246–1252. 1282–1285——The passengers are taken seven miles for a penny, the obligation being to take them three and a-half miles, *ib.* 1176——Average receipt of 4 *s.* 6 *d.* per mile, which admits of a small profit, *ib.* 1178.

Strong objection to any obligation upon railway companies to run workmen's trains at cheap fares, irrespectively of a limitation of liability, *Forbes* 1278–1284, 1282–1284. 1292–1303——Other metropolitan companies, besides the London and Chatham, to whom the principle of limited compensation for workmen has been applied, *ib.* 1286, 1287.

Tendency of a limitation of liability in Scotland to encourage the running of workmen's trains, *Mason* 1369–1372. 1386–1388——Satisfaction expressed with the limitation of liability where workmen's trains are run at a very low fare, *Yolland* 1547–1552. 1719——Experience of the Great Western Company on the subject of workmen's trains; claim to a limitation of liability on account of the cheap fares charged, *Grierson* 2022–2033.

Complaint as to the absence of cheap workmen's trains between Walthamstow and the City, and also between Homerton and the City; short-sighted policy of the railway companies in the matter, *Elderton* 2266 *et seq.*——Claim of the working classes to compensation, in the shape of penny trains for the wholesale destruction of small houses by the railway companies, and the consequent advance in rents, *ib.* 2267–2276. 2284–2298.

Objection by workmen to the limit of 100 *l.* as the liability of the companies in case of accident by the cheap trains; expediency rather of the compensation being settled by arbitration, *Elderton* 2277–2283. 2315. 2319. 2329–2335——Refusal of the North London Company to run workmen's trains save between Dalston and Broad-street, on account of their liability not being limited; communications from the secretary on the subject, *ib.* 2299–2314——Moderate rent of witness's house at Walthamstow; immense number of small houses for the workmen at low rents a little way out of London, *ib.* 2336–2347.

Summary by the Committee of the course pursued as regards workmen's trains, the liability being limited and claims being decided by arbitration, *Rep.* iv, v——Satisfactory working of the experiment, *ib.* v——Recommendation that facilities be given for the extension of the system, and that provision be made to enable railway companies to establish workmen's trains without the necessity of applying to Parliament, *ib.*

Y.

Yolland, Colonel William. (Analysis of his Evidence.)—As one of the inspectors of the Board of Trade has had a large experience of railway accidents, having held numerous inquiries and made numerous reports, 1509–1512——Absence of power in the Board of Trade or the inspectors to call witnesses at the inquiries, or to compel the companies to supply information, 1513–1517——Publication of the inspectors' reports, which are laid before Parliament, 1518——Preparation by witness of a table showing the accidents in 1867, 1868, and 1869; this table delivered in to the Committee, 1519–1521.

Evidence in detail in support of the conclusion that the block system of working is most effectual in the prevention of collisions, and that its compulsory adoption throughout the country is essential, 1522 *et seq.*——Very partial adoption of the system hitherto, 1524, 1525. 1718——Varying cost per mile in applying the system, 1526, 1527——Opinion that it would be no grievance to the large companies in compelling them to adopt the absolute block system over the whole of their lines, 1528. 1655.

Advantage if the adoption of the block system were enforced by Act of Parliament rather than by the Board of Trade, 1529–1531. 1535. 1630, 1631——Constant omission of the companies to adopt improvements until the want of them is shown by accidents on

Report, 1870—*continued.*

Yolland, Colonel William. (Analysis of his Evidence)—*continued.*

on their own lines, 1532, 1533. 1607—— Great number of facing points still unprotected by signals, it being desirable to empower the Board of Trade to enforce the placing of signals, 1533. 1634–1640.

Advantage of compulsory powers of interference in the Board of Trade, the responsibility of the companies not being diminished thereby, 1534–1540. 1601–1607. 1630–1632. 1670–1675 —— Absolute necessity of the block system on the Metropolitan and other lines where the traffic is very heavy, 1534——Statement as to the inspectors not having been consulted on the question of communication between passengers and guard, 1537, 1665, 1666.

Approval of the system of arbitration through the Board of Trade, as in the case of workmen's trains; expediency of an extension of the system, 1541–1545. 1649, 1650 ——Opinion that with the protection of the block system the present fares are high enough to cover the liability, 1546. 1552 —— Satisfaction expressed with the limitation of liability where workmen's trains are run at a very low fare, 1547–1552. 1719——Importance attached to the interlocking of points and signals, especially in connection with the block system, 1567–1569. 1601. 1652–1654——Frequent instances of accidents through culpable negligence, 1573–1575.

Practicability of applying the block system where there are long intervals between the stations, 1589–1591——Pecuniary gain to the companies by adopting the block system, as the cost would be more than covered by the expensive accidents prevented, 1592–1594——Constant neglect by the companies to adopt improvements or precautions recommended in the inspectors' reports, 1595–1601. 1607.

Objection to any limitation of liability unless further powers be vested in the Board of Trade, 1608–1610 ——Frequent want of discipline in enforcing obedience to rules on the part of the companies' servants; instance in the matter of passing signals, 1611–1614. 1677–1682 ——Consideration of the question of break power, witness contending that continuous breaks afford a valuable check upon collisions, 1615–1623. 1683–1697.

Dissent from the view that the block system causes engine drivers to be less vigilant, 1623–1625. 1628, 1629. 1641–1643 ——Valuable effect of the block system as regards accidents at stations as well as elsewhere, 1626, 1627——Difficulty in preventing accidents through fault of the passengers in leaving the trains too hurriedly, 1644–1646—— Doubt as to the advantage of a hasp in addition to the present handles to the doors, 1646–1648.

Further statement as to the expediency of power in the Board of Trade to compel the general adoption of the block system, 1655–1659——Great value of the system even though the signals by which worked may occasionally get out of order, 1660–1663—— Examination as to the qualifications and experience of the inspectors, and of the members of the Board of Trade with reference to the question of empowering the latter to enforce the adoption of particular appliances and precautions, 1664. 1698–1706.

Doubt as to the efficiency of the plans of communication between passengers and guard, save on the South Eastern line, 1667–1669—— Approval of power in the companies to be heard in objection to any appliances ordered by the Board of Trade, 1674–1676——Advantage in trains being kept to a moderate size and being provided with sufficient break power, 1690–1697. 1721.

Excellent manner in which the block system is now worked, though under it accidents may doubtless arise from exceptional causes, 1707–1715——Objection to compulsory orders by the Board of Trade as to the opening or shutting of doors, 1716, 1717—— Disapproval of excursion trains of unwieldy length, 1720, 1721.

Monday, 16*th May* 1870.

Ordered, THAT a Select Committee be appointed to inquire into the cause of Steam Boiler Explosions, and as to the best means of preventing them.

Friday, 20*th May* 1870.

Select Committee nominated:—

Sir Thomas Bazley.
Mr. Tipping.
Mr. Platt.
Mr. Joshua Fielden.
Captain Beaumont.
Mr. Birley.
Mr. Henry B. Sheridan.
Mr. Cawley.
Mr. Lancaster.
Colonel Gray.
Dr. Lyon Playfair.
Mr. Staveley Hill.
Mr. M'Clure.
Mr. Armitstead.
Mr. Hick.

Ordered, THAT the Committee have power to send for Persons, Papers, and Records.

Ordered, THAT Five be the Quorum of the Committee.

Wednesday, 25*th May* 1870.

Ordered, THAT the Select Committee do consist of Nineteen Members.

Ordered, THAT Lord John Hay, Mr. Laird, Mr. Pim, and Mr. Hermon, be added to the Committee.

Thursday, 21*st July* 1870.

Ordered, THAT the Committee have power to report their Observations, together with the Minutes of Evidence taken before them, to The House.

REPORT.

THE SELECT COMMITTEE appointed to inquire into the cause of STEAM BOILER EXPLOSIONS, and as to the best means of preventing them;—HAVE considered the matters to them referred, and have agreed to the following REPORT:—

As your Committee cannot satisfactorily complete their inquiry during the present Session, they have agreed to Report the Evidence they have taken to the House, and to recommend that the Committee be re-appointed early next Session to complete the inquiry, and Report thereon.

21 *July* 1870.

PROCEEDINGS OF THE COMMITTEE.

Tuesday, 14*th June* 1870.

MEMBERS PRESENT:

Mr. Hick.
Lord John Hay.
Mr. Birley.
Mr. Hermon.
Mr. Cawley.
Mr. Platt.
Mr. Armitstead.
Mr. Lancaster.
Mr. Joshua Fielden.
Colonel Gray.
Mr. M'Clure.

Mr. *Hick* was called to the Chair.

The Committee deliberated.

Resolved, "That the inquiry of the Committee be in the first instance limited to the case of steam-boilers used on land, whether stationary or otherwise."

[Adjourned till Thursday, the 23rd instant, at Twelve o'clock.

Thursday, 23*rd June* 1870.

MEMBERS PRESENT:

Mr. Hick in the Chair.

Mr. Lancaster.
Mr. Platt.
Mr. Armitstead.
Mr. Pim.
Mr. Hermon.
Mr. Fielden.
Mr. Birley.
Colonel Gray.
Mr. Cawley.
Dr. Lyon Playfair.
Lord John Hay.
Mr. M'Clure.
Sir Thomas Bazley

Sir *William Fairbairn* and Mr. *Lavington E. Fletcher* were severally examined.

[Adjourned till Monday next, at One o'clock.

Monday, 27*th June* 1870.

MEMBERS PRESENT:

Mr. Hick in the Chair.

Mr. Platt.
Mr. Armitstead.
Mr. Tipping.
Mr. Pim.
Sir Thomas Bazley.
Mr. Staveley Hill.
Mr. Hermon.
Mr. Laird.
Colonel Gray.
Mr. Cawley.
Dr. Lyon Playfair.
Mr. Joshua Fielden.
Captain Beaumont.

Mr. *Lavington Fletcher* further examined.

Mr. *John Penn* examined.

[Adjourned till Thursday next, at Twelve o'clock.

Thursday, 30*th June* 1870.

MEMBERS PRESENT:

Mr. Hick in the Chair.

Mr. Lancaster.	Mr. Cawley.
Mr. Staveley Hill.	Mr. Platt.
Sir Thomas Bazley.	Mr. Pim.
Mr. Hermon.	Dr. Lyon Playfair.
Mr. Birley.	Mr. M'Clure.
Colonel Gray.	Mr. Laird.

Mr. *Charles Thompson* and Mr. *Henry Hiller* were severally examined.

[Adjourned till Monday next, at One o'clock.

Monday, 4*th July* 1870.

MEMBERS PRESENT:

Mr. Hick in the Chair.

Mr. Staveley Hill.	Dr. Lyon Playfair.
Mr. Platt.	Captain Beaumont.
Mr. Armitstead.	Sir Thomas Bazley.
Mr. Laird.	Mr. Lancaster.
Colonel Gray.	Lord John Hay.
Mr. Cawley.	

Mr. *William Richardson*, Mr. *John Anderson*, and Mr. *James Nasmyth*, were severally examined.

[Adjourned till Thurday next, at Twelve o'clock.

Thursday, 7*th July* 1870.

MEMBERS PRESENT:

Mr. Hick in the Chair.

Mr. Platt.	Dr. Lyon Playfair.
Mr. Lancaster.	Mr. Hermon.
Mr. Armitstead.	Mr. Joshua Fielden.
Mr. Tipping.	Mr. Laird.
Sir Thomas Bazley.	Captain Beaumont.
Mr. Birley.	Mr. Cawley.
Colonel Gray.	Lord John Hay.

Mr. *William McNaught* and Mr. *Robert Longridge* were severally examined.

Mr. *L. Fletcher* further examined.

[Adjourned till Thursday next, at Twelve o'clock.

Thursday, 14*th July* 1870.

MEMBERS PRESENT:

Mr. HICK in the Chair.

Lord John Hay.	Mr. Lancaster.
Mr. Platt.	Mr. Joshua Fielden.
Sir Thomas Bazley.	Mr. Pim.
Mr. Hermon.	Dr. Lyon Playfair.
Mr. Laird.	Captain Beaumont.
Colonel Gray.	Mr. Armitstead.
Mr. Cawley.	

Mr. *George W. Barker* and Mr. *Edward B. Marten* were severally examined.

[Adjourned till Monday next, at One o'clock.

Monday, 18*th July* 1870.

MEMBERS PRESENT:

Mr. HICK in the Chair.

Colonel Gray.	Mr. Hermon.
Mr. Laird.	Mr. Pim.
Mr. Armitstead.	Mr. Lancaster.

Mr. *Robert Galloway* and Mr. *William Rideout* were severally examined.

[Adjourned till Thursday next, at One o'clock.

Thursday, 21*st July* 1870.

MEMBERS PRESENT:

Mr. HICK in the Chair.

Mr. Lancaster.	Mr. Birley.
Mr. Tipping.	Mr. Pim.
Mr. Hermon.	Sir Thomas Bazley.
Mr. Laird.	Dr. Lyon Playfair.
Colonel Gray.	Mr. Joshua Fielden.
Mr. Cawley.	

Mr. *Charles Beyer* and Captain *Robertson* were severally examined.

Mr. *Lavington Fletcher* further examined.

The Committee deliberated.

Resolved, "That as this Committee cannot satisfactorily complete their inquiry during the present Session, the evidence already taken be reported to the House, with a recommendation that the Committee be re-appointed early next Session, to complete the inquiry and report thereon."

Report, in accordance with the foregoing Resolution, read and *agreed to*.

Ordered, To report, together with the Minutes of Evidence and Appendix.

EXPENSES OF WITNESSES.

MINUTES OF EVIDENCE.

Thursday, 23rd June 1870.

MEMBERS PRESENT:

Mr. Armitstead.	Mr. Hermon.
Sir Thomas Bazley.	Mr. Hick.
Mr. Birley.	Mr. Lancaster.
Mr. Cawley.	Mr. McClure.
Mr. Joshua Fielden.	Mr. Pim.
Colonel Gray.	Mr. Platt.
Lord John Hay.	Dr. Lyon Playfair.

JOHN HICK, Esquire, in the Chair.

Sir William Fairbairn, Bart., called in; and Examined.

Sir *W. Fairbairn*, Bart.

23 June 1870.

1. *Chairman.*] You are a Member of the Institution of Civil Engineers?—I am.

2. Have you had considerable experience as a practical engineer?—Yes.

3. For how many years?—I have been engaged since I was 14 years of age up to this time, more or less, in engineering.

4. That would be how many years?—Upwards of 60 years.

5. And you have had considerable experience in the investigation of steam-boiler explosions?—Yes, I believe I was one of the first who took anything like an interest in boiler explosions, from the circumstance that I was frequently called in by the coroner in cases of accident when high pressure steam was first introduced, in order to investigate the causes; that was for some years previous to the establishment of the Association for the Prevention of Explosions.

6. Will you be kind enough to give the Committee your early experience of the causes of some of the steam-boiler explosions as well as your later experience?—Boiler explosions were almost unknown a quarter of a century ago, and from the days of James Watt to about the year 1835 it was a rare occurrence to hear of boiler explosions; about that time, when the principle of high steam worked expansively came into use the most disastrous consequences ensued, chiefly from ignorance and the want of knowledge of the properties of steam at a pressure exceeding 10 lbs. per square inch. At that period, that is to say, before the introduction of high-pressure steam, we very rarely had a boiler that was worked above 10 or 12 lbs. per square inch; indeed the Boulton and Watt rule was 7 lbs. on the square inch; so that when the pressure was increased up to 30 lbs. and 40 lbs., they were using that in boilers that were only calculated to stand a pressure of 10 lbs. or 12 lbs. On these occasions I was frequently called in by the coroners of the different districts round Manchester to investigate and explain the causes of those catastrophes. For a number of years I was occupied with these inquiries, so much so as to trench seriously on other duties. It was at this time, and for several years afterwards, that I suggested and advocated the principle on which the present association was founded. These suggestions were submitted to some friends and gentlemen interested in the use of steam, and it was proposed that the millowners and others employed in manufactures should establish themselves into a voluntary association for the protection of property, and the lives of those who worked and lived in the vicinity of boilers and of mills worked by steam. That was about the year 1833–34, I think, and before that time, probably from the year 1830, commenced the working of steam at a much higher pressure than had been usually done before. The suggestion was cordially responded to, a committee was formed, and a public meeting was held in the Town Hall, Manchester, which fully confirmed the principle on which the association was founded. It will not be necessary that I should describe in detail the rules and regulations of this institution, as copies will be handed to each Member of the Committee; and should further information be required, it can be easily obtained from the engineer-in-chief. I would, however, observe that the association is strictly on the voluntary principle, and for a small sum per boiler; the members are not only secured from accidents by the only means applicable for that purpose, but they are guaranteed, should an explosion occur, to the full value of the boiler exploded. Such is the principle on which

Sir *W. Fairbairn*, Bart.

23 June 1870.

the association I have the honour to represent is founded, and I have only to refer to the services it has rendered to the community, and the lives and limbs it has saved since the commencement in 1855, to recommend it as a model for adoption. I have a very strong impression in favour of this association, which is strictly voluntary, and that has worked so well for the last 15 or 16 years; and I do not know of any other association, or any other insurance company, which has worked so well and so satisfactorily as this has done. I do not think that a single life has been lost from the commencement to the present time from boilers in charge of this Association, and that is entirely owing to this careful periodical inspection. If you compare that with the number of accidents which have occurred in other parts, you will find that this association has been much more satisfactory than any other in the kingdom. I have already stated that the voluntary system was adopted in the first instance, and it has worked well ever since. We make no money, divide no dividends, and what surplus arises from the rates is employed in scientific research on subjects connected with the construction of boilers and the use of steam. From this it will be seen that in case all other associations and companies had acted on the same principle, boiler explosions would be almost unknown. Now I am decidedly of opinion that with a very careful periodical inspection, and a thorough inspection of the boilers once a year, we should very rarely hear of any such thing as a boiler explosion, or loss of life or property in that way. I believe the evil chiefly arises from want of careful inspection, and if this was properly carried out there would have been no occasion for my honourable friend in the Chair to have asked for a Committee to investigate a subject which we know thoroughly well can be done without Parliamentary assistance. These views are, however, not popular. It is considered an unsound principle to work for nothing, as we have been doing for the last 15 years; and, in order to show that such was the case, in less than two years after the association was founded, companies, on the principle of insurance, were formed, and are now in operation in different parts of the country. I have always contended against this principle, as it will be seen that the shareholders in these companies are most of them steam users; and although they enter their boilers at a much higher rate than those of our association, they nevertheless prefer it, as a considerable amount of the money subscribed returns again to their pockets in the shape of dividends. Now I maintain that the principle on which boiler insurance companies are founded is not the one calculated to prevent boiler explosions but to a very limited extent, as the natural working of such companies is to make money at the least possible cost, and to enlarge their dividends at the cost of a comparatively limited number of inspectors. The tendency of an insurance company, in a case of this kind, is to make a dividend in the first instance, and that probably at the expense of neglecting that duty which is the most imperative and important; that is to say, very careful periodical inspection. In fact, judging from the number of efficient inspectors employed by the first and largest insurance company in Manchester, where more than 10,000 boilers are enrolled; the number of inspectors are probably in the ratio of one to about 1,000 boilers, perhaps. We have about 2,000 boilers, and seven inspectors; I think the insurance company, which was the first company that was formed, has upwards of 10,000 boilers; and it is a question with me whether they have any more inspectors than we have for the 2,000 boilers. From this it will be noticed that thorough inspection is out of the question, and so long as the practice of making money at the expense of human life remains prevalent, we shall never, in my opinion, be relieved from boiler explosions. On this subject I have just received from Mr. Fletcher, our chief engineer, a document in the tabulated form, giving a statement of the number of persons killed and maimed from boiler explosions since the Association was established 15 years ago; and from this it appears that nearly 1,000 persons have been killed and about 1,100 injured. At the present time he states that we have, on the average, about 50 explosions per annum, and about 160 persons killed and wounded.

7. Mr. *Cawley.*] Is that within your own inspection?—No; it is the number of people that have been killed by boiler explosions in one year, and from that it appears that nearly 1,000 persons have been killed and 1,100 injured during a period of 10 years, according to the table to which I beg to refer.

8. That is in the whole of England?—Yes, in the whole of England for the time given in the table; but Mr. Fletcher will give the Committee full particulars. Allow me now to direct the attention of the Committee to the causes of boiler explosions which, in most cases, will be found to arise from, 1st, undue or dangerous pressure. The remedy for this is a sound and perfect boiler, made of the best material, and on the best principle of construction; also double safety valves well and properly adjusted, water gauges, blow-off cocks, &c., all to be kept in good and efficient working order. In this case the pressure of steam should never exceed one-fourth of the pressure that would burst the boiler; that will give a large margin above that which would absolutely burst a boiler. The next cause is the collapse of flues. There are a number of boiler explosions which take place from the collapse of flues. This is prevented by the introduction of two or more hoops of T or angle iron round the flues, equi-distant in the length of the flue. This is a very important point; it has only been discovered more than ten years ago, and it arose from experiments that I was engaged upon to ascertain the cause of the collapse of tubes. I found out, after repeated experiments, that with the boiler flue which is in use in what is called the Lancashire boiler, the double-flued boiler, two or three feet in diameter, and probably 30 feet in length, that boiler would burst without the hoops with probably a pressure of 100 lbs. per square inch; but if you rivet two hoops and divide the length into 10 feet, and make it stiff, it would then stand a pressure of 400 lbs. on the square inch. Hence I have had myself, and so have others, an impression that a collapse would scarcely occur in a perfectly true circle; but this is not the case, as we find that it follows a certain law, namely, that it is inversely as the length. If, for example, you shorten a flue 30 feet long by means of a perfectly rigid hoop, you double its powers of resistance and so on for the number of hoops that are employed. The next is corrosion; this is a fruitful cause of explosions, and more particularly since the introduction of high steam. The cure for this evil is careful periodical inspection, sound and perfect workmanship, and to see that the boiler is tight and free from

from leakage. I can give the Committee some samples of that (*producing some samples of corrosion*); that is not more than the 32nd part of an inch thick, and it was originally three-eighths of an inch thick. In this case there was one person killed and four others injured. We have had many examples of this; I also produce some specimens of hoops.

9. *Chairman.*] Those hoops are put at the junction of each plate, are they not?—Yes.

10. The section of the hoop being an angle or T iron?—Yes.

11. Mr. *Cawley.*] The important point is this, that you have found the theoretical laws confirmed experience, that the strength is in the inverse ratios of the length?—Yes.

12. And you found that confirmed in that case?—Yes, from external pressure; if you take double this length (30 feet), it collapses, which with a pressure of 100 lbs. to the square inch, and you put a hoop round it and shorten the distance one-half, it will just double the strength, the hoop being outside and perfectly rigid.

13. *Chairman.*] Then the plate might be bent, as shown in the drawing you produce?—Yes.

14. That is the same thing, in fact?—Yes.

15. Mr. *Fielden.*] The flue becomes four times as strong in that case, does it not?—Certainly, if the flue is sufficiently rigid to keep its form, it is not necessary to do any more.

16. *Chairman.*] At what distance should you consider that sufficient rigidity would be obtained if the strength of the plate were sufficient?—Ten feet is amply sufficient.

17. Mr. *Lancaster.*] In other words, a flue 10 feet long would not require strengthening?—No; if you made it 20 feet long, one hoop would do.

18. Mr. *Pim.*] That is to resist the external pressure on the flue?—Yes; any Member of the Committee who wishes to pursue the subject will find the whole of the experimental researches in the "Philosophical Transactions."

19. Mr. *Cawley.*] By putting those hoops around it (which are from their shape of so much greater strength to resist that particular pressure) you practically reduce the boiler into so many short lengths, and the tendency to collapse is then reduced as affecting each short length?—Yes; the fact is, that collapse follows the same law as girders; if you double the length of a girder or beam you will lessen its strength one-half; we did not know that before, but now we do know it, we ought to apply a remedy for it. If, for example, we take a boiler of the ordinary construction, 30 feet long and 7 feet in diameter, with one or more flues, 3 feet or 3 feet 6 inches diameter, we find that the cylindrical external shell is from three to four times stronger in its powers of resistance to the force tending to burst it, than the flues are to resist the same force tending to produce collapse. This being the case in boilers of ordinary construction, it is not surprising that so many fatal accidents occur from the collapse of the internal flues, followed immediately by the explosion and rupture of the outer shell. To remedy these evils, and to place the security of vessels so important to the community upon a secure and certain basis, it is essential that every part should be of uniform strength to resist the forces brought to bear upon it. The equalisation of the powers of resistance is the more important, as the increased strength of the outer shell is absolutely of no value so long as the internal flues, as at present liable to collapse at a pressure of only one-third of that required to burst the envelope by which they are surrounded. (*Vide* "Useful Information for Engineers." Second Series.

20. Mr. *Hermon.*] You have stated that the boiler plate was reduced to that thinness by corrosion?—Yes.

21. Had the corrosive substance any local or other pecularity about it?—We are unacquainted with the nature and the causes of corrosion; on many occasions we are quite at sea about it; the real fact of the matter is, that we have corrosion in a great variety of forms. I believe that we have had the assistance of almost every able chemist upon the subject, and among them, I think, Dr. Lyon Playfair has paid attention to that subject; my opinion is that it has both a chemical and mechanical action. If there is any acidity in the water, or carbonate of lime, forming incrustation, or anything that tends to corrosion, it requires careful attention; if, when you knock the plates with a hammer, you bring off a small scale of oxide of iron, then you expose a fresh surface to chemical action, and corrosion is the result.

22. *Chairman.*] I should be right in saying, that that corrosion takes place generally in places that are out of sight, except it is by some special action?—Yes, the most fruitful cause of corrosion and explosion is that if there is any leakage in the boiler the water begins to ooze out among the brickwork; it gets wet and dry alternately, and it is just as if it was exposed to the atmosphere, and corrosion takes place very rapidly.

23. But it is, generally speaking, out of sight?—Yes, and hence the necessity for constant inspection.

24. Careful inspection will enable such deterioration and corrosion to be found out, you think?—Yes; but there are other examples of corrosion for which we have not found a remedy; we do not know the cause of it where it joins the plates, particularly where at the end of a boiler there is very rapid corrosion going on, like grooving as if with a tool. I have seen that groved all round for half the diameter of the boiler, to the depth of about three-eighths of an inch, leaving nothing but a mere thin shell about the thickness of a shilling.

25. Have you formed any opinion with regard to the cause of that?—With regard to locomotive boilers, I have a very strong impression that, independently of the chemical action that may be taking place from the water that contained in the boiler, there is a mechanical action going on from the change of temperature in the plates; it keeps on longitudinally backwards and forwards, and though it is scarcely appreciable, it always has a tendency to work off any oxide of iron that may be formed, and that more particularly at the riveted joinings of the plates.

26. Mr. *Cawley.*] Is the groove you speak of between the two plates?—No; it is on the solid plate.

27. Mr. *Platt.*] The point is, that the corrosion of which you speak is one of the great causes of the explosion of boilers?—Yes.

28. Is there any other means of detecting this except by regular periodical inspection?—I think there is no other means whatever.

29. Mr. *Armitstead.*] Is corrosion easily detected?—No, it is very difficult to find out sometimes; a great deal of it takes place in the

Sir *W. Fairbairn*, Bart.

23 June 1870.

interior of the boiler. In many cases it will leave a grooved circle of not more than the thickness of a sixpence.

30. You say that the groove is immediately outside the junction of the two plates and not between the two plates?—Yes, it is inside; and the only cure is to examine the inside of the boiler.

31. Mr. *Lancaster.*] But in locomotive boilers it is difficult do it, is it not?—No, you can see it through the man hole in locomotive boilers. I should state that I might multiply those causes, such as enumerating all the different mountings and appendages appertaining to a boiler, but I will not trouble the Committee with these details, as they can be obtained from other witnesses. Suffice it to observe, that the great secret of security is inspection, and where that is duly and properly performed, malconstruction and all other imperfections will be discovered, the dangerous symptoms removed, and the boiler restored to a safe working condition. That certainly is my opinion. Then there is another subject connected with steam-boiler explosions that I am anxious to direct the attention of the Committee to; that is to say, the present unsatisfactory state of the investigations conducted by coroners into the causes of violent and unexpected deaths arising from boiler explosions. On these occasions a jury is empanelled, not composed of men competent to understand the nature of these occurrences, but of persons such as the coroner can find; and in these cases the almost universal verdict is accidental death. Want of intelligence on the part of the jury is, however, not the only evil, as most of the witnesses examined on these occasions are even more ignorant on these questions than the jury, and what appears to me to be wanted is, that the Government, by enactment, as the conservators of human life, should not only supply the means, but should compel the attendance of some scientific well-informed person to undertake the duty of inspection, thoroughly to sift the question in every case of accident, and bring home to the authors the full responsibility of the catastrophe. This officer, whoever he may be, should be perfectly independent and thoroughly conversant with boiler construction and the properties of steam. He should, moreover, be a person of strict impartiality, in whom the public have confidence, and he should be well paid. That is my opinion, so far as the verdict of coroners' juries is concerned.

32. *Chairman.*] You are of opinion, as I gather from you, that most boiler explosions should not be put down as accidental circumstances, but that they are all of them to be accounted for from some definite cause if they are properly investigated?—Yes.

33. You think that we have no business to find coroners' verdicts of "accidental death" given so often as we have them, at all events?—No. I am decidedly of opinion that, with proper inspection and making the owners of boilers responsible (and the inspection should be carefully undertaken, and pursued regularly and periodically, there being a thorough inspection once a year) you would very seldom hear of boiler explosions, and a great number of useful lives would be saved.

34. Mr. *Fielden.*] Do you often find the grooving that you spoke of just now to occur under the water alone, or also where the steam is?—It is more in the water.

35. Do you ever find it where there is only steam?—Yes; I have seen it all round the boiler, but not so intense in the steam as in the water.

36. Mr. *Hermon.*] Do you find this corrosion in any particular district more than others, so that it might be accounted for by any peculiarity in the water?—Yes, in some cases where there is hard water, and there is carbonate of lime, it is much more extensive, or where there is any acidity.

37. Do you employ any remedy by using negative chemical appliances?—I do not know what effect they have. I have not experienced them. There are a great many nostrums which are recommended, but I believe the best thing is careful inspection.

38. Who would you recommend should make the inspection?—I would recommend that it should be at the expense of the owner of the boiler, and I would make it compulsory by law, that they should employ such an association as I I have the honour to represent, or some other.

39. *Chairman.*] Have you such confidence in the sufficiency of a competent periodical inspection, that you think if it were generally adopted throughout the country boiler explosions would practically be prevented?—Perhaps not entirely prevented; but I think they would be very much diminished, and that instead of having to record 50 lives lost every year, we might very likely reduce them to five, and, after further experience, some years none.

40. Would you see any objection to a law to compel every steam user to have his boilers inspected?—No, certainly not. I apprehend that is the object of this inquiry, that the Government should be requested to make it compulsory that every person using a boiler should have it regularly inspected.

41. But not by a Government officer, I suppose?—Certainly not, but by committing it to competent authorities for inspection.

42. Mr. *Birley.*] Suppose this inspection were made obligatory as a universal law, and an explosion took place, would you make the liability of that explosion fall on the owner of the boiler?—If there were lives lost, and it could be proved that he was the cause, I would then make him liable.

43. I am assuming that the boiler had been properly inspected?—I think that should exonerate the owner from the responsibility.

44. Would you make the liability fall on the company in that case?—No, I think not; unless it could be proved that the company had neglected their duty.

45. Then would you look upon it as an unforeseen accident?—Yes; suppose there was a company entrusted with the inspection of your boiler or mine, and they neglected to inspect it periodically, and to see that it was in good working condition, I should say that the consequences would fall on the company.

46. You would have a Government inspector to inquire into the cause of every explosion, and if he found that the boiler company had neglected to inspect the boiler properly, the liability would fall on that company; would that be your view?—No; I am against Government interference at all, if you can possibly do without it. I think it is a very important question who is to be responsible in case of accident, and my opinion is that a person having a boiler should enrol it in an association (I do not like an insurance company, as I think the principle is wrong); he gets it enrolled and

and pays so much a year for its being inspected; and if the association neglects to inspect it, I think the responsibility would fall upon them; but if the owner of the boiler neglects to enrol his boiler, and to see it is regularly inspected, I think the responsibility ought to fall on the owner of the boiler.

47. Suppose an explosion occurs, and that the owner has not neglected his duty, and that the association has not neglected its duty, then you would not cause the responsibility to fall on either, I presume?—Then the boiler ought not to explode.

48. But you have already said that explosions may be expected to occur through unforeseen circumstances, though they may be a very small number?—Yes; some may occur from unforeseen occurrences, such as engineers or stokers interfering with the safety valves, or neglect of duty.

49. Mr. *Hermon.*] You spoke of making certain persons responsible, namely, the owners of boilers and others; I suppose you would not include in that, accidents arising from the carelessness of an employé; for instance, neglecting the water gauge, or the pressure gauge, or a safety valve; if a man who was accustomed to superintend the working of a boiler produced accident himself, it would be rather hard, would it not, that the owner of the boiler should be liable to compensate his family for the loss of that man's life?—I have known a man tie down the safety valve, and tamper with the works; but the responsibility would not be entirely removed from the owner, because you would infer from that that he had not employed a proper person to look after the boiler; but it might arise even with a person who ties down the safety valve; it might be from ignorance; but he runs the risk of being blown up along with the boiler, and he naturally would not do it intentionally for his own sake. Under those circumstances, it would have to be left to the jury to say who was the responsible person.

50. Of course you find more accidents arising from boilers at a high pressure than boilers at a low pressure, do you not?—Certainly. It is the same as kitchen boilers. I believe that during the days of James Watt, when he worked at a pressure of 7 lbs. on the square inch, we never heard of a boiler explosion at all unless it was from gross neglect or being stopped outright, because the moment the steam got up to a pressure exceeding 7 lbs. on the square inch, it forced the water out of the boiler; but that is not the case now with high pressure.

51. Mr. *Fielden.*] Would you test boilers up to four times the pressure at which they work?—I would not exceed one-fourth of the bursting pressure.

52. To what extent would you test a boiler above the working pressure?—Suppose a boiler to burst with a pressure of 400 lbs. on the square inch, I would only work it at 100 lbs. to the square inch.

53. Suppose you work a boiler at 40 lbs. pressure, what would you test it up to?—Not more than double the working pressure; certainly not.

54. Is it your opinion that over-testing a boiler tends to injure it?—There is no doubt of it.

55. Take a piece of iron, for example; if you apply one-half of the weight that would pull it asunder, you injure that iron very considerably?—Yes.

56. Is it not better if you are working a boiler at 40 lbs. pressure, to test it up to 60 lbs. with cold water than to test it up to 80 lbs.?—Yes, perhaps, it is; unless the boiler is new, and then you may double the working pressure.

57. Do you think that a boiler may be considered safe if it is tested at 60 lbs. when you work it at 40 lbs.?—A case might happen where a boiler had been injured by some unforeseen corrosion; it might burst with 80 lbs., and it would not be safe to test it up to 80 lbs., but you might test it up to 60 lbs. A boiler in such a condition would be on the point of explosion even at 40 lbs. pressure, and ought to be removed.

58. It might be dangerous to test a boiler up to 60 lbs. when you could work it at 40 lbs.?—Yes; if you test it up to 60 lbs., and still go on until in a very short period of time, perhaps, it would burst; then comes the question of inspection, which is a very important one, namely, to find out whether the boiler has not been worked so long as to reduce its power of resistance to the extent of one-half the working pressure, and even then it would be unsafe.

59. At what periods should the boilers be inspected; that is to say, what is the longest period that you would propose a boiler should go without being inspected?—I would have it inspected every quarter, and thoroughly inspected once a year to ascertain the state of the boiler.

60. By inspection, do you mean an inspection of the interior of the boiler?—Yes, an inspection of the interior of the boiler and the exterior, too; in other words, a thorough inspection of every part of the boiler.

61. You would have an inspection every three months, you say?—Yes, every three months; but not into the interior of the boiler, unless it were absolutely necessary from incrustration, or something of that kind.

62. What would the quarterly inspection consist of?—You would examine all the valves, and so on, to see that the boiler was in good working order, and give a certificate to that effect.

63. I think that you are in favour of a voluntary inspection rather than a Government inspection?—Yes, certainly.

64. Now suppose this association were appointed, and that everybody was obliged to have his boiler inspected by the officers of that association, how would you create control over them; what machinery would you devise to take care that the association should perform its duty of inspection?—Supposing the association were to employ inspectors, the association would look after those inspectors.

65. But who would look after the association?—They must look after themselves; they are responsible to the public, and they would be of very little value if they wanted to be looked after.

66. But associations do not always do all that they should do, and the difficulty is how to ensure that any voluntary association will do its duty thoroughly?—I am only judging from my experience in our own association; for 15 years it has worked exceedingly well, and if it requires attention, there is an executive committee, and that executive committee not only has a chief engineer who does his duty, but he has a large staff of inspectors under him, and it is the duty of the members of the association who enrol their boilers, to see that they are inspected thoroughly and periodically.

67. From what you state about your associa-

Sir *W. Fairbairn*, Bart.

23 June 1870.

tion, it appears you have a very efficient executive; but suppose from change of time and from necessary changes of persons from death, and so on, in the executive, the executive became apathetic, or that the persons were not energetic, then it seems to me that the association might not do the duty which you depute to it, and for the sake of doing which, you give it arbitrary powers to compel an inspection, is not that so?—I think the Government should deal with that question, as also the members to see that the associations were kept up to the mark.

68. Do you think if we relied upon an inspection by a voluntary association there should be Government control over that association, not to interfere with the minutiæ of their arrangements, but to take care that they did their duty?—There is a circumstance connected with it, and that is this, that any person on enrolling his boiler in such an association would have to pay for it, and very few people will pay for a thing unless they get some return for it to the value of the money they pay; under those circumstances it would naturally work well; but, suppose the association, either from want of care or from leaving to others what they ought to do themselves, was to allow the superintendence of the staff to get out of order, the time would come when something should be done to rectify it; a change of the committee, or something of that kind.

69. Persons subscribe their money in the belief that this inspection would be efficient, and we do not know that it is not efficient; and, of course, the officers would never neglect to go round; but I am supposing a case where they do go round and nominally inspect, though they really do not inspect, the boilers; do you not think, in such a case, that if a voluntary association were allowed to be used as a means of inspection, it would be necessary to have some Government control in the shape of a chief inspector or sub-inspector, to keep a check on the inspectors of the voluntary association?—I think, with regard to the association to which I belong, that their object is that the Government should establish a general principle, not going into detail at all, but leaving that to the associations and to the members of the associations. I think it would be very obnoxious to millowners and those who had factories and boilers, to have a Government inspector overlooking them; it is only in certain cases that I should wish for Government interference.

70. What I gather from you is this, that you think the Government should lay down certain broad principles which must be followed in all cases, and leave the carrying out of the detail of those principles to voluntary associations?—Yes, certainly, as I think a well-organised association, with an energetic committee, and an active superintendant engineer, would be quite equal to the task of managing their own business.

71. You think that would be more effective, and tend more to what we are all aiming at; that is to say, the prevention of explosions, than having a Government inspector to go round?—We cannot foresee the working of a law which does not exist; and very likely any enactment that might be passed by Parliament for the general supervision of boilers, might require after that law had passed, and had been tried, some amendment; at all events it is probable.

72. Colonel *Gray.*] You have had an association in Manchester for 15 years, I think, you say?—Yes.

73. Can you tell the Committee at all, what the proportion of the whole of those who have steam boilers in the district have enrolled themselves in the association?—Only a fraction of them. I think there is probably one-eighth or one-tenth of them. The number of boilers in Manchester and the district would very likely be 50,000, and we have only 2,000.

74. If something could be done to induce more persons to join the association, probably explosions would be very much more prevented?—Yes. There is a great many more boilers insured in insurance companies than there are in associations; one insurance company has 10,000 boilers while we have only 2,000. But although I could not from memory say what the strength of the staff of the insurance companies may be as compared with the staff of our association, I know it is considerably less. If for instance we have as large a staff for 2,000 boilers as they have for 10,000, the result would be a very imperfect inspection on the part of the insurance company.

75. I suppose there is no difficulty in obtaining good, efficient inspectors?—Certainly not; but they must be well paid, and must be intelligent men, and men who understand their work too; they ought to be mechanical engineers, in my opinion, of a superior class.

76. I daresay the reason of more men not joining the association is that they do not see any advantage in it?—They do not like to pay the rates. A great many people have boilers who belong neither to an association nor an insurance company, but they take the responsibility upon themselves.

77. Mr. *Cawley.*] Will you be kind enough to state in a few words what is the particular action which you think the Government could beneficially take in this matter, apart altogether from the voluntary question?—In simple terms I would say that all that is wanted on the part of the Government would be to enact a law that every person having a boiler should be bound to have it inspected by some competent authority; either an association or a company.

78. Would you have the Government take any active means to ascertain and certify the competency of those parties?—No. The fact is, that I think the less we have to do with the Government in a case of this kind the better, excepting that they should establish some general principle that steam boilers should be carefully inspected.

79. Would you leave that without the imposition of a penalty in case it were not done?—I must leave that to the Committee to determine in their Report; but I think that it ought to be under a penalty.

80. Mr. *Lancaster.*] You begin the inspection first by certifying that the boiler is a properly constructed one, I suppose?—Yes.

81. That would be the foundation?—Yes, or we would not accept it. If a boiler is defective in construction, and it is not satisfactory with regard to its powers of resistance, we object to it, and we will not have it.

82. You would retain that power to reject any boiler that did not come up to the standard of the inspector's rule, I suppose?—Yes, certainly. And then having once got a satisfactory boiler into the association, we have to take care that is kept in that state, and in good working order.

83. Any

83. Any neglect of inspection, whether by the owner or by the association, would now come under Lord Campbell's Act, and the owner would be liable for damages, would he not?—Certainly, but I never heard of penalties being exacted.

84. You have already stated that coroners' juries invariably give verdicts of accidental death, and that verdict excludes a case of that kind from the operation of the Act, does it not?—I do not say that in every case the verdict was brought in accidental death; as in several cases the causes have been fully ascertained by inspection. What I complain of is this: that witnesses are examined who are not competent to give an opinion, either from general ignorance or from want of knowledge of the particular subject, and they give evidence that induces the jury to return a verdict of accidental death, when the cause of an explosion might have been known by the examination of competent persons.

85. Mr. *Platt.*] I think we may take for granted that a periodical inspection is necessary, and we are agreed that it would be a very desirable thing?—No doubt.

86. But the means by which that inspection should be carried out is really the important point that we have to consider; now, as far as I understand the answers you have given, you appear to have a decided objection to Government inspection; would that objection be still the same if it was municipal instead of Governmental?—I think that a municipal inspection would not succeed at all, and it would not be much better than a Government inspection. What I want to do with regard to inspection is, that the owners of the boilers themselves should be the inspectors through some association that would really do the thing well.

87. You have been the president of this voluntary association for 15 or 20 years, have you not?—Yes.

88. During that time you have reached only a very small proportion of the boilers in the country, I suppose?—Yes, a very small proportion.

89. Now, I should like to know if, after that 20 years' experience, you do not think the voluntary system has failed?—No, I think not, quite the contrary; I think that a voluntary inspection is safer than any other inspection.

90. But would you not say that you had only got about 2,000 boilers out of about 50,000 in your district?—Yes.

91. Therefore, I ask you, should you not call that a failure in point of numbers?—Yes; but we have reasons for it, and here is a very excellent example set; we have gone on for 15 years without a single person being killed; and if you take the number of 50,000 boilers, how many out of that 50,000 have been killed during that time for want of inspection.

92. We are entirely agreed that great good is done by your association, but how are we to reach the 50,000 that are still left out of your association?—By multiplying the number of associations, but I must leave that to the Committee to determine.

93. But, esteeming highly your opinion, the Committee want to get a suggestion from you, if you please, as to what would be the best means of reaching those people?—I have already stated that the Government ought in my opinion to establish a law to make it imperative that every person having boilers should have them inspected, either voluntary, or as they please; let them agree among themselves how it should be done.

94. That would be, practically, a Governmental inspection, would it not?—No; I do not mean that the Government is to employ inspectors, quite the reverse; I only want the Government to make it compulsory that they should inspect, and leave the owners of the boilers to make the inspection as they please; I have already stated the number of visits that should be given, and a thorough inspection besides, once a year; and it remains with the Government to entertain it or not, as may be expedient.

95. I take your answer with regard to the Government, that you object to their having the inspection of the boilers, and I suggested whether you thought a municipal inspection would answer, and you said "No"; but the Committee are still without an answer with regard to who is the proper party to overlook the inspection, because there must be some authority to whom that must attach, must there not?—I think I said that I was extremely anxious that the Government should make it compulsory that boilers should be inspected; I did not mean that they should inspect the boilers, or that they should appoint a corps of inspectors at all, as in case of accident, either the association or the members would be responsible.

96. But you did not say who should be the parties to appoint those inspectors, and to whom they should be responsible; that is the question, is it not?—I must leave that in the hands of the Committee to say whether a Government inspection is necessary or not. My opinion is, the law of inspection should be compulsory, and inspection would follow as a matter of course.

97. *Chairman.*] I understood you to say that the Government should make it compulsory on the parties to place themselves under inspection, and then you think that the association would appoint their own inspectors?—I do not know whether the Committee understood what I said; but what I said was this: my opinion is, that the Government should compel every person who has a boiler to place himself under inspection.

98. But under whom?—Under the associations, which may form themselves under their own voluntary arrangements.

99. Lord *J. Hay.*] You do not mean that they are to be compelled to form an association?—I do not want the Government to force them to form an association; but I think it would naturally arise, if they were compelled to have the boilers inspected, that they would soon create an association for that purpose.

100. Mr. *Platt.*] I think you said, in the first part of your evidence, that there were two or three kinds of associations, one of which was an assurance association, and you thought that it was a very objectionable one?—Yes.

101. Would you be satisfied that the inspection should be thus: that if the Government said that all boilers should be inspected, certain parties might say, "We prefer to have it inspected by an insurance company"; or have you thought that that would be a very objectionable association for them to go to?—My opinion is, that it is immaterial whether the inspection takes place by an assurance society or by an association; that is a matter of no moment; but the inspection ought to be effective, and fully up to the mark with regard to the nature of the inspection.

102. Mr. *Armitstead.*] Do you think that if any

Sir *W. Fairbairn*, Bart.

23 June 1870.

any accident occurs, the parties in fault should be liable to the parties injured?—I think that people neglecting to put boilers under inspection should be liable. An Act of Parliament would be of no use without that condition, where loss of life and serious injuries are the result.

103. Mr. *Pim.*] You said that there were about 2,000 boilers in the neighbourhood of Manchester under your inspection?—Yes, we have 2,000 boilers in the neighbourhood of Manchester under the inspection of our association, and there are two or three insurance companies in Manchester besides our association.

104. But if in the 15 years that the association has been in existence there have been no accidents, are not the owners of the 2,000 boilers some of the most carefully and respectably managed concerns in the neighbourhood; and do you not think that from their general character, even if there had been no inspection, there would have been no accidents, or very few accidents, in concerns of that kind?—You see the number of boilers that we have under inspection in the association to which I belong is comparatively small with regard to the number of boilers in the United Kingdom. If a law was established to make it penal, that any person having a boiler should neglect to employ some company or association to inspect his boiler in order to prevent explosion, I think it would be a good thing. What that penalty should be, I am not prepared to say. As regards the class of subscribers to the association, they are not a selected class, but the general run of steam users.

105. But if the parties in connection with your association are among the best managed concerns in the kingdom, the experience you have had of there being no accidents is not at all a proof that the inspection would have the same result if you go to a lower class of concerns; would not that be so?—If it were established on the same principle, and carried out with the same interests and perseverance as ours, it would have the same effect.

106. You think that the Government should make a general law that every boiler owner should be forced to submit his boiler to inspection, do you not?—Yes.

107. I suppose your association only extends to Manchester and its neighbourhood?—Just so, and to other parts of the three kingdoms.

108. It does not go over the whole of the kingdom?—I daresay there are many gentlemen who have boilers, some of them more than a dozen boilers perhaps, and they say, "We will inspect our own boilers, and we will do it carefully." Under those circumstances, they take the whole of the responsibility.

109. But the point I wish to raise is this: your association exists in a district in which there are a large number of boilers?—Yes.

110. It is very easy to get up an association of owners of boilers, who are anxious that everything should be well managed, and who are well pleased to have them inspected; but how will your idea work out in places where there are perhaps two or three boilers in the neighbourhood, with no others near them; you would not propose to have a single association all over the kingdom, with a series of local associations; your plan may be easily worked in Lancashire, but how would it be in the remote districts of Ireland?—I think it would work equally well, and we have proved that it works as well in Ireland as in England.

111. But you cannot form an association where there are perhaps only a dozen boilers within a hundred square miles, can you?—In our association, we have boilers in all parts of the kingdom, including Ireland, at a very great distance apart, and our association is contending with regard to the boilers, that they should be inspected, but by whom they should be inspected is immaterial. If the Government were to establish a law to say that no person should use a boiler but what must be regularly inspected on a certain principle (I do not say that ours is the best), there would be no difficulty in working an association, provided you compelled every one to have his boiler inspected.

112. How are the inspectors to be paid?—By the owner of the boiler.

113. So much per horse power?—Yes; if you have half-a-dozen boilers, and enter your boilers into our association, you have to pay 31 *s.* 6 *d.* every year for it, and you obtain proper inspection. That would remove from the owner, to a certain extent, the responsibility of employing proper persons to carry out the instructions of the inspector.

114. You would compel the user of every boiler to pay an annual sum or tax for the inspection?—Yes.

115. Dr. *L. Playfair.*] Would you be satisfied with the private inspection of an engineer?—Yes, I would, if he was a qualified man.

116. But how would you determine his competency?—From a knowledge of his actual experience.

117. But who is to be the determiner of that competency?—The party employing him.

118. Supposing, then, a person in a distant part said, "I will take a local engineer," whose competency nobody knows, would that satisfy your idea of a proper inspection?—Persons at a distance being in communication with a number of persons employing boilers, and enrolling a boiler in an association, are sure to obtain competent inspection.

119. But I am not supposing the case of an association; I am supposing persons employing private engineers of their own; suppose I am a boiler user, and am willing to pay you, as a distinguished engineer, a large fee to inspect my boiler, is there any reason against that?—None whatever.

120. Suppose I am not able to employ a distinguished engineer, and I employ an engineer of far less mark, what is to be the proof of his competency?—You would not be justified in employing an engineer who was incompetent.

121. But you would leave it entirely to me, would you?—Yes, I would leave it entirely to you to take the responsibility; but that is a very rare occurrence; it would be much better for you to enrol yourself in an association.

122. We know that your association is well conducted, but if these associations arose all over the kingdom, what is to be the evidence of an engineer's competency?—You can have no other evidence, but by employing a competent engineer who thoroughly understands his business.

123. Mr. *Fielden.*] With regard to these associations, would you have them registered, and authorised to act by the Government?—Yes, I think so.

124. And

124. And that no association that was not registered should be held a competent association?—I think they ought to be registered, and that they should obtain the authority of Parliament as to their competency to examine boilers.

125. You would not allow any examination to be made by an association that was not registered?—No, I think not; I see no difficulty in having them registered.

126. Mr. *Hermon.*] In the proposed periodical examination by the inspector, would you recommend that the boilers should, at those periodical examinations, be tested at about 40 or 50 per cent. above the working power?—The practice in our association is this; that we test boilers occasionally, when we have any doubt with regard to their security, to something above the working pressure.

127. When a boiler has been declined or condemned, would you not make it imperative that that boiler should cease to be used?—Yes, certainly.

128. That is not the case at present, is it?—No.

129. *Chairman.*] Have you any further remarks to make to the Committee?—No.

Mr. Lavington E. Fletcher, called in; and Examined.

130. *Chairman.*] You are Chief Engineer to the Manchester Steam Users' Association?—Yes.

131. I believe that you have had considerable experience in the investigation of explosions that have taken place in the country generally?—I have paid considerable attention to the subject of steam-boiler explosions, having investigated all the most important cases that have occurred throughout the kingdom since the commencement of 1861, and reported thereon to the president and executive committee of our association. The results of these investigations have been given in the association's printed monthly reports circulated amongst its members, and sent to the public press gratuitously; so that the association has been at considerable pains to acquire information on the cause of these sad disasters, and to disseminate that information as widely as possible.

132. Will you be good enough to make a short statement to the Committee of the number of explosions that have occurred during the last several years, and the results that have attended them?—The records of the Manchester Steam Users' Association show that steam-boiler explosions are both frequent and fatal; I have selected from those records a few leading particulars that will, I think, prove of interest to this Committee. On one occasion as many as 29 persons were killed by a single explosion that occurred at the Millfields Ironworks, near Bilston, on Tuesday, the 15th of April 1862; the wreck caused by this explosion is illustrated in two or three of the photographs now shown (*handing in photographs*). In another case 13 persons were killed by an explosion at an ironworks at Masbro', on Wednesday, the 3rd of December 1862. In another case again 13 persons were killed at an ironworks at Aberaman on Wednesday, 17th February 1864. On this occasion two boilers exploded simultaneously; the wreck is shown by three of the photographs now handed in (*handing in photographs*), while these two plates (*producing iron plates*), cut from the boilers, are illustrations of their corroded state, to which reference will be made shortly. A further explosion, killing 12 persons, occurred at an ironworks at West Bromwich on Tuesday, the 1st of March 1864; the wreck in this instance also is illustrated by two of these photographs (*producing the same*). Another explosion may be named which killed 15 persons and injured 33 others at a bobbin turnery at Bingley, last summer, on Thursday, the 9th of June; the wreck in this instance also is illustrated by these four photographs (*producing the same*). A more recent one, resulting in the death of 13 persons, at the Kidsgrove Ironworks, Staffordshire, on Thursday, the 26th of May last, will be fresh in the memory of all; the ruptured boiler is shown in two or three photographs, which I produce (*producing the same*). These might be regarded as somewhat special cases, but explosions are by no means of occasional occurrence. They recur with the greatest regularity year by year; thus there have occurred already, since the commencement of this year, as many as 20 explosions, killing 44 persons and injuring 34 others; of these, I will hand in a tabular statement, giving the killed and injured in each case (*tabular statement handed in*, see *Appendix*). From that table it will be seen that since the Kidsgrove explosion, which occurred on Thursday, the 26th of May, that is to say, precisely this day four weeks, there have been six other explosions, killing six persons and injuring three others; so that, during the last month, including the Kidsgrove, as many as 19 persons have been killed. Last year, that is to say, in 1869, there were 58 explosions, killing 86 persons and injuring 126 others. Going further back still, as shown in this tabular statement (*handing in a Table*, vide *Appendix*), the Manchester Steam Users' Association has recorded since its formation in the year 1854 up to the close of 1869, as many as 539 explosions, by which 909 persons were killed, and 1,081 others injured. Adding to this those killed during this year it brings the total up to 559 explosions, killing 953 persons, and injuring 1,114 others. The total number of persons injured, including those killed, is 2,067. This, however, is by no means the whole number of lives sacrificed, as, in the earlier years of the association's operations, such complete records were not obtained of all the explosions occurring throughout the United Kingdom as is now the case; so that many escaped its notice. It may be stated that at the present time, on an average, 50 explosions occur every year, killing about 75 persons, and injuring as many others, so that, in round numbers, one explosion occurs every week, and one life is sacrificed every fourth working day in the year. Last year this estimate was exceeded, as many as 86 persons being killed, and already this year, although we have scarcely got half way through, as many as 44 persons have been killed. Thus it will be seen that explosions are not occasional, but that they recur with the regularity of a fixed law; and, judging from the experience of the past year, it appears absolutely certain that, if nothing is done to prevent these fearful catastrophes, by this time next year 50 more explosions will have occurred, and 75 more lives have been

Mr. *Fletcher.*

23 June 1870.

been sacrificed. The number of persons killed every year by boiler explosions exceeds the number of passengers killed on all the railways throughout the United Kingdom. From the Return published by the Board of Trade it appears that from the commencement of 1865 to the close of last year, the number of passengers killed by railway travelling, from circumstances beyond their own control, was 112, while during the same period the number of persons killed by boiler explosions was 336; so that for every passenger who loses his life by railway travelling, from circumstances beyond his own control, three persons are killed by boiler explosions. This will be seen from the accompanying Tables (*handing in same*, vide *Appendix*).

133. Have you found the destruction caused by explosions to be confined to the place where the explosions take place?—No; the mischief done by steam-boiler explosions very frequently extends beyond the works at which they occur, both as regards the destruction of property and the destruction of life. Thus, as recently as this day week only, viz., Thursday, June 16th, a boiler burst at a cotton mill at Blackburn, from the collapse of a combustion chamber, when the torrent of steam and hot water that rushed out from the rent, carried away the wall separating the mill premises from those of an adjoining cottage, and, playing on a young woman in one of the outbuildings belonging to her own dwelling, scalded her to death. This is a photograph of the exploded boiler and wreck occasioned, to which further reference will be made hereafter (*producing a photograph*). This represents the boiler, and this (*pointing to the photograph*) the outbuilding where the young woman was when the explosion occurred. The torrent of steam and hot water broke down the partition wall, and, firing on the young woman, killed her on her own premises. At Oldham an explosion, which occurred on Monday, the 22nd of June 1868, at a small mill let out in tenements to cotton spinners, machine makers, &c., levelled to the ground a workshop on the opposite side of the street. Fortunately no one was in the house at the time; but all the hands might have been at work. This explosion sprung from the collapse of the furnace tube, and this is a sketch of the boiler (*showing a sketch*) which was shamefully unfit for work. Into the causes of these catastrophes, however, I had better not enter at length at present.

134. What number of cases besides of that kind have you had?—A great number. Another explosion which may be referred to in illustration of the fact that the destruction occasioned by explosions is not confined to the works at which they occur, will be fresh in the memory of all; I refer to the one which occurred last year at Bingley. In this case the greater part of those killed were women and children. Adjoining the bobbin factory at which the explosion occurred was a national school, and just as the children were sporting in the playground, the boiler burst, bringing down the factory to which it belonged, burying 25 of the children in the ruins, and crushing eight of them to death; while out of the seven other persons killed, two of them were in their own dwelling-houses at the time. At Newcastle, a woman was standing at the door of her own cottage with her baby in her arms, when some portions of the *débris* scattered by the explosion of a neighbouring boiler struck her child and killed it on the spot. This occurred on Sunday, the 27th of May 1866. At St. Helen's a young woman working at her needle in an upstairs room, in her own dwelling, was struck by a boiler hurled from its seat and dashed against the window at which she sat. In consequence of the injuries she received her leg had to be amputated, and death shortly after ensued. This took place on Thursday, the 13th of August 1863. At Durham, just as an infant was making its first essay at walking across the floor of a room in a collier's cottage, a fragment of an exploded boiler came crashing through the roof, and, striking down the child, killed it on the spot. This occurred on July 30th 1864. At Miles Platting, a group of boys were sporting in a meadow, when the boiler of a locomotive engine just drawn up at an adjoining railway station burst, and scattering one of its fragments among the group, killed one of the boys on the spot, and injured another. This took place on Thursday, 26th May 1865. At Manchester, a house, in which an infirm old woman lay bedridden in an upper room, was demolished by a boiler explosion, when the poor woman with the bed on which she lay, was violently brought to the ground. This occurred on Thursday, the 14th of September 1865. At Morley, near Leeds, a most remarkable explosion occurred. The boiler burst into several fragments, and, flying to considerable distances, invaded the sanctity of three dwelling-houses in the most extraordinary manner. Half of one of the furnace tubes crashed through the roof of a cottage in which two boys were sleeping. Another similar fragment, after clearing one row of two-storied dwelling-houses, and then a street, fell upon the top of another row of houses, breaking through the roof, and lighting on a bed in the room below, while a large weight from the safety-valve lever fell through the roof of another house and alighted on another bed. This explosion occurred on the 27th of June 1863, killing 10 persons and injuring four others. One other case need only be mentioned, which was of very recent occurrence, and is as follows: At Portsmouth, a man walking along a street outside a brewery at which an explosion occurred, was struck down and killed on the spot by portions of the *débris* scattered around, while another man standing at the gates of the brewery, waiting for some grains, was seriously injured, but fortunately not fatally so. His horse, however, was killed, and the cart shattered to pieces, so that his escape must have been a very narrow one. Added to this, two dwelling-houses outside the brewery were levelled to the ground, and others seriously damaged. This occurred on Tuesday, the 29th of March 1870. This will suffice to show that the destruction consequent on boiler explosions is not by any means confined to the works at which the explosions occur, either as regards property or human life. This is of the greater importance now that boilers are of such universal adoption. They are to be found under the pavements of the streets over which we walk, in the kitchens of large hotels and clubs which the public frequent, and in the hearts of our large cities; they are to be found in the basements of factories round which, and over which, numbers of hands are employed. In fact, boilers are to be found everywhere, and at present, anyone has a right to lay down a boiler in almost any situation, too frequently to the imminent jeopardy of the lives of those living near it.

135. What

135. What has been the result of your investigations with regard to the causes of those catastrophes; can you tell the Committee, generally, how many explosions have come under your own observation of that description; I mean explosions causing death generally?—From the table already handed in, showing the number of explosions recorded from the year 1855, when our institution commenced, up to the 31st December 1869, it appears that there were 539 explosions, 909 persons killed, and 1,081 injured, making a total of 2,529 cases of injury.

136. Will you be kind enough to go on to the question of the causes of these disasters?—The cause of explosions has been involved in unnecessary mystery. Investigation shows that steam-boiler explosions do not spring from any subtle or unknown power, but from the pressure of the steam within the boiler, without any momentary and unnatural increase, and in most cases at its ordinary working point. As a rule, boilers burst simply because they are bad, bad either in make, condition, or attendance; so that, in a word, the cause of every boiler explosion is neglect, and the preventive, simply care. All boiler explosions may, as a rule, be attributed to the neglect of the boiler maker, the boiler master, or the boiler minder. Thus some explosions are due to the neglect of the boiler maker, in turning out a bad boiler, to begin with; others to the neglect of the boiler master, in allowing the boiler to be run down in condition, and to be worked out; and others, again, to the neglect of the boiler minder, in allowing the water to run short, &c. Boiler minders are often unjustly accused of causing explosions due to the want of science on the part of the boiler maker, or to the greed of the boiler master. More explosions by far are due to bad boilers, bad either from their original malconstruction, or from their worn-out condition, than to shortness of water; and where the boiler minder has to answer for one explosion, the boiler maker and the boiler master together have to answer for six.

137. Would you be kind enough to give the Committee some information as to the basis on which you ground those conclusions?—In the association's printed report for December last, I gave a summary of all the explosions that had occurred during the year 1869, with a tabular analysis of their causes, from which it will be seen (*handing in the table*, vide *Appendix*) that out of the 58 explosions which occurred last year, 26 arose from malconstruction, 15 arose from defective condition, seven arose from overheating through shortness of water; one arose from overheating through the use of boiler compositions; one arose from overheating, but the cause of which requires further consideration, while in eight cases the cause was not ascertained for the want of full particulars; making a total of 58 explosions. To increase the value of this analysis, I have carried it back as far as the commencement of 1861, and beg to present the Committee with a tabular statement of the result (*handing in a table*, vide *Appendix*). On a consultation of this table, it will be seen that there occurred, between the 1st of January 1861 and the 18th of June 1870, 411 explosions, killing 639 persons, and injuring 782 others. Of this number of explosions, the cause has been ascertained in 297 cases; of the others, sufficiently minute particulars were not obtained to warrant a decision being pronounced; of these 297 explosions, 120, *i.e.*, 40 per cent., were due to the malconstruction of the boilers, either in the shells or fittings; 88, *i.e.*, 29 per cent., were due to the defective condition of the boilers, either in the shells or fittings; 44, *i.e.*, 15 per cent., were due to the failure of the seams of rivets at the bottom of externally fired boilers; 38, *i.e.*, 13 per cent., were due to overheating of the plates; 30 of those due to overheating arising from shortness of water; six from incrustation; one from the use of boiler compositions; and one from causes requiring further consideration: five other explosions, *i.e.*, 2 per cent., being due to excessive pressure of steam through the attendants tampering with safety valves; while one explosion, amounting to, say, ½ per cent., occurred to an economiser, but whether from gas or over pressure of steam is uncertain; and one other, amounting to, say, ½ per cent., arose from causes entirely independent of the condition or construction of the boiler, and may thus be termed "accidental," making a total of 297 explosions the causes of which have been ascertained. A mere glance at that table will show that the two leading causes of the explosions enumerated therein were, one, the malconstruction of the boilers, and the other their defective condition.

138. Will you be kind enough to give the Committee a few illustrations of the explosions which have resulted from malconstruction of the boilers?—A fertile source of malconstruction is the omission of encircling hoops, flanged seams, or other appliances for securing furnace tubes in Cornish and Lancashire boilers from collapse. Here are several sketches of boilers under the inspection of the Manchester Steam Users' Association, in which these flanged seams, or encircling hoops, are shown. These sketches will clearly show what is meant by the terms "flanged seams" and "encircling hoops" (*laying some sketches on the Table of the Committee*). Those have already been before you in Sir William Fairbairn's evidence, so that they are not now so fully needed.

139. It is to the absence of those stays, or hoops, or flanges, that you attribute a great many cases of malconstruction of boilers?—Yes, just so; attention to this subject has been called by Sir William Fairbairn in reports on his researches into the resistance of tubes to collapse, while the necessity of these appliances has been pointed out in the association's reports for years. They are now very generally adopted by many first-class makers, and have been by some for years. Yet, in spite of this, they are neglected by others, and in some parts of the country it is impossible to persuade steam users that a furnace tube can collapse from any other cause than that of shortness of water. Hence a number of explosions from collapse of the furnace tubes, of which one or two illustrations may be given. One such occurred at Messrs. Bass and Company's brewery, Burton-on-Trent, on Thursday, the 1st of June 1865, killing two persons and injuring seven others. The collapsed furnace tube is shown in this photograph (*producing the same*). Another occurred at a tin-plate works near Swansea, on the 4th of April 1866, killing five persons and injuring five others. The collapsed furnace tube in this case is also shown in these photographs (*producing the same*). Another, again, occurred at Strathblane Print Works, Scotland, on the 9th of September 1864, killing seven persons and injuring seven others.

Mr. *Fletcher.*

23 June 1870.

others. Another occurred at the Abercarn Ironworks, in South Wales, on the 22nd of November 1865, killing six persons, as well as injuring nine others. All these explosions would have been prevented by adopting the simple precaution of strengthening the furnace tubes by encircling hoops. Seven explosions occurred from the neglect of this precaution last year, and similar cases might be cited almost without end. Explosion after explosion from this cause has been called attention to in the association's printed reports, and the adoption of the encircling hoops, or other adequate appliances, recommended *ad nauseam*. Yet these explosions go on, and, with the present ignorant prejudice that exists on the subject, they are likely to do so. Perhaps I may be allowed to quote a single brief sentence from my report on the collapse of two Cornish boilers, which happened in May 1868. The sentence is as follows: "Both these explosions occurred in the neighbourhood of the Land's End, where there seems an inveterate prejudice against adopting the simple precaution of strengthening the tubes with rings or other suitable means, in consequence of which fatal explosions constantly occur in the locality, and the single-flued Cornish boiler, though so safe if properly constructed, numbers almost, if not quite, as many explosions as any other. Thus, through persistent malconstruction, its character is seriously damaged. Strange that this should occur in the county that gave this class of boiler birth, and from which it takes its name." Mr. John Hocking, a member of an engineering firm in Cornwall, of long standing, wrote me shortly after, that these remarks on the obstinacy of Cornishmen to strengthen the furnace tubes of their boilers, which he considered not at all too strong, had been copied into the local prints, which he trusted would have a tendency to remove the prejudice against the adoption of the precautions recommended. I mention this to show that the association has not failed to speak very plainly on this subject, and to circulate information broadcast with regard thereto. Yet since the insertion of those remarks in the Cornish papers, explosion after explosion has continued to occur in Cornwall, simply from the collapse of furnace tubes, which might have been prevented by the adoption of the hoops recommended. The monthly report for July 1866 also deals very faithfully with this subject, and gives particulars of five explosions resulting from collapse of furnace tubes. On tabulating a number of explosions that had occurred during six consecutive years, and arranging them according to the class of boiler from which they had sprung, I found, somewhat to my surprise, that out of 227 boilers that burst, 49 of them were of the Cornish class, so that out of every four or five explosions, one springs from a Cornish boiler, or 22·5 per cent.; yet the Cornish boiler when well made and well looked after is one of the safest that can be adopted, and never bursts until it is abused. Further, under the head of malconstruction, it may be stated that a great many boilers burst from weak manholes, in consequence of the plates not being strengthened round the opening with a substantial mouthpiece; I am provided with photographs and models which will illustrate two or three of these explosions (*producing the same*). This is a model of a small crane boiler that burst from a weak manhole, killing four persons and injuring three others, on the 19th of April 1869, at Barking Gas Works; this is a photograph of another small boiler that burst from a weak manhole, at a braid manufactory at Leicester, on the 31st of May 1866, killing one person and injuring one other; this photograph represents another explosion from the same cause, which occurred at a brewery at Norwich, on the 13th of March 1866, killing one person and injuring another; this next photograph represents a portable agricultural boiler which also gave way at the unguarded manhole, on the 9th of January 1865, at Retford.

140. By an unguarded manhole, you mean that it is not strengthened with any ring round it, but simply a hole cut through the plate?—Yes, without a substantial mouthpiece to strengthen it. It will be observed that these are all small boilers, but considerable destruction occurred on their explosion. I have here two plates which will explain the matter to the Committee (*two plates being produced*). These plates are from the boiler itself, and this is where the manhole was, from which the rent sprung; this was a small boiler which you could almost take up and carry away with you.

141. There is no protection there whatever, is there?—None; those are not peculiar cases, but they are very frequent, and the cause is simply what I have already stated; we never approve a boiler until it has a mouthpiece. Explosions from unguarded manholes are very common, by some of them nearly a dozen persons have been killed, though the boilers were small, looking as if they were not capable of doing much mischief.

142. A great many of those boilers which do not appear dangerous to a casual observer are capable of doing much mischief, are they not?—Just so; but people will not be convinced till the boilers burst. Other explosions, due to malconstruction, arise from want of stays, and four boilers burst from this cause last year. Three explosions of this character may be briefly referred to. One occurred on board a steamer lying in the Thames on the 11th of August last, the end of the boiler being blown out, when three persons were killed. This drawing (*producing a drawing*) illustrates the construction of the boiler, and the mode in which it failed. This further drawing (*producing the same*) shows another boiler that gave way from defective staying, at Dudley, on the 27th of November 1867, killing one man. In this case one of the ends of the boiler was blown out, consequent on the removal of the furnace tube. When the furnace tube, which formed a most valuable longitudinal stay, was removed, no adequate provision was made for repairing its loss, and the end was blown out from sheer weakness. This unwise practice of taking out furnace tubes from Cornish boilers without inserting suitable stays in their place, is by no means an infrequent source of explosion; in illustration of which, it may be stated that an explosion from this cause occurred at Aberaman on the 31st of May 1869, killing four persons and injuring four others. Another explosion, owing to the flat end of a boiler being blown out, occurred at Lydney, on the 28th of October last, killing one person and injuring five others. Another explosion from want of stays occurred at Tunstall, on the 28th of July 1866, resulting in the death of two persons and in injury to seven others. In this case the boiler was of considerable size, being as much as 36 feet long by 9 feet in

in diameter, while it was worked at a pressure of from 35 lbs. to 40 lbs. on the square inch. The end was blown out and the boiler thrown to a considerable distance, while, in addition, another boiler alongside was thrown on to a public road, and as this road happened to be on an incline, the boiler went rolling down with a man and a boy at work inside it. These explosions were all the result of unscientific boiler making. In addition to the preceding, malconstruction is sometimes due to defective material and workmanship; in illustration of which, an explosion may be referred to which occurred at Norwich on the 27th of September 1866, by which the works were laid in ruins, seven persons killed, and two others injured. The havoc produced by this explosion is shown in these photographs (*producing photographs*). Other cases of malconstruction are due to the defective equipment of the boilers, such as bad safety valves and bad water gauges. The safety valve which I now place on the Table (*producing the same*), and which is loaded with a direct spiral spring of very inferior construction, was productive of an explosion at Burnley, on the 26th of April 1866, by which two persons were killed and two others injured; while another safety valve of similar construction, fitted to a similar boiler, and turned out by the same maker, caused a second explosion at Liverpool, on the 9th of October 1866, on board a steamship, killing eight persons; this safety valve is so defective that a turn of the nuts adds some 60 or 70 lbs. to the pressure; there was but a thread between life and death. The boiler fitted with this safety valve was styled at the inquest, by a scientific witness, as little short of an "infernal machine"; the expression, though a strong one, appears to have been warranted. One turn of the nuts would make about 80 lbs. difference in the pressure; the man took them off to clean his boiler, and when he had done that, he had nothing to go by except his eye; that was a small boiler, scarcely my own height These drawings show the construction of the boilers from which these explosions sprung, and also the direction of the rents (*producing drawings*).

143. Mr. *Cawley*.] You assume that he had, in fact, screwed it down too tight, do you?—That was so; but the man could hardly help it.

144. Just so; he had nothing to guide him?—No.

145. Mr. *Lancaster*.] There was no neglect on the part of the man in that case, was there?—No; we tested that with water pressure, and we found it the most ticklish thing we ever had to do with; at the inquest, the maker, through his lawyer, endeavoured to attribute this explosion to shortness of the water.

146. One was at Burnley, and the other was on the deck of a steamship at Liverpool?—Yes.

147. The Burnley boiler was a crane boiler, was it not?—Yes; for hoisting purposes.

148. Mr. *Hermon*.] Were those boiler explosions the result of defective construction?—Yes; it is about two or three years since these explosions occurred, and I trust these safety valves are stopped; I called attention at the inquests to the defective safety valves and unguarded manholes. With regard to explosions resulting from defective condition of boilers, I may state that boilers are too often allowed to be worked on till the plates become so wasted away by corrosion, as to be no thicker than a sheet of brown paper. Sometimes this arises from damp in the flues, when the boiler becomes wasted externally, and sometimes from the corrosive action of the feed-water, when the boiler becomes wasted internally. This is the plate which Sir William Fairbairn called attention to in his evidence, which is no thicker than an old sixpence (*producing a plate*). This plate was cut out from a boiler that burst at Wigan, on the 24th of April 1865, killing one person and injuring four others. The fireman, who was only an inexperienced lad of 19 years of age, was standing on the top of the boiler at the time of the explosion, and was blown to a distance of 100 yards, being, of course, killed on the spot. It appears that this boiler had been seldom, if ever, inspected; indeed, the external flues were so contracted, that the attendant stated that no examination could be made; so that the boiler had just been allowed to work on until it burst; while one alongside, which was uncovered by the explosion, was rapidly approaching the same point, the plates being dangerously eaten away where in contact with the brickwork. It may be added, that the owner of this boiler had another explosion at his works only a fortnight before, by which three persons were injured. The explosion due to the thin plate was attributed by the owner to shortness of water.

149. Mr. *Lancaster*.] I wish, in one or two cases, you would give the date from which the boiler was set to work?—I am only afraid of burdening the Committee with too many details; this, I think, was an old boiler.

150. Mr. *Hermon*.] Do you know the pressure on that boiler when it burst?—I think it was about 40 lbs.; at the same colliery they had another explosion a fortnight before that.

151. Mr. *Cawley*.] Can you give the Committee the age of that boiler?—It is not always easy to get the ages.

152. Sir *Thomas Bazley*.] Is it not desirable to know the length of time for which they are actually at work; the age is not always a criterion, is it?—Corrosion would affect the boiler as much without the action of the fire as with it, and, in some cases, more. This is my report on the explosion at the time: "On examining the fragments of the exploded boiler, I found that the primary rent had occurred just where the plates had rested on the brickwork seating, and where they had been so reduced by corrosion for a considerable length as to be as thin as a sheet of paper, so that it was a matter of great surprise that the boiler had not exploded long before; the boiler showed signs of great neglect throughout, the plates being also materially corroded where they had rested on the other side wall. It was difficult to ascertain precisely the age of the boiler, but it was an old one, and reported to have been down not less than 20 years; it had been seldom, if ever, inspected; indeed, the external flues were so contracted that the attendant stated he was unable to get up them to make any examination, so that the boiler had just been allowed to work on until it burst, and the one alongside, which was uncovered by the explosion, seemed to be rapidly approaching the same state, being seriously eaten away where it had been in contact with the brickwork, at which part the plates were shaling off, and were of a bright red colour, from the effects of active corrosion."

153. Can you state at what pressure the boiler was working when it exploded?—I will refer to my report on this explosion made at the time.

Mr. *Fletcher.*

23 June 1870.

From this it seems that the boiler was 25 feet long, 3 feet in diameter, and three-eighths of an inch; the pressure would be about from 50 lbs. to 60 lbs.; it was reported to have been at work not less than 20 years, and had been seldom, if ever, inspected.

154. Mr. *Cawley.*] Have you evidence which you could rely upon that the boiler was actually working at a pressure of 50 lbs. on that thin plate of iron?—I do not know that I have; it would be clear on seeing the explosion that it had gone from the wasting of the boiler, therefore there would be no practical difference whether it was worked at 40 lbs., 50 lbs., or 60 lbs.

155. But we have doubts on our minds whether it is possible that a piece of iron worn to that extent could at any moment have stood a pressure of 50 lbs.?—It depends on the brickwork; it is an astonishing thing, no doubt.

156. Are not people likely to run away with the notion that a boiler will bear a great deal more pressure than we should venture to put upon it, if they find that a thin piece of iron actually did bear a pressure of 50 lbs. to an inch?—It looks a very extraordinary case; even 40 lbs. is extraordinary to me.

157. It is inconsistent with most of the experiments that you have made on the bursting powers of iron, is it not?—I should not trespass on a boiler at that pressure. I have a copy of the evidence given on the inquest at that time, and in it I find "the pressure upon the boiler was about 50 lbs"; but I could not say that it exceeded 25 lbs. These two plates (*producing two plates*) were cut from two boilers worked side by side, and which exploded simultaneously at Aberaman, on the 17th of February 1864, killing 13 persons, and injuring 10 others. The boilers were 43 feet long, 9 feet in diameter, and worked at a pressure of 45 lbs. per square inch. These plates will show, to some extent, the extraordinary manner in which the boilers had been attacked internally by corrosion. The water in this case was drawn from coal workings, and was very corrosive in its character. It might be worth while for the Committee to look at the plate, for it is the most extraordinary plate I ever had. The Committee will see that there is a longitudinal groove in one of the plates.

158. *Chairman.*] Was there a great portion of the iron in that state?—I managed to secure that piece, but I could not get any more. I left with a promise that I should have plenty of it; there was a very large quantity in that state; enough to cover this table.

159. It had been exposed to the action of the water, I suppose?—Yes, decidedly.

160. Sir *T. Bazley.*] You are aware, I suppose, that the corrosive power of the water varies very much in different districts?—Yes; the water in this case was drawn from the coal working, about three miles up, I believe; I believe the longitudinal furrow in this plate (*pointing thereto*) started the explosion of one boiler, and then the other followed. I have one or two more cases, and they are important. This boiler (*producing another plate*) I was told went in two years; and those plates, though now as thin as cardboard, had been originally 7-16ths of an inch thick. This was at Bury.

161. You attribute that to the action of the water, I suppose?—Yes; it was reduced from 7-16ths of an inch to 1-16th, and it had been re-bottomed, I was told, two years before.

162. Mr. *Hermon.*] Was that boiler inspected?—I never heard of the boiler until I heard of the explosion, and went to see it. None of those cases had been under our inspection.

163. Mr. *M'Clure.*] Do you know if this belonged to the inspection of any other association?—I am prepared to enter into that if the Committee wish it. This plate (*producing another plate*) was cut from the boiler that exploded at Bingley on the 9th of June 1869, killing 15 persons, and injuring 33 others. The boiler gave way at the bottom of the external shell, where the plates were seriously reduced in thickness by corrosion. This plate (*producing another plate*) was cut from a boiler which exploded at Accrington on the 19th of October last, killing two persons, and injuring three others. This boiler gave way at the bottom of the external shell, in consequence of extensive corrosion of the plates when in contact with the brickwork. The specimen will be found at the line of fracture to be reduced to the thickness of 1-16th of an inch. In this case the boiler was improperly set, and the brickwork was damp.

164. Mr. *Pim.*] That was a case of external corrosion, was it not?—Yes.

165. And the previous two cases were internal corrosion?—Yes, the previous two were cases of internal corrosion.

166. Mr. *Platt.*] You would not attribute that entirely to the boiler being set in damp brickwork, would you?—It was not set in damp brickwork, but there was water falling on it, and that kept it constantly damped.

167. *Chairman.*] It could not be inspected, I suppose, in consequence of the bad way in which it was set up?—I believe there was an underspring; at all events, it was low, and there was some question about the roof at one end of the boiler, and there was a dropping on to the top. This plate (*referring to another plate*) is a specimen of most extraordinary boiler repair; it is difficult to do it justice by any description (*the Members of the Committee inspected the plate which stood at the side of the Committee-room, being too large to be produced at the Table*). This plate was cut from a boiler which exploded near Kidderminster on the 16th of July last, killing one person, and injuring four others. It will be seen that the plate is reduced by external corrosion to the thickness of a sheet of paper.

168. How long had that boiler been at work?—The boiler in question was of the plain cylindrical egg-ended externally fired class, and measured about 21 feet in length, by four feet six inches in diameter, while the thickness of the plates was as nearly as may be 3-8ths of an inch, and the ordinary working pressure about 50 lbs. on a square inch. It appears that about a year before the explosion happened, the attendant had discovered a flaw on one side of the boiler, which he repaired in the following unsatisfactory manner; instead of having the defective part cut out and a new plate securely riveted to the boiler, he laid a patch about four feet eight inches long, by nine inches wide, on the outside of the boiler over the defective part, and in a horizontal direction, while he laid another patch of very similar dimensions inside the boiler, immediately under the outer one, passing a number of bolts, amounting in all to 37, through the three thicknesses, and leaving between each of the patches and the boiler plate, a layer about half an inch thick of hemp or felt, or something very similar, in order

to

to make the whole straight and watertight. To accommodate the length of the bolts to the three thicknesses of the plate and two thicknesses of padding, 49 rough and irregularly shaped bits of iron were put under the nuts as washers, so that the whole presented a most unmechanical and clumsy appearance, looking far more like a relic from a scrap heap than a portion of a boiler worked at a pressure of 50 lbs. on the square inch, on the integrity of which the safety of life and limb depended. Such a patch, or rather plaister, proved, as might be expected, anything but effective. The boiler kept on leaking, and the water trickled down upon the longitudinal seam of rivets just below, eating the heads off on its way, and also thinning the plate a few inches lower down, where it was covered by the brickwork forming the top of one of the side flues, until it was reduced for a length of upwards of four feet down to the thickness of a sheet of paper, in consequence of which the boiler burst, simply from loss of metal.

169. That boiler was not, I presume, under any inspection?—None, except the stoker's.

170. Mr. *Armitstead.*] Did any loss of life occur?—It killed one person and injured four others.

171. *Chairman.*] What was the verdict at the coroner's inquest in this case?—The verdict in the case of the Kidderminster explosion was, "that the deceased died from the effect of a boiler explosion; and the jury were of opinion that the explosion took place in consequence of the boiler being worked in an unsafe state. They attributed the accident to the unskilfulness of the engineer in charge; they did not attribute any carelessness to him, but want of skill. They also expressed satisfaction at the light thrown on the affair by Mr. Inshaw's evidence." By my persuasion they put the boiler under the inspection of Mr. Marten, of Stourbridge. They offered to put it under our inspection, but Stourbridge was nearer for them. This model (*producing a model*) represents a boiler that burst at Her Majesty's dockyard, Chatham, on the 7th of September 1866, killing two persons and injuring three others. The model also shows the lines of rent assumed. In this case the boiler gave way at the bottom of the external shell, where the plates were wasted by external corrosion.

172. This boiler burst from the effects of external corrosion?—Yes.

173. The line of rent seems to have run into the man-hole?—Yes.

174. This was at Her Majesty's dockyard at Chatham?—Yes.

175. And the boiler was under the same kind of inspection as the marine boilers, I suppose?—It was under the inspection of the boiler maker at the dockyard. This photograph (*producing another photograph*) shows the wreck occasioned by the explosion of a boiler through external corrosion at the bottom of the shell when resting on a midfeather. It will be seen that the whole house was laid in ruins, in consequence of which several lives were lost. The explosion took place at Manchester the 23rd of December 1867, killing six persons and injuring four others. This photograph (*producing another photograph*) shows the wreck occasioned by the explosion of another boiler from external corrosion, which gave way at the bottom of the shell. In this case, like the preceding one, the entire works, with the rooms above, were brought to the ground, and several persons buried in the ruins. This explosion occurred at Leeds on the 27th March 1866, two persons being killed and six others injured. This photograph (*producing another photograph*) shows the fragments of another boiler that burst from thinning of the plates from external corrosion at Batley, on the 11th July 1867, killing two men and injuring three others. This photograph (*producing another photograph*) shows the fragments of another boiler that burst at Wortley, from the same cause as the one just referred to at Leeds, on the 30th December 1867, injuring two persons. This photograph (*producing another photograph*) illustrates an explosion that occurred at Messrs. Furlong's, the dyers, near Manchester. I have several cases of that kind that affect the public at large, and not merely those who have an interest in the premises.

176. Mr. *Cawley.*] An explosion will inflict injury for a certain distance beyond the place, irrespective of the question to whom the premises belong?—Of course. Defective condition is a most prolific source of explosions, and many other cases might be given, but it is thought the above will suffice. Explosions arising from this cause are most destructive in their results, inasmuch as the external shell is frequently attacked, and when this gives way, the entire boiler is generally hurled from its seat, torn into a number of fragments, and scattered around on every side. The ravages, however, of corrosion can always be detected, by competent examination, in time to ascertain the danger and avert explosion.

177. *Chairman.*] The Committee understand from your evidence that explosions arise from simple and known causes, and thus that they can be grappled with; would you be kind enough to state in what way you propose to grapple with them?—I should propose to grapple with them simply by competent inspection. Boilers should be inspected in the first instance and tested by hydraulic pressure before leaving the maker's yard, being carefully examined while under pressure. Also they should be periodically inspected while in use, both when under steam and when at rest. Every boiler should receive at least one "entire" examination while at rest every year; that is to say, the boiler should be entered, and the external brickwork flues passed round, and the entire surface of the plates carefully examined. Competent inspection would have detected the weak furnace tubes and the defective staying, as well as the cases of corrosion already referred to, in time to have prevented the explosions; we have found this to be the case from the working of our own association. We have frequently met with dangerous defects in boilers when first enrolled with us. We have found some boilers on the eve of explosion, and have given warning, either of the thin plates or weak furnace tubes, in time to avert disaster. In illustration of this, one or two cases may be given of the condition in which some boilers have been found when first enrolled with the association. I have here a report (*producing a Paper*) on the first examination made of two boilers somewhat recently placed under the inspection of our association. The plates of these boilers were seriously corroded, and one of them so thin that our inspector knocked a hole through with his hammer. It should be added that these two boilers had but one safety valve between them, placed on the steam pipe beyond the steam stop valves,

Mr. *Fletcher.*

23 June 1870.

valves, so that had the stop valves been left shut by inadvertence, as might have been the case in getting up steam, the boilers would have been without any safety valve at all. On a faithful report being made to the owners, they at once pulled out these old boilers and laid down new ones. With such an arrangement of safety valve it is a perfect miracle that the boilers escaped explosion, and, as this case was met with within two or three miles of the Manchester Exchange, it shows that even in that manufacturing centre, independent boiler inspection is highly necessary. In another case, on one of the association's inspectors examining a couple of Cornish boilers (*producing a Paper and drawing*), he found them both so wasted by corrosion along the bottom, where resting on the mid-feather wall, that a thickness of not more than a 16th of an inch remained. The owners at once had the boilers taken out, turned bottom upward, and thoroughly repaired. This is another report (*producing another Paper*) from one of our inspectors on the examination of a Lancashire boiler, which, like the last, was set upon a mid-feather wall. This wall was 18 inches wide, and the plates, where resting on it, were found to be dangerously corroded from one end of the boiler to the other, while the seating was caked with oxide upwards of an inch thick, which had scaled off from the plates. The external flues were excessively damp, and the boiler had been lying at rest for some time. The party in possession at the time of the examination had but just purchased the boiler, and though the plates were completely rotten, it was with much difficulty that he was persuaded that the boiler was unfit for immediate use. Had steam been got up in the boiler but one result could have followed, and the owner has to thank the association for saving him from an explosion, though rather against his will. All the five boilers referred to were just at the bursting point, and this danger was exposed by the association's inspections. Other cases could be given, were it necessary. This, I thought, would be a sufficient list in illustration of the competency of inspection to detect the dangerous condition of bad boilers in time to prevent explosions.

178. Have any of the boilers enrolled in your association exploded?—I can answer that question more accurately if I confine myself to the period during which I have had the honour of being connected with this association, viz., the last nine and a-half years, which, no doubt, will be a sufficiently long range; during that period, with but one exception, to which I will immediately refer, no explosion has sprung from any boiler approved by this association; the exceptional explosion just mentioned arose from the overheating of the furnace crowns of a boiler, consequent on the injudicious use of boiler compositions.

179. Mr. *Cawley.*] Will you be kind enough to state, for the information of some persons who may see this evidence, who may not know it as well as the Members of the Committee, what you mean by that term?—The term "boiler compositions" is a very usual one for chemical compounds put into the water to prevent corrosion or incrustation; in consequence of the overheating just named, one of the furnace crowns rent, but the boiler was not stirred from its seat, nor was anyone injured; the practice had been recently adopted, without the knowledge of the association, of heavily dosing this boiler with large quantities of caustic soda and arsenic, and as blowing out was neglected, as it too frequently is when compositions are used, the water in the boiler became nearly as thick as gruel, in consequence of which overheating occurred; this plan of what may be termed "dosing boilers with patent medicines," is a course which this association has never approved, while it has been at considerable pains to warn its members against the danger of such practice; thus, while the boiler was proved as safe, and passed as such by the association, the treatment it received at the hands of its owner was not approved, and it should be observed that it burst through its treatment, which the association had not approved, and not through its construction or condition, which the association had approved; in addition to this explosion, four others sprung from boilers which this association had not approved, and for which it was not responsible. The particulars of all four explosions can be given if required; but, perhaps, the particulars of one will suffice. In this case the boiler was constructed with an oval flue of very weak form. Several explosions had occurred through the weakness of these flues in similar boilers, and the danger had been plainly pointed out to the owner; I had pointed it out myself at an interview, had also written him thereon, while the warning had been repeated in our periodical reports. In consequence of these warnings the owner called upon me with his boiler maker, and arranged for the flue to be strengthened; but this was not done promptly, and while the maker delayed, the boiler burst, as the association said it would, if not strengthened. This explosion was simply a confirmation of the correctness of the association's reports.

180. Mr. *Birley.*] That was a second explosion, was it not?—Yes, they were two distinct cases. During the last 5½ years the association has adopted the plan of endorsing its approval of such boilers placed under its inspection, as it has felt justified in doing, to the extent of 300 *l.* on each boiler, or in other words, of giving a pecuniary guarantee of the safety of each approved boiler to that amount. This draws a distinct line between the boilers approved and those not approved, and has been found to secure a greater amount of co-operation from the members, and also to add weight to the inspections. The only boiler guaranteed by this association that has ever exploded is the one referred to, that failed from overheating of one of the furnace crowns, consequent on being "dosed with patent medicines" without the knowledge or consent of the association. The guarantee system has now been in operation for the last 5½ years, and while during that period only one explosion has sprung from any of the boilers guaranteed by the Manchester Steam Users' Association, 279 explosions have occurred, killing 380 persons and injuring 473 others outside its ranks. Looking at the number of boilers under the charge of the association, even supposing that the collapse of the furnace tube, referred to above, caused by the use of compositions, were reckoned as an explosion for which the association was duly chargeable, it would only make the proportion of the boilers under the charge of this association that explode, to be 1 in 10,000 per annum.

181. How many boilers are there in the kingdom to which those explosions refer?—No one knows

knows how many boilers there are in the kingdom, but they might perhaps be moderately estimated at 100,000.

182. You think it is not more than that?—I cannot say; a consideration of the circumstances previously named, will show that the explosions that have sprung from the boilers under the charge of the Manchester Steam Users Association are no argument against the validity of periodical boiler inspection, and there can be no question that if this system were faithfully carried out and generally adopted, it would prove perfectly adequate to put down all the steam boiler explosions in the kingdom.

183. *Chairman.*] The general opinion appears to be that the only way to put down these explosions is to enforce the periodical inspection of every boiler in the kingdom, is not that so?—It is increasingly so.

184. Will you be kind enough to state to the Committee your views upon that point a little more fully?—In answer to that question I can only state that I should much rather see all the boilers in the country placed under inspection voluntarily than by compulsion, and have done my utmost, while I have had the honour of being connected with the Manchester Steam Users Association, to promote voluntary inspection; but the carelessness of steam users, and the frequency of explosions, with the great loss of life resulting therefrom, drive me to the conclusion that the time has arrived when coercion must be adopted, and that every steam user should be compelled by law to place his boilers under competent periodical inspection, and without this he should not be allowed to use them. Compulsion may be an ugly word, and steam users may object to it, but compulsory inspection will be found to prove a forced benefit, and I cannot see any hardship in compelling careless steam users to do that which careful ones have voluntarily done with so much benefit to themselves for years. The experience of our association has shown two things; one that voluntary inspection will prevent explosions, and the other that steam users, as a rule, will not accept this remedy. There are not at the very outside more than 20,000 boilers throughout the entire kingdom, enrolled either with inspection associations or insurance companies, and as the total number of boilers throughout the kingdom may be moderately estimated at not less than 100,000, it follows that out of every five boilers in the country, not more than one is either under inspection or insurance. Under these circumstances I see no remedy but that periodical inspection should be enforced by law, the result of which, if faithfully carried out, I cannot entertain a doubt would be to reduce explosions to a minimum, and save the greater portion of the 75 lives now annually sacrificed.

185. Have you any suggestion to make to the Committee with regard to the manner in which a general inspection of the steam boilers throughout the kingdom should be carried out?—I should like to be allowed to answer that question negatively in the first instance, because it is rather important to clear the ground; various plans are proposed, and the plan very generally proposed is, that a very heavy deodand or penalty should be levied in the case of an explosion, to make the parties responsible. I should like to touch upon that point.

186. Perhaps you will be kind enough, in the first instance, to state to the Committee what you yourself recommend; if I rightly understand your evidence, your opinion generally is, that this inspection should be carried out so as to bring the whole of the boilers in the United Kingdom under some efficient inspection?—Just so.

187. Mr. *Cawley.*] Your evidence shows two things; first, that the explosions which take place are easily traceable to causes which may be remedied?—Yes, decidedly.

188. And, in the second place, that the remedy is to be found in periodical competent inspection?—Yes.

189. Now we come to the third point; how would you suggest that that competent inspection should be attained?—It seems to me that the best system is as follows: first of all let it be enacted that every boiler should be inspected, and that no boiler should be allowed to be used unless certified as safe and sound. With regard to the parties to administer that inspection, I do not think that it should be administered by the Government imperially or locally; but that to administer it there should be formed one central board, consisting of steam users, so as fairly to represent the general steam interests of the country; this steam board to be so elected that it might win the confidence of the whole of the country, and fairly represent it; it should be composed, in my opinion, of one half of men of commerce, and the other half of men of science. By men of commerce I mean steam users who own boilers, and those who have a direct pecuniary interest in their management. The others should be engineers, and other men of science, having a general interest in the use of steam, and competent to advise the steam board with reference to questions of boiler inspection, and add weight to their counsels. This board, I think, might consist of about 40 members, and control from one centre; but have a number of inspecting centres. About 30 inspecting centres might be required all over the country, or as many as might be found necessary, from which the operations might be conducted. At present our association administers from Manchester. We go as far north as Darlington, and as far south as London, Dover, Portsmouth, and Plymouth. We go as far east as Norwich, and we go as far west as Dublin, Cork, Bantry, and Limerick. Now if we can do our members justice at that distance, it must be clear that they could be done greater justice to with a number of centres, with a radius of about 10 miles, so that the whole number of boilers in the country would receive as full attention, under a general system, as they do now under our system working at Manchester.

190. Mr. *Cawley.*] Would you propose to leave the appointment of the inspecting centres to the central board?—The central board are to rule the whole thing; that is to say, to appoint the staff to administer, make laws, bye-laws, rules, and regulations; to fix the rates, and raise or lower them, as they find necessary, and this power might safely be entrusted to them, as they are steam users themselves, and thus have the right feeling for steam users; in fact, they would be responsible for the whole well-being of the concern.

191. If I rightly understand you, your general scheme is this, that Government should make it obligatory on all steam users to have their boilers inspected?—Yes.

Mr. *Fletcher.*

23 June 1870.

192. And that they should be, in fact, a constituency who should elect a central board, and that the central board should have all the authority of making the necessary laws for carrying out that inspection, and appoint such sub-committees, if I may use the term, or centres of action, as might to them seem necessary for the carrying out of the work?—Very much so; if I may use the term, it would be a national steam users' parliament.

193. You mean national in the sense of being limited to those who are steam users?—Yes, with no sub-commitees; I think that would involve confusion at once.

194. Then what do you mean by inspecting centres?—There would be local staffs of officers for administering the inspection.

195. And they are to report to the central body?—Yes, decidedly; the management is to rest with the central board in Manchester, Leeds, Birmingham, or London. The locality of the central board is to be settled hereafter. There is to be a central board of control, locally elected and operating through local inspecting centres.

196. I suppose you would subdivide the kingdom into districts for elective purposes?—I would have local representation, but a central board of control.

197. But do you mean by local representation that the kingdom would be divided into areas, and that within each area the steam users would elect their representatives?—Yes, so that the board might be responsible to the steam users of the neighbourhood.

198. *Chairman.*] That is to say, such places as Manchester, Bolton, and Preston, would each send one or two representatives to the central board?—Yes, that is what I mean.

199. Mr. *Hermon.*] This Board would have the appointment of the staff of inspectors, I suppose?—Yes, entirely so; if it were worked with local boards, there would be too great a variety of views and opinions upon the subject. Boiler construction is a progressive and not a fixed science, and as has been shown by those tables which I have handed in, more explosions arise from bad boiler-making than any other cause, which proves that boiler-making is not understood. If you had 20 controlling boards, you would have 20 different opinions. A boiler, which is considered safe in Cornwall, we do not consider safe in Manchester; what would be safe at one place would not be safe at another, so that safety would be a question of geography.

200. Mr. *Cowley.*] That is assuming that each sub-committee had an independent authority, but I did not assume that?—It is very generally proposed that inspection shall be carried out by the local authority. I wish to show that central control is essential to integrity of inspection, which is so important.

201. Mr. *Platt.*] According to your plan, you spoke of Manchester, Preston, and Bolton, and all those places having a representative for each place; would that be independently of the size of the town or borough, that is to say, would you only give one representative to Manchester, for instance?—The details of election would have to be considered. The plan which suggests itself to my mind, which of course might admit of development and improvement, would be to elect the board in this way: let there be about 16 representative centres; let the coal trade of the north be represented by Newcastle, and let the cotton and woollen districts be represented by Manchester, Leeds, and Rochdale; those places would not elect the representatives directly, but every corporation would have a voice, and each corporation around those centres would send one of its members to the meeting of delegates to be held by the mayor of each of those towns.

202. Would it not be more simple to delegate the matter to the municipal council at once, and let each municipal authority be responsible for each locality, the same as it is with regard to gas-meters. With regard to gas meters, they are under the inspection of the municipal councils in that way, excepting where they manufacture their own gas, are they not?—I do not think I quite understand your proposition; is it that the municipal authorities should elect their own inspectors?

203. Are you not aware, as a matter of fact, now that the inspector of gas-meters is placed under the municipal councils, where they do not manufacture gas themselves; I ask whether the arrangement would not hold good with regard to boilers?—I think that it would decidedly not hold good, for the reason which I have first given you; you would have all kinds of decisions, and most contrary decisions; the inspections would contradict each other.

204. Mr. *Cawley.*] If an Act of Parliament could by any possibility prescribe the same thing to be done in the working or manufacture of steam boilers as with regard to gas meters, then it would be a matter of small moment whether the corporation appointed inspectors or not, but they have no voice as to what meters shall be fixed under the Gas Act, have they?—Just so.

205. Mr. *Platt.*] To whom are those inspectors to be responsible after you have got your board elected?—It is to be a national board, and it is to be responsible by public opinion to the whole nation, and to the Government; they would be all, or nearly all of them, steam users, and if that steam board fails, the Government must take the thing up; but give the steam board an opportuunity of managing such a system, they would be desirous that the Government should not manage it, and they would see that it did not fail.

206. Dr. *L. Playfair.*] Your idea is very much what exists with regard to the medical education of the country; there is a central board elected by the profession, which manages the whole of the medical education of the country, and there are branch boards in different parts of the kingdom under that board, and the expenses are paid by the profession, just as you would propose that the expenses should be paid by the steam users, I suppose?—Yes; every steam user should pay.

207. Do you mean that the 40 members of the central board should be all paid for their services?—By no means; I propose that it should be an honorary board. A number of persons would be glad to serve; the engineering talent would be the highest that the country could produce, and to have a seat at that board would be a post of great honour.

208. I suppose you know that in the case of the central medical board it is paid for, and that it is extremely expensive to the country?—The labour of this board would not be at all arduous, like that of the medical board.

209. Mr. *Fielden.*] You do not intend to have sectional boards, do you?—By no means. What I propose

I propose is, that there should be one national central board, and every one else engaged in the service should be under its direction.

210. Mr. *Hermon.*] The local person is merely appointed by and under the control of the central board?—Just so.

211. Mr. *Fielden.*] I understand that your answers applied to the election of a central board, and not to any sectional board?—Just so; one national board, locally elected.

212. Mr. *Hermon.*] That is to say, locally elected by the steam users?—Yes; locally elected by the steam users.

213. Mr. *M'Clure.*] Are the expenses to be paid by the steam users?—Every steam user to pay so many shillings for each boiler at a fixed rate.

214. Colonel *Gray.*] Do you think that gentlemen of sufficient eminence would be found ready to serve on that board merely for the honour of it?—I cannot have the slightest doubt of it; it would be a most honourable position, and it would be one that would be sought for by gentlemen of eminence; knowing as I do the working of our association, I am sure the labour of that board need not be onerous at all; the board would merely have to exercise a moral control, and have the power of a veto; they would have to carry out no detailed work whatever.

215. Mr. *Hermon.*] The financial work would be mere controlling, would it not?—Yes; they could stop everything with a word.

216. Mr. *Cawley.*] They would have to lay down rules, would they not?—Yes, the fundamental rules, but the labour of carrying them out would devolve on the paid officers.

217. The success of the whole thing would be secured, you think, by making it absolutely illegal for anyone to use steam boilers, without being subject to that controlling body?—Yes, I think so; I believe that if every boiler were under such an inspection, explosions would be practically prevented; I do not doubt that such a body would carry their duties out honestly, and would be above all minor influences.

218. Sir *T. Bazley.*] Have you considered the question with regard to establishing boards of sectional influence and importance, instead of having one great centre, I mean, as there are about 100,000 boilers in existence, whether it is possible to have 20 sectional boards, representing the 5,000 boilers that would be found, say in each district, with the power of sending a gentleman from each board to the central conference, once a year, on the principle of the British Association; it does appear to me, that where the boilers are, there should also be the administrative talent and knowledge; I do not see how you could very easily communicate from a central board the detailed information that would be required from time to time in the various districts of the United Kingdom; have you considered the matter from that point of view?—Yes, I have considered it from that point of view, and I am sorry that I cannot agree with you in your view of the matter.

219. I was merely asking the question?—I have studied the subject for a very long time, and I could find no point of rest until I arrived at the central board, and since then all difficulties have vanished. I tried every other system. It would have been more satisfactory to my mind if I had been allowed, in giving my evidence, to go through the negative points of the argument in the first instance, as I could in that way have made the matter clearer. If there were separate committees, I am sure that they would all conflict one with another. For instance you cannot get flues encircled with hoops in Cornwall, in spite of all that can be said on the subject. Sir William Fairbairn has made and published researches upon this subject; but it does not matter; you cannot convince Cornish men that it is not shortness of water which causes the explosion. A Lancashire Board would contradict a Cornish Board, and *vice versâ*.

220. Mr. *Cawley.*] By giving separate boards with separate legislative powers, conflicts would arise; but the question is this, could not sub-committees act as administrative boards locally, but not with separate powers?—I was answering Sir Thomas Bazley's observations and did not understand them to mean that.

221. Sir *T. Bazley.*] That is what I meant?—Then the local board would simply be administrative boards.

222. Yes?—In fact, servants of the central board?

223. Yes, not a board perpetually sitting, but a yearly conference; I think there would be a conflict of a most beneficial kind with the sectional boards, inasmuch as in some particular sections there might be a discovery made which would be communicated with great advantage to the central board; and by an annual report of the proceedings of the sectional board with recommendations from the central board, you would arive at a degree of practical knowledge that certainly we do not possess at the present time; have you ever looked at the subject from that point of view?—Perhaps that is a matter for consideration.

224. Mr. *Cawley.*] I gather from what you state that your impression is this, you rather look to this being done by inspection; but the honourable Member for Manchester recommends the thing being done by a local board just as the Inspectors of Factories report to the central authorities?—Just so.

225. You would deal with steam users as you deal with a locality with regard to local government; you would make it imperative that certain duties shall be carried out by the users of steam, but you leave the appointment of the parties to carry that out to be elected by the steam users?—Just so.

226. Mr. *Platt.*] You make it a voluntary matter; you make it compulsory that every boiler shall be inspected, but with regard to the administrative power that is not compulsory?—That is the advantage of the system; you combine the voluntary and compulsory principles.

227. Is that your view with regard to the inspection?—The inspection is to be enforced by the Government, but not administered by the Government. The administration is to be by the steam users themselves.

228. Then you come to this question which I asked Sir William Fairbairn; who are the people who are to be responsible in case of failure or mistake, or who is to call them to order, and bring them into active operation?—I cannot see any weak point there; an honorary board of that kind I propose could be trusted with the inspection of the boilers of the country; they would be steam users themselves; the steam users desire that the

Mr. *Fletcher.*

23 June 1870.

Government should not take them into their hands, and they would know if they did not do their duty, the Government would take the matter under their own control, and that would be the rod *in terrorem* over them; I am sure they would not fail under those conditions, and the highest talent in the country, might be secured for the board.

229. Dr. *L. Playfair.*] I should like to put a case exactly similar; the case of the medical profession; every medical man must be registered and placed on the official register, and pay a fee for registration; do you propose that every steam user should be registered, and should pay a fee corresponding to the number of his boilers in order to meet the expenses?—Yes, a fee on the number of boilers.

230. Next there is a central medical council elected by the medical corporations; you propose that the board in this case should be elected by certain large districts?—Yes.

231. The central medical council is a paid council, and has complete control by Act of Parliament over the whole interests of the medical profession of the kingdom. You propose that your Central Steam Users' Association should have complete control over all the boilers of the kingdom?—Yes, decidedly.

232. In the case of the medical council they have local medical associations, who are the administrators in that locality; you propose that there should be local associations to administer the Central Steam Users' Association, do you not?—No, not local associations; I propose that there should be local officers or staffs of inspectors.

233. Not boards?—No; there would be but one board.

234. There is the difference between the medical scheme and yours?—Yes, there we branch off.

235. *Chairman.*] There is only one central board proposed by you?—Yes.

236. And different district administrations only carrying out the orders of the central board?—Just so.

237. Mr. *Cawley.*] It would be a compulsory board, would it not?—Yes, it would.

238. And that board, I undertand you to say, should have the complete confidence of the parties who use steam, which would be the body who would elect the board?—Yes, the board should have the fullest confidence of the parties who use steam.

239. Mr. *Platt.*] Do you contemplate that this central board should be incorporated by Act of Parliament, or that it shall be simply a voluntary association?—I do not know whether I sufficiently understand what would spring out of being incorporated.

240. You cannot be incorporated without being a corporate body; you would have to obtain Government powers for that purpose, and I presume through an Act of Parliament?—Just so.

241. Sir *T. Bazley.*] My inquiry rather is, whether there might not be instituted local corporations of boiler users who should correspond with the central committee originating in their own bodies, that there should be about 10 individuals each from, say 20 districts in the country, making 200 people in all, and that there should be a central body that should promulgate yearly the discoveries made by those individuals, and should also make recommendations annually with regard to the best manner of preventing accidents?—I understand the idea.

242. Mr. *Armitstead.*] Do you propose that all those who submit boilers to an examination, shall be free from any damage that may arise from explosion to the parties injured, in case it is proved in court that the examination has not been sufficient?—First of all, I will answer that question by stating that I have the fullest confidence in a complete examination; I am justified in saying from our experience that there would be no cases of damage, but still I am willing to accept the possibility of failure. I think your position ought to be met, but I must ask you to grant my position of full confidence in the inspection; but looking at the ulterior possibility, I think it would be right that every boiler inspected and approved, should be guaranteed to a very handsome amount, so that if by any possibility there is a failure, there should be that amount to cover any damage that is done, just as we do at present; we do not wish to give an irresponsible report, and we endorse it with 300 *l.*, not that we expect to have to pay compensation, because we lay out the money in inspection instead.

243. In case the 300 *l.* should be insufficient, do you mean that the parties should pay the damages that the court might give?—In that case the amount might be enlarged.

244. You do not mean absolutely to exclude damages in the case of accidents, do you, if the parties have submitted their boilers to an examination?—I should say decidedly cover them. If the board undertook the inspection of a boiler and the boiler failed through their default, then I should like to see the board pay damages out of the steam users fund.

245. Mr. *Cawley.*] Of course that would be limited to accidents occurring from defects in boilers in which the defects could have been detected, would it not?—Yes; suppose such a rotten plate as that which is before the honourable Chairman, if we could imagine that that could be overlooked by a competent inspector, then the board should pay all damages; but I simply put it as a hypothetical case, I do not believe it possible.

246. Mr. *Armitstead.*] I should like to see penalties attached in case of neglect; would not that be a good thing?—Yes.

247. *Chairman.*] You assume that the inspection which you recommend should be so good and so definite as to prevent the possibility of an explosion; but in case it should occur, I think I understand you to say that parties having complied with all the necessary conditions should be exonerated?—Yes.

248. If the payment made periodically is not sufficient, you must alter your rates; but you assume that the sum paid, say, 25 *s.* or 30 *s.* a boiler, is sufficient to meet all contingencies?—Yes.

249. Mr. *Armitstead.*] My question refers to damage done to any parties whatever; do you think your association should be liable for that?—That is a question of general justice; it hardly affects the question. But my view would be to be liberal in the extreme. If a calamity like an explosion should happen, let everybody who has been injured be compensated; but it is almost a hypothetical question, since competent inspection prevents explosions.

250. Mr. *Fielden.*] But we must consider that possibility, must we not?—Yes.

251. Mr. *Cawley.*] You feel some difficulty as to what the word "incorporated" means, do you not?—I am not a lawyer.

252. What I understand you to mean is this: that an Act of Parliament should be passed, making it compulsory on the parties to elect this board and giving the board powers?—Yes, clearly.

253. Mr. *Birley.*] I understand that you propose that this board should be something like a board of health?—Somewhat.

254. And the qualification for an elector should be the possession of a steam boiler, being registered and paying for so many boilers?—Yes. The board being elected through the medium of the town councils, which might not represent every steam user individually, but be sufficiently comprehensive to represent the body of steam users generally.

255. But who would be the electors of the board?—The steam users.

256. The steam users are to have votes?—Yes.

257. Would you give each man one vote, whether he had one boiler or 50; would the constituency be simply this; that every user of a steam boiler who is registered would be an elector?—The general idea is that every steam user should be an elector, through the medium of the town councils.

Monday, 27th June 1870.

MEMBERS PRESENT:

Mr. Armitstead.
Sir Thomas Bazley.
Mr. Cawley.
Mr. Joshua Fielden.
Colonel Gray.
Mr. Hermon.
Mr. Hick.
Mr. Staveley Hill.
Mr. Laird.
Mr. Pim.
Mr. Platt.
Dr. Lyon Playfair.
Mr. Tipping.

JOHN HICK, Esq., in the Chair.

Mr. Lavington E. Fletcher, re-called; and further Examined.

Mr. *Fletcher*. 27 June 1870.

258. *Chairman.*] The last question asked you at the previous sitting of the Committee was with regard to the number of votes that you would propose to give each man; whether it should depend on the number of boilers, or that each individual should have a vote; have you anything to add to the Committee upon that subject?—I think I stated at the time that the mode of election then recommended was not essential to the plan, but that any plan that would render the board a faithful representation of the views of steam users would meet the object in view; since that I have taken the advice of an eminent barrister upon the subject, who has somewhat modified the mode of election. I have the form of it, as he proposes it should be, and I will give it to the Committee in a very few words.

259. I suppose the Committee are to understand that you hand that in as your own views?—Substantially so, though I would wish decidedly to point out that I should have preferred to have made no reference whatever to the Board of Trade, but I was assured by legal authority that the reference so made was absolutely essential. Whether it be so or not I will leave to the wisdom of this Committee to decide; but my own view of the matter is, that a central board, occupying so high and so public a position as that proposed, might be safely left to discharge its duties, without any assistance whatever from the Board of Trade, and that it would be more congenial to steam users were this the case. The steam board would have the eyes of the country upon it, and were it to fail in the discharge of its duty it would, of course, be blotted out. Steam users and the members of the board themselves would have too much at stake to admit of a failure. It appears to me, therefore, that the element of the Board of Trade might be entirely dispensed with, and I shall be glad if this Committee, in their wisdom, should confirm this view. What I want to secure is a National Board, elected by the steam users themselves, in any way that shall fairly represent them. Before reading the paper I may say that the basis of it is simply this: that 50 explosions occur every year, by which 75 lives are lost. This goes on from year to year, and if nothing is done to stop it we shall have a repetition by this time next year, and the remedy is simply a competent periodical inspection. If the steam users refuse that remedy, the question is, how shall it best be applied so as not to cramp steam users, or harass progress, and yet to prevent explosions. "The proposed measure has regard only to the public safety; it has no commercial or trading element in it. The object is to protect the public against explosions of steam boilers. Such explosions can be reduced to a minimum, if not altogether avoided, by an organised system of periodical inspection. All boilers should be inspected and certified by a public authority, duly constituted for the purpose, with no other object in view than that of efficiently performing a public duty; it should therefore be enacted by Parliament that from a certain period no boiler should be used which is not certified. The authority for carrying out the inspection of boilers and granting certificates should be a board constituted by Act of Parliament, to be called the Steam Boiler Commissioners, or by any other appropriate title. The first members would be nominated by the Act; the board to be periodically recruited by new election, a proportion of the board going out yearly, biennially, triennially, or at other stated periods, as may be considered advisable. The principle of popular election should be adopted as the basis for electing members of the board; the electors would be the proprietors of certified boilers. Candidates for vacancies to the board should be nominated by the electors, and when nominated the Board of Trade should have a veto on the candidature. The election of candidates, approved by the Board of Trade, would be managed through the medium of voting papers transmitted through the General Post Office. The Board of Trade should have the power of introducing *ex officio* members to the board. The proceedings of the board to be conducted according to regulations approved by the Board of Trade, in a manner analogous to the course now adopted for many other public boards. The board would have the power to appoint all appropriate officers. The whole cost of administration to be defrayed out of inspection and certificate fees, paid by boiler proprietors. These fees to be fixed by the board, subject to approval by the Board of Trade. The aggregate of these fees

fees would form a 'fee fund,' from which all expenses would be defrayed; the fees to be, from time to time, fixed according to the exigencies of expenditure. If at any time the fee fund is in excess of authorised expenditure, the surplus to be appropriated under the direction of the Board of Trade, subject to the sanction of Parliament." That just gives the leading principles of the board as proposed; of course there are many points of detail arising upon that scheme.

260. You say "the election of candidates, approved by the Board of Trade, would be managed through the medium of voting papers transmitted through the General Post Office"; do you propose that every steam user should have a vote?—Yes, I propose that every steam user should have a vote for every boiler, so that every boiler would be represented; a man with one boiler would have one vote and a man with ten boilers would have ten votes.

261. Then a man with 50 boilers would have 50 votes?—Yes; every boiler would carry a vote.

262. What number of steam users do you assume there are in the country?—My answer must be taken as only an assumption; but I assume that there are 40,000 or 50,000, because I find, as a rule, that we have two or three boilers to every member, and if you take 100,000, which is a very moderate calculation for the number of boilers in the whole country, you would bring it to about 40,000 or 50,000; but it is, after all, an assumption. We average three to each man; the person who owns a colliery may have 100 boilers, and may have a dozen or 20 collieries; we have three boilers to a set of works, but one man may have 20 works.

263. Mr. *Cawley*.] Your estimate is that 100,000 boilers would be in 50,000 hands?—I think 50,000 is rather high.

264. Mr. *Hermon*.] You state that every steam user should have a vote per boiler?—Yes.

265. And that the committee of management should be chosen by the steam users?—Yes.

266. You also spoke of having a representative of that chosen body in every district or certain districts, did you not?—No, I think not.

267. At all events, you spoke of a local board, so to speak, in each district?—No; there was no proposition of mine for a local board; my idea is a central board.

268. A central board, with the whole control of England and Wales?—Yes, a central board, with the whole control of England and Wales; I am only proposing that for England and Wales at present, leaving Scotland and Ireland out, without any decision whatever about them for the present. My idea is a central board of control, with local representation.

269. In the shape of inspection?—A representation with regard to votes; each steam user has a voice in it.

270. But after the election that representation at the local board would be merely the inspectors, I suppose?—Yes, the officers; they would not be a board; there would be centres of operation, as many as might be necessary, so that the remedy might always be at the doors of the steam users.

271. Colonel *Gray*.] How many members do you contemplate the board being composed of?—I would rather leave that open as a matter of detail, because that can be taken afterwards. I have not considered whether it should be 20 or 40, or what it should be; but I should say 20 would be a good number.

272. You stated in your former evidence it was not proposed that they should be paid?—No, the post should be quite honorary; there should be no inducement to enter on the board but the desire to render the public a service.

273. It would be made compulsory on all steam users to register their boilers, I suppose?—Decidedly so; that is the basis of my scheme.

274. And they would be under a penalty, of course, for neglecting to do so?—Yes.

275. Of course it would be a matter of detail hereafter where the board should meet?—Yes; but it would be at the most convenient centre.

276. Mr. *Cawley*.] In the proposal you have now given us you rather modify your previous idea to this extent, that in the first instance the board would be named by Act of Parliament, and subsequently only those who owned boilers, which had been certified as safe, would have a voice in the matter?—The general principle is the same; the mode of election is modified, subject to the disclaimer I have given. Steam users were before to have a voice, and they have a voice now.

277. But I understood you on Monday to say that the board should be elected by all the steam users?—That is my idea.

278. That word "all," would include the parties using boilers, whether their boilers were sound or unsound; but now the proposition, as I understand you, is, that the first board shall be named by Act of Parliament, and that then the subsequent elections should be limited to those whose boilers are certified?—The term "certified boilers" is used, but I do not see much difference between the certified boilers and the others, because all would have to be certified.

279. No, all would not be certified, because the boilers which were found unfit for use would be rejected, would they not?—They would not exist long.

280. They would have no vote?—Just so.

281. Do you find a greater reluctance on the part of those who use inferior boilers, or who work at a very excessive pressure, to join your association, as compared with those who are more anxious to maintain good boilers?—Those who work the lower class of boilers, of course are the least likely to enter our association.

282. And, as a matter of fact, do not enter, I suppose?—As a matter of fact they do not enter, and if the boiler is entered and a fault is found, the boiler is withdrawn.

283. That is to say, withdrawn from your association?—Withdrawn from our association; they often withdraw if a faithful report is sent in.

284. You mean that if they find the boilers do not meet your approbation, they withdraw from your association?—In many cases if we point out defects which might be remedied, they withdraw the boiler at once.

285. In other words, they withdraw from the association?—Yes, I mean that they withdraw from us, not that they put the boiler on one side.

286. It seems to follow from that, that the parties who really make use of the association are simply those who are desirous to do everything that is necessary to prevent explosions, and that the indifferent people do not take up the question?—I should think that we have, as a rule, the more liberal-minded class of steam users. A liberal-minded steam user may have a bad

Mr. *Fletcher.*
27 June 1870.

boiler, but when it is pointed out to him he meets the case frankly; and such cases we have. We have no difficulty with a man who meets us frankly.

287. This paper you read this morning is a very great change in your system, because I think this proposition becomes, to a large extent, Government inspection, as you give power to the Board of Trade of introducing *ex officio* members, and also rejecting any candidate; is not that so, and would not the effect of that proposition be, to a great extent, to take the thing very much out of the hands of the steam users?—It was thought that it should be somewhat under Government control; but I should prefer to omit that part of the proposal.

288. But it is not quite the open popular scheme which I understood you first to propose? —The main idea is to have a steam users' board. There are many questions about it that will require consideration.

289. But I want your views clearly; your original evidence was that you had confidence in the steam users as a body, electing competent parties who really, as your association does, would desire to carry the Act of Parliament out to its fullest extent; but this new proposition seems to throw doubt upon that, because it introduces an important controlling element; do you think that if left to the parties using steam, it would be sufficient to secure an efficient inspection, or do you think that that is so uncertain that it would be absolutely necessary to introduce this controlling power?—No, I do not think it would be necessary to introduce it with regard to the conduct of the periodical inspection; but my legal authority thought that the general public would have more confidence in the board if there were that latent power, which would only be called into play when it was rendered necessary. It was rather as a provision than otherwise that that was put.

290. *Chairman.*] It was merely as a protection to the public that it was proposed to call in those *ex officio* members?—Yes, a latent protection, not to be called into play unless it was absolutely necessary.

291. Mr. *Laird.*] Do you think that you would get a good class of men to be candidates if, after being elected by the steam users, they were subject to be rejected by the Board of Trade?—It is after being nominated that that would apply.

292. Would it not be as well under that proposal to give power to the Board of Trade to appoint the whole board, since they would have virtually the power of electing the board?—It is only for the Board of Trade to strike out a man that might not come up to the standard.

293. You must put some faith in the steam users in selecting the men, and after you have selected them some of them may be struck off by the Board of Trade if they please; is not that so? —It was thought, I suppose, that there might be a great many more nominated than would be required, and that the Board of Trade would regulate that.

294. Then, in that case, why not let the Board of Trade do the whole of the work, since the board would virtually be appointed by the Board of Trade, under the scheme as it stands. Do you know of any board constituted in this way?—I am told that several boards are constituted very much in that way.

295. Do you know anything of the constitution of the Mersey Dock and Harbour Board?—I cannot say that I do very fully.

296. They are a board publicly elected by the ratepayers, and the Government appoint a certain number; but the Government have no veto on those elected by the ratepayers. Now if you left out this veto, and allowed the steam user to appoint a certain number, and the Board of Trade to appoint a certain number, would that be fairer than your scheme?—That is another way of doing it, if the Board of Trade were admitted at all.

297. But the proposition is that the Board of Trade should have a veto on those who are nominated, and also to appoint a certain number of members, is it not?—Not necessarily to appoint any others, but as a reserve, if they found it necessary, I suppose.

298. Mr. *Platt.*] How often do you consider inspection necessary?—There should be, at least, one annual internal thorough examination; which we should term an "entire."

299. Of every boiler?—Yes, of every boiler.

300. And all those boilers that were not certified would be condemned; that is to say, they would not be used?—It would depend on what was the matter with them; it might be but one plate out of order.

301. But you say that every boiler must be certified?—Yes, before being used.

302. If it is not certified, then I presume you would say that the boiler ought not to be used? —Yes, for the time being; it would not necessarily be condemned *in toto;* it might be only for a week, while the boiler was repaired.

303. Of course you might find that by the substitution of a plate that boiler would be perfectly sound, and then, when the bad plate was taken out and a new one put in, you would certify that the boiler was fit for use?—Yes, quite so.

304. But if that was not the case you would have it condemned?—It would be suspended.

305. That is to say, it would not be used; you would not have a boiler in use until it had been certified?—Quite so.

306. Now then about this board which you propose; supposing the central board should sit in London, what becomes of your local element? —You would have as many inspecting centres all over the country as you found necessary.

307. But you spoke of one central board, did you not?—Yes, with centres of inspection.

308. Would you have the board moving about the country?—No; there would be offices, 30 or 40 centres of inspection, all over the country, where you would have a staff of officers very similar to our Manchester staff.

309. That would be 30 or 40 boards, would it not?—There are no local boards; the inspectors are paid officers; servants.

310. Servants of whom? — Of the central board.

311. That is to say of the central board that sits in London?—Yes.

312. Do you think that the parties in those 30 or 40 centres would simply carry out the instructions which they might receive from the central board in London without exercising any judgment of their own?—Most decidedly; the whole thing could be laid before the central board in London, and they could have the most absolute control, and in a minute put their finger on any point

point to which they objected, or on which they wanted information.

313. Do you think that you could get gentlemen to sit on those boards without any authority except what was delegated to them?—There is only one board.

314. But what are the others?—The others are servants; inspectors, secretaries, and paid officers.

315. Then my question is more pertinent still; where is your local authority for the purpose of supervision?—All the authority is vested in the central board.

316. That is to say when the central board is once elected, then the duty of the steam users throughout the country is ended for the time being, they having delegated all powers to the central board?—Yes, for the time being; but they would always have the ear of the members, and could make their complaints known if they had any.

317. It appears to me that you get rid of all local authority and supervision, according to your proposal, do you not?—I hope I have made it quite plain.

318. Mr. *Armitstead*.] You mean that the board should confine its operations to England and Wales?—Yes.

319. What is your reason for excluding Scotland and Ireland?—It is merely as a commencement; I thought they might prefer to have their own board, but they might possibly be included.

320. I suppose the statistics which you gave the Committee with regard to the number of explosions, and so on, referred to the United Kingdom?—Quite so.

321. Mr. *Tipping*.] Supposing a man had only one boiler, which you refused to certify, and he was at once to order a new one, would you entirely stop his works during the interval of time before he could put the new one in; it would be a serious matter to a man to have everything stopped, from the moment a boiler was not certified, would it not?—It must depend on the condition of the boiler; if the boiler was absolutely working in peril of life it would be stopped.

322. Of course; but you would not lay down an absolute rule upon that point, that an uncertified boiler could not be allowed to work, would you?—No, any boiler that could work would be certified; it would only be stopped if it was in imminent peril.

323. Of course there is a minimum and maximum danger always?—Yes; those cases would have to be met with great consideration and indulgence; we have many of those cases, and we lay down the law so as to meet the members as far as possible.

324. I suppose you consider each member of the board the representative of local constituents, especially with regard to getting over the difficulty of local feeling which has been suggested?—Yes.

325. The members of the board would be like Members of Parliament in that respect?—Yes, as each of them would be open to any complaints of steam users in the neighbourhood, every steam user would feel that he was protected.

326. Mr. *Pim*.] Do you state the number that you propose to have on this central board?—I would rather leave that open as a matter of detail.

327. But you propose that a certain number should be elected, and a certain number appointed by the Board of Trade?—According to the paper which I read, the Board of Trade would exercise a veto, but that is a point for further consideration.

328. I thought you recommended also, that the Board of Trade should appoint certain members in addition to the elected members?—The paper suggests that there should be a latent power of that kind.

329. In this central board would rest the appointment of all officers, then?—Yes.

330. I need hardly ask you this, unless the inspectors were thoroughly suited to their work, they would be of very little value?—Just so.

331. Do you consider that you would be more likely to get a good appointment of inspectors if they were appointed by a central authority sitting in London, than if the country were divided into different districts; say that there was a board for the Lancashire district, and boards for other districts, or say that England was divided into six districts, and that there was a local board in what I may call the Lancashire district; do you think that the probabilities would be more favourable to the good appointment of inspectors by a local board appointing them for those districts in which they were very intimately interested, than by a scheme in which they should be appointed by a board sitting in London?—I think the central board would be able to accomplish that as well as local boards; of course, the board would not take upon themselves the election of all the paid officers, but those whom they held responsible for the execution of the work.

332. Accidents occur very generally through the want of knowledge of the boiler owner, or the persons in charge of them; have you had before you the suggestion that the boiler minder, or some person connected with the boiler, should undergo an examination and prove his competency, in the same manner as the mate of a ship is examined before he can hold that office?—It is rather a mistaken idea to suppose that explosions arise so much from ignorance or neglect on the part of the parties who attend to the boilers.

333. I do not mean necessarily on the part of the boiler minder, but on the part of the persons connected with the boiler, including the owner?—Is the question whether the owner should undergo an examination?

334. No; the suggestion has been made whether any person connected with the boiler should undergo an examination; that is to say, that there should be proof that there was some person in the factory that understood something about it?—Explosions do not arise from that cause as a rule; there is a great mistake on that head. A well-appointed boiler can hardly be injured by any fault of the men.

335. But do you think that any owner who understands his business would have in his place anything except a well-appointed boiler; and if he has a badly-appointed boiler, is it not a proof that he does not thoroughly understand the danger?—It shows that the owner does not understand the danger, and this system of inspection would at once meet that, and prevent any difficulty.

336. How often do you expect the central board to meet; do you expect them to meet frequently, or only once a year?—I think quarterly meetings

Mr. *Fletcher.* 27 June 1870.

meetings would be sufficient for them to grasp everything.

337. There would be no local authority whatever except the local inspectors, would there?—There would be nothing to clash with the authority of the central board, which would be supreme.

338. All the inspectors would be servants of the central board?—Yes.

339. Do you not think that considerable objection would arise if you were to leave Scotland and Ireland out of any such arrangement?—I only propose to leave them out just for the present in considering this matter, and afterwards it might be shown whether it were more desirable to make it one large system or let Scotland have one centre in Glasgow, and Ireland one centre in Belfast. I thought it might be more convenient, and that it might be more easy in the working of it.

340. I think you made a statement about there being 100,000 boilers in the kingdom?—Yes. I say that that is a moderate estimate.

341. You said, on the last day of your examination, something about some very small boilers; would you have any limit with regard to size?—There need be no limit as long as you can get at them to examine them, but when they are so small that a man cannot get inside the flue, and so small that you cannot get round them, they can only be worked on at a risk.

342. Might the boilers you spoke of have been examined?—Yes; they might have been made all right had they been looked after.

343. But one or two of those small boilers exploded; what was the size of the smallest of them; what was its nominal horse-power?—The boiler (*producing a photograph*), by which one person was killed and another injured, was a small boiler with two flues in it, fired underneath; the length was eight feet, the diameter three feet two inches and a half, and the pressure 45 lbs.

344. Was there not another that you spoke of as being so small that you could almost carry it?—Here is another (*producing another photograph*). The height of that is five feet four inches; the diameter two feet four and a-half inches; the plates are a quarter of an inch thick, and the pressure of steam 75 lbs. on the square inch.

345. Was there not one which you said about half your own height?—It was a little higher than that.

346. You think that all those boilers ought to have been inspected?—Most decidedly.

347. Sir *T. Bazley.*] You have stated that you have about 2,000 boilers in your association?—Yes.

348. Now, from my own knowledge, I believe your association to have contributed very essentially to the public safety, and in every respect I believe it to be quite efficient; probably you concur in that opinion?—Yes, quite.

349. Now, with efficient assistance, could you extend the operations of the association to 5,000 boilers?—Undoubtedly.

350. The association, as now existing, has been spontaneously called into existence by the residents in your immediate neighbourhood, has it not?—Yes.

351. As you acknowledge the efficiency of the association, (in which I have the fullest confidonce,) why cannot that principle be extended all over the country; you have been selected with great discrimination by your own neighbourhood, and I do not know that a better appointment could be made; why should you change the system from local to central: the central board acting at a distance of 300 or 400 miles, perhaps, from the scene of action; I recur again to the great convenience that would accrue from a series of local boards originating very much as the Manchester Board originated, and acting on the same principle with a central board to report annually, and promulgate sound opinions on the construction and use of boilers?—I am afraid of the irresponsibility of several boards of that kind, seeing that diversities of opinion occur with regard to boilers; in Cornwall, they will not accept the simple truth that flues collapse from weakness; and you would have the Manchester Association and the Cornwall Association flatly contradicting each other.

352. If an Act of Parliament was simply passed, requiring all boiler users to possess a certificate of safety, you would compel associations to exist in every part of the country where boilers are being used; at the present moment, there are many people who will not permit a scrutiny of their boilers, and will not enter into any association; I, myself, rather believe in the necessity of having an Act of Parliament to compel every user of boilers to possess a certificate of the safety of the boiler; do you not think that more efficiency would attach to local boards with a reference to a central board for the diffusion of useful knowledge for steam users than to one central board?—I am rather afraid of the division of authority between all those boards, and it appeared to me that a national system was the safer system, the board to be composed of first-class talent from the whole country; and their decisions to be diffused over the whole of the country. You would get the pick of the talent on this one board, and this talent would disseminate itself over the whole country. In the other case, you might have a very talented board at one part of the country which would be contradicted by a board at another part.

353. At all events, your association is an instance of what can be done locally?—Yes, I think so.

354. Dr. *L. Playfair.*] You propose that the central board should be the executive board, and have charge of the whole affair?—Yes.

355. And that the central board should meet only four times a year?—It should meet as often as required, but I think four meetings a year would be sufficient to allow the board to grasp the whole matter.

356. In what manner would it be executive; would not that practically make the secretary the executive, and the board a mere name?—All the officers would do their work just as is now done under the Manchester Steam Users' Association; but the board would have a thorough control, and protect the steam users against injustice; nothing would be done that would not pass before them.

357. Then it would be a court of appeal rather than an immediate executive, would it not?—They would not have to do the work, but they would be absolute masters.

358. I can understand a court of appeal meeting four times a year, but I do not understand, if there are no responsible members of that board always present, how they are to be an executive; will you explain that?—Our committee meet only periodically, when everything affecting the working

ing of the association is laid before them, and they have full control.

359. How often do they meet?—They meet monthly; everything is laid before them then, and they have the fullest control.

360. You propose the board to be honorary and unpaid?—Yes, quite honorary and unpaid.

361. Do you think that people would come up from all parts of the kingdom to attend those quarterly meetings if they were not paid?—I think so; the honour of a seat on such a board as that would be considerable; it would be important to save them as much labour as possible, and not to throw details upon them.

362. Mr. *Hermon.*] Did you state just now it might be necessary, where a boiler was condemned, to stop the works if it was in great danger; may I ask, is it not your practical experience that it is usual in large works to have a spare boiler to allow of cleaning and so on?—Yes, quite so; I do not know that I made use of that expression precisely, because it has never occurred with our association yet.

363. I may take it that from your experience, you find there is in all large works a spare boiler?—Yes; but where there is only a single boiler, it is sometimes a matter of great difficulty.

364. Mr. *S. Hill.*] Do I understand you to propose, that for the purpose of electing the board, you would have an election throughout the country?—Yes, a general election throughout the country; every boiler carrying a vote.

365. Dr. *L. Playfair.*] What is the average number of boilers in work; how many steam users would that represent?—I said 40,000 or 50,000, but I think I rather over-stated it.

366. Have you any idea of the expense of merely the postage to send out electoral papers to 40,000 or 50,000 steam users?—It would only be a penny per steam user, not a penny per boiler.

367. *Chairman.*] A question was put to you with regard to the smallness of boilers; can you define a small boiler; what would you say should be the limit of size; to what boiler would you confine the inspection; because it seems to me an important question as to what we should call a boiler for the purpose of inspection; we can tell very much where you would begin, but where would you end?—That is not an easy question to determine; but you might begin with the principle that the inspection should include all boilers used for other than household purposes; you might draw the line between trade and domestic purposes.

368. It appears to me, from your answers with regard to small boilers, that those small boilers were the most dangerous, from the difficulty of examining them, or of getting into the flues?—Yes.

369. Mr. *Pim.*] A small boiler would usually be a high pressure boiler, would it not?—Yes; but there is no absolute rule.

370. *Chairman.*] There was another question put to you by the honourable Member for Manchester with regard to whether you find any difficulty as to the distance at which you inspect; I understood you to say that you inspect all over the country?—We inspect now from Manchester all over the country; but if we had a number of inspecting centres, we should inspect with even greater ease than now. The head centre would not be further off from the scene of operation than it is at present.

371. You think that you could get as effectual an inspection under the management of the central board as you do now?—Yes, and more so; because we send inspectors all the way to Cork, Norwich, and Bantry Bay; whereas, if we had inspecting centres all over the country, they would be within a few miles of their work.

372. Have you formed an opinion with regard to the number of centres you would have, and where you would have them?—That could not be determined until the number of boilers is known.

373. In the case of an explosion, you do not propose to compensate; that would be outside your limits, would it not?—My measure, as I stated, has only regard to the public safety; it has no commercial or trading element in it, and it does not include any payment or compensation in case of an explosion. The idea is, that competent inspection is sufficient to prevent explosion. Granting, however, for argument's sake, that there might yet be one or two exceptional cases, it might be left to outside agency, such as insurance companies, to provide compensation for such; or, should the Committee prefer it, there would be no difficulty, perhaps, in the board having the power of appropriating a portion of the "Fee Fund" for compensation in those peculiar cases; but that is not the fundamental principle at all; the principle is prevention, and not compensation.

374. Mr. *Platt.*] In speaking of those centres throughout the country, of whom do you say those centres are to be composed?—There would be a chief inspector and secretary, and as many sub-inspectors as were required.

375. All being servants of the central board?—All being servants of the central board.

376. The central board is the only master, and everybody else are to be servants?—Yes.

377. Colonel *Gray.*] With regard to the insurance companies that we have heard of, it was stated by you that there was a steam users' association which had under inspection about 2,000 boilers, and insurance companies which had under inspection 10,000 boilers?—Yes.

378. Was that one company or several companies?—That is one company. There are two others that have not so large a number, who have about the same as we have, speaking in round numbers.

379. Are those three companies in Manchester?—The head offices of two of the companies are in Manchester, another is at Stourbridge, with a branch in the north at Darlington.

380. Mr. *Tipping.*] You propose giving up the present local system for a central system, the reason being, I suppose, this, that you consider that the voluntary system at present existing suits the local plan, but that anything like legal compulsory power requires centralisation and uniformity of action?—Quite so; our system now is purely voluntary. The chairman and all the members of the executive committee give their names, and time, and labour gratuitously. When you compel people to have their boilers inspected, it seems to me that you alter the whole basis of it; and were you to have a number of different centres, you would have various sentences passed, and one would contradict the other. If you hand it over to insurance companies a very serious issue would come of it. There is a great misunderstanding on this point;

Mr. *Fletcher.*

27 June 1870.

it is supposed that insurance companies have a direct interest in inspecting boilers and preventing explosions, because they pay compensation when an explosion occurs; that is a total fallacy. The insurance principle does not tend to the prevention, but directly to the promotion, of steam boiler explosions. The insurance principle has been before our board a great many times, and we should have adopted it years ago if it had run parallel with our principle, which is that of prevention. Of course a joint stock company has for its object profit and not philanthropy; it has shareholders and must pay them a dividend. Of course it will not spend a sovereign to gain a shilling, as that would not be business. Now there are 50 explosions in the country every year, and to get at the chance of an explosion, and the risk of insurance, we only want the total number of boilers in the country. The total may be taken at 100,000. Now 50 explosions on 100,000 boilers is 1 in 2,000; it is 1 boiler in 2,000 that explodes; that is to say, the risk is 1 in 2,000, therefore the risk of insurance is 1 *s.* per cent. You can insure a boiler for 100 *l.*, which is a very common amount, for 1 *s.* Now our experience shows that to make a competent internal examination, on which the safety of a boiler depends, will cost 1 *l.*; that is to say, to inspect it will cost 1 *l.*, and to insure it will cost 1 *s.*; to leave the boiler alone and pay compensation will cost 1 *s.* a boiler, and to inspect it and prevent explosion will cost 1 *l.* Suppose a company has 10,000 boilers, and five of them, if left alone, will explode every year. If the company simply insured them for 100 *l.* a piece, it would have to pay compensation to the extent of 500 *l.*; if it wants to prevent explosions it will have to make an examination of each of the 10,000 boilers, that would be 10,000 *l.*; it would cost 10,000 *l.* to prevent explosions and save life, and 500 *l.* to accept explosions and to pay compensation with loss of life.

381. Mr. *Armitstead.*] You now take for granted that all the boilers in the kingdom are insured, do you not?—I am assuming that if you take 10,000 you have a fair sample.

382. Mr. *Cawley.*] That is to say, for the purpose of ascertaining the rate of insurance, you take the proportion to the total number, just as you might take the proportion of deaths to the total number of lives?—Yes; that is to say the less they do the more the profit; the more they do the less the profit; inspection and insurance are directly at war.

383. Your broad proposition is this, that the cost of prevention by inspection is greater than the loss by explosions, setting aside the loss of human life?—Yes, to the insurance company.

384. If people insure and the company that insures them allows them to take their course, the company is in a pecuniary point of view better off than if it exercises inspection and prevents explosions?—Yes, and then there is the poor stoker.

385. Mr. *Pim.*] As a matter of fact, do not insurance companies inspect also?—One insurance company has about 10,000 boilers enrolled with it, in round numbers, and last year it made about 5,000 examinations. I confine myself now to internal and flue examinations; the company left 5,000 boilers unexamined in this way, for which they took the money.

386. As a matter of fact, since those insurance companies started, have you had any explosions by which life has been lost with any boiler which was insured?—We are not an insurance company ourselves.

387. But you take an account of all explosions; when there have been explosions, have any of them been boilers insured in those insurance companies?—Most decidedly; this is a photograph (*producing the same*) of an explosion that took place at Loughborough, which was under an insurance company; that boiler had never been examined in the flues; it had been with them for years. I can produce a photograph of another boiler in which the plates had gone as thin as a sheet of paper (*producing a photograph*). This boiler had been under an insurance company for years, and they had never inspected it in the external flues. A question arose with regard to the payment on the boiler, and the boiler was withdrawn just before the explosion. They had insured it, however, when it was in a highly dangerous state; when it burst, it blew the whole house down.

388. Mr. *Platt.*] Do you know of any instance where those insurance companies have given compensation for loss of life?—I have never heard of any case of that kind; persons have appealed to me to know what they should do; at Leeds a young man said he had lost his father, and came to me to ask my advice.

389. I suppose you do not know that there is anything in the rules of any insurance company that provides for compensation for loss of life?—Not on the payment for the boiler; there is another schedule for further payment.

390. For what?—For lives; but another insurance has to be effected.

391. Does that form part of the insurance?—No, not necessarily; a master may insure his boiler without insuring the stokers' lives.

392. That is another part of the insurance?—Yes; they must pay again for it.

393. Colonel *Gray.*] The 1 *s.* per cent. does not include the stoker, does it?—No; the stoker is ignored altogether.

394. Mr. *S. Hill.*] In the cost of 1 *l.* for inspection, do you include the cost of inspectors, and the board, and everything?—That is the annual flue examination, including the externals; the whole would be rather more.

395. Would 100,000 *l.* on 100,000 boilers cover the cost of inspection, and all the machinery for inspection?—There need not be, as a rule, more than one annual "entire" examination, but then there should be an external examination. I doubt if 1 *l.* would quite do it.

396. What you put as the cost of the board of inspection, and the whole machinery that you want?—It would be very much about what our present charge is, that is to say, a guinea and a half.

397. So that if there are 100,000 boilers, the cost of the board and all the machinery would be 157,500 *l.* a year?—Yes.

398. *Chairman.*] You would propose to spend the whole of that sum in inspection; you do not divide anything?—No; there are no profits to be divided, for the whole is to be expended in rendering public service.

399. And preventing this shocking loss of life?—Yes.

400. Sir *T. Bazley.*] What dividends may the insurance companies pay?—They now pay regularly 10 per cent.; the shares were up to 300 *l.*, 400 *l.*, and 500 *l.* premium.

401. Mr

401. Mr. *Pim.*] Suppose a boiler owner is, under the new law, forced to submit to inspection, and suppose the inspector reports that a boiler is not safe, and suppose he refuses to attend to the intimation of the inspector, and says he is quite satisfied that the boiler is safe, what would you consider ought to be the legal condition of things; would you propose to stop the works, or what would be the position of things in such a case?—In the first place, such an order as that would never be issued on the *ipse dixit* of any inspector; the board themselves would determine what would be best for all steam users; that would be carefully investigated first of all, and then, if those rules were transgressed there would be power to stop a boiler; but, if the examination were merely overrun, a man might possibly be fined; but in extreme cases, where life was in danger, it might be necessary to stop the boilers; say, when the plates were gone very thin.

402. Mr. *Laird.*] The plan that you give in this morning does not tally with what you stated before; are the Committee to consider this as your final scheme?—The fundamental principle is the same, namely, that it should be carried out by the Steam Users' Board; there is a difference in the system of election, and any plan that would be fair would be acceptable.

403. This is, after careful consideration, your opinion as to how the board should be elected, namely, that one-half should be elected subject to the veto of the Board of Trade on nomination, and that they should have the power to appoint members in addition?—That is not expressed in the paper I read, I think.

404. "Candidates for vacancies to the board should be nominated by the electors, and when nominated the Board of Trade should have a veto on the candidature"?—Just so; that was the suggestion, but the question of the introduction of the Board of Trade is a matter for further consideration.

405. Then "The Board of Trade should have power of introducing *ex officio* members to the board" in addition to that?—That is to be a latent power; they were not to be compelled to use it.

406. If I understand it rightly they are to have a veto on the parties nominated, and that in addition, if they choose they may have the power of introducing *ex officio* members?—Yes, that was the proposal as it was put for me by a legal gentleman.

407. But are the Committee to regard that as your own last recommendation?—By no means, it is open to consideration with regard to the Board of Trade.

408. Your object is to have a central board representing the different parts of the country, so that the rules may be uniform, and apply throughout the country?—Yes, that they may be steam users, who have a fellow feeling with the steam users.

409. But this memorandum of yours rather does away with the principle of the board representing the steam users, because, virtually, under this memorandum, the Board of Trade would have the appointment?—No doubt that is open to improvement. My own idea is that it should be a popular representative board.

410. Then you do not yourself lay stress on the Board of Trade having a veto, and having power to appoint members?—I should not myself at all desire it if the Government would not think it essential.

411. Would it not be better, then, to recommend a simple representation of the steam users, letting the Government come in, and ask for representation if they please?—I quite take that view of it; I have confidence in the steam users that they would do the thing rightly.

412. You think that the central board should be appointed and nominated by the steam users?—Yes.

413. With the view of having throughout the country a uniform system of examination and inspection?—Yes.

414. In fact it would be something like Lloyds' Register, in London, who keep up the classification, and make periodical surveys?—Yes.

415. You would have agents throughout the country?—Yes, it would be a steam users' parliament, belonging to the constituents throughout the country.

416. Mr. *Hermon.*] To put an extreme case upon the paper you read. If the Board of Trade were to veto the whole of the candidates, where would the election be then?—There would then be a fresh nomination by the electors; but I have already stated that the interference of the Board of Trade is not essential to my measure, and needs further consideration.

417. Mr. *Cawley.*] I suppose from the words "latent powers" which you employed, we are to understand that the system would work as written down in the paper you read; you are quite clear that, individually, you do not wish that the Board of Trade should have such a power as is now suggested?—By no means; that was intended to be in reserve if the steam users were supposed to be not going right.

418. By the powers to the Board of Trade do you not mean absolute power to exclude at their pleasure, but merely powers under reserve, in case of certain contingencies happening?—Yes, as a reserve. I was told that that would be a power that would never be called into exercise.

419. Mr. *S. Hill.*] The plan which you submit to the Committee is, in fact, only a sketch?—Just so.

420. Mr. *Fielden.*] It is not your own idea that the Board of Trade should have all those powers?—No; I should personally wish as little of the Board of Trade as the Government will allow us to have.

421. Mr. *S. Hill.*] Your scheme would be to have as little of the Board of Trade as the Government would let you have?—Yes, if that would meet the views of the Government, and then I would have this steam board answerable only to public opinion. I should be glad if that view of the case were adopted.

422. *Chairman.*] Is there any other point on which you wish to address any observations to the Committee?—No.

Mr. JOHN PENN, called in; and Examined.

Mr. *J. Penn.*
27 June 1870.

423. *Chairman.*] YOU are a Member of the Institution of Civil Engineers, I believe?—I am.

424. And you are also extensively engaged as a practical engineer, are you not?—Yes.

425. Have you had frequent opportunities of seeing the result of steam boiler explosions?—Yes, I have.

426. To what cause do you attribute these explosions in general?—They are to be attributed to various causes; malconstruction in some cases, neglect in others, and so on.

427. Will you be kind enough to describe any case of malconstruction that has come under your observation which has led to an explosion?—I do not remember any particularly, though I have seen such things certainly; but more frequently it has been from neglect or want of knowledge on the part of the people having charge of the machinery.

428. Inattention to the safety of the valve for example?—Yes, or shortness of water and other things, such as corrosion, and so on.

429. Do you consider that proper inspection and examination would have prevented all those accidents?—Yes, I have no doubt it would have prevented most of them.

430. Do you consider that the neglect has been on the part of the persons in attendance or on the part of the owners of the boilers generally?—That is difficult to answer; if a boiler is defective, and has been overworked and too long in use, then it would be the fault, no doubt, of the proprietor of the boiler, if it had not been inspected; but if it were from an accident, or from neglect on the part of the man in charge, you could hardly blame the manufacturer or owner.

431. I suppose you have found such cases where the proprietor himself has not used sufficient care?—I have no doubt about it; it is very often so.

432. Are you of opinion that compulsory inspection would have obviated the mischief in such cases?—Yes, I have no doubt it would do a great deal of good.

433. In fact, you are in favour of compulsory inspection?—Yes.

434. How would you propose that that inspection should be carried out, so as not to be too harrassing to steam users?—I do not know; I have not considered that; I only see a necessity for something being done.

435. But you are speaking generally in favour of compulsory inspection?—Yes, I think it would be a good thing.

436. But you have no proposition to make to the Committee with respect to that?—No; I have had so little time to consider the matter. Mr. Fletcher is very much better up in the matter than anybody else that I know.

437. Are you at all acquainted with the mode of inspection at the Manchester Steam Users' Association, or any of the associations?—Yes; and very good it is at the Manchester Steam Users' Association.

438. That is your opinion of it?—Yes, decidedly.

439. Are you of opinion that if it could be carried out more extensively it would prevent explosions?—Undoubtedly. The periodical examination of boilers, I think, is becoming more and more manifestly necessary every day.

440. If such a system could be carried out throughout the whole country, do you think that it would entirely prevent explosions?—Not entirely, perhaps, but certainly it would do away with most of them. You could not prevent accidents, of course, but periodical examinations would tend that way, and very greatly too.

441. Mr. *Hermon.*] If I rightly collect the drift of your evidence, you think that if the present system adopted by the Manchester Steam Users' Association were fully carried out, there would be no necessity for Government interference?—No, I think not. If that principle were carried out thoroughly, exactly as the Manchester Steam Users' Association are carrying it out, that would be all that could be desired.

442. But, under the circumstances, you think that that system should be made compulsory?—Just so.

443. Mr. *Fielden.*] You do not think that the Board of Trade should have a veto, or any power in this matter, do you?—I do not know; I have not thought of that.

444. How often do you think it is necessary, for ends of safety, that a boiler should be inspected?—That is a matter of opinion. I do not know the rule in Manchester, but I should rely on their opinion more than my own on such a question as that.

445. I suppose an outside examination would be sufficient sometimes?—Yes; but if an examination takes place it should be a thorough examination.

446. You cannot tell how often you think it should be made?—No; but a good deal depends on the age of the boiler, the dimensions, and the way in which it had been used. You could judge pretty well when you had got all those particulars.

447. Colonel *Gray.*] You say that you think the system of inspection which they have in Manchester is a good one?—Yes.

448. You are aware that that is a voluntary inspection, are you not?—Yes.

449. And that only a very small proportion of the boilers in the district are inspected?—I dare say.

450. Would you propose to make that inspection compulsory?—I think it would be most desirable. I mean, that a system which appears to have worked so well as that which has been adopted in Manchester should be made general.

451. But it is only voluntary at present?—If it is only voluntary at present, and it does not answer with regard to the extension of the system, I think you should have some greater force put on.

452. You would like to have it made compulsory?—Yes.

453. Would you make it a Government inspection?—That is a question I have not quite gone into. I do not care how it is made, so long as it is made.

454. It is quite clear that it will not be made general without some application of compulsion, you think?—I think so; I think we should have a compulsory measure.

455. Mr. *Cawley.*] When you referred to the Manchester system, you meant the Manchester system of inspection, and not the question of the voluntary principle?—Yes, I meant the system of inspection.

456. You have had some experience of Government inspection, have you not?—Yes.

457. Will you be kind enough to inform the Committee what is the inspection which they exercise at present over marine boilers?—I think it is very good; when circumstances admit of it, when a vessel comes in the machinery is inspected by a Government officer, appointed by the Board of Trade.

458. That inspection commences with the first fitting out of the vessel, I suppose?—I am not quite sure about that, but I think so.

459. You are not sure whether they require a certificate, are you?—I think they do; but I am not quite clear about it.

460. Afterwards the inspection is periodical, is it not?—Yes.

461. Is it your experience that that works satisfactorily?—I think so; I have heard no complaints against it whatever.

462. So far that would rather tend to show that Government inspection, through the Board of Trade, might be valuable?—Yes, undoubtedly; I do not know quite that that would be the best way of doing it, but there seems to be something wanting with regard to boiler inspection, and if it cannot be done without compulsion you must have compulsion, I think.

463. Do the Board of Trade appoint special inspectors for Government vessels?—Yes.

464. Do they appoint them at each port?—Yes, they appoint them at the principal ports.

465. Are their duties defined by any published rules?—Yes.

466. Which rules are, I suppose, known to all the trade?—Yes, quite so.

467. And they work satisfactorily, in your opinion?—I think perfectly so.

468. Do those inspections extend to all marine boilers?—Yes, I think so; I know that they extend to all vessels carrying passengers.

469. I suppose they have got some compulsory powers over other vessels to correct defects in the machinery, have they not?—I am not very much up in that, and I can hardly answer the question.

470. Could they withhold a certificate?—Yes.

471. That, of course, is a compulsory power?—Yes, I have no doubt it is. I believe I know of a case where they would not grant a certificate.

472. And, therefore, the vessel could not carry passengers?—Just so.

473. Did that case occur here in London?—No, I think not; it was some time ago.

474. Do you know where it was?—I think it was at Dover; I am not quite sure, but I think it was there.

475. Mr. *Platt.*] I think you stated, in answer to the Chairman, that explosions often take place from shortness of water and defective safety-valves?—Yes.

476. May I ask whether you do not find that corrosion is also often the cause of explosions?—Most assuredly that is very frequently the cause, and that would be discovered, no doubt, by inspection.

477. In fact, the adoption of a system of inspection is the only way in which you can discover anything of that kind, is it not?—Yes.

478. You stated that marine boilers are inspected; how often are they inspected?—I think it is four times a year, but I will not speak to that positively; or, at all events, it is whenever an opportunity permits. With regard to vessels running in the Thames, I think it is four times a year.

479. What is your opinion with reference to a local inspection like the Manchester one, or a central inspection, like the one you have described?—So far as I am able to judge of the Manchester system, it works thoroughly as far as the inspection goes; we all know that it is not generally adopted, but I think something should be done in the same way, seeing that that system has prevented so many explosions.

480. That we are all agreed about, but the question is with regard to the authority; you have already stated that the Board of Trade, as far as regards marine boilers, appoint inspectors of their own?—Yes.

481. Now, the Manchester system has been working in an opposite direction; they have been a local body, composed of the large manufacturers of the neighbourhood. The question is, which place you think would be the most effective; local bodies, or a central board, operating like the Board of Trade?—I have not considered that question; and which would work best I cannot, off-hand, say.

482. Mr. *Armitstead.*] Is it not the case that many explosions now occur in consequence of the much higher pressure under which boilers are worked?—Yes; and an explosion in a high pressure boiler is more severe than in a low pressure boiler.

483. But what is the inducement to work a boiler at such a high pressure; is it economy in fuel?—The inducement to work a boiler at high pressure is economy in fuel, no doubt.

484. Sir *T. Bazley.*] Are there any associations in London for inspecting boilers?—I think not; there is only the Board of Trade for merchant and passenger vessels.

485. As a professional engineer, are you ever applied to for the purpose of making an examination or inspection in particular cases?—Yes.

486. Have you found defects in boilers as to which you have been so applied to?—Yes.

487. You think that great benefit would be derived from the establishment of inspecting boilers, do you not?—Yes; I do not know the proper way of carrying it out, but no doubt it is desirable.

488. *Chairman.*] Have you any other observations which you wish to make to the Committee?—No.

Thursday, 30th June 1870.

MEMBERS PRESENT:

Sir Thomas Bazley.
Mr. Birley.
Mr. Cawley.
Colonel Gray.
Mr. Hermon.
Mr. Hick.
Mr. Staveley Hill.
Mr. Laird.
Mr. Lancaster.
Mr. M'Clure.
Mr. Pim.
Mr. Platt.
Dr. Lyon Playfair.

JOHN HICK, Esq., IN THE CHAIR.

Mr. CHARLES THOMPSON, J.P., called in; and Examined.

Mr. *C. Thompson.* J.P.

30 June 1870.

489. *Chairman.*] YOU are Chairman to the National Insurance Company, Manchester, are you not?—Yes, of the National Boiler Insurance Company.

490. How long has your company been in existance?—Since the year 1864.

491. The results of a good many explosions have naturally come under your observation?—Several of them have come under my observation.

492. To what do you attribute those explosions generally?—I think they are very generally attributable to carelessness; largely so.

493. Do you think they would have been avoided by careful periodical inspection?—I have no doubt at all that a large number, and perhaps all of them, would have been prevented by careful periodical inspection.

494. Do you know from your own knowledge and observation, that many explosions have occurred through defects in construction?—Some explosions have occurred from that cause.

495. And also from corrosion and deterioration of the boiler?—Yes, in some cases, that is the cause of the explosion; that is to say, working the boilers when they are known to be deficient in strength, both from wear and tear, and also insufficient repair.

496. In such cases as that, it must have been the result of carelessness, either on the part of the boiler owner or the attendant, must it not?—Yes; the deficiencies that had arisen should not have been overlooked by the attendant.

497. Explosions of that nature would have been avoided if the boilers had been regularly inspected by a careful and competent person?—Most certainly.

498. Are there any other causes of explosion that you are aware of, beyond bad construction and deterioration?—In some cases the water is of a character which induces corrosion, that is one cause; but I should like to state, that with regard to scientific evidence, I am scarcely capable of giving such information as the Committee would require; my object is, to show the commercial advantages of periodical inspection of boilers, and the advantages also of insurance.

499. Will you be kind enough to explain to the Committee what is the immediate object of insurance in this matter?—The idea is, that this is a legitimate business as much as any other kind of insurance, either insurance against fire, or life assurance, or marine insurance; that it comes within the same category, and is a fair subject of business; and it has been proved by experience that not only are boiler owners protected against explosions and accidents, but that a profitable business can be made by insurance.

500. But should not inspection, with the view to prevent explosions, be the first consideration?—Certainly.

501. Is that so with regard to your company?—Yes, certainly; we have that object primarily in view, that is to say, the prevention of explosions; but in connection with that, we think the business can be made remunerative to those who insure.

502. Your association is much like any other insurance society?—Precisely.

503. A person could, for example, take shares in your company, without being a boiler user?—Yes; the shares are marketable.

504. And he could put money into it as an investment?—Yes.

505. Without any regard to whether he was doing any good towards preventing accidents?—Yes; a large proportion of our shareholders are not steam users.

506. Is it your opinion that the owners of boilers are very culpable when accidents do occur, if they are not under some supervision?—They are very culpable; I believe the experience of the last year or two has shown that conclusively; out of the number of accidents that have occurred, the remarkable fact is, that scarcely any of those boilers have been under any independent inspection.

507. As you have already stated, periodical inspection by an experienced practical engineer would prevent many if not all of those explosions?—It would prevent most of them undoubtedly.

508. What do you consider a sufficient amount to be paid for a boiler, to insure it?—It depends a great deal on the pressure; we charge 20 *s.* per cent. per annum, to insure a boiler working at a less pressure than 40 lbs. to the inch.

509. Twenty

509. Twenty shillings per cent. on the cost of the boiler do you mean?—Twenty shillings per cent. insurance; we insure a boiler to the extent of 100 *l.* for the sum of 20 *s.*

510. How many inspections would you consider necessary per annum?—We endeavour to hold three or four inspections, and sometimes we give even more than that; but we give a thorough inspection once every year if we can get an opportunity.

511. You said you charged 20 *s.* per cent. per annum for a boiler up to a pressure of 40 lbs. to the inch; what is it above that pressure; what is it for about 50 or 60 lbs.?—About 5*s.* per cent. additional. The rate I believe is 25 *s.* for 60 lbs. pressure; and 30 *s.* for 80 lbs. pressure; that will ensure 100 *l.* in case of damage arising from any explosion, amounting to that sum.

512. Mr. *Cawley.*] When you say 20 *s.* per cent. you mean 20 *s.* per 100 *l.*?—Yes.

513. That is, of course, one per cent. properly speaking?—Yes.

514. At all events it is 20 *s.* per 100 *l.* that you mean?—Yes, 20 *s.* per 100 *l.*

515. *Chairman.*] What is the nature of the inspection that you would call a complete inspection?—An internal and external examination of the boiler by a very competent engineer.

516. And that you make three or four times a year?—No, that is a thorough examination; it is called a *thorough* in the technical use of the word.

517. What kind of examination is an ordinary examination?—That is an examination of the fittings; seeing that the various fittings work well, and that the general condition of the boiler is good; inquiring a little what has been going on (since the last visit) from the caretaker.

518. Your inspectors sometimes make a report and advise upon a boiler without making it necessary to insure, and you charge a certain sum for that, I suppose?—Yes; we have a system of inspection without insurance; the routine is precisely the same as in the case of insurance; the reports which the inspector would hand to the chief engineer in the office, which are revised by him before they are sent to our board, go through the same process with a person who entered for mere inspection, as with one who entered for insurance. The cost per boiler is about 15 *s.* to 18 *s.* per annum.

519. Mr. *Cawley.*] That is what you charge them?—That is what we charge them.

520. Is that for any particular number of inspections?—We think about three visits per annum would be included in that fee.

521. *Chairman.*] It is not absolutely necessary, that is to say, it is not compulsory for you to inspect when the parties have insured?—We do not insure without a careful inspection.

522. Mr. *Cawley.*] You make a previous inspection?—Yes, we make a previous inspection; not always a thorough internal inspection; if an inspector considers a boiler to be in fair condition, and it is not quite convenient to the owner to give time for a thorough inspection at the moment the boiler is insured, we embrace the earliest opportunity afterwards for a thorough inspection.

523. *Chairman.*] You have stated that, as far as insurance goes, you are in much the same position as other insurance companies; now, with regard to other insurance companies, for houses, for instance, they do not think it necessary to go and see the state in which the houses are kept with regard to the use of fire and candle, but they go on and take the risk; I presume you do much the same?—Our periodical visits, of course, give us some information with regard to the condition of the article insured; but that does not differ materially from other insurance.

524. What number of boilers have you under insurance?—We have about 2,000 boilers insured, or rather more than that. We have had between 3,000 and 4,000 under our care in the course of our operations.

525. Mr. *Cawley.*] How many have you at present that are not insured?—Not a very large number; so few that the number is quite immaterial. It will be seen that the insurance is included for a very few shillings of additional charge.

526. You say that insurance is 25 *s.* or 30 *s.* per 100 *l.*, and that the other is 15 *s.* or 18 *s.* per boiler. I was going to ask you what is the average, per boiler, of the insurance?—That entirely depends on the pressure. Do you mean the additional charge for insurance?

527. No; I mean this: when you say your charge is 25 *s.* per 100 *l.* for insurance, I want to know, out of the 2,000 boilers, what the average of the insurance is per boiler per annum?—I should say it would be under 25 *s.*, because of the larger number that are working under 60 lbs. pressure than above it.

528. But the point is, whether the amount per boiler insured averages less than 100 *l.*; if the average is less, of course the amount you receive is less than 25 *s.*; but if the average is more than 100 *l.*, of course the average per boiler would be more; I want to know what the average insurance per boiler is?—I am not able to say what the average would be. Frequently about 200 *l.* per boiler is insured. There is also a system of taking boilers in a group, taking four or six, or even up to 20 boilers, in a group, and insuring a certain amount over the whole, in case of accident to any one boiler. We do not always confine ourselves to insuring for 100 *l.* a boiler; we have as high an insurance as 500 *l.* on a boiler in some cases, and even more than that on locomotive boilers, and then, of course, the amount of premium is multiplied by the number of hundreds.

529. What I want to know is this: what is the average amount per boiler; because we cannot compare the amount of the inspection per boiler, with your charge for insurance, unless we have some idea what the average amount per boiler insured is?—If the average cost is about 15 *s.* to 18 *s.*, and the difference for insurance is from 20 *s.* to 25 *s.*; that difference in payment is the amount charged for insurance.

530. Yes; but unfortunately you begin with the word "if"; we want to get at the fact of the actual cost of insurance?—I cannot say what the average is.

531. Sir *T. Bazley.*] Do you state that boilers insured are usually insured at the rate of about 50 *l.* per boiler?—No; we do not take any insurance for less than 100 *l.*; that would not be worth inspecting.

532. Mr. *Cawley.*] Then when there are four boilers in one case, they may be insured for four different sums of 100 *l.*, or for four different sums of 200 *l.*?—Yes.

533. Would you not insure a group of boilers for less than 100 *l.* per boiler?—Yes, we would insure

Mr. *C. Thompson*, J.P.

30 June 1870.

insure four in a group in case of accident, to any one for 200 *l.*

534. Mr. *Staveley Hill.*] You would not take the insurance of any one boiler under 100 *l.*?—Certainly not.

535. But you would take the insurance of any number of boilers for a less sum than 200 *l.*?—Not less than 200 *l.*

536. Mr. *Hermon.*] What would be the average amount per boiler on your books?—I think 250 *l.* would be the average.

537. Mr. *Birley.*] Do you insure anything beyond the boilers themselves?—All damage done by the explosion, to the surrounding property, is made good to the amount of the sum insured.

538. You would take an insurance for 1,000 *l.*, I suppose?—We do not take an insurance on any single boiler to that extent, except in one or two cases; we have done so in some locomotive boilers; we take up to 1,000 *l.*

539. But suppose there are very extensive buildings around the boiler, would you insure them at the same time?—We do not include them as part of the contracts, but we hold ourselves responsible, and have paid for damage done to other property, even than the boiler fittings or the buildings.

540. *Chairman.*] What number of inspections have you made during the last year?—The chief engineer will be able to give you that information; but all the 2,000 boilers that are in our books have been inspected several times throughout the year.

541. Mr. *Hermon.*] I think I understood you to say that you inspect every boiler that you insure?—Certainly.

542. Mr. *Lancaster.*] In fact you have a pecuniary interest in doing so?—Decidedly we have; for our protection we can demand at any time a *thorough* inspection, which is an internal examination of the boilers.

543. And that you do with the view of saving yourselves from having to pay the insurance?—Certainly.

544. *Chairman.*] Over what extent of country have you boilers under your inspection?—From Aberdeen to Plymouth; over the whole of the United Kingdom, in fact.

545. Your company is paying good dividends now, is it not?—Yes, pretty fair. We paid 6 per cent. last year to the shareholders.

546. Colonel *Gray.*] Is that about what your company has paid in previous years?—It was larger than in previous years, but the establishment of a business requires time, especially this kind of business. We hope to pay a larger dividend this year.

547. What is the 6 per cent. dividend paid upon?—On the subscribed capital. Our shares are 10 *l.* shares, with limited liability, on which 25 *s.* per share only has been paid, and that yields 6 per cent. at present, or rather more this year.

548. How many shares have you?—A few less than 5,000.

549. Have your shares risen in value?—They are not quoted on any market list. They are not very often changing hands.

550. Have you any difficulty in inducing parties to insure?—There is a great deal of competition. We have that kind of difficulty, between the various associations.

551. Then, if you charge 20 *s.* per cent., and some other parties charge 15 *s.* per cent., they would get more business than you, I suppose?—A good deal would depend on the nature of the inspections given. We find that our officers are very well appreciated, and our business is necessarily increasing. There are a very large number of boiler owners who neglect to insure, and who neglect also to have their boilers periodically inspected. Of course there is a difficulty in getting at those people.

552. Inasmuch as we gather from you that your opinion is that a periodical and thorough inspection, such as you could give, would prevent a great many, if not most of those explosions; I suppose you would think it very desirable that such an inspection should take place universally?—Most desirable.

553. You would make it compulsory, would you not?—Yes, certainly.

554. How would you effect that?—I think a simple plan of compulsory registration of all steam-boilers should be insisted upon in the first instance, and that the owners of the boilers should be called upon to make an annual return of those boilers, whether in use or not working, and that that return should contain an affirmation that those boilers had been examined, and by whom.

555. To whom, in your opinion, should the return be made?—I am rather inclined myself to say the local authorities; those returns might be made to the clerk of the justices of the peace for the county, or as in our own case in Manchester, to the municipal authorities; or they might even be placed in connection with that department now existing for the inspection of weights and measures, which is worked through the police department of our council. It seems to come within the range of that class of service.

556. Having registered all the boilers, you would then insist upon every boiler being placed under some inspection?—Certainly.

557. And no boiler not so inspected and registered should be allowed to work?—Yes, certainly.

558. But what penalty would you propose to impose in case those rules were not complied with?—I have not thought what the amount of the penalty should be, but I think that an order made by the House of Commons, that all boilers should be periodically inspected, and a report made to some authority upon them, would be sufficient. I think that such an order would be respected; but the responsibility of any accident to any boiler not under such an inspection should be visited with very severe penalties.

559. Mr. *Hermon.*] Have you any knowledge that after any boiler has been condemned or refused to be inspected by any officer, that boiler has continued at work, although, in the opinion of the insurance officer, it was unsafe?—Yes.

560. You know of cases of that kind, do you?—Yes; we have no power to condemn a boiler; we simply refuse to renew the insurance.

561. But you have known cases where boilers refused, have been continued at work for a long time?—Just so.

562. And explosions do happen from those boilers that you have refused?—Yes, very serious explosions.

563. Mr. *Birley.*] The object of your company is to take only good risks, I suppose?—We are careful to examine into all proposals for insurance. Every proposal comes first under the notice

notice of our officers, and then under the notice of our board.

564. You exclude hazardous risks, do you not?—Yes.

565. Ordinary insurance companies take hazardous risks, at enhanced premiums; do you do that?—No, we never do so; we are simply governed by the pressure.

566. But an extra pressure of 60 lbs. or 80 lbs. is a legitimate hazardous risk, is it not?—You are aware that boilers are constructed to work at certain pressures.

567. That is what I say, is legitimate; but you take no hazardous risks as ordinary marine or fire insurance offices do, at enhanced premiums, with that exception?—Certainly not.

568. In fact you avoid them?—Yes.

569. Colonel *Gray*.] You have mentioned the number of shares in your company, and the amount paid on them; can you tell the Committee the proportion of shareholders you have who are steam users, and those who are not?—I should say that about one-half of our shareholders are steam users; some of them are large steam users.

570. The other half, I suppose, are simply holders of the capital of the company?—Just so.

571. You say that you always make an inspection, and a careful inspection, previous to insuring any boiler?—We do.

572. I think you have stated that you have about 2,000 boilers insured in your office?—Yes.

573. After the first inspection are those boilers all inspected thoroughly once a year?—Not always thoroughly inspected; that is to say, internally inspected; but as frequently as we can get inspections from the owners we have thorough inspections made. They are not always thoroughly inspected every year, but there are three or four visits annually to every boiler on our books.

574. But is it not desirable that there should be at least one thorough inspection every year?—It depends a great deal upon the attendants who have charge of the boilers, because the care of a regular attendant must be estimated as being of value. We should not insist, in all cases, on having a thorough inspection every year.

575. Mr. *Cawley*.] Then what would be the nature of the inspection which you would make compulsory, apart altogether from your present system. I understand you to say it could be done by having every boiler registered, and that every year the owner of the boiler should be bound to send some certificate or other document to the local authorities setting forth that that boiler had been inspected?—Yes.

576. Inspected by whom?—That return should state by whom the boiler was inspected, and there should be authorised inspectors of steam boilers. Such companies, for instance, as our own, or the other companies who insure, or who inspect steam boilers, or even engineering firms of respectability should be authorised to inspect steam boilers through competent inspectors, who of course, should be certificated men.

577. Who, in your opinion, should have the appointment of those certified inspectors?—Companies like our own would stand on their merits, as would also private firms, and boiler owners would have the choice of those companies, or of private firms. Of course, whether they chose insurance companies, or simply inspecting companies, they would choose them on their merits.

578. But if there is to be a certificate which is to be deemed sufficient and that is to be received by the local authority, there must be some party authorised by some tribunal or other to inspect the boilers; it may be a company's man who might be appointed, but what I want to know is, by whom is he to be appointed as inspector?—Take the case of a firm having boiler makers in its employ, one or two or three are competent men to make those inspections, and to make drawings, and to set forth in a report the condition of a boiler; that servant should be registered as a competent inspector.

579. But who is to register him?—His master; his employer.

580. Then who are the authorities who are to receive this report?—His employers in the first instance, and its value will depend on the respectability of the employer or the companies.

581. Then am I to understand this, that you simply mean that a maker is to have his boiler inspected by some one whom he chooses himself to employ; a man from one of the insurance companies, or anybody he supposes to be competent; and that a certificate is to be sent in to the authorities, and if the authorities think the parties respectable, they are to hold that sufficient?—The authorities would know the character of the firm giving such certificates, and certificates given by the inspectors of the firm would be sufficient, in my idea, for an ordinary inspector's certificate.

582. You would not require that the authorities themselves should register those parties beforehand?—No, I do not require that; but I require that the firm should be registered, and authorised very much in the same way as we do in Manchester and Salford with regard to gas fitters and water fitters.

583. You think that registering the inspectors, in the same way as those men who are authorised to put up gas-fittings or water-fittings, would be sufficient?—Yes, I do; this is a very much more important matter, of course, and therefore the choice would be much more restricted. But it is that kind of authorisation which I think the local authorities ought to give to firms or companies.

584. I think you have already informed the Committee that the insurance system does not secure the inspection of the larger proportion of the boilers in the kingdom?—Just so; a very large proportion of them are still not under inspection.

585. Have you any idea what the proportion is?—Probably from 17,000 to 20,000 boilers may be under care and inspection out of 70,000 or 100,000 boilers in the kingdom.

586. Do you mean under the inspection of companies?—Yes, under the inspection of companies; I mean independent companies; I do not think much of inspections performed by the servants of owners of boilers; I do not think that that can be an inspection which is at all satisfactory; and in the case of firms being boiler-makers or engineers entering their servants as inspectors, they should not be allowed to inspect their own employers' boilers.

587. When I use the word "inspection," with regard to inspecting boilers, I mean inspection by independent parties?—Just so.

588. You think there are from 17,000 to 20,000 boilers under inspection?—Yes, quite that.

589. You have only 2,000 boilers insured in your office, you say?—We have rather upwards

Mr. *C. Thompson*, J.P.

30 June 1870.

of 2,000; we have had about 3,500, but owing to circumstances of business, and various causes, many have fallen in.

590. *Chairman.*] They have been withdrawn, you mean?—They have been withdrawn from work altogether; the changes in Lancashire and Yorkshire have been very numerous of late.

591. Mr. *S. Hill.*] How much did you pay during the last year for inspecting boilers alone, by your own inspectors?—The officers' travelling expenses last year amounted to 485 *l.*, that is to say, without salaries or office expenses; simply the travelling expenses of the officers we employ.

592. The operations of your office extend, do they not, from Aberdeen to Plymouth?—Yes.

593. Can you give the Committee the amount of the sum that you paid for inspecting boilers during last year?—I cannot get nearer to it than just stating the expenses incurred in travelling, because they are paid by salaries.

594. Will you be good enough to give me the salaries of the inspectors?—They get from 100 *l.* to 150 *l.* per annum.

595. How many inspectors have you?—We have five or six regular inspectors, and several occasional inspectors up and down the country, resident.

596. Therefore the travelling expenses and the total cost of inspecting the 2,000 boilers, was considerably under 1,000 *l.*?—No, it would be very much more than that; because of the salaries and expenses connected with their department; probably 1,500 *l.* would be about the sum.

597. How many inspectors did you say you had?—We have five or six regular inspectors, and several occasional inspectors, resident in the districts.

598. What is the average cost that you pay for the inspection of a boiler, including the chief inspector; that is to say, all the expenses proper to the inspection?—We reckon that each boiler costs us from 12 *s.* 6 *d.* to 15 *s.* per annum in the actual cost of inspection only.

599. For inspection?—Yes.

600. Do you receive, before you insure any boiler, a report of the state of that boiler?—Yes, certainly.

601. Have you got any report by you that you can show the Committee?—No; but the engineer may have one with him.

602. I will read you an answer that was given by Mr. Fletcher. He says, at Question 380, "Now our experience shows that to make a competent internal examination, on which the safety of a boiler depends, will cost 1 *l.*, that is to say, to inspect it, will cost 1 *l.*, and to insure it, will cost 1 *s.*; to leave the boiler alone and pay compensation, will cost 1 *s.* a boiler, and to inspect it and prevent explosion, will cost 1 *l.*;" now, how far do you agree with that answer?—I do not know on what basis Mr. Fletcher arrived at those conclusions at all, for a man will very easily inspect, and thoroughly inspect a boiler in half a day inside and out, and try every plate and every valve and movement connected with it; therefore I cannot see how it could cost 1 *l.*

603. You say that you have reports of boilers, before you insure them?—Yes.

604. Have you any report of boilers after they have once been insured, with regard to their state and condition?—Yes, every quarter, or as near as we can get them.

605. A report from whom?—From one of the inspectors who visit them.

606. You mean a report from the inspectors who visit them, of every boiler?—Yes, a report from the inspector who visits, of every boiler.

607. They make those inspections three or four times a year?—Yes.

608. Mr. *Hermon.*] You do not think that your inspectors' expenses, including wages and travelling expenses, come to about 15 *s.* or 20 *s.* per boiler for inspection?—Not quite so much as that.

609. Mr. *Platt.*] Have you anything connected with life insurance in your office?—No, we do not at all entertain accidents to the person.

610. You entertain insurance only with regard to boilers?—We only entertain insurance with regard to boilers and the surrounding property, whether it be buildings, or goods, or machinery.

611. Have you ever had any claim for loss of life?—No, not for loss of life.

612. Then of course you have not paid anything for loss of life?—Certainly not; that is clearly stated on our policy.

613. Mr. *Pim.*] An internal inspection, you say, should be conducted once a year; do you mean an inspection not only of the inside of the boiler, but of the exterior of the boiler, and of the flues?—Yes, of course, a man will go through the flues in making that inspection inside and out, as well as inside the boiler itself.

614. Had you any losses last year by explosions?—Yes; we had one accident to a boiler last year which was not preventible by ordinary inspection at all. That was a case of loss of water; that is to say allowing the water to go down.

615. In that case, was there loss of life?—Yes; there was a loss of one, if not two, lives in that case.

616. And the boiler had been inspected, and you thought it all right?—Yes; there was no doubt it was in a satisfactory working condition, but owing to the water getting too low, and the attendant not observing that, of course the boiler burst.

617. You mean that it was carelessness on the part of the attendant?—Yes; there is not a shadow of a doubt about that.

618. Sir *T. Bazley.*] In estimating the cost of inspecting boilers, do you not include the general expenses of the establishment?—Yes.

619. Have you not, besides the working inspectors, a superior or scientific inspector, who has a larger salary than the sub-inspectors?—Certainly. The gentleman who will succeed me in my examination is the chief engineer in our company, under whose inspection all reports from the subordinates come.

620. In any doubtful case he is appealed to, and, perhaps, goes and inspects the boiler just the same as the subordinate inspectors?—We have assistant engineers under him, between him and the ordinary inspectors, who take occasional journeys.

621. You say there are about 17,000 or 20,000 boilers under inspection in the kingdom?—Yes.

622. How many boiler preserving associations and insurance associations may there be?—There are three insuring associations, and one mutual association, which may be called an insurance association also, inasmuch as they give a guarantee now in case of explosions up to 300 *l.*

623. Where

623. Where are those associations fixed in the country?—Our own is in Manchester, and the Steam Power Company is also in Manchester, and the Prevention of Steam Boiler Explosions is also in Manchester. The Midland Company has its head quarters at Birmingham.

624. Would it, do you think, be convenient for the examination of the boilers to have a central authority situated in London or Glasgow?—I do not see any advantage in that at all.

625. You would not be particularly favourable to a distant control of boilers in Lancashire?—I do not see that any good could arise from that, and I should not be favourable to it on account of the tendency to divide the responsibility.

626. You state that you think it is desirable to have certified examiners?—Yes.

627. Would you give to every proprietor or user of a steam boiler a certificate of having had that boiler duly examined quarterly or annually?—I should expect from the owners of steam-boilers a return drawn in uniform form, to be applicable to all parts of the country, which should show that the boiler had been examined, and by whom, and what was the condition of the boiler at that time, a few special questions being answered from the report of the inspector himself, or the report of the inspector might be appended.

628. Probably you would not permit a boiler to be used at all for steam purposes, the user or owner of which had not a certificate of its safety on examination?—We do not usually issue certificates of safety; we supply report to the owner that the boiler has been examined, and is in such and such a condition, and if anything seems required to be done, we suggest it to him; but if those requirements are not complied with, probably when the policy fell out it would not be renewed.

629. Should the compulsion be Parliamentary or municipal?—Certainly it should be a Parliamentary compulsion, because so many boilers are situated away from municipal authority.

630. You would not permit a boiler to be used which was not inspected?—I would not permit a boiler to be used which was not registered; the registration itself, I think, would bring them under notice once a year, because the return would have to be made, by the owner himself, to some authority every year.

631. Would registration, do you think, be safe without examination?—Registration should compel an examination; the very fact of having to register a boiler as being a working boiler, would show that the owner brought it under some kind of independent inspection.

632. Would you make that a clause in the Act of Parliament?—Yes.

633. Mr. *Hermon.*] I understood you to suggest that firms should register their engineers?—Firms might certainly register their engineers as competent independent inspectors.

634. But at the same time, I understand you to say that you would not consider their inspection and report sufficient for their own boilers?—Certainly not for their own boilers.

635. Do you not think that an efficient engineer who is employed by large firms, who is capable of making mechanical drawings and sections, would be equally well able to make a report as an inspector whom you employ at a salary of 100 *l.* or 130 *l.*?—Certainly, that is why I would recommend that they should have authority to inspect steam boilers.

636. But not their own employers' boilers?—Just so; not their own employers' boilers.

637. Unless such a man's report is to be sufficient for his employer's boiler, I do not see the good of the employer registering him, because any inspection he made elsewhere would be at the expense of his employer, because he would be using his employer's time, would not that be so?—I want to put into the hands of firms of that character, the power of inspecting boilers for profit, that they might, where people do not require insurance, apply to competent engineers, or boiler-making firms to have their boilers inspected by those certified inspectors whose certicates should be handed in to the authorities.

638. Colonel *Gray.*] You say that when you first insure a boiler, you make a careful inspection of it. Now would it not be worth your while, and advantageous to the company, and likely to make a better investment of the capital, if you saved yourself the expense of inspecting, and took the risk of any explosions taking place after you had once seen that the boilers were in good condition?—That would not satisfy us.

639. But would it not be to your interest with regard to the dividends?—No, I think not, because our visits are really the valuable part of the whole process; the visits of our inspectors are always an advantage to the insurers. We do not wish to throw impediments in their way; we wish to assist them to make the working of the boilers safe.

640. But your object is to make dividends for the shareholders, is it not?—But we should not be so likely to make a profit if we left everything after the first inspection to the insurer himself.

641. But you would save a great deal of expense, would you not?—No doubt, but that is not altogether our object.

642. Mr. *Platt.*] Might I ask what per-centage of the boilers, under your insurance, have come to grief?—In the six years of the operations of the company, I think we have had three serious explosions; I think not more than three. We have had several cases of accidents to flues, collapse of flues, owing to shortness of water, especially where our patent plug has not been used, a plug which is very useful in preventing explosions.

643. What amount of compensation have you paid during that time?—I can give the Committee each year separately. The amount of compensation paid in the year 1866, was 117 *l.* There is no entry for 1865. I dare say there was nothing paid in that year. In the year 1867, the amount of compensation was 539 *l.* That included one case of an insurance on a boiler for 400 *l.* all of which we paid within a few days of the accident. In 1868, the amount of compensation was 127 *l.*, and in 1869, it was 163 *l.*

644. Colonel *Gray.*] There was an explosion at Manchester last Monday; was that boiler insured with you?—The boiler is not under our care now. It had been under our care a year ago. It is one of those instances in which, after withdrawing from the insurance, an explosion happened.

645. Mr. *Cawley.*] Was that the one at Chadderton?—Yes, at Chadderton.

646. Mr. *Platt.*] When you declare a dividend

Mr. *C. Thompson*, J.P.

30 June 1870.

do you retain a large reserve fund?—We have a reserve fund. In the year 1869 it amounted to 796 *l.*, which was the appropriation of profits from year to year, after paying our dividends; but then the reserve fund on which we depend is the unpaid-up capital of 8 *l.* 15 *s.* per share.

647. Is it not very likely that as you increase in years, your risks will increase very considerably?—Our income will increase.

648. With the risk?—We think not, because by our care towards the insurers we induce them to renew the old plant, and put in fresh boilers; therefore with our increasing years our profit will be larger.

649. But suppose they do not do that?—Then we should cease to insure. We should run no risk.

650. Is it not a very unwise proceeding for your company to divide the whole of their dividends, because the risk must be greater as time wears on?—We are providing for that, because even in 1869, when the balance was 798 *l.*, we carried a further sum of 208 *l.* that year to that account, so that there is now above 1,000 *l.*, which is at the rate of about 200 *l.* a year going to the reserved fund, which has never yet been drawn upon.

651. Mr. *Cawley.*] Whereabouts was this boiler that exploded in Chadderton?—It was near Chadderton.

652. Whose boiler was it?—I forget the name of the individual.

653. Mr. *Lancaster.*] Had you refused to continue the insurance on that boiler?—Yes.

654. Mr. *Cawley.*] Why did you refuse to continue the insurance in that case?—Our engineer will be able to answer that question fully. I am not aware of the precise reason why.

655. Mr. *Lancaster.*] When you find that the moment of danger has come, you refuse to insure any longer?—We refuse to insure unless the repairs or alterations which we think necessary are made; of course it is to our advantage to have those alterations made in order to continue the insurance, and get a profit from it.

656. But the moment the point of danger has come, you withdraw from the insurance unless they renew the boiler or put it into a safe condition?—On the lapse of the policy at the end of the year we do not renew the insurance, but of course we are responsible up to the end of the year.

657. Mr. *S. Hill.*] Had you, previous to this explosion, brought to the notice of the owner of the boiler the cause of your withdrawing your insurance?—He refused to renew the insurance. The refusal was on his part, because he refused to make those alterations which our engineer deemed necessary.

658. The engineer prescribed a certain course of repair, the owner refused to do that, and the insurance necessarily fell through?—Yes.

659. Mr. *Platt.*] One of the answers which you gave just now suggests another question; there would never be much risk in your company, because at the end of the 12 months, under one pretence or another, you could always say you would no longer insure a boiler?—Then comes the question, how long should we exist under such circumstances as those.

660. Whatever becomes of the people that insure then, I can see quite clearly that you, the company, would be perfectly safe, because you would run away when there was danger; is not that so?—We do not run away; we suggest what is necessary to be done, and the honourable Member, I am sure, would not advise us to do otherwise; we should be morally culpable if we did.

661. Mr. *Lancaster.*] That refusal to continue the insurance, is equivalent to a notice that the boiler is unsafe, is it not?—Yes; it is necessary that we should not only protect the public by that protest against going on, but we show that we are willing to go on if the thing is made right.

662. But your refusal implies to the public, that a boiler is not safe, does it not?—Certainly.

663. Mr. *Hermon.*] You have said that a good many explosions happen through the non-use of your patent plug; is that a plug which fuses when there is shortness of water, allowing the water to run off in some way?—Yes, in all cases where the shortness of water is the cause, an explosion would be prevented.

664. That plug fuses and extinguishes the fire?—Yes.

665. Mr. *Cawley.*] Will you tell us, in estimating the amount of insurance, what proportion of boilers you calculate to explode, on an average, annually?—We have not been long enough in existence to make any very clear calculation, but from what I have shown you we may safely say that we shall not have more than two explosions in three years.

666. I apprehend that when you commenced the business of insurance, like other people you made an estimate of a certain charge which would enable you to meet your insurances and leave you a profit?—We were guided very much by the experience of an older company, which had made its profit.

667. What company was that?—The Boiler Insurance Steam Power Company.

668. Then what is the basis of your rate of insurance, apart from the inspection?—It is the experience that we have.

669. Then tell me, is it on one boiler in one hundred, or on one boiler in a thousand?—That would be decided very much by the character of the boiler. In the iron or coal districts, the probability is that the number would be very much larger; but if we confined ourselves to Manchester and the Lancashire and Yorkshire boilers, the number would not be so great; I think, probably, one in 1,000 would be quite a fair estimate of any probable explosion in the course of a year. It is more than the other company in Manchester have, I believe.

670. That is to say one in 1,000 out of those which you chose to insure?—It would be less than one in 1,000.

671. Then of course the amount required to cover that is a very simple calculation?—Yes.

672. Then we may take it that your company is based on something less than the proportion of one in 1,000?—Less than one in 1,000 per annum; certainly it is less than that.

673. Taking your charge of 25 *s.*, or whatever it is, I want to know what proportion of that was really for insurance, and what to cover expenses?—In round numbers you may say 5 *s.* for insurance, and 20 *s.* for expenses.

674. *Chairman.*] Is there any other matter to which you wish to refer?—No.

Mr. HENRY HILLER, called in; and Examined.

675. *Chairman.*] YOU are Chief Engineer to the National Boiler Insurance Company?—Yes.

676. How long have you been in that position?—I have held that position for about six years. Previously to that, I was assistant engineer to the Boiler Association—the Manchester Association for the Prevention of Boiler Explosions.

677. Which is now the Steam Users' Association?—Yes; I was assistant engineer there: I had been previously one of their inspectors. I have been engaged in what you may call boiler inspection, and business connected with it, for about 11 years.

678. You have had, of course, considerable experience in the investigation of the causes of boiler explosions?—Yes, I have.

679. To what cause do you attribute those catastrophes generally?—I attribute them to various causes; I have tabulated them here and they may be classed under somewhat the following headings. First, originally defective or weak construction. Secondly, Defective or insufficient fittings. Thirdly, Defective mode of setting, or improper arrangement of flues. Fourthly, Defective or weakened condition through wear, neglect, mismanagement, and other unfavourable circumstances. Fifthly, Carelessness, or mistake of attendants.

680. Have you a statement of the proportion of boilers coming under each head of the causes?—Yes; I have the particulars of the explosions which have come under my notice during the last five years, or rather during the five years ending 31st December 1869; 288 explosions were reported to me as having occurred in those five years; I obtained reliable particulars of about 223 of them; 36 were from external corrosion; 36 from deficiency of water; 29 from fracture at riveted seams at the lower part of boiler, generally over the furnace (externally fired boilers); 29 from insufficient staying or malconstruction; 29 from weakness of internal flue tubes; 24 from over pressure; nine from internal grooving; eight from internal corrosion; eight from weakness of the shell at the manhole; five from fracture through flaws in the iron, that is to say, defective material; two from unusual accumulation of deposit on furnace plates (plain cylindrical externally fired boilers); one from collapse of tube through deposit; one from thinning of copper fire-box, by external wear (a locomotive boiler); one from defective fire-box stays, that was a locomotive boiler; one from weakness of manhole cover; one from defective manhole mouthpiece; one from fracture in the flanging of an end plate, plain cylindrical boiler; one from defective arrangement of external flues, and one from the boiler being without a safety valve. Those are the 223 explosions of which I obtained reliable particulars; 65 other explosions either occurred in distant places, or with regard to which I was unable to obtain the particulars required.

681. The greatest number of boilers have exploded from corrosion, and from want of water, being 36 of each?—Yes; I have divided the corrosion into two heads, internal and external; external corrosion is caused by external moisture or leakage.

682. Mr. *Cawley.*] You have not separated those explosions into the main heads, namely, original defects, and defects occurring subsequently; the first heading here is "External corrosion," which is not an original defect; the second is "Deficiency of water," which is not an original defect; and the next is "Fracture at riveted seams at the lower part of the boiler," and that is not an original defect?—There are five general headings which I read; the fifth was carelessness, or mistake of attendants; but I have given the first heading as original defect, or "weak construction," and then enlarging on that, I say that those particular boilers would be so and so.

683. Can you summarise your answer of the original defects, and tell the Committee the proportion, because we know that that could be remedied by some inspection previous to the boiler being fixed?—Many boilers are originally weak from the ignorance of the men making them, through not sufficiently staying the ends; or in cases where there are flue tubes of large diameter not strengthening them by hoops, or cross tubes, which are generally adopted by the leading firms in Lancashire and other neighbourhoods; other boilers are weakened in other ways owing to the want of knowledge on the part of the parties engaged in constructing them; I class under that head the boilers failing from bad workmanship. Those cases are not so numerous as boilers actually failing from malformation, as distinguished from bad workmanship; but bad workmanship may lead to many explosions, inasmuch as if a seam is not properly closed, or the riveting not well done, the boiler will begin to leak, and that will lead to corrosion, which may result in an explosion. Then comes the inferior materials which will in the same way conduce to increase the number of explosions; there is no doubt that in many districts very bad iron is used, and I think it is a very important matter in any legislation, that some regard should be attached to the material used; perhaps it might be insisted upon that no iron should be used in boiler construction that would not bear an average strain of 20 tons on the square inch; that is what we call the Staffordshire strength. It should be insisted upon that every maker of boiler plates should mark clearly and distinctly on all his plates his brand, showing the quality of the iron, and so on.

684. *Chairman.*] In what class of works have those explosions generally occurred?—I think that more explosions occur at collieries and iron works, than anywhere else.

685. What description of boilers are generally used there?—At collieries, they generally use a cylindrical boiler, externally fired, without any internal flue tube.

686. An ordinary egg-ended cylindrical boiler? Yes.

687. What is the cause of fracture or explosion in such a boiler as that?—Fractures are generally induced, to a great extent, by deposit from the water with which the boilers are fed; they often use bad water from the pits and so on, which deposits a large sediment, and through the peculiar manner in which those boilers are fired, the seams over the furnace become injured, and then through the alternate contraction and expansion to which they are subjected, they eventually fracture; if that is not discovered in time, the

Mr. *H. Hiller.*

30 June 1870.

the rent extends, and the boiler is torn to pieces with explosive force.

688. As a matter of course, if there is a considerable sediment in the water, it will find its way to the lowest point which is in contact with the fire?—Yes, it is like a hollow dish.

689. Is there not a good deal of prejudice in favour of that kind of boiler among coal owners?—Yes, its simple form is a great recommendation to them; they have not the skilled attendants which we have in the mills in Lancashire; besides, those boilers are so easy to clean; there are no internal tubes, and the consequence is, that many of the engineers in collieries adhere to them, because they can be easily cleaned and easily repaired; but they certainly do require frequent repairs for the reasons I have given.

690. As a rule, are those boilers under any other inspection than that of the owners?—Not generally; I believe the insurance companies, with the exception perhaps of the Midland Company, have fewer colliery boilers than most other classes. The Midland Company have a very large proportion of collieries, and iron works; we have only a small number. Ours is a very mixed lot of boilers. The association have a great many boilers in Lancashire, mostly at cotton mills, which are a very superior class of boiler.

691. You have spoken now of the general cause of explosions in that description of boilers. What are the causes in other descriptions of boilers; such as those which are used in factories and other places?—Occasionally factory boilers are made suitable for a certain pressure, supposing it is a two-flued boiler, and sometimes the pressure is raised afterwards, and through want of precaution, and regard to the strength of the tubes perhaps, the flue tubes may collapse, in consequence of the pressure being too high; in other cases, the fittings may be insufficient; there may be a bad safety-valve, which leads to excessive pressure.

692. Mr. *Cawley.*] But is it the fact that you find from experience that accidents do arise from those causes?—Yes, it is the fact. Explosions arise sometimes through the water guages being fixed wrongly, and fixed too low, thus deceiving the attendant; I have known cases of that kind; sometimes I have known cases occur through the attendants mistake or carelessness, in not testing often enough. I have known an explosion occur through the omission of a proper back pressure valve, in consequence of which omission the water was forced from one boiler to the adjacent one, and the flues of the boiler which the water left became red hot, and consequently collapsed, leading to an explosion.

693. *Chairman.*] Are there any other causes?—External corrosion is a most fruitful source of violent explosions; many two-flued boilers which we consider a very safe class have exploded through corrosion.

694. How has that been caused?—Most frequently through external moisture, dampness due to the seating being too broad a wall, or having at the bottom a mid-feather wall, which made it impossible to tell the condition of the plates unless that wall was removed. Corrosion occurs where the iron is in contact with the brickwork, until the plates become so thin that an explosion ensues.

695. How would you ascertain what deterioration was going on by corrosion in that way?—We very often advise people to remove portions of the brickwork to let us test the plates. In many other cases we have advised them to re-set the boilers, which has been done.

696. Having removed the brickwork, how do you ascertain the fact; do you drill the plates?—Yes, frequently; if the plate appears to be seriously wasted, we suggest drilling and gauging.

697. In order to ascertain the remaining thickness, I suppose?—Yes.

698. Then all the causes you have named can be guarded against, at least explosions can be guarded against by proper inspection?—Most of them can. You cannot guarantee that an attendant shall not make a mistake. Two out of three explosions in our company have been owing to the attendants; that happens continually. One came from overloading the safety-valve, contrary to the instructions of the master; another was from deficiency of water through the attendant not attending properly to the feed supply.

699. How many inspections per annum do you think are necessary to provide against such casualties; I mean the inspections by your association?—We think that the boilers should be visited periodically, about three or four times every year; but we desire that at one of those visits we should have what is called a thorough inspection; that is to say, the inspector would get inside the boiler, and creep up all the flues, and examine the interior and exterior of the boiler in every part that was accessible. But external inspections are valuable; sometimes we can see how a boiler is being worked in the usual way; we see whether the attendant is firing and feeding the boiler properly; whether the fittings are kept in order; whether the safety-valve is at the usual point, or whether he has got extra weight on it. We sometimes find fire-bars or lumps of iron attached to the safety-valve, which is quite wrong.

700. Have you any difficulty in inducing parties to have their boilers inspected?—We have in some cases a great difficulty. Some parties appear to have great confidence in their own arrangements. Many good and very careful firms employ a skilled engineer.

701. Mr. *Cawley.*] Is that difficulty experienced with firms who are insured with you?—No, with firms who are uninsured. I understand the question to be whether we find a difficulty in getting people to place boilers under inspection, and I say that with many people we do find that difficulty.

702. *Chairman.*] But having insured their boilers, are the parties satisfied, then, and do they place difficulties in the way of inspection?—We find that the best firms are the most ready to meet us, but there is a difficulty. We find great difficulty in inducing parties to meet us, as they should do. Our anxiety as a company, and our board of directors second me very well on that point, is that one inspection should be thorough and complete, and that we should have no explosions if possible, but we find very often that when we have arranged with firms to have a thorough inspection, and when our inspector goes there, there is no preparation for him. If we complain, they are offended sometimes, and so we cannot tell the condition of the boiler.

703. Are they satisfied when they have insured the boilers?—Some of them are insured for so small a sum that if an explosion occurred the insurance

insurance would not cover the loss, but the average would be 200 *l.* on each boiler, taking them all through.

704. Taking a thorough inspection, and two or three general inspections, what would it cost?—It depends on the number of boilers. If it is a single boiler at one place, it would cost us from about 17 *s.* to 20 *s.* per annum.

705. That is to say, taking the average of boilers?—Yes.

706. Would that include travelling expenses to and from the place?—It would, in those districts where we have a local inspector. In some of those cases we have to incur travelling expenses to and fro. In other cases the inspector is on the spot.

707. Do all the boilers enrolled with you receive one through inspection every year?—They do not. Sometimes we have a great difficulty in getting people to prepare for an inspection. We go into many districts, and the inspectors take their rounds regularly, and with many of those firms we give them notice on a proper form that we have for the purpose, requesting them to prepare their boilers for a thorough inspection; but we often find that they disregard the notice. Many of them only stop, perhaps, at the local holidays, and they all come clustering in at once, wishing us to inspect them all, just when it is impossible. But if they would meet us we should be able to make a thorough inspection once a year.

708. You consider one thorough inspection necessary both inside and outside the boiler, in order to make it safe?—Yes; once a year, a thorough inspection of each boiler is desirable.

709. What proportion of the boilers insured receive such inspection from you?—I should say nearly half of them.

710. What becomes of the other half not inspected?—They are externally inspected; and some of them internally, perhaps.

711. But that is not such an inspection as would enable you to judge thoroughly of the state of the boiler?—Not thoroughly. I may say that we act in various cases according to our knowledge. In some cases we can judge pretty accurately from the external condition of the boiler, and knowing the quality of the water used is a great point. We have a clause in our policies by which we can demand a thorough inspection, and we have had to give up insurances, because the parties would not meet us.

712. Do you think that the inspection should be compulsory?—Yes.

713. How would you propose to carry it out?—I think that a system of general registration would meet the difficulty. By issuing notices, and advertising the fact to all boiler owners, that they would be required to register every boiler in use on their premises, whether used regularly or occasionally; and that they should be required to register within a specified time, under a penalty. A form of return should be prepared, which those owners should fill up, giving the description, make, age, pressure per square inch load on the safety valve, of such boiler, with its approximate dimensions, and a description of the repairs done within the last twelve months; and also stating how used and worked, and if in good working condition, according to the owner's or user's knowledge at the time that the return is made. I think, also, that this return should be signed by the owner or user, or by his manager, and that it should be forwarded to the registrar in each town or district, and that this return should be accompanied by the engineer's report on the last inspection, stating the condition of each boiler. This report should be on a form provided for the purpose, consisting of simple answers to a limited number of queries relating to the description and dimensions of the boiler and fittings, when and how examined, and the state of the boiler and fittings at that time; the form should include such questions as relate to the general safety of the boiler, including the attention that is given to it. In order that the registrar may understand the report without difficulty, queries should be put at the foot of it, such as "What is the general condition of the boiler?" to which the examiner would write "good," "moderate," or "bad." If the examiner pronounced the boiler bad, or dangerous, he should state his reasons, so that any man practical, or non-practical, could understand it at once. I think also, that there should be a query to this effect, "Do you think the boiler is safe as it is at present worked?" To which he should reply, "yes," or "no." If the latter, he should state his reasons for such decision; I think also that the form for the return should contain also brief instructions with regard to the necessary preparation for a thorough inspection which the owners would be expected and required to make; that I think is very important; I mean that they should be required to make a proper preparation for the inspection, as I stated before. We find owners who will not go to the trouble, and who would rather give up the insurance and take the risk, than go to the trouble of spending 5 *s.* or 10 *s.* to clean out a flue for us.

714. From whom should those inquiries emanate in the first instance; you say that notices should be issued with those returns?—Yes.

715. By whom should they be issued?—I think that parties should be appointed in each town or district, or county, who should be called registrars of steam boilers, to whom those returns should be made, and that they should receive them and file them, looking them over, and noting which boiler was reported "good" or "bad."

716. Who should appoint those registrars, in your opinion?—The local authorities under the supervision of the Government; if the local authorities did not proceed to appoint a registrar, Parliament might appoint one, and charge to the district the expense.

717. In fact, if the local authorities did not do it, it should be competent to the Government to take it into their own hands?—Yes.

718. Mr. *Hermon.*] Do I understand you to say that this return or report may be made by the owner's own engineer?—Whoever examined the boiler should send in a report to the owner, and the owner should send in this report with the annual return on registration, so that the registrar may see whether the boiler is in good or bad condition. The registrar need not be an engineer to understand them, if they were properly worded.

719. *Chairman.*] Would you propose any penalty in case of failure of complying with those conditions or regulations?—Certainly; the inspection would not, in fact, be compulsory without that; but I think, perhaps, if the adoption of a more stringent inquiry and investigation into each explosion were carried out, and if an engineer of special experience were engaged to examine every boiler reported upon, and the

Mr. *H. Hiller.*
30 June 1870.

owner were made responsible for the consequences of explosions, that would have the effect of stimulating the owners to take up all the means within their reach of having their boilers inspected by competent people.

720. Who would be the parties to authorise certain persons to inspect the boiler?—I think that a suitable extension of the present organisations would quite meet the matter. There are two insurance companies who extend their operations from John-o'-Groats to the Lands End. The Manchester Association has a large connection in various places; and then there is the Midland Company, who inspect and insure chiefly in the midland counties and the north of England. Those organisations are quite equal to the work if they should be called upon to do it; but, at the same time, it would be unjust to compel a firm to join any company against their will; therefore, I think, that respectable firms of engineers or boiler makers might be authorised to undertake inspections through their men; but they should be required to produce a certificate of competency showing the practical experience of boilers which those men possessed, and those men should be required to write their own reports, upon which the members of the firm, or their manager, would report to the owner. I think it desirable that no independent party should be permitted to assume the responsibility of inspection on his own account. All the inspectors should be supervised by their own employers; either the heads of engineering firms or the insurance companies, and the firm themselves (the employers, I mean), should report to the owners of the boilers, and that would give status and responsibility, and authority to the report. At the same time I do not think that any inspection, whether undertaken by Government officials, by a mutual association, by insurance companies, or by engineering firms, should profess, or should be allowed, to supersede the regular inspections made by the agents or by a firm of engineers.

721. That is to say, you would not remove the responsibility from the users of the boilers?—Just so; I mean those inspections to be simply a check on negligence, and to act as a stimulant.

722. Some of the associations have been in operation 14 or 15 years, have they not?—The Manchester Association, with which I was formerly connected, have been in operation ever since the year 1855.

723. Throughout the country generally there are only about 20,000 boilers enrolled, either with insurance companies, or any other companies; that is the extent of it, is it not?—Yes.

724. There are not more than 20,000 boilers enrolled?—The number is under 20,000, I think.

725. Does not that appear to you a very small number considering the advantages offered by the different associations?—Yes, it is a small number.

726. And considering, too, the number of years for which they have been in operation?—Yes.

727. I suppose that is another reason why you would say that the inspection should be made compulsory?—Yes; there are certainly some reckless people who would rather not have their boilers inspected.

728. Mr. *Cawley.*] It looks as if that were the case with the majority of them, does it not?—No; some respectable firms inspect by their own engineers, who are really good competent men, and who do their work well; but even they should be supervised by some one, because I have known cases where the boilers of a first-class firm were placed under our inspection, we have been able, from our special experience, to give them very useful information.

729. *Chairman.*] I know from my own experience, that a great deal of stress is laid on the importance of the fusible plug, as a preventive of explosions; are they of any further use than to prevent boilers exploding from shortness of water, and preventing the plates becoming heated and consequently weaker?—I only recommend the fusible plug to what we call internally fired boilers. Their only advantage is to prevent accidents from deficiency of water. Our company have the patent right of the fusible plug, of which I have a specimen here (*producing the same*), which we recommend strongly, because we have found it very efficient.

730. Dr. *L. Playfair.*] At what temperature does the fusible plug melt?—It is regulated according to pressure. Our ordinary plug melts at a temperature of about 350 degrees.

731. *Chairman.*] That means about 70 lbs. pressure, does it not; 300 degrees being about 50 lbs.; but of course you would get a higher temperature when there was no water in contact with the plate?—Immediately the water falls below the furnace crown, the temperature soon rises, and if there were no low-water valves, or no alarm whistle, no fusible plug, or anything to call attention, the boiler would get so hot that the pressure would distort the plates, and some times lead to an explosion.

732. Mr. *S. Hill.*] Will you permit me to look at that fusible plug?—Yes (*producing the same*). The peculiarity of this plug is, that it is formed of two cones, one inside the other, and those two cones are united by the fusible metal.

733. What is the fusible metal?—It is a mixture of metals, tin and lead or bismuth, or something else; and it is fixed on the top of the furnace. The internal cone is simply soldered to the outer one, and when it is fused out there is an opening through which the steam rushes. When the boiler becomes short of water, the soft fusible metal which unites the cones is melted, and the inner cone falls away, leaving a large clear opening, through which the steam rushes, and extinguishes the fire, thus saving the boiler from injury.

734. Mr. *Lancaster.*] The lowest temperature, you say, is about 350°?—Yes.

735. The plates are not very much weakened even at twice that heat, I suppose?—Sir W. Fairbairn's experiments show that a flue heated to 400 degrees, scarcely shows any perceptible diminution of strength.

736. Have you ever known a collapse to take place from shortness of water with one of those fusible plugs?—Not with this plug. We bought the patent, and with boilers that are insured with us, we take care to see that the plugs are clean, and whenever due attention has been given to the plug we have never had a case in which it has failed to act.

737. *Chairman.*] Is there anything further which you wish to state to the Committee?—I think, in any legislation on this matter, it may be desirable, not merely to require the owner of the boiler to make due preparation for a thorough inspection, but I think that in future it should be made

made illegal to set any boiler with flues of such a size that they cannot be entered for inspection. A boiler may be so placed and so fixed as to work quite as economically with flues so made that it may be properly inspected just as well as those which are made so contracted. I think the law should deal with that matter. We meet with boilers that have been at work for seven, eight, or ten years, and the flues are so small that no one could inspect them.

738. You speak now with regard to brickwork flues more particularly, do you not?—Yes; I think the owners in every case should be required so to set their boilers that the flues may be entered for inspection, or, at all events, that they should leave such openings as would enable anyone to inspect them, otherwise we shall never have done with these explosions from external corrosion; there are several points in that direction which I think, without interfering with the progressive improvement of steam boilers (which I think would be very objectionable), might be enforced generally, so that defects which arise after a boiler has been set to work may not be overlooked.

739. How would you define the class of boilers that should be placed under inspection?—I would say that all steam boilers used for manufacturing purposes should be under inspection; I do not include in that, circulating boilers for household purposes; but all boilers constructed as ordinary steam boilers are, and working under steam pressure. I would even take those of one-horse power, many of which are working in little out-of-the-way places. People are scalded through little explosions which we never hear of. My idea is, that there are 25 per cent. more explosions than I have got recorded in my return.

740. Dr. *L. Playfair.*] I think in your plan you do not seek to remove private inspection, or private responsibility?—Certainly not.

741. And the steam user is still to have his private inspection?—Yes.

742. But in addition to that, you wish responsible public inspectors also to be established?—Yes.

743. What inducement do you give to the steam users to come into this scheme; they do not seem to have any advantage by your plan; it is simply arbitrary compulsion for the protection of the public; that is all, is it not?—Yes. The compulsory inspection is for the protection of the public and the workpeople.

744. And you give the steam users no advantage by associating together, in order to induce them to co-operate with the law; but it is simple and absolute compulsion, is it not?—I look at it in this way; I do not think it is necessary that people should be compelled to have a periodical inspection; but I think there should, at least, be one inspection per annum, made by an independent individual. In twelvemonths, of course a boiler may alter very much; it is therefore to the interest of the steam users, and the public, and the workpeople, that those boilers should be supervised by some one on the spot, who would detect any little thing that was wrong.

745. You spoke of three or four inspections per annum as being necessary; do you intend the three to be private inspections, and one only to be made by a public inspector?—Our inspections we consider desirable three or four times a year; many parties insured with us have only one or two boilers; those men are not perhaps engineers, and we think it desirable that they should be compulsorily supervised, to see how they are working the boilers. Even in case of large firms, it acts as a stimulant to the engineer.

746. But if a boiler requires to be inspected three or four times a year, how often is the public inspector to do it?—Is he to do it only once, or three or four times?—I think the public inspection ought to be made only once a year, but it should be a thorough inspection.

747. Mr. *Hermon.*] You say that a good many of those explosions arise from external corrosion?—Yes.

748. And that they partly arise from the manner in which the boilers are set in the brickwork?—Yes.

749. Can you suggest any better plan of setting them, because the boiler must rest on something; and, as a rule, I fancy they are not placed on more brickwork than is necessary, or that there are no more plates covered with brickwork than is necessary?—It is the fact that in many cases the seatings are excessively broad. I have known a boiler 5 or 6 feet in diameter, with a 4-feet wall under it, whereas two walls of about 3 inches broad would have carried it.

750. But if that brickwork is perfectly dry when the boiler is set, would that remove the difficulty, or does it arise from leakage?—If leakage occurs, it acts on the boiler when the brickwork is so broad, and corrosion goes on until the plate is so thin that perhaps a man strikes a hammer through from the inside when cleaning it, or an explosion occurs.

751. You spoke of the steam users refusing to make the preparation for those periodical visits or inspections; under those circumstances, you would require the boiler to be stopped, would you not?—Yes, for the annual thorough inspection.

752. Therefore once a year the owner must stop his works during that examination?—Yes.

753. Have you seen that in recent inquiries before coroners' inquests a great many of those explosions are attributed to accidents?—Yes.

754. Do you agree with the general tenor of those verdicts?—Certainly not.

755. Do you think that the explosions arise from causes which, with proper precaution and inspection, could be avoided?—Certainly; there is no mystery about that; they arise from plain causes, which could be detected if a proper opportunity had been given for inspecting them.

756. Mr. *Birley.*] You have stated that many explosions occur from defective construction?—Yes.

757. Would you propose to place the boilermaker under compulsory inspection as well as the boiler user?—I think not; it is rather an awkward question. I think if the owners were made responsible they would not be tempted to go to such cheap men for their boilers.

758. Would you have a boiler inspected as soon as it is set up, and before it is used?—Yes.

759. And condemned if it were faulty in construction?—Yes, I think so.

760. That is to say, before any boiler was permitted to work you would have it inspected, and condemned if the construction were faulty?—Yes.

761. What do you propose should be the qualification of the inspectors; should they have certificates?—My scheme is that the firm should be

Mr. *H. Hiller.*

30 June 1870.

be responsible; in the case of those inspectors I propose to hold the firms, their employers, responsible. Supposing Messrs. Petrie, of Rochdale, who are an engineering firm, for instance, undertake to inspect boilers for their customers; they know the character of the workmen on the premises, they know who are intelligent and who are not, and they would instruct those men how to proceed; those men would make inspections and make returns to their masters. Now I think that a first-class engineering firm would be very good judges with regard to who would be competent to make those inspections, especially if (as I think is desirable) the Government were to issue some general instructions on the point, founded on the experience of the three insurance companies and the associations.

762. But you take no public security with regard to the qualification of the inspector, do you?—I would take the character of the firm; they would think it such discredit if they gave wrong advice, that they would take proper care in the matter.

763. How would you secure the responsibility of a firm?—Their general character in the district or the country would be sufficient, I think; I think there are plenty of firms whose characters are generally accepted as respectable.

764. Would your company insure a boiler to any extent; that is to say, beyond the value of the boiler itself, in order to cover injury to buildings?—We do not generally exceed 500 *l.* on any boiler, which covers the surrounding property.

765. Would you do it if you were asked?—We have done it on locomotive boilers sometimes; but we have not included the surrounding property with them.

766. Colonel *Gray.*] You do not appear to be much in favour of the Government taking the responsibility of this inspection?—No, I am not.

767. You prefer its being in the hands of the local authorities?—I think the Government should exercise what I may call moral compulsion, by insisting upon those returns, which I have already mentioned; and I think that would lead to what we desire without establishing an expensive machinery, such as a Government set of chief inspectors and sub-inspectors, throughout the country; it has not been found to work well in other countries; such an inspection must be bound by routine.

768. What other countries do you allude to?—I refer to America, for example; I have a paper here, published by an insurance company in America.

769. Is that a boiler insurance company?—Yes, the Hartford Insurance Company; that is on similar principles to ours; and their inspections are allowed to supersede those made by the State. In Germany, they have adopted a similar principle, and last year a gentleman from Holland, one of the officers of State in the Dutch Parliament, called on me with regard to this matter; he said that the Government rules are very arbitrary indeed, so arbitrary, that they prevented people doing what was really safe and reasonable; in fact, I know that boilers which would have been passed here, have gone on to the Continent and been rejected, because they did not happen to have a certain thickness of plate; no notice was taken of the quality of the plate, whereas scientifically, they might be very strong boilers.

770. Can we judge of the effect of a Government inspection here from what takes place on the Continent?—There is some difference, no doubt.

771. You think that there should be a thorough inspection once a year, and yet it appears from your own statement that only half the number of boilers insured with you have that inspection; is not that so?—Our business is not concentrated. Take, for example, the different associations and insurance companies; when I was with the Manchester Association we had great difficulties in getting a thorough inspection; in fact, there was no incentive, but when they adopted the guarantee principle they obtained a lever by which they could enforce their rules. They have weeded out the malcontents, and they have got a connection of parties who are willing to inconvenience themselves in order that the boilers may be inspected; but we have to go into districts where people are not, so to speak, educated in this manner, and they do not appreciate our inspections as they should do. They look upon a thorough inspection as a great hardship; they would rather throw up the insurance than let their boilers undergo an inspection; and that is the reason why thorough inspections are not more numerous.

772. You have ben asked questions about insuring buildings; is there any insurance effected with you for compensation for loss of life?—No, we do not take insurances for loss of life. We have only had three lives lost in connection with boilers insured with us since our establishment six years ago, so that we have been very fortunate, which I attribute to our careful inspection, while in the same period about 350 explosions have occurred in various parts of the country, causing the death of 463 persons, and serious injury to about 620 others, so that I think our results will compare favourably with those of any other office.

773. Mr. *Cawley.*] You expect, as I gather from your evidence, that respectable firms would be willing to become inspectors, and would inspect through their men, but they are themselves to be the responsible parties, and the parties to give the certificate?—Yes; they would be paid a certain fee for the inspection.

774. For what kind of fee do you think a leading firm would be willing to stand before the public as responsible for the safety of a boiler in which they had no interest whatever?—Many firms who have made the boilers, actually undertake the inspection of them.

775. The boilers that they had made themselves?—Just so.

776. But the Committee, I think, understood you to say that they were not to be the inspectors of their own boilers?—That question was put to Mr. Thompson, and I think he meant boilers in use on their own works, not boilers made by themselves. I should say that they ought not to inspect their own boilers, but the boilers that they have made for other parties.

777. You think that they might inspect boilers of their own make?—Yes, they might inspect the boilers which they had made for other firms.

778. But take other firms who, under your classification, would not be respectable, and who make boilers; who is to inspect their boilers?—I believe that any engineering firm would send a man to inspect boilers, if requested to do so, and paid for it.

779. Do you think that that would work satisfactorily with the leading firms in Manchester; take Messrs. Galloway's, or any of those firms who are considered respectable, and suppose an inspector went and condemned another maker's boiler?—Yes; I think it would be satisfactory; they would give their reasons for condemning a boiler if it were unfit for use.

780. Satisfactory to whom?—The owner of course would not be satisfied if he thought he had got a good boiler, and found he had a bad one.

781. Do you think that a certificate of that kind would be more effectual in the eyes of the public than of an independent person?—By an "independent person," I mean an irresponsible individual.

782. The responsibility would be the same in both cases, would it not?—If we were to let independent persons inspect on their own account, that would not do.

783. But take the case of an inspector appointed by some qualified tribunal, independently of the parties using or making the boilers, how would that work?—Does the honourable Member mean an inspector appointed by an association, or by a company, or by the Government itself?

784. I mean an inspector appointed by the Government or some local authority. The inspectors appointed by the association of steam users who are merely voluntarily associated together for the purpose of securing their own boilers and the insurance company, who are a trading company, may have an interest in inspecting boilers, but I do not look upon them as independent. You think that an inspection by a firm in the trade of another trader's boiler, would be as satisfactory in the eyes of the public as that of an inspector appointed, as the factory inspectors and the inspectors of weights and measures are appointed, do you?—That might be open to abuse sometimes, but in any case of difficulty they could have recourse to the authorised inspectors of the insurance companies and associations, who inspect at about the cost price without insurance.

785. But the association's inspection extends only to parties who are willing to have their boilers inspected; and according to your evidence the large majority do not choose to have their boilers inspected; and we assume that to include the very parties who most need inspection; is not that so?—Yes; but I think that a great many people who are now averse to insurance would place their boilers under the inspection of the existing companies, knowing that they could not get it done more cheaply or reliably elsewhere, so that the difficulty would be met in that way.

786. What fee would induce a respectable firm to undertake this inspection, do you think?—I have known firms undertake it for 10*s.* a boiler, and others a guinea for a single inspection.

787. Now about this last explosion of a boiler near Middleton Junction of the Oldham branch of the Lancashire and Yorkshire Railway; did you state that this boiler was insured by your company at one time?—Yes.

788. Do you remember at what pressure you insured that boiler?—I noticed when Mr. Thompson gave his evidence this morning, that he made a mistake. He said that we refused to insure this boiler. The facts are these: About 15 months ago, in March 1869, I think it was, the firm were altering their engines and putting up high pressure engines, and they proposed to increase the pressure to 60 lbs. We asked for a thorough inspection of the boilers, and we had a thorough inspection of two of them. The boilers had been insured up to 50 lbs. pressure with us previously. Two of the boilers were nearly new, and made by the Messrs. Galloway. We were most anxious to get the old boilers inspected first, which we did. They then commenced to work at a pressure of 60 lbs. But we asked for a thorough inspection of the other two boilers. We named Whitsuntide, 1869, as the time when they might afford us an opportunity; but instead of giving us any chance of a thorough inspection, the insurance was withdrawn. The old firm, I believe, failed, and the mill passed into other hands, so that we lost all responsibility. They did not give us an opportunity, and withdrew the insurance; and since that time I believe the boilers have been worked up to 70 lbs. pressure.

Mr. *H. Hiller.* 30 June 1870.

789. But do you recollect what the pressure was which your association reported that the boiler was fit to bear; the boiler that was exploded, I mean?—We believed it was fit to bear a 60 lbs. pressure, at the same time we asked for a thorough inspection.

790. Are you aware of the evidence given at the inquest?—Yes.

791. You know that Mr. Harman has stated that it was reported, I do not mean by you, but by your association, to be safe at a pressure of 60 lbs., and that he stated on oath?—Yes.

792. Are you also aware that Mr. Charles Galloway has stated on oath that the boiler was made only to bear a pressure of 40 lbs.?—No, I was not aware of that.

793. Mr. Harman stated that your association reported it was capable of bearing 60 lbs., and that it was insured at 60 lbs.; you are aware of that?—I will tell you how that arose; it is only just to our association that I should do so. We had a man in our employ who examined that boiler; he took the dimensions of it, and he made a mistake in the thickness of the plates at that time. I discharged that man for carelessness. We wanted a thorough inspection in order that we might verify those dimensions, but the opportunity was never afforded us.

794. You certified or reported, whichever it was, without a thorough inspection, that it was capable of working at 60 lbs. pressure?—Without a thorough inspection immediately. That information which was given to Mr. Harman was given to him as private information.

795. Colonel *Gray.*] Were the two boilers made at the same place, and of the same age, and the same in every respect?—All the four boilers were made at different places, and times, I think.

796. Mr. *Cawley.*] This particular boiler that exploded is said to have been made so recently as the year 1866, by Messrs. Galloway, is it not?—Yes, I believe it is.

797. Therefore it was not an old boiler?—No; I was told that when they did not renew their insurance with us they went to Messrs. Galloway, and that they have examined the boiler since, and certified it.

798. The evidence is also that the boiler had been working up to a pressure of 70 lbs. or even 74 lbs., so you would not wonder at the explosion, would you?—No.

799. But

Mr. *H. Hiller.*

30 June 1870.

799. But I want to know the fact, whether you had reported it to be safe, and insured it at a pressure of 60 lbs., when the maker has only taken it at 40 lbs.?—We were never informed of that.

800. You have stated that you have dismissed the man whom you had employed?—Yes, we dismissed him because he was unsteady, and he misled me about that boiler by returning a wrong thickness for the plate. We are exposed to mistakes in that way.

801. Do you think that a respectable firm might not send a man who could be no more certainly depended upon than that man of yours?—Any of us might be mistaken; I know that the association have had to change the men sometimes in consequence of their not being satisfactory; all of us are apt to do that.

802. Mr. *Lancaster.*] You said that explosions most frequently occur at collieries and iron works?—Yes.

803. And you say that it arises principally from the effects of bad water?—Yes.

804. And you also condemn the class of boiler, called the plain cylindrical boiler?—No; I did not exactly condemn the cylindrical boiler, but I say it is not quite so safe as the internally fired boiler.

805. Will you be kind enough to explain that to the Committee?—When those seams over the furnace fracture, there is nothing to hold the boiler ends together, and the boiler parts into two or more pieces, or if there is a seam exposed to the heat over the furnace, that is in a state of tension, if it is longitudinal; and where it is fractured of course the rent commences, and may extend to other plates, and culminate in an explosion.

806. Would that be mainly from bad water, or from irregularity of supply?—Yes; if a boiler be irregularly fed, the water first up and then down, the boiler would be alternately hot and cool; that will all tend to the same result.

807. That applies to all boilers, does it not?—It applies to internally fired boilers, but you have not the same result in a tube boiler; it will only lead perhaps to leakage if the tube is properly strengthened against collapse.

808. You put down a large number of the boilers as failing from corrosion?—Yes.

809. That applies principally to flued boilers, they are more liable to corrosion than those externally fired boilers, are they not?—No, they are not more liable to corrosion; it is because the flued boilers are generally set with external flues, and placed at a lower level; the shell of the boiler is at a lower level, and is thus more likely to be damp on the seating, and owing to the broad seatings leakages often take place which lead to a fracture.

810. You have said that it is an important point in the construction of a boiler that you should have good plates?—Yes, I think every plate should have the maker's name, and the quality of the iron stamped upon it.

811. You are aware that Government, as well as all railway companies, in making bridges and other works, stipulate that the iron shall be of a certain strength?—Yes.

812. There is no difficulty in having that strength ascertained, is there?—No certain plates are known to average a certain strength. They have testing machines for the purpose.

813. Twenty tons to an inch is a fair average for a boiler plate, I think?—Yes, that is what we call a good Staffordshire plate.

814. There is no difficulty in manufacturing that kind of plate all over the country, is there?—No, certainly not.

815. Under the head of malconstruction you also class the setting up, in a defective manner; that would all come under that head, would it not?—It is not exactly so, perhaps.

816. First of all you say that before a boiler should be set to work you would have a certificate that it was properly constructed?—Yes.

817. The setting up of that boiler, with all its fittings, would form part of that arrangement; if there was any defect in the setting, or in the walls, and so on, that would all come under the head, whether it should be certified or not, would it not, before it began to work?—Yes; I think it is desirable that the setting should be included.

818. You attach great importance to the certificate that the boiler is properly constructed and set up before it is set to work?—Yes; I attach great importance to the certificate that the boiler is properly constructed and set up before it is set to work.

819. You say if that were so it would have saved, as I gather from your report, 15 per cent. of the explosions?—I cannot say exactly what per-centage of the explosions it would have saved, but at all events it would have saved some of those explosions from external corrosion.

820. In other words, one-sixth of the explosions would be prevented by a thorough inspection previous to setting the boiler to work; can you answer that question?—I should hardly say as large a proportion as one-sixth.

821. *Chairman.*] At all events, it would materially decrease the chance of an explosion, if those things were provided for in the first instance, would it not?—Yes; I should say it would decrease the chance of explosions at least 5 per cent.

822. Mr. *Lancaster.*] But does not your table imply, that if a thorough inspection took place previously to a certificate being granted, it would remedy that difficulty and lessen the explosions by 15 per cent.?—Say from 5 to 10 per cent.

823. I am dealing with cases of mal-construction?—With regard to the mal-construction of the boiler itself, I should say that 90 per cent. of the cases might be prevented.

824. Sir *T. Bazley.*] Will you be kind enough to inform the Committee whether in many cases your plugs have fused or not?—Yes, in a great number of cases; I should think that they have saved 100 boilers at least from damage since we got them generally adopted. I have reports here, referring to a dozen cases which I picked out haphazard; in some cases, the boilers got short of water during the night; in other cases, the men were negligent, and in other cases, the water-guage was broken.

825. Do you know of any case in which your plug has failed, or an accident has happened?—No; not since we got them into general use, and got the manufacture of them into our own hands.

826. Mr. *S. Hill.*] With regard to the explosion at Middleton, did you certify that that boiler could be worked at 60 lbs. pressure?—We accepted it at 60 lbs. pressure.

827. You insured it at that pressure, did you?—Yes.

828. When

828. When was that?—As near as I can recollect, it was the beginning of 1869.

829. When did you find out your mistake and dismiss the man?—We did not dismiss the man in consequence of that; but if we had known that, of course we should have called attention to it at once.

830. Your dismissal of the man was for other negligence, was it not?—Yes, for other negligence.

831. Was it for negligence of a similar character that you dismissed him?—I cannot recollect an instance of a character like that; I know that it was for general want of care he was dismissed.

832. Mr. Thompson said, in his evidence this morning, that you could give me some of your reports of inspection?—Yes, I have some here (*handing some reports to the honourable Member*). Those are some which I have just taken out of our ordinary reports. We take every particular of a boiler when they give us a thorough inspection showing every stay of the boiler, the dimension, the thickness, and so on; in an external inspection our inspectors are instructed to take every particular that they possibly can. In the case you refer to, the man returned a seven-sixteenths of an inch plate, whereas it turned out to be three-eighths of an inch, they not giving us the thorough inspection which we asked for, we were not able to verify it.

833. What would be the expense of making an inspection, as complete as this, with this well finished sketch, and with all the details?—It could not be done under 15 *s.*

834. It would not cost more than that, you think?—No.

835. Could you make the inspection, and make this drawing, and this report, for 15 *s.*?—Yes.

836. What inspector made this report?—Mr. Billington, he is our Sheffield inspector.

837. He went from Sheffield to Halifax then?—Yes. Those people had seven boilers insured, and at the time he made this sketch he would have inspected a lot more boilers which would be in the district.

838. But he would not have an opportunity of inspecting seven or eight boilers at the same time, would he?—That was in last December.

839. How many of those thorough inspections similar to this were made by your company in the course of last year?—I cannot say.

840. Can you tell me about the number?—Seven hundred or 800, perhaps. You must bear in mind the number of boilers that are insured; but some of them had not been insured with us long. Some of them we have not had an opportunity of so inspecting.

841. *Chairman.*] But you have had 2,000 boilers insured with you for a considerable length of time, have you not?—Mr. Thompson, I think, did not quite understand your questions. We are continually having new boilers proposed, and other firms discontinuing their insurances.

842. But you have 2,000 boilers under your inspection?—We have now; but the Christmas previous to that we had 1,500 or 1,600.

843. Mr. *S. Hill.*] I thought you never insured a boiler until it had had its first inspection; I understood that from Mr. Thompson.

Mr. *Thompson.*] I said that we never insure a boiler until we have seen it.

844. What kind of inspection do you make before you insure a boiler?—(*The Witness*).] The inspector examines it as far as he is able to do so, and takes particulars of all the fittings, the load on the safety valve, and everything he can get from common external inspection. If we are satisfied, after the inspection, that the boiler is in a safe condition, we take the risk.

845. You may have on your books at this time a very considerable number of boilers then that have never been thoroughly inspected at all?—There are some boilers, no doubt, which have not been so inspected at all.

846. Fifty per cent. of them, probably?—No; you would find that some of our boilers that were examined perhaps in the middle of 1868, may not have another inspection until 1870.

847. Can you tell me then what per-centage of the boilers which you have on your books have never been inspected?—Perhaps about 15 per cent. that have never been thoroughly inspected.

848. I mean anything more than an external inspection?—Yes. I now produce another report of a very intricate boiler (*producing a paper with a drawing*).

849. *Chairman.*] In this case, there are two tubes for the length of the fire-place, and an oval flue with a number of Messrs. Galloway's tubes?—Yes.

850. Mr. *Pim.*] What is the pressure used in these colliery boilers?—I do not think the pressure in those collieries exceeds on an average above 35 lbs. on the square inch.

851. It results from that that it is not high pressure that is the great cause of the explosions, does it not?—Not in those cases.

852. Do you think that accidents arise most frequently from want of knowledge on the part of the collier?—Want of knowledge which produces want of care; it is ignorance, ignorant negligence, I should say.

853. Of course, if it be ignorant negligence, it is still negligence?—No doubt it is negligence and want of care that causes the greater number of those explosions.

854. I think you would not except from inspection any boiler on account of its size, if it was used for industrial purposes?—I think not; I would not except any one.

855. That would include locomotive boilers on railways; and perhaps you would include those moveable boilers which are conjoined with engines; say, for instance, many of those which are used for agricultural purposes?—Those would require special legislation almost, you cannot get inside them; the railway companies themselves have better opportunities than any ordinary inspector would have, except when they have the boiler in the shop and had the tubes out; but it is almost a haphazard system caused by the peculiar construction of the boilers; most of the explosions in locomotive boilers occur from the thinning of the plates consequent on corrosion, and the action of the water near to the riveted seam, and those, of course, may be reduced a great deal by superior construction. But at the same time it is impossible to have a criterion, except, perhaps, by applying the hydraulic test of the condition of a locomotive boiler.

856. It results from that that there would be a great difficulty of inspection with regard to railway locomotive boilers, and certainly with regard to those moveable boilers which are not set and are used with engines, such as those for agricultural purposes?—Yes, there would be a great difficulty

Mr. *H. Hiller.*

30 June 1870.

difficulty with regard to railway boilers especially, because of the engines moving about, and the peculiar character of them; but with regard to other boilers, if even only an external inspection were made, it would be valuable, because they are so often negligently worked with such defects existing that anyone could see them with only an external inspection. We had some proposed for insurance lately where the fire-box in three out of four of the engines were distorted from want of water, or the accumulation of sediment from the water.

857. Are there many establishments worked now with a single boiler?—Yes.

858. If a thorough examination were made it would be necessary to stop those establishments for some length of time, would it not?—Certainly, it would be necessary to stop them for a couple of days.

859. Colonel *Gray.*] Have you any boilers used for agricultural purposes insured in your company?—Yes, we have.

860. Have you many?—Not many. We do not cultivate that business, because there is such difficulty in obtaining an inspection of the boilers.

861. Mr. *Lancaster.*] You would not recommend the inspection of locomotive boilers of railway companies; you think that the railway companies can do it better themselves?—Yes, under present arrangements most certainly.

862. You would not apply your rules to railway companies' locomotive boilers?—No; except in explosions. If anybody was killed I would have an inquest held.

863. But you would not fix the same rule for locomotive boilers worked on railways as for other boilers?—I think not.

864. *Chairman.*] Did you not say that it was a haphazard system on railways?—It is rather haphazard. You cannot see inside the boilers, and they work on for a number of years until the tubes begin to leak.

865. Mr. *Lancaster.*] Can you suggest a better plan of inspection than that adopted by the present railway companies?—Not without incurring great expense.

866. Mr. *Hermon.*] You make examinations on Good Fridays and Christmas-days; did you ever do it on Sundays?—I never compel that.

867. But does your staff ever do it?—I do not think we have made an examination of above three or four boilers on Sunday since our company commenced.

868. *Chairman.*] Have you anything further to state to the Committee?—At inquests, in cases of explosions, I think there should be a strict investigation into the cause of every explosion; I think that a strict investigation by a competent engineer, would cause parties not only to have their boilers inspected, but to see that the preparations for the inspections were really of a satisfactory character; I think that at every inquest, there should be the evidence of some engineer; I do not wish to put myself or my brother chief engineers forward, but I think that some one with similar special experience in these matters ought to be called upon to give evidence.

Monday, 4th July 1870.

MEMBERS PRESENT:

Mr. Armitstead.	Mr. Hick.
Sir Thomas Bayley.	Mr. Staveley Hill.
Captain Beaumont.	Mr. Laird.
Mr. Cawley.	Mr. Lancaster.
Colonel Gray.	Mr. Platt.
Lord John Hay.	Dr. Lyon Playfair.

JOHN HICK, Esq., IN THE CHAIR.

Mr. WILLIAM RICHARDSON, called in; and Examined.

Mr. *Richardson.*
4 July 1870

869. *Chairman.*] YOU are a Member of the Association of Mechanical Engineers?—Yes.

870. You are also one of the firm of Messrs. Platt Brothers & Co., Oldham?—Yes.

871. You have had considerable experience in the management and working of steam boilers?—Yes, I have.

872. You are a member of the Steam Users Association also?—Yes.

873. And you are on the committee of that institution?—Yes.

874. What number of boilers have you under your own control in your own establishment?—About 40.

875. Have you ever had an explosion in your own works?—No.

876. As a member of the Steam Users Association, naturally, the results of explosions have come at different times under your observation?—Yes.

877. Generally speaking, from what have those explosions proceeded?—Generally from weakness and inattention.

878. And some of them have arisen from defects of construction, I suppose?—That is weakness.

879. And mismanagement in the use of the boilers?—Yes.

880. Is there any other leading cause that you can assign for explosions?—Yes; there is the wasting away by the wear and tear of the boiler, and a great many things that tend to weakness.

881. Will you be kind enough to favour the Committee with your opinion generally with respect to the manner in which these sad catastrophes could be prevented?—They could be prevented by the introduction of tests to try the strength of the boilers. A small hand pump should be applied to the boiler once per annum, or at any other time when there was any sign of weakness, or after a boiler had undergone repair, and that test should be imperative, say at 50 per cent. over the pressure at which the boiler was allowed to work. If you carried out that test perfectly, that boiler would be safe.

882. You think that a test of 50 per cent. would be quite enough above its working pressure?—Yes, I think it would be quite enough.

883. What kind of inspection would you consider necessary?—An entire thorough inspection.

884. That is to say, a thorough examination of the outside and inside of the boiler?—Yes, a thorough examination inside and outside. But the great thing which I would rely upon would be the force pumps.

885. Would you make that inspection and testing compulsory?—Yes, decidedly.

886. How would you do that?—Through the corporation of the district where the boiler existed.

887. You mean the town council of the district?—Yes.

888. You think that they should enforce that inspection?—Yes. Let them keep a competent engineer, in some portion of their staff, who would be ready to inspect and test boilers.

889. Mr. *Cawley.*] You insist more on the value of testing than on the value of what is called inspection?—I do not know the difference between the two.

890. But you would not call an inspection complete without the testing?—No.

891. *Chairman.*] What would you do in case of non-compliance with the instructions of the corporation or inspector?—I would apply the force of the law, just the same as you do in other matters.

892. Do you think that one such inspection a year would be sufficient?—Yes, except a boiler showed signs of weakness; if it did it should be imperative in the user to report to the authority; if it began to leak or had taken any injury, he should at once report to the authorities.

893. Should such an inspection, in your opinion, remove in any degree the responsibility of the parties themselves?—That would bring two minds in to bear upon it; if the parties owning the boiler had not sufficient knowledge themselves, the inspector would assist their judgment.

894. How, in your opinion, should such an inspection be paid for?—The parties who owned the boiler should pay the cost of the inspection, just the same as they now pay for the cost of the boiler; if a firm like ours had 40 boilers and paid attention to the boilers, and did all that was right, so that the inspectors had nothing to do but to come into the yard and see the test put on, I would not charge them as much as I would

Mr. *Richardson.*

4 July 1870.

charge a person with a single boiler four or five miles from the centre of the town.

895. You said that you thought the force pump test would be quite sufficient to ascertain the state in which a boiler was?— Yes, I think so.

896. Of course it would be the duty of the inspector to see that the safety and feed valves were in good order?—Yes, and all the fittings should be tested so that not even lowness of water could arise without giving an alarm to the attendant.

897. What do you think of the idea of a central steam board to appoint inspectors in different parts of the country?—I should call a corporation a central board in its own district. I do not think that any other centres are required.

898. You think that each district should appoint its own board of inspectors?—Yes.

899. Colonel *Gray.*] You think that the corporation of a district should be the authority to enforce compulsory inspection, but there are many boilers that are used in districts where there is no corporation, what would you propose to do in that event?—If there is a county organisation I would impose a duty on them. We have county police and so on, and there are competent men at the head of them to look after boiler inspection.

900. What might the cost of inspection be, do you think?—It would vary very much according to the expense of travelling. I should say that in a town like Oldham, 10*s.* would be the amount.

901. Do you mean 10*s.* per boiler per annum?—Yes; 10*s.* per boiler per annum.

902. But that is much less than what the Steam Users Association charge, is it not?—Yes; but they travel to great distances, and take up a great deal of time in inspection, another thing, they have to give guarantees of restoration in case anything happens.

903. Are your boilers under the inspection of the Steam Users Association?—Only two of them.

904. I understand that they charge a guinea and a half a boiler?—Yes.

905. Of course that would come to a great deal on 40 boilers?—Yes.

906. Are you opposed to the Government having anything to do with the inspection of boilers?—Yes, I am opposed to the Government having anything to do with it.

907. Would it not be better done by a central authority for the whole country?—No, it would not be half so well done.

908. How would the factory inspection be if it were done by corporations do you think?—I think it would be quite as good as it is at present.

909. Would there be any more difficulty in having a Government inspection of boilers than there is in a Government inspection of factories?—Yes, a great deal more.

910. How would it be more difficult?—In factory inspection there is nothing to prepare for the inspector; he has only to come in and see that the mill is going on right; but for a boiler inspection the boiler has to be cooled and taken off and swept clean, so that he can get into all parts of it.

911. But if there were a factory inspector appointed for Oldham he could give notice and tell them when he proposed to inspect, could he not?—But he wants to catch them doing wrong.

912. No, he wants to see that it is all right, does he not?—If they do wrong he wants to find them out.

913. At all events your decided opinion is that it would be better done by the local authorities than by the Government?—Nobody knows better how to do it than the local authorities.

914. Yes, that might be so in Manchester, Bolton, and so on, but in country places it is very different, is it not; take a mining district for instance?—There is no difficulty at all in a mining district more than there is in any other district, if some responsible person is made to do it as a duty.

915. That is what I suggest, the Government should do, is it not?—If you do the thing in the district and enforce it by law you cannot have any better Government plan; we do not want to have to send 100 miles for the Government inspector to come down.

916. Dr. *L. Playfair.*] Are you aware that the co-operation of localities has not been given at all to the Government in carrying the Workshops Act into operation; do you know that it is almost a dead letter throughout the country, and that the localities do not see the necessity for such an inspection, and do not aid the Government in carrying out the Act?—I was not aware of that. We have carried out every suggestion that has been given to us.

917. But the Workshop Act, which takes in places that are not factories, is scarcely in operation in any part of the kingdom, is it?—I do not know.

918. But you mean the Factory Act, do you not?—No, we are under the Workshops Act.

919. Has the town council of Oldham put that Act of Parliament in force in Oldham?—We have the doctor and factory inspector coming to our works, and they obtain answers to all the questions that they ask.

920. Do you know that there are two Acts of Parliament, namely, the Factory Act and the Workshops Act?—No, I do not know that; all I know is that we are under inspection.

921. Mr. *Cawley.*] How long have you been under inspection?—We have been under inspection for two years now, perhaps.

992. You said that you thought 10*s.* would cover the expenses of inspection?—Yes, in our town.

923. Do you think that that would be sufficient where you tested by hydraulic pressure?—Yes, it would be quite sufficient.

924. Do you think that 10*s.* would cover the expense of testing?—It would more than cover the expense of testing in our case, because we do the whole of our business ourselves.

925. But assume that there was an inspector appointed by the corporation, and that he tested each boiler in Oldham with hydraulic pressure, do you think that 10*s.* would cover it?—If he charged his time for inspecting, and the parties had him to pay, they would take very good care that he was not kept long doing his business.

926. That would cost them something, would it not?—Yes; they would pay for the time he was there.

927. What I want to know is, if 10*s.* would cover all the cost that anybody had to incur?—Yes; I think 10*s.* would be the average cost of the whole lot; I do not think it would cost 5*s.* in some cases.

928. When you tested by hydraulic pressure a boiler

a boiler that had been at work at 50 lbs., you would test it up to 75 lbs., would you not?—Yes.

929. When you do that do you hammer the boiler at all under pressure?—No.

930. It is a perfectly dead pressure, is it?—Yes, perfectly dead.

931. Have you ever made any experiments of the difference of what iron will bear when it is perfectly still, and what it will bear when under vibration?—There is a great difference I know, but we ought not to put a boiler to that test.

932. Do you think when an engine is working, especially when she has just started, that there is no vibration in the boiler plates?—It is my opinion that there is a good deal more vibration with steam than with water.

933. Then are the conditions the same unless you apply the hammer to the plate while the dead pressure is on?—I think the hydraulic process is quite enough.

934. That is your opinion, is it?—Yes, certainly.

935. But that is not the result of any actual experiment, is it?—No; but I would not alllow any one to strike a boiler when under pressure.

936. Then with regard to local inspection by engineers appointed by the local authorities; whom would you have to make rules and regulations under which the inspection should be made, and to prescribe the test?—That would have to be done by a council of engineers, or something that the Board of Trade would approve of, I suppose. Those kind of things I think ought to come under the vote of the users; there ought to be a kind of Parliament of users and engineers; eminent men qualified to do that.

937. You have mentioned the Board of Trade, do you think that those rules and regulations should be made by a council of users, and then sanctioned by the Board of Trade?—Yes; I think the users ought to have some voice in this matter.

938. But, at all events, you would have some rules prescribed for the inspector's guidance?—Yes, decidedly.

939. You would not leave that to the local authorities?—No, I would give them rules to work by.

940. And having rules to work by, you think that it would be sufficient to leave the corporations to enforce them?—Yes; the corporations should report to the Board of Trade annually what they had done.

941. And those reports, I suppose, would be published?—Yes.

942. Mr. *S. Hill.*] What is your opinion of the steam boilers insurance associations?—My opinion of steam boiler insurance associations is, that I think they would be of use in this way, to satisfy timid people that they were not going to be ruined if they had an accident; but with regard to inspection, I think they have no right to be inspectors of boilers. The inspection, in my opinion, should be done by somebody else, and after that inspection has taken place, those who wanted to insure boilers could get them insured at a very much less sum than if they were not connected with inspection.

943. You look upon insurance associations as more for the prevention of loss than with regard to the safety of the public?—It is more with the view to profit, I think.

944. You think that it is more with a view to profit than with any regard to safety?—Yes, decidedly; if there were no boilers blown up at all, insurance would go out of existence, and if there were very few boiler explosions the fee for insurance would come down very small; but as long as there is a mystery about it they can get high premiums for insurance, and they can afford to neglect inspection, and the result we perceive.

Mr. *Richardson.* 4 July 1870.

945. You regard insurance associations, therefore, as rather detrimental than conducive to the public safety?—Yes.

946. Have you known many accidents to arise from corrosion in the setting of boilers?—Yes, I have known several instances of that kind.

947. You would have that also come under the control of the inspectors, as well as the other matters, would you?—Yes; I think there should be in every town an office, where there should be diagrams showing the proper methods of setting, and every different condition of the boiler, exposed to view; and likewise everything in connection with the boiler, such as mountings, taps, and so on, all in a full-sized section, for anyone to see, and to any steam user who did not quite understand them, the engineer or the inspector should explain them; or any other engineer in the town could go and view this museum, and see all the best things that came up; I would encourage engineers to send things there to be exposed to view.

948. What, in your experience, is the most ordinary vice or fault in setting boilers?—Setting them so that the water can rest on the brickwork, and if there is a leak, then the water gets on to the boiler, and it lodges on the brickwork, and the salt in the mortar eats the iron away; I have never let lime touch a boiler for more than 20 years, but applied plumbers putty instead.

949. What would be the time that it would occupy, do you think, to inspect and test a boiler?—It depends a good deal on the person who makes the inspection.

950. But what would be the average time, do you think, occupied in that process?—Some men would do it in half the time that others would; if a boiler were properly cleaned, inside and out, he would be a very slow man that took more than an hour and a half or two hours.

951. How long would it take to test the boiler, do you think?—If he had a handy cistern it would not take him long.

952. Are you of opinion that it would take him the greater part of half a day to inspect and test a boiler?—It would depend on the situation of the boiler; if he had to pump water in it would.

953. I suppose if you were told that you had to examine and test 100 boilers in a district, you would expect to be about 50 days over them?—No; if I could find a great many of them in a single yard, I should do them much quicker; if they were squandered about the country, I might only do one in a day; but in Lancashire we very often have those thorough tests done at holiday times, and all in a single yard at that time.

954. Mr. *Platt.*] I was going to ask you many of the questions that have been already asked, but the first question I will ask is with regard to the compulsory inspection; now, I take it for granted that you seem to be of the same opinion as all the witnesses who have been examined before the Committee; you consider that absolutely necessary, do you not?—Yes.

Mr. *Richardson.*

4 July 1870.

955. You have not been asked many questions with regard to the mal-construction of boilers and the causes of accidents; that subject again is so well understood by the Committee, that the honourable Chairman did not think it necessary to trouble you on that point, but I may ask you a general question, and that is, whether these explosions are not preventible, to a very large extent?—No doubt they are preventible, to a very large extent.

956. The difficulty that we seem to have is entirely about this board, and with regard to who should appoint the men to inspect the boilers; you were asked a question just now about the factory inspectors, I would ask you whether it is necessary in factory inspection for the workshops or mills to be closed?—No.

957. But in boiler inspection it would be necessary to have the boiler closed, would it not?—Yes.

958. And if they had only one it would close the establishment?—Yes.

959. But if they had a spare boiler, then of course that could be used while the other was being cleaned?—Yes.

960. Then with regard to the municipal board, I understood you to say that you thought the municipal corporations in boroughs would be the best local body?—Yes, I do think so.

961. That is to say, to have the charge of the enforcement of this inspection?—Yes.

962. And outside of the municipal boroughs you think that the county authorities would be sufficient to undertake the inspection in the same way?—Yes.

963. Would you not recommend that a report of those periodical inspections should be sent by those authorities regularly to the Board of Trade?—I have stated that they should report annually to the Board of Trade what they had done.

964. I know that you have said so, but I am asking you the question again; then the Board of Trade would have the power to enforce the Act of Parliament which might be passed upon this subject, would it not?—Yes, no doubt the Board of Trade would keep some efficient person to carry out that part of their duty.

965. I suppose you would also give powers to the Board of Trade for the revision of the bye-laws that might be necessary?—Yes, I would suggest that the steam users, if they, on inspection, found any inconvenience at all, would make it known to the Board of Trade in their report.

966. Then you would have attached to the Board of Trade some competent engineer, the same as they have now with regard to railway and other matters?—Yes, to see that the public was protected in this matter.

967. Then you say, as far as your experience goes, that all boilers should be tested to 50 per cent. over the working pressure?—Yes.

968. You would have all boilers registered, and then they should be tested by the force pump, and proved at 50 per cent. above the register?—They should never be allowed to carry more than two-thirds of the steam pressure on which they are tested by water pressure.

969. You would give power to the corporations to grant licenses in their respective localities?—Yes. I would not let anybody use a boiler without a license.

970. Not for any purpose, I suppose?—No, not for any purpose.

971. If a person buys a new boiler, you think that he ought not to be allowed to use it until it had received the sanction of the local authority?—Decidedly.

972. You said further, that these inspections by local authorities should be annual inspections?—Yes, they should not be less than once a year; I mean the thorough inspections inside and out. The inspector might go as often as he liked to see the boiler at work, and make an outside inspection. I would have the place open to him at any time to go and see that the fittings were doing their duty; he could do that business at his convenience.

973. But you say, so far as regards persons having boilers tested annually, that would be sufficient for their coming within the requirements of the law, unless, as you said, a defect had been observed in the meantime?—Yes.

974. And that defect the user should report to the proper authorities?—Yes, at once, the same as we report now; if a person gets hurt in the works, or loses a finger, or gets his arm broken, we report to the doctor within so many hours, or else we are under a penalty. I would have it the same with boilers. The master or minder should report in the same way.

975. And you would have penalties inflicted in all those cases for non-compliance, would you not?—Yes, that is the only way I can see of getting it all done.

976. And those penalties, for instance, would be enforced hy the magistrates of the district?—Yes.

977. Do you think that steam users alone would be the proper parties to form the board?—Oh dear no; I think the board should be elected by the council. The steam users would elect a council as favourable to their views as possible, but the general public should be represented as well; the council should represent both the steam users and the public.

978. You think that the public have an interest in the question as well as the steam users?—Decidedly.

979. Mr. *Armitstead.*] You said that persons insured their boilers in an insurance company in order that they should not be ruined in case of an accident?—Yes. I say if a man had only one boiler he would be perhaps too poor to buy a new one. I would not prevent him insuring his boiler. No inspection would ever prevent all boilers giving way, it would very nearly do it; but there must be some risk whatever we do, the same as we know is the case with respect to guns, sometimes a man gets his finger shot off, though he buys the very best gun he can.

980. But I believe that insurance companies only insure to a limited extent?—Yes.

981. So that really, if a boiler explosion did much injury, a man might be almost ruined even if he was insured?—Yes, but he could insure up to what he liked, up to a reasonable amount. I think the insurance companies take risks up to 300 *l.* in some cases.

982. Sir *T. Bazley.*] Would you confine the management of the local boiler associations to the whole of the municipal council, or would you have a selection of the municipal council?—My view was that one of the committees of the council would be appointed to that duty.

983. Do you mean that they would be elected by the boiler users?—No; elected by the council themselves, the same as all committees of council are elected. No doubt the council would select the

the best men they had on the council, and who possessed the best knowledge to act in that particular capacity.

984. Do you think that the municipal councils contain all the engineering and mechanical skill of the district?—There is a great mistake made about mechanical skill; there is very limited skill required; it is more a question of care and attention to duty.

985. But would not a committee selected from the practical men in any general trade where steam power was required, make a better committee than the municipal council?—I do not think that it would be justice to the public to leave it entirely to the steam users; they might favour one another's ideas and make things rather too easy. The public suffer very much from these explosions, and they have no control over them. I think they ought to have control over them as well as the steam users.

986. But in Manchester the steam users make their selection, and they have been very fortunate, have they not?—Yes; but they have not been able to force the bulk of the boilers under their care to be inspected; neither do I think that any committee constituted in that way would be able to do it, and I consider that it would not be right to pass a law to give power to the steam users to do it all. From my experience on the Manchester committee I can state that there is a great difficulty even with members of their own committee to get them to attend to the regulations of the association, to say nothing of the people outside. If they have got a boiler that they think is safe, they sometimes want to continue it against the majority of the opinions on the committee and against the opinion of the engineer.

987. Might not that occur in the municipal committee?—Yes, but if we had a fresh law upon these subjects making a breach of duty penal, people who are not themselves in opposition to that committee would find that they made themselves responsible for a very serious matter, and I think nobody would like to do that.

988. Not to make any invidious distinction, let me ask you whether, in your opinion, the gentlemen now connected with the Local Steam Boilers Association in Manchester are not more competent than any members of the municipal council of Manchester would be, for the purpose of regulating the inspection of boilers?—No; some of them may be, but I think they are not, as a body.

989. You are quite aware that councils in municipalities have multitudinous duties to perform that have no connection with engineering or mechanical pursuits?—Yes; but if they had extra duties, they should themselves be multiplied in number.

990. In fact, you are decidedly in favour of local management?—Yes, decidedly.

991. Mr. *Lancaster.*] I understand you to say that you are in favour of hydraulic testing for boilers?—Yes.

992. And you think that 50 lbs., or one-third, would be a sufficient margin for all boilers?—Yes.

993. You think that a boiler, for example, carrying 10 lbs. on the square inch, tested up to 15 lbs., would be sufficient for that boiler?—Yes; but there are not many of those things in existence now.

994. You think that a test in the same ratio would be applicable to a locomotive boiler of 150 lbs. pressure?—I have had no connection with locomotive boilers, but, as I have been asked the question, I would say no; I would have a larger margin; there is more vibration and hard usage than in the case of a stationary boiler.

995. You think that there is no danger of the iron being permanently damaged by applying too great a hydraulic test?—I think if the iron does show any signs of failure upon the test, then the pressure of the steam should be lowered in that boiler.

996. But is it not possible for a boiler to be injured by the hydraulic test, without showing symptoms of decay?—No; I do not believe that theory myself.

997. You say, I think, that much skill is not required to inspect a boiler?—Not a great deal.

998. You propose to give a certificate when a boiler is set up, that the boiler is fit to be worked, do you not?—Yes.

999. Therefore all mal-constructions come under the first inspection, do they not?—No, only for the time.

1000. You say that the first inspection is to determine the boiler as fit to be used; that is to say, whether it is properly constructed, whether it is properly set up, and whether the fittings are proper?—Yes.

1001. Do you mean to say that no skill is required to see to that?—No, I did not say that, I meant that there was not so much skill required as the public were led to believe.

1002. But for that certificate to be granted you must have the boiler inspected, and that is part of the inspection, is it not?—I would have every new boiler when it was made, tested in the boiler yard, and the boiler maker should give a certificate of the test, and that it had stood such a pressure, and had held it tightly. I would have that certificate to come to the engineer of the corporation, and I would have attached to it a sketch of the boiler, and the dimensions, how it was made, the thickness of the plate, the method of staying the mountings, and so on. That certificate, as I have already said, should come to the engineer of the corporation; he should take that certificate, and when the boiler was set up he should put it through all those tests, check all those measurements, take the certificate into his office, and place it where the public could get at it at any time they pleased, and see that the thing was there. Another thing I would do; I would tie down every maker, that when he sold a boiler he should not put a plate into it that had not stamped on it the man's name. In Lancashire a few years ago a man could go and offer a boiler and sell it at about 50 or 75 per cent. below what a real good honest man could sell a good branded boiler for. I would give every tradesman the chance to live according to his merits. We have many steam users in Manchester who know nothing about iron, and if they get the thickness of the plates, and the size, they do not take notice how they are put together; whether it is branded iron or cinder iron, or whether they are cross joints; they see it is such and such a boiler, and at such a pressure, and another man offers them a boiler and they take the cheapest. A man says, "That will carry my pressure;" perhaps one-half the plates are punched, and in bending them they break

Mr. *Richardson.*

4 July 1870.

break half the way through at the rivet holes. Then the whole thing severs and goes away. I say that if the thing is done by the municipal council who know all the parties and all the circumstances, and are good meaning people in the town, and who would have an interest in keeping the thing right and assisting the engineer, it would be much better.

1003. The engineer would be an inspector, I suppose?—Yes; the council should employ an engineer competent to do the business.

1004. Mr. *Cawley.*] But he should act under certain rules laid down in the first instance, you say?—Yes; he should act under certain rules laid down in the first instance, and he should have a certain line of duty.

1005. Colonel *Gray.*] With regard to the amount of fee per boiler for inspection, you say that you think 10 *s.* a boiler would pay?—Yes, in a town like ours.

1006. I understand that the insurance companies charge 20 *s.*?—Yes.

1007. And the Steam Users Association charges a guinea and a half?—Yes.

1008. Do you think that 10 *s.* would be a fair amount to charge?—Yes; in the steam users and in the insurance offices there are gentlemen to keep, and a fine office to be upheld, and a great many records taken that are put on the shelf, and are never seen any more; consequently there is a great deal of unnecessary expense which would not be needed under the municipal authority.

1009. But you mentioned that drawings and so on would have to be made, did you not?—Yes, I would get it from the boiler-maker; he would do it the easiest of anybody.

1010. That would be an additional tax on him, would it not?—He would make the boiler at the same price and supply it at the same price as he does now, and he would be very glad to get the order.

1011. But do you think that that would be a fair fee?—It would vary; a man should be paid for the time it took him to do it. If it was a long way off you would have to pay travelling expenses, but if it was near home and there were a great many in one yard, he could do it for a quarter the money, and be quite as well paid.

1012. You say that you have only two boilers out of 40 under the Steam Users Association?—Yes.

1013. Suppose the fee of registration on compulsory inspection were 23 *s.* a boiler, you would not object to all your boilers being charged at that rate I suppose?—If the whole of the municipality were charged at the same rate, I should not mind, because the surplus revenues would go into the exchequer of the town, and we should have so much less rates to pay.

1014. Why is it that you have not had more than two boilers out of 40 under the Steam Users Association?—We only put those two in for compliment, because they wanted us to give them a helping hand, and we could not do that without being members in some shape.

1015. You are opposed to Government inspection, and yet you come to the Board of Trade to get some competent person to have all this carried out?—I do not think they would obey any other power; but I want as little to do with them as we can help.

1016. That is really your answer; you do not like the Government interference, and you would have as little as you can, but you admit that you must have some?—Yes, just as the Workshop Act is carried out. The only thing is to have somebody to make them do it.

1017. You would have the boiler owner compelled to report accidents to the boiler itself just the same as accidents of any other kind in your works?—Yes.

1018. Of course that would be a report to the Government, would it not?—No, only to the municipal authority.

1019. But it would go to the Board of Trade, would it not?—The municipal authorities would report to the Government. But the great secret is this, I want to have the doctor at my door; I do not want to have to send to London for a doctor to stop a certain inflammation.

1020. But you know that all the best doctors are to be had in London, do you not?—Yes, but they are too far off to be of any use.

1021. *Chairman.*] Have you any further observations to address to the Committee?—No.

Mr. JOHN ANDERSON, called in; and Examined.

Mr. *Anderson.*

1022. *Chairman.*] You are Superintendent of Machinery to the War Department?—I am Superintendent of Machinery to the War Department.

1023. I believe you have paid a good deal of attention to the management of steam boilers?—Yes.

1024. And you have had your own works at Woolwich under very careful supervision?—Yes.

1025. Have you had any accidents from explosions of boilers?—No.

1026. But I suppose that the results of explosions have come under your observation?—Very rarely.

1027. Generally, would you say that explosions proceed from mysterious causes, or that they are referable to very definite causes?—They are generally attributable to very simple causes; it is quite a matter of inspection.

1028. Is it your opinion that we have no business with so many verdicts of accidental death in these cases?—I think not.

1029. You think that generally there is some definite cause for an explosion?—Quite so.

1030. What would you consider proper and efficient means to be adopted, in order to prevent those explosions?—In all the boilers of the War Department those that have not some means for preventing incrustation are thoroughly cleaned and examined after every 300 hours of working, and those that have something to prevent incrustation are allowed to go on for 500 hours, and then they are thoroughly cleaned, outside and inside; they are examined and tested at double the working pressure, and with hot water; and then, once a year, at least, we have the Manchester Steam Users Association to inspect again.

1031. That is to confirm your own observation, in fact?—Yes.

1032. When

1032. When you test under pressure, do you subject the boiler to any hammering?—No.

1033. You consider the simple abstract pressure sufficient?—Yes.

1034. But you test up to double the working pressure, you say?—Yes, we test to double the working pressure, whatever that may be.

1035. I suppose you are of opinion that such an inspection as you give would be quite sufficient to prevent explosions anywhere?—Yes, I think so.

1036. How often do you inspect the outside of boilers?—After every 500 hours' working, at the latest.

1037. You make a thorough inspection then?—Yes, we make a thorough inspection.

1038. Then your boilers are under the surveillance of skilled persons constantly?—Yes, they are constantly under the surveillance of skilled persons, and they are carefully examined every time, but not so thoroughly as that which is done yearly, or oftener, by the Manchester Steam Users Association.

1039. I believe you have a code of rules that are adopted for the boilers under your care?—Yes, I have brought some of them with me.

1040. Will you be kind enough to favour the Committee with a copy of those rules?—Yes, I will do so. There are two things. There is first a small set of instructions for the stokers, and another pamphlet drawing attention to some of the principles connected with the subject (*handing some papers to the Committee*).

1041. I am asking these questions with regard to the country generally; do you think that boiler inspection should be made compulsory everywhere?—Yes, most decidedly.

1042. By whom, in your opinion, should that inspection be carried out?—I fancy that the way in which we are situated in the War Department answers very well. I do not think we could be very much better off than we are.

1043. You carry out your own inspections?—We are all the better for the Manchester Steam Users Association in addition.

1044. Because of the Manchester Steam Users Association coming in contact with different parties, hear different opinions, and you get the benefit of their experience?—Yes, that is important, and besides it quickens us up immensely.

1045. Do you think that the Manchester Steam Users Association have been a benefit to the country generally?—Yes, I think they have, and I should be very glad to see their operations extended.

1046. Do you think that if the same system as that which is adopted by the Manchester Steam Users Association were carried out generally, it would be the means of preventing nearly the whole of the boiler explosions?—That is my opinion.

1047. Would there, in your opinion, be any difficulty in forming such associations throughout the country?—No, I think not.

1048. Do you think that that might be done by means of the municipal councils in towns?—I have not thought much about that, but I am very pleased with the results as far as we are concerned.

1049. I believe that the Government have a large number of boilers under the inspection of the Manchester Steam Users Association?—Very nearly 180.

1050. Taking the suggestions which are conveyed in the pamphlet which you have been kind enough to hand in; if those suggestions were carried out, you think that that would be the means of preventing a great many explosions?—Yes; that pamphlet was not written with any pretension of being a book; it was merely for the guidance of our own people.

1051. Captain *Beaumont.*] Do you remember the explosions which took place at Chatham?—Yes.

1052. Did you inspect that boiler?—No.

1053. Are you aware whether the same or an analogous system of inspection to yours exists with the boilers under the Admiralty?—I believe not so systematically as we have done it; we have done for 17 years just as we do now, except with regard to the Manchester Steam Users Association.

1054. Do you remember whether any investigation was made at the time, not only with regard to the cause of the explosion, but also with reference to the inspection which the Admiralty were accustomed to put on their boilers?—I forget the circumstances.

1055. Do you remember the cause of that explosion?—No, I forget the cause of it.

1056. Have you read the evidence of Sir William Fairbairn before this Committee?—No.

1057. He spoke of grooving as a cause of weakness in boilers; have you any theory to advance with regard to that?—No; but I see that certain plates, from some cause or other, have holes forming in them; I refer to certain inferior plates that I have recently met with. We are endeavouring to ascertain the precise cause.

1058. Have you ever seen pieces of graphite in the locality of the damaged plate?—No.

1059. Should I rightly describe the grooving, such as you have seen, if I called it a grooving an inch wide, an eighth of an inch deep, and say a foot or so long, which would be found somewhere below the water line, but never above?—Yes; but I cannot explain the cause.

1060. Will you be kind enough to inform the Committee exactly what you have seen?—We often find that condition of things; but there is something that puzzles me even more, a patch will be selected and a hole eaten away right through the boiler in a very short time. I think it is due to the character of the iron in a great measure.

1061. Have you ever traced that to anything connected with the brickwork on the outside?—No.

1062. Has your observation been sufficient to enable you to have any opinion to give to the Committee, as to whether it is due to any special position of the brickwork, or such matters outside, or has your observation been, that it is a matter of chance, so far as you know, where the effect of the grooving might be looked for?—I have seen it so very seldom that I could not state; more particularly I have not traced it to any particular condition; in fact, I have only seen it in two boilers.

1063. Is it an electrical action, do you think?—No, I think not; I think it is connected with the quality of the iron.

1064. I believe that it has been observed in connection with the bolt holes in boilers; have you observed it under those circumstances?—No, we use no bolts.

Mr. *Anderson.*

4 July 1870.

1065. Not for the rivets?—Yes, but we do not observe it particularly at the rivets.

1066. There is a theory also with regard to explosions that take place when the engine has just started, have you any opinion to advance upon that?— No, only the usual explanation about the steam becoming superheated, and the reduction of the pressure, due to the engine going to work, this causes a greater ebullition for a moment afterwards; and the water being at a higher temperature due to the previous pressure.

1067. But might it not be frequently owing to the water in the boiler being low, and consequently the plates being heated, and then when the engine is started, it relieves a portion of the pressure, and so sets the water awash, which passes over the heated part and generates more steam?—That is possible. But it very rarely happens with boilers that are properly fitted up. We have had our boilers very long at work, and have never had any symptoms of that nature.

1068. The precautions which you take are such as to ensure there being no lack of water, I suppose?—Yes.

1069. Mr. *Cawley.*] You appear to have your boilers very often inspected?—Yes.

1070. By whom are they inspected?—By men belonging to the department.

1071. Are they men specially appointed for that purpose?—Yes, but they have other work to perform as a rule.

1072. But they are men whom you consider perfectly competent?—Yes, perfectly competent.

1073. You think that the Manchester Steam Users Association has been a benefit to the country?—Yes.

1074. You know that it is a voluntary association, and that a comparatively small number of boilers are under its inspection?—So I have heard.

1075. I think you are of opinion that it is very desirable to make boiler inspection compulsory over the whole of the country?—Yes, I should like to see that carried out very much.

1076. Would that be better done, do you think, by a central Government authority than by a local authority?—It is very difficult to say, but their experience is very great. If you were to put the same individuals under Government, there would not be a very great difference.

1077. It is quite necessary to have compulsory inspection of some kind, you think?—Yes, I think that a compulsory inspection of boilers is necessary.

1078. But whether it should be by the Government or not, you are not prepared to say?—No, I am not prepared to say.

1079. Colonel *Gray.*] I suppose it must be a considerable expense to your department to have those numerous inspections?—No, it is not; it would cost us as much nearly to do it ourselves if we did it as well and as often, because, as I have already said, those who inspect boilers belonging to the War Department have other duties to perform. Unless we had a great staff that had to do that thoroughly, and nothing else, we could not have the boilers in the state that we have them now by the Manchester inspection.

1080. Do you pay to the Manchester Steam Users Association a guinea and a half a boiler?—We pay three guineas a year per boiler.

1081. Is that irrespective of the size of the boiler?—Yes, irrespective of the size of boiler.

1082. How many inspections have you in the course of the year?—We have one at least, and as often as we like to send for them; we have them constantly; we can send for them by a telegram, at any time, and when we have any doubtful boiler we get it inspected at once.

1083. That fee amounts to 540*l.* a year for the inspection of the boilers?—Yes.

1084. Besides your own inspection?—Yes.

1085. That is very much more expense than a private firm would like to incur, perhaps?—There is a guarantee of 300*l.*, but I do not attach any value to that; it is scarcely likely that we should ever have an accident, with the care we take.

1086. I think you have stated that you never have had an accident?—We never have had an accident.

1087. Mr. *Cawley.*] With regard to the grooving which has been spoken of, is it a grooving which frequently takes place alongside the joints?—I have seen it very rarely.

1088. Therefore, you are not able to form any opinion with regard to the cause?—No.

1089. The other spots which are spoken of are apart from the joints, are they not?—Yes; we are trying to get at the cause.

1090. But that is in spots away from the joints, is it not?—Yes.

1091. Indiscriminately, I mean?—Yes.

1092. Mr. *S. Hill.*] How often have you had your boilers tested?—They are all tested every 500 hours at the outside, at double the pressure which they work at.

1093. How many boilers have you had tested altogether?—We have had the whole of them tested.

1094. How long has that been going on?—For 17 years.

1095. Have you had any boiler give way under that test?—No.

1096. Have you never had one fail?—No; we always condemn them before they fail.

1097. On what principle do you condemn them?—It is very seldom that double pressure will distort a boiler; you see certain parts becoming thin, and sometimes you see leaks developed and made plain by pressure, but it is very seldom that you see symptoms of failure.

1098. Am I to understand that you have condemned boilers without testing them?—No.

1099. You say that you have condemned certain boilers, but you never knew them to give way upon testing?—We never use a boiler after it has stopped work, without testing it first at double the pressure.

1100. You say that you have never known one to give way under the test?—I have seen a leakage sometimes.

1101. Then you have known them give way under the test?—I have not seen a boiler ripped open by the testing.

1102. But you have discovered leakages?—Yes, constantly; but we never let a boiler go to work until there is not a single leakage under the testing.

1103. Lord *J. Hay.*] You say that you have carried on this system of double inspection for 17 years?—No, not the system of double inspection; that is quite a recent introduction with the Manchester Steam Users Association.

1104. You

1104. You have had no accidents since you have had your boilers inspected by the Manchester Steam Users Association, have you?—No, nor yet before.

1105. Therefore the immunity which you have enjoyed from explosions you do not attribute to the association?—We are in a better condition than we were before; we have had the benefit of their knowledge, which is very great.

1106. But with regard to the fact of not having had explosions, it is not traceable to the inspection by the Manchester Steam Users Association?—No, just so.

1107. Mr. *Platt.*] I think you have stated that you would have all boilers compulsorily inspected?—Yes.

1108. And that you are very much pleased with the Manchester system?—Yes, I am very much pleased with it.

1109. If that system was made compulsory, do you not think that the public ought to have some voice in the matter?—It would be more satisfactory, no doubt.

1110. At present the Manchester Steam Users Association is simply confined to steam users, but if you made this system of inspection compulsory all over the kingdom, would not the public like a share in the regulation of that system?—Yes, it would be necessary to mix up the public with it to some extent.

1111. Otherwise, it would put immense powers in the hands of the association, would it not?—Yes.

1112. You say that you obtain a great deal of information from the Manchester Steam Users Association?—Yes, a great deal.

1113. Would not the public derive the same information from the reports of the municipal councils being sent up to the Board of Trade, which would all be read by the public and be at the public service?—But it is not that kind of information that I am referring to, although there is a great deal in that. The kind of information which we derive is from their thorough knowledge of steam boilers of every kind, and very careful inspection of our boilers, pointing out little things that are apt to be overlooked. The kind of information that they give in that way is very great.

1114. Take the case of an explosion, the municipal authorities would send in not only their own engineer's report, but perhaps other engineer's, and that report after going to the municipal council would be sent up to the Board of Trade; would you not obtain valuable information in that way?—Yes, very great.

1115. Sir *T. Bazley.*] At what pressure do your boilers work?—At 60 lbs. and downwards, very seldom above 60 lbs.

1116. In your frequent examinations of your boilers have you ever discovered defects, which, if not removed, would imperil the safety of the boilers?—Yes, on many occasions.

1117. And you are thoroughly convinced that you have derived great benefit from such examination?—Yes, I am thoroughly convinced of that.

1118. Lord *J. Hay.*] What is the reason, do you suppose, that induced you to desire this inspection by the Manchester Steam Users Association, it appearing from your evidence that it was not in consequence of any explosion having taken place; was it because you felt that your own inspection was not quite trustworthy?—No; some one connected with the War Department, I do not know who it was, originated the matter. The paper was referred to me asking my opinion; I thought the matter over and I considered that it would be a very good thing indeed. I thought we could not lose very much by it, because I saw the means of dispensing with one or two individuals who did that kind of work, in fact, I saw my way to reducing a certain part of the establishment; it removed certain difficulties, and to me, personally, it is more satisfactory.

1119. Was the consequent reduction at all commensurate to the increased cost, which is 500*l.* a year?—I do not think we lose very much by it, and I am sure that we are very much better for it.

1120. Mr. *Platt.*] The increased cost of three guineas for the inspection of a boiler is owing to the distance from the centre of operations, I presume?—Yes; our boilers are scattered over England and Ireland.

1121. *Chairman.*] The duties being more onerous than is the case with other parties, because you call on the inspectors of the Manchester Steam Users Association to come up whenever you think proper; that is to say, you are not limited to any number of visits?—Just so.

1122. You think that it can be very easily ascertained when a boiler has become unsafe to use?—Yes.

1123. You have no difficulty about it?—None whatever; we know years beforehand that it is coming on, and we watch it from month to month, and record its history. Our system of record, in addition to all that I have been speaking of now, is very precise.

1124. Mr. *Cawley.*] Did I understand you to say that you thought the Government department was a gainer, not merely in the mere inspection of the boilers, but that it afforded you an amount of information with regard to the construction and working of boilers, which was of great value?—We have all the benefit of the experience of the Manchester Steam Users Association, which is very great; very few are willing to allow that, but it is the fact.

1125. Colonel *Gray.*] The inspector comes all the way from Manchester; he is not in London?—I believe so; he comes from Manchester; I believe that one of the inspectors was brought up in one of the Government departments, but that does not affect the matter.

1126. Captain *Beaumont.*] I think I understood you to say that you are in favour of a compulsory inspection?—Yes.

1127. Would compulsory insurance, in your opinion, go far to meet your views?—No; I have no faith in insurance.

1128. None whatever?—None.

1129. I suppose you look upon it in this sense, that the boiler is practically insured by the damage that is caused in the event of an explosion falling on the owner?—Yes; it would be a very rash thing to say that we shall have no explosions under a system of inspection, but the risk is reduced so much that it is not worth insuring.

1130. You do not think that insurance would remove the inspection from the owners of boilers, who might not be professional men, to the insurance people who would have professional men to do it?—I attach no value to insurance.

1131. *Chairman.*] Have you any other statement which you wish to make to the Committee?—No.

Mr. James Nasmyth, called in; and Examined.

Mr. *Nasmyth.*

4 July 1870.

1132. *Chairman.*] I believe that you are a Member of the Royal Institution?—Yes.

1133. You were in business for a considerable time as an engineer and boiler maker, ?—Yes, for 25 years.

1134. You are now out of business, I believe? —Yes, but I have still my eyes open on all matters connected with engineering.

1135. Naturally these fearful catastrophes in boilers have come frequently under your observation?—Yes.

1136. To what have you generally been led to attribute those catastrophes?—There are a great variety of causes, but it appears to me that the most probable causes of boiler explosions may be classed as under: first, deterioration of original strength; secondly, original mal-construction; thirdly, defective materials; fourthly, defective workmanship, original or in repairs; fifthly, short supply of water; and sixthly, over or undue pressure. I consider those six as the most prominent sources of these catastrophes. With regard to the first subject, deterioration of the original strengh of the boiler, this refers to decay by general or local corrosion, often the result of an unseen or inaccessible leakage; defective repairs, or tinkering of parts difficult of access, and generally effected in haste and under circumstances adverse to the production of sound and careful workmanship. Secondly, as to original mal-construction, all the causes just named would be much aggravated by original mal-construction, namely, the existence of forms and arrangements of material ill adapted to withstand the strain which they are naturally subject to. Thirdly, as to defective materials; that refers, among other things, to an inferior and brittle quality of iron in the boiler plates or rivets, so rendering them liable to crack under the continual action of expansion and contraction to which the material of the boilers is naturally subjected; blistered or unsound plates, and cracking of the rivet holes from one to another. I may amplify that by saying, that in the normal action of a boiler there is a continual heating and cooling of all parts of the boiler going on that produces a bending, pulling, and pushing action. It is the way in which a boiler gradually approaches a catastrophe, for sooner or later it will come to an explosive condition, and the great object of all precautions is to arrest the boiler in its use before those destructive conditions have arrived at a dangerous maturity, and hence the necessity for inspection to find when the point of danger is near.

1137. Mr. *S. Hill.*] Have you any technical word to express that?—No; it is a continual action of give and take that the soundest piece of iron in a steam boiler will in time give way to. If you take a piece of strong wire and cannot break it, and then you bend it backwards and forwards, at last it will part in two, and so it is with the material of a boiler; it is a mere question of time, however well made the boiler, and whatever the excellence of the materials, it is day by day approaching the time of the catastrophe, unless you stop the mischief before it arrives at a dangerous maturity. The fourth cause is defective workmanship; rivet holes cracked by forcing the holes to coincide, which, from defective punching did not agree in the first instance before the plates were rivetted together. From my experience I have found this a very material source of weakness in putting plates together. It is very important that every rivet hole should be opposite its corresponding hole, but from defective punching when the plates are put together, the workmen find that one hole is partly eclipsing the other, then in order to compel them into coincidence they use a conical steel punch; thus the natural consequence of the treatment the boiler receives is a complete tear or an embryo tear. That begins the mischief, and when once you destroy the integrity of the plate, a great deal of the strength is gone. I might pull a sheet of paper a long while without tearing it across, but the moment you make a little rent in the edge, it gives way. And just in that manner, when an embryo tear is made in a boiler, it is inoculated, so to speak, with mischief. That is why I consider defective workmanship is a very fertile source of danger; I mean in the incomplete coincidence of the rivet holes. These are technical matters, but they are very cogent to the subject, and are at the very foundation of the question. Plates cracked in bending to the required form, the result of original brittleness, or bending them when too cold, is another source of injury and danger. Defective repairs or tinkering under adverse circumstances, namely, haste and inaccessible parts, or other conditions adverse to the production of sound and careful workmanship. Many boiler explosions have resulted from bad repairs. Boilers are very often badly repaired, especially where the work is effected in a very inaccessible part, where a man cannot find room, or even find light, to see to do the work thoroughly. If you look into the records of explosions you will find that most of the boilers which have produced the greatest catastrophes are boilers that have been under repair. It is generally stated at inquests that the boilers were but "recently repaired and carefully inspected." That may be very true, but all practical men know that when you repair a boiler in some part difficult of access, the repair cannot be done with the same degree of soundness that it would be if the boiler was perfectly open in the yard of the boiler maker. The fifth cause is short supply of water. This cause may on the first occurrence result in an explosion, but otherwise, though not immediately resulting in an explosion there and then, may yet so injure the material and damage the integrity of the original form of the boiler, especially the internal flues, as to result sooner or later in an explosion by the collapse of the flues, or giving way of the part, the strength of which has been injured by the result of the overheating, consequent on the short supply of water. The sixth and the last cause is overpressure. This cause of explosion may result from defective safety valves in combination with general or local deterioration of the material and strength of the boiler, or of the existence of one or more of the causes named under the previous heads. The subject of boiler explosions in reference to the causes of such catastrophes, viewed as a whole, is one of a very complex and difficult nature, inasmuch as a boiler explosion is generally the result of a more or less complex

complex combination of any of the before-named six causes.

1138. *Chairman.*] You are of opinion that those very fertile causes of explosions could all be prevented by constant inspection?—Yes, they are preventible if that inspection be thoroughly effective, but there is a great difficulty about that.

1139. Have you formed any opinion with regard to how such an inspection could be carried out?—I should put it under the strongest pressure of the self interest of the proprietor of the boiler, and involve him as far as you legitimately can in the results of the catastrophe; I mean involve his interests in it, though that is, perhaps, an uncharitable way of viewing the subject.

1140. In fact, you would make it compulsory as far as possible?—Yes, decidedly.

1141. Have you any theory of the way in which you would carry this out?—It is a subject new to me, and I do not know how I would legislate upon it, except by laying down that general principle, to involve the owner's interests in the result.

1142. Are you acquainted with the operations of the Manchester Steam Users Association?—Generally I am, but not minutely; it got into full operation since I left business.

1143. But you know their system of inspection, I presume?—Yes, I have the greatest respect for it; it depends of course on what is the ability of the inspector, and also the nature of the inspection. It is very difficult to inspect an unseen leakage; an unseen leakage may be to so small an extent that it may not call attention to itself by emptying the boiler; it may go on corroding portions of the boiler, very often those portions that lie in contact with the setting, and these are very difficult to inspect.

1144. It may be local and extending over a very small portion?—Yes, but on the principle of the rent in the sheet of paper, the consequences may involve the safety of the whole boiler.

1145. That determines the ultimate strength of the boiler?—Yes; the strength of a structure is its weakest part; that is a very good sound mechanical maxim, and very cogent to this inquiry; you must hunt out which is the weakest part of the boiler, and if that source of mischief be in a dark flue, hidden away below the brickwork, I do not know how the inspector can find it out.

1146. But I suppose a competent person, being aware that such things do exist, could easily arrive at the fact?—Not very easily. In the case of a boiler set in brickwork, with a leakage in contact with the bricks and mortar, there might be nothing there to call attention to it. If there were a running of water, of course there would, and that kind of leakage is less dangerous than those small insidious corrosions that go on and on to dangerous maturity, and yet may remain quite unseen by a very sharp inspector.

1147. What is your opinion with regard to the test by water pressure?—I would have a very severe test.

1148. Of course, that would certainly find it out, would it not?—Yes, the very sound of the escape of water would draw attention to it; doubling the working pressure would be the least that I would go to; if a boiler cannot stand double its working pressure, it should be held suspected.

1149. Would you think it necessary to hammer a boiler put to any extra strain in that way?—No, I do not see much use in that hammering; a very practised ear might detect by the alteration of the tone that there was some unsoundness; and so it might be of use.

1150. If the object was to place the boiler in the same circumstances that it would be in when working in the steam engine, namely, that it has a certain vibration, then the circumstances would not be the same under simple pressure when the boiler was not at work, would they?—No, but I do not think that it would matter very much; many boilers would stand a pressure with hot water, that if tried by hydraulic pressure with cold water would give out a great deal sooner; you would develope a latent weakness by cold water much sooner than with hot. You may knock about a worn boiler plate, even if it was defective iron and very brittle, if it is heated up to the temperature of boiling water, you might beat it about like a sheet of copper; but if it is a very defective plate, and you treat it with the same violence in a cold condition, the latent defects will soon be found out.

1151. One very fruitful source of danger is bad workmanship; the rivet holes not being opposite each other, which cannot be seen very well?—Yes.

1152. And another is corrosion, which is also difficult to find out?—Yes.

1153. In one case the respectability of the maker would be some guarantee?—Yes.

1154. But there is nothing to enable corrosion to be easily found out?—No; there may be loss of resistance from bad rivetting, either by non-coincidence, or by the straining of the plates to produce coincidence; that produces embryo cracks, which develope into full cracks, and those develope into leakages, and then the causes merge into others, until serious mischief comes of it; and all the more dangerous, because it is not so large a leakage as, from its extent, to call attention to it.

1155. How would you define the class of boilers that should be placed under inspection?—I would say any iron vessel that was intended to contain water under high pressure for working steam engines, or for the production of steam under, in fact, any pressure at all as boilers. The general acceptation of the term means, a vessel capable of furnishing steam of such elasticity as to propel the piston of a steam engine; but there are boilers used in some manufactories for the supply of high pressure steam without reference to driving a steam engine.

1156. Dr. *L. Playfair.*] In many of the boiler explosions that have been brought before the Committee, the lines of explosion very often follow the line of the rivets?—Yes.

1157. And the reason is what you have stated, namely, that the boiler has been weakened there by the causes you assign?—Yes; and another important cause that follows immediately on the process of rivetting is, that in forming the head of the rivet you thicken the body of it, the rivet, if it is half an inch when you put it into the hole, becomes perhaps five-eighths of an inch in diameter after it is rivetted up, as you decrease the length of the rivet in the action of rivetting, that produces dispersive or rending action.

1158. You spoke of leakage as being a great source of danger; you know Mr. Mallett's experiments on corrosion of iron?—Yes.

Mr. *Nasmyth.*

4 July 1870.

1159. After there is a little rust formed in a particular part, do you conceive that leakages are produced by that small rusting, and that the rust is then formed more rapidly, and increases the corrosion?—Yes, there is curious chemical action and reaction taking place, cause and effect becoming each other alternately.

1160. The rust once being formed, the mischief goes on progressively and faster?—Yes.

1161. When it takes place on the seat of the brickwork, do you think that the brickwork itself has any action in promoting the rust or the leakage?—No, not as brick; not as mere material, but as a kind of sponge to hold the damp and the corrosive agency in close contact; if it took place in an open flue, the draught of air would sweep away the vapour, and convert the water into vapour; but where you put it into contact with bricks, you stop the evaporation; it is sopping in a damp place where all the conditions of corrosion and deterioration are in the fullest action.

1162. Captain *Beaumont.*] I suppose you heard what has been said with regard to grooving by the previous witnesses?—Yes.

1163. Have you any theory to advance with regard to that?—No; I have no theory that I should venture to offer to the Committee. I have seen remarkable cases of grooving, especially in locomotive boilers, that have scarcely been in action three months, where they have deeply established themselves just behind the overlapping of one plate with another; the appearance was so entirely local that it struck me that it was due to some special chemical action.

1164. And not to electrical action?—There probably was an electric action lying at the basis of the chemical action as the originating cause of it. In locomotive boilers the whole of the boiler may be taken as an electrical apparatus, for you have every necessary condition in the brass tubes that are non-soluble, and the iron that is highly soluble and a saline fluid in the water of the boiler, with those like agencies at work; one is the zinc plate, and the other is the copper plate, of a battery, and the most corrodible, that is to say, the iron, is destroyed; but why it should concentrate itself on one locality, instead of diffusing itself all over the surface is a very recondite question indeed.

1165. Have you seen many examples of that kind?—Not many. I was called in by the London and North Western Railway Company, on the occasion of a very serious accident to a boiler that exploded under those circumstances; it was the boiler of an engine which had been for about seven or eight years in continuous wear. The question occurred to me, was this due to mere mechanical agency or to some other circumstance? In order to clear that up the company were so liberal as to allow two or three new boilers to be untubed and inspected thoroughly inside. We found one made by Messrs. Byers and Peacock three months before the inspection only, in a most dangerous condition. The boiler plates were the very best that they could have, and the workmanship was admirable, but there were those almost fatal grooves.

1166. In the middle of the plates?—No, where the one plate overlapped the other, the corrosion was just at the edge of the overlapping.

1167. Have you ever seen a case of a plate being corroded in the centre?—We had a thorough overhauling of the old boilers in their yard, where there were the *débris* of engines for the last five or six years, we found very many of the plates very much pockpitted, or eaten into patches of holes.

1168. Was that always in the water space and not in the steam space?—I think it extended over the entire body of the interior of the boiler. The interior of a locomotive boiler is all subject to the water, where there is violent ebullition.

1169. You would not like to localise the effect of the grooving to any particular part of a boiler, I suppose?—No; at all events my information would not justify me in expressing any definite opinion.

1170. Would it not be very difficult for any inspector to detect this until it absolutely had taken place in such a way as to be apparent?—It would depend a good deal on the accessibility of the corroded parts; if it was a capacious boiler, so that you could go inside with a proper light and carefully inspect it by viewing and feeling the plates, you might then detect where the mischief had commenced.

1171. But it is a description of weakness which cannot be anticipated or prevented by any inspection, is it not?—Just so.

1172. It can only be noted when it is in existence, in fact?—Just so; but the great value of the inspection would be to stop it before it arrived at dangerous maturity.

1173. You have said that all the sources of weaknesses that you have enumerated could be avoided, and the boilers made practically safe by inspection; but how is that applicable to defective workmanship in the shop?—It is only partially applicable.

1174. That is a cause of weakness again which would be beyond such an inspection, is it not?—Yes, unless it was bad workmanship, in the way of cracking of the rivet holes, and it had gone so far as to make the cracks visible to the inspector; his attention would be easily drawn to them if they had gone to any considerable extent, for there would probably be a leak, but not always.

1175. There would be then two causes of possible explosion which would be beyond such an inspection as you were alluding to?—Yes, I think so.

1176. Colonel *Gray.*] You said that you thought that inspection should be made in the interest of the owner?—Yes.

1177. Is it not already his interest, in so far as he suffers if an explosion takes place?—Yes, of course; no one would wilfully have an explosion under any circumstance, I should think; but in many cases the suffering, and even commercial loss, that the proprietor is subject to, is very small in proportion to the terrible results to people who are destroyed or injured for life.

1178. But what I mean is this: how would you make it more the owner's interest than it is now to have his boiler inspected?—I would be almost inclined to apply a little of Lord Campbell's system to him, though a homœopathic dose, perhaps.

1179. But there must be some compulsion, must there not?—Yes.

1180. Would you rather have a local authority than a Government authority?—I think it would be better to have a local authority; I agree with Mr. Richardson in the opinion that if each locality had an inspector of their own, sharply looked after by his constituents, he would

would be more effective than anyone coming down from a central authority in London; you might have a grand supervisor, but I would rather have local men to inspect the boilers.

1181. But you must have somebody to look after them, must you not?—Yes; I think the town council would, if the locality had a town council and corporation.

1182. But do you not think that Government authority, applied over the whole, would be a benefit to the system?—It might be.

1183. I suppose that returns would have to be made to the Board of Trade or some other public department?—Yes, by all means, so as to classify the results.

1184. Mr. *Cawley.*] And there would be required some one to lay down rules under which the inspection should be made, would there not?—Yes, I think it would be the most wholesome plan of all to lay down some standard course of rules for inspection, and then let the subordinate town councils or corporations work under those general principles.

1185. With regard to the application of Lord Campbell's Act, I suppose you know that it is not an Act of Parliament peculiar to railways at all, but that it is just as applicable to any one of these explosions as to railways?—I was not aware of that.

1186. But to obtain compensation you must prove negligence?—Yes, no doubt.

1187. With regard to the inspection and testing of a boiler, you would draw a distinction between the original testing of a boiler, before it has ever been put up and used, and that which you would apply afterwards, would you not?—Yes.

1188. Take the testing of a boiler in the first instance, when it has never been made hot, you would then apply cold water, would you?—Yes.

1189. Now, just bearing in mind some questions which I have put before, do you not think it brings the boiler into a nearer approximation to the state in which it will afterwards be, to apply, to some extent, a small hammer, to bring a certain amount of vibration on the plate; would not that assist in detecting any defect?—I could not say that I think it would, but to say the least of it, it would do no harm, and it might be an element of discovery.

1190. Subsequently, you would prefer cold to warm water?—Yes, it would be a severer ordeal to the boiler.

1191. After it has once been heated, you mean?—Yes.

1192. Have you, in your examinations, arrived at any theory with regard to why so many boilers have exploded at the moment that the steam was let out of the boiler on starting the engine?—There are a great many theories more or less apparently profound, one of them relating to the production of gases, and so on; but most of those cases will be found to result from shortness of water. In the flue of the boiler, or even without its being a flued boiler, there might be a portion of it not covered with water; on the opening of the valves so as to let the water that was in a comparatively tranquil state pass into sudden ebullition, there would be a splashing of water upon those over-heated plates, and a sudden production of steam; too sudden for the safety valve to relieve the boilers of it.

1193. That is possible, but is it not also possible that a very much more simple cause may be the true one. I think your own experience, in former times, showed that metal, when under a strain pretty near to its ultimate strength, will very rapidly fly if it be exposed to a very small amount of vibration, and particularly if that is not synchronous?—Yes; it might be so.

1194. Would it not be the fact, that the boiler would have been standing perfectly still, with the steam at rest, and would there not be a certain amount of vibration on the plates from that very ebullition which you have just described?—Not such an amount as would produce a catastrophe.

1195. But if it was near its point of ultimate strength, would not that be so?—I am not aware that there is any great vibration at that moment to which you refer.

1196. But if there were much ebullition of the water when under a pressure of, say 50 lbs., there must be vibration resulting from that; I mean fibrous vibration?—Yes; in certain cases, where the water is entirely deprived of air, a very curious action takes place; and Mr. Grove, the Queen's Counsel, has most beautifully investigated that subject. Everyone who has conducted chemical processes, in glass vessels, knows that if you put water in a Florence flask, and boil it over a lamp, it boils very comfortably for half-an-hour say, after which you will find the frothing kind of boiling disappears altogether. The boiling goes on by convulsive efforts; the water lies still for a minute, and then suddenly jumps up most violently. I have seen it knock a retort off a stand; it was that phenomenon that drew Mr. Grove's attention to the subject; he thought that the real cause was from the entire absence of air in the water, for the moment you introduce air, in ever so minute a proportion, the frothing or safe ebullition returns.

1197. Mr. *S. Hill.*] The air was not entirely absent, was it; he boiled the water, I believe, for three weeks and could not get rid of one bubble?—Yes, it is a very curious subject.

1198. Mr. *Cawley.*] You think that something of that kind probably takes place in the flue of the boiler?—I think it is worthy of being taken into account as one of the many obscure causes of such boiler explosions.

1199. But your opinion is that a thorough inspection by a competent party before the boiler is fixed, and periodically inspected, would prevent a large number of accidents?—Yes, I do most decidedly. It is very desirable, but I think, that you should keep aside as far as you can all very recondite and ultra-philosophical reasons; they sound very learned, but they confuse practical men and take away the responsibility from the right source. I believe that nine-tenths of the boiler explosions arise from very plain common sense understandable causes, if you could only get at them.

1200. Mr. *S. Hill.*] You have stated that there are two causes of explosion which would escape the notice of the inspector?—Yes.

1201. Would those two causes escape a test, or would a test show them to exist?—A test would tend to show it if it was a leakage in contact with the brickwork in an unseen part. The only way in which it would be seen would be if a dribbling of water took place, and that of course being observed by the inspector would bring his attention to a focus, and would show him that there was a place worthy of being specially investigated.

Mr. *Nasmyth.*
4 July 1870.

vestigated. In such a case his duty would be to have the brickwork taken down and lay the boiler bare where the water made its appearance, and then in all probability he would find corrosion or leakage going on.

1202. Speaking from your great experience, do you think that testing could ever generate the mischief?—No, I think not. It might in some degree be open to objection; all actions of that kind are more or less so, but it is the least of all the evils. I would rather meet any risk resulting from slightly damaging a boiler by over testing it than go on from day to day till the evil had reached a fatal maturity which might at any moment bring on a catastrophe.

1203. What was the date of the explosion on the North Western that you investigated?—It was seven or eight years after the boiler was made.

1204. But when was it?—It was about five or six years ago.

1205. Mr. *Platt.*] I suppose you have no doubt in your own mind that a testing pressure would be quite sufficient to discover bad workmanship and bad material?—Not altogether bad workmanship, unless the badness of the workmanship had developed itself into a crack, or such a localization of weakness as would result in a rupture there and then.

1206. That would be so in the case of bad riveting, would it not?—Yes, if it was bad enough to show itself.

1207. When you spoke just now about double pressure, were you speaking of cold water or warm water?—I would have cold water; if you want to treat a boiler very kindly you can have it a little warmed, but the colder the boiler the more severe would be the test with regard to the quality of the materials of the boiler.

1208. Were you in the room when Mr. Anderson was being examined?—Yes.

1209. He also made use of the words "double pressure," but he said that they always tested with hot water; now, it is well known, is it not, that testing with cold water is the more severe test?—Yes.

1210. Would you still apply double pressure if you used cold water?—Yes, I think I would.

1211. You are very strong on the question of penalties, I think?—Yes.

1212. In any bye-laws or regulation that might be found necessary, with due regard to carrying out the inspection, would you enforce penalties in the ordinary way on all parties using boilers if they broke those rules and regulations?—Yes.

1213. Sir *T. Bazley.*] Does not inferior metal sometimes lead to disasters in boilers?—Yes.

1214. And inferior construction also?—Yes.

1215. You have stated that you would visit with compensating responsibility in cases where accidents occur to steam users, those who apparently were the offenders?—Yes.

1216. But should not the responsibility be divided in some cases between the boiler maker and the boiler user?—Yes; that would be attained by making the iron manufacturer who supplied the plates guarantee the quality; by which I mean sharing with you the responsibility that might result from any defect in his materials.

1217. So far as you could you would extend the principle of punishment wherever an offence has been committed?—Yes, I would.

1218. *Chairman.*] With regard to the grooving of plates, that grooving, you state, never exists except pretty near the junction of the two plates, or running parallel with the joints?—Yes.

1219. It has been suggested to me more than once that that grooving might be caused by the very expansion and contraction which you described?—Yes.

1220. Being held at the joints it would give way entirely, just in the same way as the sheet of paper you described by the pulling; do you think that may be caused by any such operation?—It may, but I do not think it probable; it looks to me more the result of chemical than mechanical action.

1221. But if it were chemical would it not be likely to occur in other places except at the joints?—I have found several boilers corroded in patches, but not grooved.

1222. But I speak exclusively of grooving where the pit holes and patches occur; do you not think that that is from the presence of graphite or other impurity in the plate very often?—Yes, it might be, and it might very often result from the great purity of the iron, at the corroded part if the iron plate is not homogeneous in its entire structure, but is patchy in quality; the quality generally might be very excellent, but patches might be more steely than other parts, and then the corrosion will localize itself at one or other of those parts; there are very remarkable instances of that all about London. If you notice the old railings of houses that were made of Swedish and Russian iron, you will find that they are corroded in notches; where the corrosion has localized itself, it is as if you had chipped the railings with a chisel. The cause of that is that those portions that have been corroded have been, so to speak, electro-positive or electro-negative, to the rest of the iron; they have not been in electrical harmony with the whole mass. Where you have a substance that is not in electrical harmony with itself, some one portion of it will give way to a solvent power more than the other.

1223. It would be scarcely fair to attribute that to non-homogeneity, because it might be homogeneous with regard to the metal, might it not?—With regard to iron made in Sweden and Russia, the very nature of the process is to make one portion with a large quantity of carbon, and another with perhaps none at all; it is a very complex combination of chemical substance; you will find that any solvent will dissect it in a most remarkable manner, more like a piece of knotty wood than anything else; whereas, a piece of homogeneous steel would dissolve all away, and show no structure.

1224. But a plate which was perfectly homogeneous would not be subject to these corrosions?—But I should expect steel plates, from their naturally more homogeneous quality, to corrode more equally.

1225. Then the pitting in the plates may be due to the presence of graphite, or impurity?—I cannot say.

1226. Mr. *Platt.*] With regard to homogeneous steel, if one portion was a little harder than another, that would make no difference to the localisation, would it?—Do you mean mechanically harder, or more carbonaceous.

1227. It might be that part of a plate was a little more like iron, and another part might be a little

a little more like steel, and the plate still be homogeneous?—I would not call that homogeneous when the parts of the same plate vary in quality.

1228. But you find it so sometimes, do you not?—Yes, it would be a question of more or less, but I could not call any substance homogeneous that had three or four different qualities in the same mass.

1229. But I thought you meant that the corrosion where the material was not so homogeneous, and might be likely to settle in that particular part?—Yes, it might, in one or other part.

1230. Captain *Beaumont.*] What is your opinion with respect to the value that compulsory insurance would have to effect the end we have in view?—I think it would be damaging to the public safety, by removing the responsibility from the parties immediately concerned.

1231. But it would place the responsibility on the shoulders of the insurance company, who would be as directly interested as the owner of the boiler, and who would have a machinery more capable of professional examination?—No; when you have a company concerned; I have no faith in insurance companies as a means of reducing the frequency of boiler explosions or lessening their disasterous results.

1232. Colonel *Gray.*] There is one question which I wish to ask you about locomotive boilers; do you think that they ought to be compulsorily inspected?—Yes, I think they ought.

1233. We were told by one witness that he thought the system pursued by railway companies was rather haphazard; do you agree in that opinion?—It is a strong term to use; they are so terribly interested in the state of their locomotive engines as an element of disaster, that I should say they are very attentive to the inspection; but from the very nature, without removing the tubes, of a locomotive boiler, you cannot get into it, and to take out all the tubes would cost 300*l.* or 400*l.* every time it was done, which would be a very serious affair indeed.

1234. It would be a much more serious affair to make it compulsory on railway companies than on other boiler users, would it not?—Yes, very much more serious, from the special nature of a locomotive engine boiler.

1235. But still you think it is desirable for the public safety that that should be done?—I should recommend to drill half a dozen holes not thicker than a straw, particularly at the place where grooving was likely to take place, so that the thickness of the boiler plates might be guaged at such parts, and if that boiler gave a good answer for itself, then plug up the holes and no mischief and no very great expense would be incurred. But the terrible results that I saw at Wolverton from a groved boiler have alarmed me ever since.

1236. Railway companies being rather powerful bodies, would they not rather rebel against being put under compulsory inspection?—They may, but that is a separate question from whether it is desirable or not to have that inspection compulsory

1237. You think that it is desirable?—Yes, I do think so.

1238. Captain *Beaumont.*] With regard to the drilling that you have just spoken of, however small the hole is it must weaken the boiler, but you think it would be so little as to be inappreciable?—Yes, it is not worth considering; there are perhaps a hundred holes drilled in locomotive boilers, and no mischief comes from them.

1239. *Chairman.*] Very likely it would not make them weaker where the rivets are?—No, I should recommend a dozen of these small guaging holes to be drilled every now and then, say every 12 months, or oftener, as might be found desirable.

1240. Captain *Beaumont.*] To test the thickness of the metal you mean?—Yes.

1241. You agree in the necessity for this inspection under all circumstances, as I understand you?—Yes.

1242. *Chairman.*] Have you any further observations to make on any point to the Committee?—No.

Thursday, 7th July 1870.

MEMBERS PRESENT.

Mr. Armistead.
Sir Thomas Bazley.
Captain Beaumont.
Mr. Birley.
Mr. Cawley.
Mr. Joshua Fielden.
Colonel Gray.
Lord John Hay.
Mr. Herman.
Mr. Hick.
Mr. Laird.
Mr. Lancaster.
Mr. Platt.
Dr. Lyon Playfair.
Mr. Tipping.

JOHN HICK, Esq., in the Chair.

Mr. William McNaught, called in; and Examined.

Mr. *W. McNaught.*
7 July 1870.

1243. *Chairman.*] You are a Practical Engineer?—Yes.

1244. And you have been for some time so engaged, I believe?—Yes.

1245. For how long have you been in practice?—About 40 years, but I have been engaged nearly 30 years as consulting engineer.

1246. You are chairman of the Boiler Insurance and Steam Power Company?—I am.

1247. How long has that company been in existence?—I think it has been in existence since the year 1859; I do not know the actual day of the month.

1248. It was not the first association of the kind?—The first association was got up by Sir William, then Mr. Fairbairn, and I was an honorary member of the original association.

1249. That is to say, the Steam Users' Association?—Yes, the Steam Users' Association. The company of which I am chairman was formerly the Steam Boiler Assurance Company, but we had to change the name when we made it a limited company.

1250. Now, are there several other associations of a somewhat similar kind?—Yes.

1251. In what does your association differ from others; from the Manchester Steam Users' Association, for example?—We inspect boilers to the same extent as they do; we have an efficient staff of engineers, inspectors, clerks, and so on, but we pay for the boiler explosions altogether; we pay for the sum insured for, and if there is partial damage, such as the collapse of a flue or any little damage to the shell that cannot be classed as an explosion, we make good that damage; it is about six to one; for every pound we pay for a total explosion we pay 5*l.* or 6 *l.* for partial damage; there are sums as small as 3 *s.* 6 *d.*, and sometimes it is 130 *l.* for partial damage.

1252. You have a greater number of small damages than you have of serious explosions?—Yes, not only a much greater amount in number, but also a greater amount in money; they are 20 times more in money; and in number they are about 40 times as many, and those damages we always make good.

1253. Now, does the insurance element tend as an inducement to parties to have their boilers placed under inspection?—My opinion is that it does, because they have more confidence in the inspection. We have an efficient staff of engineers and inspectors, and as far as I can gather the mind of the public, they think we pay more attention to it than the societies which do not pay in the case of an accident; I do not say that we have better inspection, but I think that the public have an idea that they get better inspection.

1254. What number of boilers have you insured in your company?—We have at present upwards of 12,000 insured; about 12,500 I think.

1255. Do you take the boilers of everybody who applies to you?—No, we insure boilers all over the kingdom and in Ireland; that is to say, we have inspectors in Ireland, London, Edinburgh, Glasgow, and every place of importance, in fact; but when we receive an application to insure a boiler, we have a printed form which we submit to the proprietor, and which has to be returned, filled up, to the head office; the engineer and staff of the head office send their inspector to call and inspect the boiler; if we think it is trustworthy we insure it; but if we do not think it is trustworthy, we do not insure it until we have had it thoroughly inspected. I should say that out of every 100 applications for insurance, we reject about 20, because they will not fulfil our conditions, and will not have the boilers put in order; I think it is right that I should inform the Committee that I am giving that by way of guess only.

1256. In fact, you refuse to take the boiler, if you do not think it is safe?—Yes, we refuse about 30 boilers every month, and we accept about 120; that is within the mark.

1257. You say that you have upwards of 12,000 boilers insured in your office?—Yes, about 12,500.

1258. You have 12,500 boilers actually under inspection?—Yes, actually under inspection.

1259. Are they all inspected?—Yes every boiler is inspected. But some of them we cannot thoroughly inspect on account of the difficulty

difficulty in getting the millowner to stop the working of them, but they are all inspected as well as you can inspect them under the circumstances.

1260. What do you mean by, "as well as you can"?—We examine the outside of the boiler, and inquire with regard to the thickness and quality of the plates, and examine the safety-valve; and, in fact, do all we can without going inside the boiler. In some of the small factories, they cannot afford to stop working, but in large works they generally have a spare boiler or two, and there is no difficulty with them.

1261. But every boiler insured with you is inspected?—Yes, there are about four inspections in the year, and as many thorough inspections as we can get the owner to allow us.

1262. But all boilers have an inspection of some kind?—Yes, we never insure without inspecting the boilers, and we continue to inspect them, as a rule, three or four times a year.

1263. But is there a thorough inspection?—Yes; there is a thorough inspection with a view to ascertaining the thickness and quality of the plates; the age of the boiler, going through the interior of the boiler, through the flues and through the brick flues, and sounding and examining everything; we do not consider that a new boiler, when the water is clean, requires that. We have an idea of the quality of the water in every part of the country, and we are more particular where we know that there is lime or any deleterious substance in the water to spoil the boiler.

1264. I presume you consider that your association has been productive of very much good in preventing explosions?—As far as I can make out, we have fewer explosions than any other society whatever, considering the number of boilers under our care.

1265. But have you had explosions in boilers under your care?—Yes, we have had 20 since the society began.

1266. Probably your chief engineer will be able to give the Committee the details of those explosions?—Yes; I can give a general statement of the causes, but perhaps you would prefer to take it from him; we have been established 11½ years; I wish to state, if the Committee will allow me, I am quite aware that this is a Committee appointed to ascertain the truth, and to be guided by the evidence with regard to the necessary precautions, but as our society has been stated to the Committee as a society having many explosions, I may state the fact that in the Steam Users' Association, to be equal to them we ought to have had 27 explosions as against 20, that is to say, we are better than them as 20 is to 27, in proportion to the number of years that we have been in existence, and the number of boilers under our respective charge; I should not have taken notice of that, but as I have read in the public papers that we do not inspect our boilers, and that we are not so good as they are, I think it is my duty to put forward that statement; I do not say that we are better than they are, but I state the exact facts.

1267. If inspection is so valuable as a means to prevent explosions, do you not think it is desirable that inspection should be undertaken throughout the whole of the country?—Yes, I think it is desirable if you could arrange it properly, but I do not think inspections, however careful they are, will entirely prevent accidents, because the majority of the accidents which we have are entirely beyond the power of inspections to prevent.

1268. In your opinion, would a good and thorough inspection contribute very much to reduce the number of explosions?—My opinion, from all the facts that I can gather from my experience of 15 years, is that if we had good inspections with facilities afforded for the examination of the boilers, there would not be above one-fourth of the explosions that do occur now, but there still would be accidents.

1269. One-fourth would take place, and then only one-fourth would remain, is that what you mean?—Just so.

1270. Then you could remove 75 per cent. of the explosions?—Yes, 75 per cent.; at present we remove upwards of 60 per cent. in our society alone.

1271. But you only take boilers that you consider quite safe?—We naturally wish to take every boiler that we can take that is safe. We have no means of coercion to make the owners put the boilers in good order, but we reject them where they will not do it, and in many cases where we have rejected them we have found that those boilers have exploded shortly afterwards.

1272. Would you propose to make the inspection compulsory?—Not entirely compulsory. It is not for me to legislate, but my own idea is that it would facilitate the safety of boilers; in the first place, if there was some qualified gentleman, who was probably a good engineer, whom you could trust, or perhaps two gentlemen, to attend coroners' inquests, and if there was any palpable error in the verdict he could set it right.

1273. But my question was rather, whether you would consider it desirable that the inspection should be made compulsory, and if so, how you would propose to have the inspection carried out?—It would be better to have a compulsory inspection than none at all; but I think that manufacturers would reckon it a great evil to have a Government compulsory inspection. The object of the first association established under Mr. Fairbairn, was to prevent Government inspection.

1274. But I am not assuming Government inspection, but compulsory inspection of some kind?—I would rather have compulsory inspection altogether than none at all.

1275. Assuming that compulsory inspection were established, how would you carry it out?—I should propose, as I was saying, to have a gentleman or two gentlemen appointed to attend coroners' inquests referring to boiler accidents, in order to sift the evidence and examine the boiler, and to see that the verdict of accidental death (which is the usual verdict) was not brought in when there was some glaring culpability on some one's part; and that the party who was to blame ought to be blamed, and that the engineer or the party appointed should have the power to prosecute that party, in spite of the verdict, if he thought fit.

1276. Who should, in your opinion, appoint that officer, or their officers?—I think the Government should appoint them.

1277. Mr. *Birley.*] Do you not think that that would be a very dangerous interference with the coroner's jury, and would it not almost be better to have a different tribunal?—It might be; it would amount to a different tribunal; in case of a coroner's jury bringing in a very wrong verdict, he could take up the case, and be a kind of public prosecutor.

Mr. *W. McNaught.*

7 July 1870.

1278. You seem in that almost to supersede the functions of the coroner's jury, do you not?—As far as I know the proceedings of coroners' juries with regard to boiler accidents, it would almost be better to have no inquiry at all.

1279. Would it not be better to have a different tribunal altogether in such cases?—I have not considered that, but I think coroners' juries would then be more careful to return true verdicts, and then, if there was anything glaringly wrong, the officer should have the power to take up the case the same as the Lord Advocate in Scotland has.

1280. He would, in fact, be a public prosecutor?—Yes, he would be a public prosecutor; in the case of its being brought to his knowledge, that any boiler was being worked in an unfit state, he should have power to compel the proprietor to allow an inspection; you cannot inspect, unless you have power to compel the owner to stop the boiler and cool it.

1281. But that is Government inspection at once, is it not?—It is a very mild form of Government inspection; Government inspection would be to have a whole staff of inspectors like excisemen going round every mill in the district, and ordering every boiler to be stopped whenever they pleased, and that would almost ruin the owners.

1282. But is not a mild system of inspection objectionable on both sides; might not the inspecting side feel that it had too little power, while the side inspected fancied itself unduly interfered with?—It comes back to the old thing; there is an Act of Parliament, I believe it is Lord Campbell's Act, where, if there is any life lost, or any injury done, the person causing the injury can be prosecuted; if that Act of Parliament was enforced, there would not be much necessity for Government inspection, because the millowners would take care that their boilers were kept in good order.

1283. If there be anything like fatal accidents, then you think the Government inspector should step in, and you believe that the apprehension of that interference would prevent a great many accidents?—I think it would; it would make people more cautious in inspecting their own boilers; of course, it is only in fatal accidents that a coroner's jury is called in at all.

1284. Colonel *Gray.*] You say that you think compulsory inspection would be better than none, but you have not formed an opinion with regard to how that compulsory inspection should be carried out?—In all things you cannot go into a subject like that at once. You gain ideas by experience, and I think that the views which I have already stated are all that I could lay before the Committee.

1285. But could not something of this kind be done to make it imperative that all steam users should have some certificate granted to them, which would only be granted on the inspection of the boiler?—It depends on the party who grants the certificate. The party who granted the certificate should be thoroughly competent, and would require to be licensed by the Board of Trade, after undergoing a thorough examination. The difficulty would be to find people in every part of the country that had sufficient experience. They would require, not only to be good engineers and mechanics, but to have a scientific knowledge of the construction of the vessels, and how to contend against the different strains they were subject to.

1286. You must have a large staff of inspectors if you have 12,000 boilers insured in your office, and you inspect them three or four times a year, all over the kingdom, must you not?—Yes; we have a chief engineer and five assistants. All of those are first-rate, thorough engineers; then we have 26 or 27 inspectors, I do not know which; we reckon that we must have one inspector for 500 boilers.

1287. What do you pay your inspectors?—We pay our staff of inspectors, which is under the immediate surveillance of the engineering staff in the office, from 120 *l.* to 150 *l.* a year, and all their travelling expenses and hotel bills and everything.

1288. What do those in the office get?—They begin with about 200 *l.* a year, and go up to 600 *l.* or 700 *l.* a year, but the average might be in the office about 350 *l.* a year. They must be good men, of course, for their duties.

1289. What do you charge per boiler to the persons insured?—We charge according to the quality of the boiler. If we insure a boiler for 100 *l.*, and if the pressure is under 40 lbs., we charge 20 *s.* a year for inspection and insurance.

1290. What do you charge above that rate?—When the pressure comes above 40 lbs., we charge 25 *s.* We do not increase the rate after that, because we have the option of not taking the boiler unless we think it is trustworthy. If we once insure a boiler, whatever the amount, we insure for the whole year, even if the owner does not continue to comply with our rules; but if at the end of the year our rules are not complied with, and they do not think right to make the boiler safe we cease to insure.

1291. Have you any locomotive boilers insured in your office?—No, we do not insure locomotive boilers; we do not consider it necessary.

1292. If there were a Government inspection, that would rather interfere with the operations of your society, would it not?—It depends on circumstances. Our society has been in existence for 11½ years. We pervade the whole of Great Britain and Ireland. We have a large staff, and we know our business. I think if the Government were going to insure boilers themselves, it would be their duty and their interest to adopt, as far as possible, the existing societies.

1293. The Government would not insure boilers, they would only inspect them, would they not?—I suppose that would be so. Suppose, again, the Government, went in for compulsory inspection, as they used to do long ago for compulsory vaccination, the Government did not employ medical men of their own, but they accepted any recognised surgeon with a certificate, and that would simplify operations very much. That is one view of the subject for the Committee to consider.

1294. Mr. *Platt.*] Do you not think it would be a great advantage to the community if every boiler was inspected before being brought into use?—I think it would be an advantage, and a very great advantage to the community, if every boiler was inspected before it was brought into use; but I do not care too much about inspecting boilers on the makers' premises, for if it has even to be conveyed five miles, a boiler weighing 12 or 14 tons, the strain of lifting it on the waggon and conveying it to the place where it is intended to stand, and the shifting it (however tight it may be in the maker's yard), gives it a strain in the

the transit. It should be tested on its site before it is bricked in.

1295. But my question was more general than that; you, no doubt, are aware that a great many boilers, what I will call bad boilers, which are unscientifically constructed, are now made throughout the country; if those boilers were inspected before being brought into use, those original faults of mal-construction would be discovered, would they not?—Yes, they would be discovered, provided the inspectors were sufficiently up to the business, which I suppose we must assume.

1296. Then in that case the question of compulsory inspection is an absolute necessity, is it not?—That is for the Committee to decide. I think inspection would be an advantage. When our society was first instituted, that was part of our business. We said that we would examine boilers, and give a certificate with reference to their trustworthiness, but I do not think that we had more than a dozen applications.

1297. Without going into the question, who should grant those certificates, would it not be an advantage that every boiler, before it was brought into use, should be certified by some one?—Yes, it would be an advantage that the boiler should be certified, but that would never obviate the necessity for continual inspection. With a new boiler, however good it may be, if the water is wrong, it may silt up the part of the boiler exposed to the fire, and burn it in a short time; you would still require continual inspection. If the idea of this inspection of new boilers was to supersede in the minds of the boiler users the necessity for continual inspection, that would do an injury.

1298. I thought you were not very decided about compulsory inspection, and therefore I simply press the question again home to you; but the next question (which I was going to put) is, whether periodical inspection is not absolutely necessary in order to keep people up to the mark?—Yes, we find it so; but there are many causes for boiler accidents. There was a remarkable case within our experience, of a boiler turning a high-pressure engine; where the feed-water is heated by the waste steam it is sure to form a deposit on the boiler, and burn it in the course of two or three months, so that we will not insure a boiler that is supplied from feed-water heated by waste steam; the grease and oil often finds its way to the water, and it finds its way to the boiler; I have seen a very thick deposit; it is generally over the fire-place, so that no inspection would make it safe.

1299. Were you the original founder of your society?—No; I was originally vice-chairman. I was one of the first members, but I was an honorary member of the other society.

1300. Did your society originate with some other society, or is it a society which originated within itself?—I believe it originated with the same people. Mr. Forsyth, who was killed in a boiler explosion at Messrs. Sharp, Stewart, and Company, was one of the originators of it. But the origin of Sir William Fairbairn's society was this: there was an explosion of a boiler in Rochdale. I was employed by one of the parties, and Sir William Fairbairn was employed by the other, and we went together frequently to Rochdale, and had a good deal of talk about it. Mr. Fairbairn was anxious to get up a society, so as to prevent Government interference. I suggested that an insurance society would be better. I said, "Let the inspection be the same, but let the parties who inspect, back their inspection by paying, if they make any shortcomings."

Mr. *W. McNaught.*

7 July 1870.

1301. But as you did not originate this society, did you pay anything for the good-will?—No, I paid nothing for the good-will; I was one of the original members.

1302. And the society itself paid nothing, I suppose?—No, it paid nothing; because I was one of the original members.

1303. What dividend, may I ask, have you paid?—We have never paid more than 10 per cent. But the first two years we saw ruin and starvation staring us in the face. We had to make calls, and we had the shareholders howling about us. I should never like to go through what we did again. But eventually we got round the corner, and since that we have done very well.

1304. Do you insure for loss of life?—Yes.

1305. Have you ever been called upon to pay for loss of life?—I am not aware that we have; they do not avail themselves much of it.

1306. That is a separate rule, I suppose?—Yes; that is a separate rule. We also insure the whole of the mill hands for a trifle against accidents; or if the boiler sets fire to the mill.

1307. You insure the boiler?—Yes.

1308. Do you insure any other portion of the building?—Yes; to the amount covered by the boiler; but if we insure the fireman, we have a separate rate for insuring the firemen and engineers, and also a rate for the mill hands.

1309. But my question was not merely with regard to the firemen, but with reference to the public generally, and those who might be working at the mill, and passing by?—No, we do not insure them. We insure the whole of a cotton mill with a certain number of hands for a very trifling sum.

1310. That is to say, all the people working in the mill or manufactory?—Yes, all the people working on the premises.

1311. But not the people passing and repassing?—No, there would be no object in doing that, because they are so seldom there.

1312. What is the highest amount that you go to in that way; is it per person or in a lump sum?—I think 50 *l.* is the usual sum that a fireman insures his life for; but we do such trifling business in that way, that it is scarcely worth while mentioning it.

1313. If you had a large mill with a thousand people at work in it, would you insure it to the extent of 50,000 *l.*?—No, we do not insure mills at all.

1314. I thought you said that you insured the workpeople in mills?—Yes, we insure their lives.

1315. Suppose there were 1,000 persons; how much would you insure?—We only insure the lives of the workers about the mill or about the boilers, on condition that the damage arises from a boiler explosion; if a boiler explodes and sets fire to a mill, and some of the workpeople perish from the fire, we should be bound to pay the life insurance.

1316. But what is the number that you limit yourselves to?—I do not know; Mr. Longridge may have the particulars, but we do so little in that way that it is scarcely worth while calling it a part of our business. The workpeople seem to be very apathetic in taking advantage of it.

1317. After, for instance, a person has been insured with you for a number of years, if you

Mr. *W. McNaught.*

7 July 1870.

go to his place and find that his boiler is defective, and you impose certain conditions on him which he refuses to comply with, what is the case then?—The case is then that we try to persuade him, and when the policy lapses at the end of the year we will not renew it unless he complies with our conditions, and in many cases (I daresay our engineer can give the Committee all particulars) the boilers have exploded.

1318. Suppose the steam user puts in a counter-statement from an eminent engineer to show that the regulations you make are not necessary, what then?—We acknowledge no engineer but the one who is acting on our part; we consider that we have sufficient knowledge to enable us to determine.

1319. Mr. *Lancaster.*] You say that you attach more importance to the inquiry before the coroner's jury enforcing Lord Campbell's Act than to inspection; is that so?—That is not my meaning; my meaning is, that the enforcement of Lord Campbell's Act would induce people to attend better to the inspection.

1320. You do not mean that that would be a good substitute for inspection?—No, but it would induce people to inspect more carefully.

1321. You are aware, are you not, that Lord Campbell's Act is applicable to loss of life arising from explosions?—Quite.

1322. I presume that you have no amendment to propose on that point?—No, I have no amendment to propose except to carry it out as well as you can.

1323. The coroner's jury inquiry is not a final inquiry, is it?—I believe not: but the difficulty is, that poor people have not the means to assert their own rights. The poor man who is killed is not there to tell the story, and very often he is blamed when the blame lies in the construction of the boiler, and in the owner of the boiler not putting sufficient means in the hands of the engineer or foreman for the safety of the boiler.

1324. You see no difficulty in enforcing that Act of Parliament against railway companies. Poor people enforce it frequently against railway companies, do they not?—No doubt; and I cannot see any reason why it is not enforced under the other circumstances. But, generally speaking, if you take a mill district, and even iron works, there are whole families working in the district, and the prosecution would be generally against the proprietors; and although there is only one man or two men killed, they may have 20 or 30 relatives working in the mill or manufactory; and they may feel a considerable difficulty in endeavouring to make the proprietor pay a penalty for the loss caused.

1325. That is your opinion, is it?—That idea was evolved from your question.

1326. Are you acquainted with the mode of inspection adopted with regard to marine boilers?—I ought to be, for I have been consulting engineer to some of the largest steamboat companies in the kingdom.

1327. Do you see any difficulty in applying the same rule of compulsory inspection of boilers belonging to all steam engines as you do in marine boilers?—I have not given that subject any thought until this morning; but if you take first-class steamboats, they generally have a chief engineer who is paid at the rate of about 300 *l.* a year.

1328. That is not the point; is it not the case that, previous to steamboat boilers being certified, a competent engineer, appointed by the Board of Trade or otherwise, inspects those boilers?—Yes, he does; I am aware of that.

1329. And a certificate is given that the boiler is a safe boiler to work with that pressure, is it not?—Yes, that is right enough, and I think it would do no harm to inspect land boilers on the same principle; but land boilers are generally made quite round, whereas marine boilers are forced to be made in all forms, and very often flat, owing to the form of the vessel; but there is more necessity for the inspection of a marine boiler at first, even than a land boiler, and there is less necessity to continue to inspect it when once it is started, because the staff on board the steamer are all well-qualified engineers, and on board a large vessel they have at least five engineers.

1330. The marine inspection takes place periodically, does it not?—Yes.

1331. And as far as you know, that inspection has been satisfactory?—There have been very few accidents in marine boilers hitherto.

1332. Do you see any reason why something similar should not be adopted with regard to land boilers?—The harbours at which marine engines are made are very few, compared with the places where land boilers are made, and you would require a much larger staff to inspect all the land boilers.

1333. But in your opinion, would it not be proper to enforce a system of inspection on land boilers similar to that on marine boilers?—Yes; I have already stated that it would be advisable to inspect all boilers before they are passed.

1334. That would be a compulsory inspection, would it not?—Of course, it would be a compulsory inspection.

1335. If a compulsory inspection of boilers took place periodically, after they set to work, do you think in that case that people would insure their boilers?—I do not know; I never gave that a thought.

1336. You cannot give an opinion on that point?—No, I cannot give an opinion on that point; they might insure them in addition.

1337. But you do not feel sure that they would do so?—No, I do not feel sure that they would do so.

1338. Do you not think that such an inspection would deter people from insuring?—I think the object of insuring them is to obtain good inspection, and they would get better inspection from insurance companies than from the companies that do not insure.

1339. But my question is this: you say that an inspection is necessary?—Yes.

1340. If the inspection is made compulsory, would it, in your opinion, tend to prevent people from insuring their boilers?—I really cannot tell.

1341. Mr. *Armitstead.*] You at first spoke of the small damages which you have to pay in a great many cases?—Yes.

1342. What do the small damages consist in, and how do they arise; that is to say, what do you call small damages in contradistinction to large damages?—I should say that a small damage is what very often happens. We recommend fusible plugs in all boilers; but they do not always put them, and unless they are kept in good order, they may be inoperative. A fusible plug that a man gets it into his head to trust to, is worse than none at all, because unless it is cleaned once a month or so it is inoperative; small damage is when the water

water gets low, and the crown of the boiler comes down a little; sometimes it does not damage the plate at all, but it brings down the crown of the furnace, and it becomes out of a circular shape; in many cases we can get at the heated plate and straighten the furnace up, and it is as good as ever, but sometimes the plate is cracked; we only pay damages for explosion of the shell, or collapse of a flue; we do not pay damages for wear and tear. Every month we have to pay on an average about 16 of those small damages, sometimes as low as 3 *s.* 6 *d.*, and sometimes it goes up to about 130 *l.* We always restore the boiler to its original state; we have two or three inspectors of boilers travelling about the country, and they are telegraphed for whenever there is any accident, and if the boiler is repairable they go and superintend the repairs.

1343. You call them small damages when it does not actually come to an explosion, do you? —We have some explosions where we have only about 40 *l.* to pay, and we have some small damages where we have to pay 140 *l.*

1344. You have stated that 20 boilers out of a 100 you have to refuse?—About that; it may be 15 out of 100.

1345. Can you state the principal reasons for that refusal?—Sometimes they will not give us an opportunity of a thorough inspection when we doubt the boiler, and there are many reasons; sometimes the pressure appears too great, and in some cases we want the flues hooped, in order to make them stand the strain; sometimes the boiler is too far gone by corrosion to be trusted, and unless they will take out the defective plates, and put the boiler in proper working order, we refuse to have anything to do with the boiler.

1346. You refuse to insure if they will not conform to your regulations?—If they will not conform to our regulations for the safety of the boiler.

1347. Do you not think that coroners' inquests would have proved more satisfactory if scientific men had attended, and pointed out to the jury the real causes of explosions?—Yes, I think so; and I have already stated so in answer to a question put to me by the honourable Chairman.

1348. Do you think, for instance, if the Board of Trade sent a scientific man to every accident that occurred, and he drew the attention of the jury to the real causes of the accident, that juries would give more satisfactory verdicts?—Yes; I think the person sent down ought to have some power given him independently of merely reporting on the accident, and he should have the power of forcing the owner, when required, to allow an opportunity for a thorough inspection. It is a great calamity that we do not always get those opportunities given us.

1349. The gentleman so appointed would point out to the jury the true causes of the accident? —Yes, and he should be a man without local influence.

1350. If there is any neglect on the part of the steam user, the jury might know it through this scientific officer, and give a verdict accordingly?—Yes, or if there is any neglect on the part of the engineer or the fireman.

1351. Mr. *Tipping.*] You said that the majority of accidents that occurred to your Company were independent of inspection; did you mean by the majority, explosions or all kinds of accidents?—I mean by an explosion, where the boiler is ruptured, and made useless. But as chairman of the company I have a book containing a list of those things, and I find that every month we have to pay sometimes as many as 17 bills for damages, and against every bill I write in my own handwriting the cause of the damage. That shows that the majority of small cases are from want of water, and no inspection can prevent that, because it depends on the firemen's attention.

1352. May I conclude that the majority of the accidents which inspection cannot prevent, arise from carelessness?—About one-half of them do.

1353. You said that the majority of the accidents could not be prevented by inspection, but that universal inspection would reduce the accidents down to one-fourth, did you not?—No, I did not say the majority of the accidents; but a great many of the accidents cannot be prevented by inspection. But if our company had more facilities for examining the boilers (I do not say compulsorily), we could prevent more accidents. The millowners, some of them having only one boiler, they must keep the boiler going on, or they might become bankrupt in bad times, because the merchant in Manchester refuses to take the goods sometimes on the plea that they are not delivered in time. In many cases it is very difficult for a poor man to stop his boiler. I will take a few cases of damage. There was one in Halifax from unequal expansion of the plates; that is to say, if there is a very long flue and a hot furnace, the plates bend, and continue bending, like a piece of paper. There was another at an iron company. The immediate cause was unbroken seams; that is to say, the boiler was made without the plates overlapping each other. One at Morley from faulty material; another at Claypole, Claypole's, of Leicester, from corrosion; another was from deterioration, and so on; one at Newcastle from faulty repair; another, deterioration; another, corrosion, and so on; another, overheating and spoiling the iron; another, deficiency of water; another, deterioration and deficiency of water, and so on; internal corrosion, deterioration, faulty repairs and so on; those are a few specimens. About half of them were from deterioration, some from want of water, and some from faulty construction.

1354. Do you think, from your experience, that the most dangerous class of boilers in the country are the class which do not come to your company or similar companies at all, or come in less proportion than the better class of boilers; or do you think that you insure what you may call a fair average of the boilers of the country?—I think that we ensure a fair average of the boilers of the country, but I think that the Fairbairn Association had a better class than we had, because the company was got up principally by wealthy proprietors in the neighbourhood of Manchester. They were only a local association at first; they did not go more than 35 miles round Manchester; of course, eventually, they extended further; but I could name a number of the first associates of the institution; they were all large firms, and they could afford to have a boiler or two boilers stopped for repair and examination; therefore, there was not so much chance of an accident with them for a number of years as with a company like ours going over the whole of Ireland and England; I think we ensure about a fair average of the boilers.

1355. Lord Campbell's Act with regard to prosecution for accidents, is a permissive Act, is it

Mr. *W. McNaught.*

7 July 1870.

it not?—Yes, it is, for the relatives of those that are injured, to apply.

1356. Would you make it compulsory?—I would have a scientific gentleman to attend at the coroners' inquests, to give information as I have already stated; and to report to the Government, and the Government might do what they liked; I think something should be done in that direction. I think that would almost cure the evil without any compulsory inspection, for people would, in that case, have good people of their own to look after their boilers, or else apply to some of the companies to do it for them.

1357. Sir *T. Bazley.*] Have the Boiler Associations of Manchester contributed by their inspections to increase the safety of the public, do you think?—Yes, I do think so; I think, on an average, they have increased the safety of the public more than 50 per cent.; about 60 per cent.

1358. You are favourable to the extension of that principle to the whole of the country where boilers are used, are you not?—I think it would act very well if it was encouraged to expand. That is to say, if we are encouraged so that we could obtain more facilities for inspecting boilers, and if Lord Campbell's Act was carried out, not stringently, but fairly.

1359. And if the Legislature required that every steam user should possess a certificate that the boiler was in a perfect condition, I suppose?—Yes, that would be a good thing, but that certificate should be renewed about every quarter of a year, because no man can tell whether a boiler is in good order without an inspection in three or six months after.

1360. Probably you would require the certificate to be signed by a competent person every six months, say?—Yes, that would be a good thing.

1361. You stated, you feared that in some districts of the country, a talented engineer could not be found for inspecting the boilers?—In some of the districts where there is not much machinery you could not depend on the engineer, if you employed a local engineer with local interests and influence, a small man, I think you could not depend on his report; he would be apt to have a bias in favour of the parties using the boilers.

1362. In the case of Manchester, the chief engineers are the engineers of your own company, and the Steam Users' Association, they are not what may be called Manchester engineers, are they?—No; I meant the acting inspectors; those that creep through the boilers and into the flues.

1363. But cannot talented engineers be obtained in every district of the country, from what I may call the engineering market?—Certainly; but I thought in licensing them, and giving them certificates, it might be the same as you license gas or water-fitters; you cannot expect a labouring man to go and give the certificate; you would require to be very careful as to who gave the certificate.

1364. The Manchester Associations have had a local origin, have they not?—Yes.

1365. Could not there be local associations all over the country?—No doubt.

1366. Do you not think that sound opinions would be obtained generally from engineers who had no connection with the Government whatever?—Yes, but I think that there should be some central board, or the Government should license them; I mean that they should not let all and sundry go in.

1367. Yet, in Manchester, that association originated without the assistance of the Government in any way whatever, did it not?—No doubt.

1368. Why cannot all the other parts of the country do the same thing?—Sir William Fairbairn was a thorough engineer; I think it could be done in the same way. I think there are no associations in Scotland at all, but I think there are four or five in England.

1369. If we had an Act of Parliament compelling every user of steam to possess a certificate, would they not form themselves into bodies that would pursue the same system as that in Manchester?—Yes; the first association that I knew of was in Blackburn, when the late Mr. Kenworthy was connected with it; they had an association three years previous to the Manchester Association. But when Sir William Fairbairn's institution began, the Blackburn association thought it was no use their continuing their operations, and they gave up and merged into the Manchester one; so that that is an argument against the multiplication of local associations.

1370. But you are decidedly in favour of periodical examinations of boilers, are you not?—Certainly.

1371. Mr. *Hermon.*] I understood you to say that in cases of coroners' inquests, you would insist on a Government inspector being sent down to assist at the inquiry?—Yes; some gentleman representing the Government, or some officer appointed. I should say that he should be a permanent officer.

1372. You also said that he should have the power to order an inspection of boilers?—Yes; when supposed to be required.

1373. But how is this inspector to know when such an inquiry is supposed to be required?—It is wonderful the knowledge that common firemen now possess with regard to both steam-engines and steam-boilers. In Oldham you find common workmen who are just as well up as some consulting engineers in this matter. At all events, they have a fair knowledge of the subject, and there are always men about the place who have an idea when a boiler is dangerous. I would allow a man whose life depended on it to ask for an inspection.

1374. You would recommend that this inspector sent down by the Government should have power to act promptly, without any suggestion from the coroner's jury or the coroner himself, I suppose?—Yes.

1375. Mr. *Fielden.*] Did I understand you to say that you were in favour of compulsory inspection?—No; I would rather avoid compulsory inspection, if I could; but I would rather have compulsory inspection than no inspection. I would like to facilitate spontaneous inspection.

1376. To put it broadly; if we had compulsory inspection, would you entrust it to a central authority emanating from London, or would you entrust it to voluntary associations?—I do not see how you could have compulsory inspection with voluntary associations.

1377. Could it be done in this way; by a Government official licensing those voluntary associations to inspect, and giving them a certificate?—Yes, I think that would be the way in which it would be most effective, and give the Government the least trouble.

1378. That

1378. That would be better than a central association in London, would it?—Yes, I think so.

1379. Would it be necessary, under those circumstances, in case of a large boiler explosion, at all events, attended with loss of life, that the Government inspectors should attend to see that those associations had done their duty?—Yes, I think it would be necessary that the Government inspectors should attend to see that those association had done their duty; also to see that the factory owners had done their duty, and that the workmen employed to take care of the boilers had done their duty.

Mr. W. McNaught. 7 July 1870.

1380. That is to say, on the plan on which Government inspectors attend in cases of railway accidents now?—Yes.

1381. *Chairman.*] Have you anything further to state to the Committee?—No.

Mr. Robert Bewick Longridge, called in; and Examined.

1382. *Chairman.*] You are a Mechanical Engineer?—I am.

1383. You have had a good deal of experience in the inspection and management of steam boilers?—Yes.

1384. I believe that you are chief engineer and manager of the Boiler Insurance and Steam Power Company (Limited)?—I am chief engineer and manager.

1385. Were you previously to that connected with the association now called the Steam Users' Association?—I was appointed chief inspector when it was first formed.

1386. That was in the year 1855, I believe?—Yes, it was in 1855.

1387. You remained with the Steam Users' Association until the end of the year 1858?—Yes, I remained with them till the end of the year 1858.

1388. Were you succeeded by Mr. Fletcher?—No, I was succeeded by Mr. Harman.

1389. Will you be kind enough to state to the Committee your reason for leaving the original association?—The association did not make much progress, and at that time it had only about 1,560 boilers under inspection, and I did not see much prospect of its extending its business, as at that time they limited the operations of the association to 35 miles round Manchester. As I did not see any prospect of its extending, I resigned the appointment.

1390. Had you reason to believe that the insurance which was contemplated in connection with the inspection was calculated to diminish the number of explosions, or to improve the inspection in any way?—Yes, I thought that if they also insured they would be able to extend their operations very considerably.

1391. I believe that you have had proposals for the insurance of a great number of boilers?—Yes.

1392. About what number?—About 22,500.

1393. How many of those boilers have been accepted?—The exact number of proposals was 22,570, and we accepted 19,502.

1394. Why were the remaining 3,068 refused?—Many of them had not efficient mountings; some of them were in a bad condition. In some instances the firm were not willing to pay the rate of premium that we charged, and some of them changed their minds, and thought it not worth while insuring the boilers.

1395. Did you endeavour to induce parties to comply with your conditions, so as to bring the boilers under inspection?—Yes; we always pointed out the defects, and advised them what to do, and said we would then insure the boilers.

1396. But they did not think it worth while to insure them?—Just so; they did not think it worth their while.

1397. Have there been any explosions of boilers under your inspection?—Yes, we have had 20 explosions altogether.

Mr. R. B. Longridge.

1398. What description of works were they where those boilers exploded?—There were eight in iron works, five in collieries, three in cotton and woollen mills, two in bleach and dye works, one at a corn mill, and another at a gunsmith's.

1399. What description of boilers were they generally?—Ten of them were plain cylindrical boilers, with hemispherical ends, which are the boilers commonly used in iron works and collieries.

1400. What were the other 10?—The other 10 were boilers with internal flues.

1401. What was the cause of the explosions in those boilers respectively?—In the plain cylindrical boilers, four of them exploded from deterioration of the iron, two from injudicious repairs, three from overheating, owing to accumulation of deposit, and one from internal corrosion, owing to the presence of acids in the water.

1402. With regard to the flue boilers, what was the cause of the explosions?—One was from malconstruction, owing to the man-hole having no strengthening ring round it, one from faulty material, the plates being little better than cast iron; one was from unequal expansion, owing to the steam being raised too rapidly on a frosty morning, one from injudicious repairs, two from corrosion of the plates on the underside of the boiler, and four from negligence of the attendants (letting the water get too low).

1403. Would not a good, thorough inspection have prevented a number of those explosions?—The only explosions that could have been prevented were those from corrosion; the deterioration of the plates you cannot detect; that is to say, deterioration in the tensile strength of the plates.

1404. Mr. *Hermon.*] Could you not have detected that by drilling?—No; you have no means of ascertaining that, unless you cut out a plate and break it.

1405. *Chairman.*] With regard to the explosions from the use of faulty materials, to whom do you attribute the blame?—In reference to the explosion which resulted from the use of faulty material, by which nine lives were lost, I may mention that at the inquest the merchant who supplied the plates stated that he sold them as ordinary merchant iron, for the quality of which he considered himself in no way responsible; the boilermaker, of course, would know that it was not suitable for the purpose.

1406. Then the boilermaker of course would be greatly to blame, would he not?—Yes, he was decidedly culpable, but there was no means of knowing that until after the boiler had exploded.

Mr. *R. B. Longridge.*

7 July 1870.

1407. What number of boilers have you under inspection at this moment?—The total number of boilers under the inspection of the company on the 30th June last, was 12,688.

1408. Have you formed any idea of the number of boilers that there are in the country?—I think there would be about 100,000.

1409. What proportion of that number would you say were in connection with steam-engines; that is to say what you would call power boilers?—I am merely speaking of those connected with steam power.

1410. Would you not assume that there were very large numbers that were not in connection with steam-engines, but which were used for generating steam for other purposes?—I am including all bleach and dye works, and so on.

1411. You include those in the 100,000?—Yes, I include those in the 100,000.

1412. Do you not consider that boilers in connection with steam-engines, as a rule, are safer than those not in connection with steam-engines; is there not, generally speaking, a skilful attendant on a boiler, where there is a steam-engine, while, it may be, simply a fireman in the other case?—Where there is only a single boiler you often find an incompetent man; but if there are a number of boilers, generally you have a man that is more competent.

1413. Do you know the number of explosions that take place at the present time, annually?—They average about 50 explosions and 80 deaths. That is the average for the last 11½ years, since the company has been formed; it would be a little more, perhaps, but those are what I actually know of.

1414. It is simply like a death being caused by a boiler explosion every fourth working day in the year, is it not?—Yes; pretty nearly. The actual number I have got amounts to 581 boiler explosions, causing 922 deaths in 11½ years. There have been others, no doubt, of which I have got no account.

1415. Mr. *Platt.*] Those were stationary boilers, I suppose?—One or two of them were steam-tugs in the Thames and at Bristol.

1416. *Chairman.*] At present there are 50 explosions every year, you say?—Yes.

1417. And you say that there are 100,000 boilers in the country?—Yes.

1418. That would be one in every 2,000 boilers?—Yes; about that.

1419. What rate of explosions are there in connection with boilers that have been insured?—In those that we have insured the rate has been one in 4,600.

1420. That is to say, those insured in your office?—Yes.

1421. Do you know the number of explosions that took place last year?—Last year there were 63 explosions.

1422. What did those explosions proceed from generally?—Nineteen were from malconstruction, and partly also in some of those cases from deterioration in the quality of the iron; 19 from corrosion of the plates; nine from negligence of the attendants; three from over-pressure; two from injudicious repairs; two from over-heating in consequence of accumulation of deposit; there was one accident from the dome of a locomotive coming in contact with the arch of a tunnel, and the other eight I did not obtain particulars of; that makes a total of 63.

1423. The chief causes of explosion seem to be malconstruction, faulty material, deterioration in the quality of the iron, and corrosion?—Yes; what I mean by deterioration is the plates losing their tensile strength after being exposed to fire for some years.

1424. You must have given the matter a good deal of attention with a view to the prevention of those accidents, because I believe it is on record that the deaths which now occur from the explosion of steam boilers are three times as large as those caused by all the railway accidents in the country, is it not so?—I cannot state exactly.

1425. But such being (as it is) the case, it is a most important subject?—Yes.

1426. Have you any scheme to suggest to the Committee on that point?—Yes, I have; what I would suggest is, that one or more engineers be appointed by Government as inspector or inspectors of boilers, to investigate the cause of every boiler explosion which may take place. In case of any personal injury being sustained by an explosion, the owner of the boiler should be required to give notice of the same, by post, within 24 hours, to the Government inspector, or failing to do so, should be liable to a penalty not exceeding 20 *l.* The inspector should, on receipt of the notice, himself make an examination of the boiler, and should, in case of any death resulting from the explosion, be empowered to call any witnesses he might think fit to give evidence before the coroner. Wherever, in the opinion of the inspector, there was conclusive evidence of culpable negligence, but nevertheless the inquisition resulted in a verdict of "accidental death," as would frequently be the case, the inspector should, with the sanction of one of Her Majesty's Secretaries of State, prosecute those deemed culpable, as is now done by the Government inspectors of mines under similar circumstances. If the owner of the boiler were convicted, the relatives of the deceased would doubtless avail themselves of Lord Campbell's Act to obtain compensation. The inspector should have power at any time to stop the working of any boiler for thorough examination, by giving notice in writing to the owner thereof, who should be required to have the boiler properly cleaned, and the flues swept by the time appointed, and also, if specially required, should remove any brickwork or covering of the boiler that the inspector might deem necessary. If, the owner should object or neglect to make the necessary preparation for such examination, he should be liable to a penalty of 1 *l.* for every day beyond the day appointed, during which he might so neglect. The inspector should be authorised to employ any competent man he might think proper to make such thorough examination, the fee for which should be 20 *s.*, and should be paid by the owner of the boiler. If, after such examination, the inspector should consider the boiler in a dangerous condition, he should give notice in writing to the owner thereof, specifying the particular defects, and requiring him forthwith to remedy the same or replace the boiler. If the owner should deny the dangerous condition of the boiler, and object to replace it, or remedy the defects, he should be required within three days after the receipt of such notice, to give notice in writing of such objection to the inspector; and further proceedings should be taken for the determination of the matters in difference by arbitration. When the matters in difference had been determined by arbitration, then if after the owner had been furnished with a copy of the award, attested by the inspector, he should neglect

glect forthwith to take proper and active measures for removing the danger, he should be liable to a penalty of *5 l.* for every day after the receipt of such copy of the award during which he might so neglect. All penalties to be recovered in a summary manner before two justices of the peace, or in Scotland before the sheriff of the county or place where the offence had been committed. If this course were adopted, I feel convinced that the periodical inspection of steam boilers would soon become general, and boiler explosions would be of rare occurrence.

1427. You think that what you have proposed would prevent a great number of those explosions?—I think that all that it is possible to prevent might be prevented in that way.

1428. Are you of the same opinion as the previous witness, that 75 per cent. of the explosions could be saved by such a plan?—I think you would reduce them to about 1 in 5,000; I do not think that you could reduce them below that, because you cannot detect the deterioration of the iron, and you cannot prevent negligence on the part of the attendants.

1429. Can not you detect deterioration even by the most careful inspection?—No.

1430. Dr. *L. Playfair.*] When you say that periodical inspections would soon become general, do you mean an independent local periodical inspection, and not an inspection from any certified authority?—Yes, I mean that the owners would employ some one to inspect the boilers for them; I think it should be left to their own option to employ whom they thought fit.

1431. I think your plan is based on not diminishing the responsibility of the steam users?—It is.

1432. At the same time you entirely agree in the importance of periodical inspection?—I do.

1433. In fact, your system of insurance involves inspection also?—Yes.

1434. I suppose that is the reason why you have had so few explosions?—Yes, it is entirely attributable to inspection.

1435. Is it not the case that the Manchester Association have had practically no explosions at all?—During 15 years they have had seven explosions, causing nine deaths; I mean the Steam Users' Association.

1436. Sir William Fairbairn stated to the Committee that there was not a single case of loss of life, did he not?—If he stated that he was in error; he had forgotten.

1437. Mr. *Hermon.*] Have you seen the fusible plug that was exhibited by Mr. Hiller the other day?—No.

1438. You understand the nature of the fusible plug, I suppose?—Yes.

1439. Suppose that fusible plug became thoroughly coated with deposit, would it not be perfectly inoperative?—Yes; it would be entirely useless.

1440. You spoke just now of a boiler that burst owing to being made of very improper iron to be used for boilers?—Yes.

1441. Did the coroner's jury find fault with the maker of the boiler for having used material in the manufacture of the boiler which he knew was not suitable for the purpose?—No; I think he was not blamed at all. The verdict was accidental death.

1442. If a Government inspector had been present, do you think the result would have been different?—I do not know. I am very doubtful about coroners' juries, because, even on the clearest evidence, they acquit.

1443. In your Boiler Insurance and Steam Power Company, I think you have stated that the proportion of explosions has been one in 4,600?—Yes.

1444. Mr. *Fielden.*] You prefer the system that you have sketched out, to having local associations duly certified by competent officers to inspect?—I do.

1445. But you think that in all cases of explosion, it is desirable that some independent person duly qualified should go down to inspect the boilers, and report upon them?—Yes; it is absolutely necessary, I think.

1446. He would be a Government officer, in fact?—Yes.

1447. Mr. *Birley.*] Is any inspection more competent than that of a well-ordered and properly managed concern where people know every joint and rivet in a boiler?—We find that inspectors who have had experience for 10 or 12 years are always much better qualified to find defects and in many cases, where we have been told that a boiler did not require inspection, because the men were so exceedingly competent, we have found the boiler in a dangerous condition. In one case where they kept a boiler-maker, whose sole duty was to examine and report upon the condition of the boilers, we found that a great number of them were totally unfit to work, and one of them had actually exploded and killed a great many people.

1448. Is it your opinion that the engineers and inspectors whom your company are employing are more competent, or is it merely that there is an advantage in having another eye upon a boiler?—They are decidedly more competent, as they have had much more experience; they are men better qualified to detect defects than any ordinary attendant.

1449. Are you of opinion that boilers should be inspected at the boiler-makers' works before they are set up?—I think it is desirable; we are frequently asked to do it, and we frequently send inspectors to examine boilers at the boiler-maker's before they leave his premises.

1450. So that any error in the construction of the boiler is noted?—Yes.

1451. Do you often find defects under those circumstances?—We often find them leaky, and in some cases defective in construction, not strengthened enough.

1452. What is done in that case?—We send a report to the owner stating where the defect is, and telling him how it is to be remedied.

1453. And they do remedy the defects, I suppose?—Yes.

1454. Mr. *Laird.*] Do you think that the inspector should be a Government inspector?—The officer I propose ought to be a Government officer.

1455. He would be the party to inspect every boiler before it left the works, I suppose?—No, not at all. His duty would be simply to investigate the cause of an explosion when it took place.

1456. But you think that the boiler should be inspected before it leaves the works?—Yes; but that is the duty of the steam user. He should be held responsible for the condition of the boiler.

1457. The purchaser of the boiler should

Mr. *R. B. Longridge.*

7 July 1870.

employ an inspector to examine it, you think?—Yes; I do think so.

1458. Colonel *Gray.*] I gather from your evidence that you do not consider it necessary that there should be compulsory inspection universally?—No, I do not consider it necessary at all.

1459. You think that if the plan which you recommend were adopted, and it was left to the option of the steam user, he would have his boilers inspected?—If it were made so far compulsory that the owner knew he would be punished in case of an explosion occurring through any culpable negligence, he would take care to have the boilers inspected.

1460. Do you not think that there are a great many steam users who would go on and take their chance of an explosion, just as they do now?—I think not. If one or two of them were sent to prison for a few months, that would deter the others.

1461. Do you inspect many boilers in mining and agricultural districts?—We inspect a good many in mining districts, but not many in agricultural districts.

1462. Are the boilers similar in those districts to what they are in our manufacturing districts; have you more explosions in mining districts than in agricultural districts?—In iron works and collieries we have decidedly more explosions than in any other works.

1463. Your object is not to prevent explosions, but to make the best profit you can for the company, is it not?—No, our object is to prevent explosions, because if they occurred we should lose our reputation, and that would prevent our being able to make a dividend.

1464. But fire insurance companies are sometimes very glad to have a good fire, are they not, because more people come to them to be insured?—Yes; but they do not attempt to prevent fires, because they have no system of inspection; while our main object is to prevent explosions.

1465. Mr. *Platt.*] The system which you recommend seems entirely to take the thing away from the local parties by appointing a Government engineer to inspect, is not that so?—No; my object is to make every user of steam power responsible. I would leave it entirely to his own discretion to employ whom he thought fit, but I should have it clearly understood that he would have to bear the consequences in case of an explosion. I would merely call in the Government officer after an explosion had occurred, or if he obtained any private information that some one was using a dangerous boiler (a neighbour might give information to the Government inspector), then he should investigate the matter before explosion.

1466. Then how do you get over the malconstruction of the boiler; you were asked that question, and you said you thought it would be a very good thing if all boilers were examined before they were brought into use, did you not?—Yes.

1467. But the answer which you give now is rather the reverse of that, is it not?—No; the owner of the boiler must be responsible for it, and for his own interest he ought to have the boiler inspected before he receives it. We are often desired to examine second-hand boilers, and we do so, and in the majority of cases they are rejected on receiving our reports.

1468. You think that the law you would propose would be sufficient to put the manufacturer on his guard, and that he would be more careful in ordering a boiler than he is now if he knew the penalties that would follow an explosion?—Yes.

1469. That you think would be sufficient?—Quite.

1470. Have you ever insured a boiler without an examination?—Never.

1471. You were asked a question just now by one of the honourable Members, whether you did not look more to profit than to safety; would you not make more profit the less you pursued your examinations?—I think not. I do not think the boiler owners would insure at all unless it were for the inspection that we give them.

1472. Do you not find a difficulty in their giving you facilities for examination?—We do, and that is the only difficulty we have to contend with. When they will not give it we cancel the policies.

1473. Then I will put the same question to you as I put to Mr. McNaught; after you have inspected a boiler for a number of years, you go to inspect it again, and you find reason to distrust the soundness of that boiler; you make a report, and you recommend certain things to be done which might result in very great expense to the insurer, might it not?—Yes.

1474. He might say, "I refuse to do this, I consider the expense too great;" he calls another engineer, and the other engineer says that it is not requisite to be done; then what remedy has he against you if you refuse to continue the insurance?—He has no remedy; several cases have occurred where we have refused to continue the insurance; the owner has stated that he has had a boilermaker to examine the boiler, and that he said it was quite safe, and unless we were willing to take it as it was, he would not continue the insurance; under those circumstances, we have refused to continue the insurance, and within a short time the boiler has exploded, and killed a good many people; we have had more than one case of that kind.

1475. You have stated, have you not, that it was a very difficult matter to detect any flaw in the material?—It is.

1476. Do you not think that if all the iron or steel used in the construction of a boiler was to be marked with the name of the maker, it would be an advantage?—Yes, it would be an advantage; but even the best plates deteriorate; the best Low Moor plates exposed to fire for a length of time become as brittle as possible.

1477. But would there not be more responsibility on the maker if all the iron or steel were marked with his name?—Yes; no doubt it would be decidedly better to have all the plates branded.

1478. Have you ever been called upon to pay for loss of life?—No, we have insured very few lives indeed. I do not suppose that above a dozen insurances have been effected in that way. The boiler owners do not seem to care about it.

1479. Now, with regard to this Government engineer. You say that a written notice must be sent to the manufacturer, when he was coming to inspect a boiler?—Yes.

1480. What do you mean by that?—I mean that if the Government inspector obtained information that any one was working a dangerous boiler, he should have the power to stop the boiler for a thorough inspection.

1481. That

1481. That is to say, he might stop someone's works on information which might not be true?—Yes; but before stopping the works the Government inspector should write to the owner to ascertain whether the boiler had been examined, and if so he could obtain all the particulars before he decided.

1482. Would not that place immense power in the hands of this man?—Undoubtedly.

1483. Do you not think that the same thing could be carried out by local management?—I think not, but it depends on how the inspectors are to be appointed.

1484. It has been suggested to the Committee by one of the previous witnesses that the municipal council should be employed to grant licenses to every person using a boiler, and that no person should be allowed to use a boiler without a certificate from their engineer; what do you think of that proposal?—I think that would be altogether useless, because I think municipal councils would appoint men to inspect boilers who were totally incompetent.

1485. You would have no confidence in men appointed by municipal councils for boiler inspection?—No, none whatever.

1486. I suppose you would, on the other hand, have no confidence in any local body appointing their own inspectors?—That is a different thing, for I look upon steam users' associations as being very different from municipal authorities.

1487. But the steam users are only composed of parties immediately interested, whereas the municipal bodies would contain members of the public as well as steam users, would they not?—But many of the appointments would be made more from interest, I think, than from the particular qualifications of the inspectors.

1488. That is to say, you would have more confidence in a Government engineer than in any local bodies?—Certainly.

1489. Is not that rather a reflection on your own company?—I think not.

1490. Would you be in favour of a Government officer in preference to an inspector chosen by the steam users generally, apart from the municipal authorities?—There is the distinction; the municipal authorities are totally different from the steam users; the steam users would select the best men they could get, but I do not believe that that would be done by the municipal authorities.

1491. But you think that the steam users would be likely to appoint competent men?—I do.

1492. Mr. *Lancaster.*] Are you in favour of compulsory inspection by the Government?—No, decidedly not.

1493. At all events, you would make the Government engineer supreme in all inquiries; that is to say, you would invest him with power to stop the works, or to order the inspection of any boiler?—Yes; I should give him that power.

1494. And you do not call that compulsory inspection?—No, I do not propose that the Government engineer should himself make those inspections. He would employ any person whom he thought fit to make those examinations, because the gentlemen who would be qualified for this appointment would not be the class of men suitable to make those examinations; you must have a working man who would do all the dirty work necessary in inspecting the boiler.

1495. But your Government authority would have power to appoint those inspectors?—Yes.

1496. In fact, he is to be an officer in the same position as you are in with your company; you appoint the sub-inspectors, do you not?—Yes; I appoint the sub-inspectors.

1497. And you would propose to invest the Government engineer with the same authority as you have, namely, to appoint persons to examine on his behalf?—Yes; that is only to select the inspecting persons in each case; not to have any inspectors under him, but that in any particular locality he might select any man he pleased to make an inspection for him.

1498. You have spoken of malconstruction, and you have suggested the examination of a boiler before it leaves the maker's yard. Now, who is to be the person that is to grant the certificate in that case?—I should leave it to the person who is going to buy the boiler, to select any man he thinks fit, and whoever he employs should give that certificate.

1499. Whether he was competent or not?—It is to the interest of the steam user to select competent men for that purpose.

1500. But whoever was appointed you would hold his certificate to be sufficient?—Yes; at all events, the owner must be responsible for it.

1501. Still, up to that point, you would hold it to be a properly constructed boiler?—It might not be properly constructed, of course; if it were a competent man that the owner sent, of course it would be all right, but he might unluckily appoint some one who was not well qualified.

1502. But if a certificate is granted that the boiler is properly constructed, that certificate would be handed in, would it not, in any inquiry that took place subsequently?—Of course, it would.

1503. And it would be held to be evidence that it was a properly constructed boiler, would it not?—No, it might not satisfy the jury; the owner would have to give evidence that he was justified in employing that man.

1504. Is not that a roundabout way of doing it; would it not be better to make sure in some way of having a competent man to whom you could apply to grant a certificate?—No; I think the owner should be left to his own discretion; there are plenty of competent men, and I think it is only right that a man should choose for himself.

1505. You do not think it is right that some central authority should have the power to inspect and grant certificates before a boiler is set to work?—No.

1506. I believe that you are in favour of a thorough periodical inspection of all boilers?—Yes.

1507. But still you would not make it compulsory?—No; at least, I would only have indirect compulsion.

1508. If the periodical examination were compulsory, do you think that owners would insure under those circumstances?—Yes; I think many would.

1509. But do you not think that that compulsory periodical inspection would lessen the tendency on the part of the owners to insure?—It would, to some extent, I think.

1510. It is your belief, is it not, that if a thorough inspection took place, a very small percentage of explosions would occur?—Yes.

1511. The public would soon learn that, would they not?—Yes.

Mr. *R. B. Longridge.*

7 July 1870.

1512. And do you think that after they had learnt that fact, they would continue to insure their boilers?—Yes, decidedly; because we give that very inspection which they desire.

1513. But would they not get that without insurance?—Yes, they could, certainly; but I think they would give preference to inspection with insurance, because, in the one case, there is a greater responsibility than in the other, and the owners consider that our inspection is more to be depended upon.

1514. The primary object of all these associations is inspection, is it?—Yes.

1515. You have stated that you do not think local parties ought to control that inspection?—I think they ought not, because I do not think they would appoint qualified men for those duties.

1516. Do you not think that engineers appointed by large communities like Liverpool (I will not say Manchester, because you represent Manchester), would be competent to inspect and report upon boiler explosions?—They might find competent men, undoubtedly, but I do not think that municipal authorities would select proper men.

1517. Let us take counties that are under the management of the magistrates and quarter sessions; do you not think the courts of quarter sessions and magistrates would appoint competent persons in order to release themselves from the responsibility of appointing incompetent men?—I do not think that they would have opportunities of judging. We find the greatest difficulty in obtaining men qualified as inspectors.

1518. Then, how can the Government obtain more competent men than corporations or magistrates, and courts of quarter sessions, do you think?—I merely speak of the Government selecting one or two men. The duty of those men is not to make those examinations that the inspectors are required to make; their duties are quite apart from the examination of boilers.

1519. You think that could not be done by a county or a borough?—I think not.

1520. Mr. *Armitstead.*] Do you not think if the inspection of boilers at regular intervals was not compulsory that the public would run a much greater risk than if such inspection was compulsory?—I think not. If there was a certainty of punishment in case of culpable negligence, the boiler owners, for their own protection, would take care to have the boilers inspected.

1521. You think that there would be no inclination to save expense and avoid inspection on the part of the owners?—Not if they knew that there was a certainty of punishment in case of negligence.

1522. Mr. *Tipping.*] You mean to say that you would replace universal compulsory inspection, by what I may call wholesome terror, do you not?—Yes, that would be indirect compulsion.

1523. You have no idea whatever of anything like a grand system of inspection; but merely a wholesale prosecuting power, and a power of ordering an exceptional inspection where it is desirable or necessary?—Precisely.

1524. So that inspection under the Government authority would be rather the exception than the rule?—Yes, it would.

1525. But it would be sufficient to keep people up to their duty and responsibility?—Yes, that is all.

1526. I understood you to say with regard to the explosions, that there were only three out of 20 in the number that you could have prevented; that is only 15 per cent. How could inspection so very largely reduce the number of accidents; three out of 20 is about 15 per cent., and that is but a small proportion of the number of accidents which inspection would prevent, is it not?—I will take the number of explosions which occurred last year as the average; nine of those were from the negligence of the attendants which you cannot prevent; that is a seventh of the 63; there are others from deterioration of the iron, which you cannot detect. Those are the two principal causes that cannot be prevented.

1527. I suppose your reason for allowing the purchaser to select his own inspector rather than having a universal system of inspection, is to keep up the responsibility as much as possible?—Decidedly.

1528. What is the difference in the cost of inspection without insurance, and inspection with insurance?—The cost of inspection without insurance is 17 *s.* 6 *d.* per boiler; for insuring 100 *l.* the cost is 20 *s.*, including the inspection; there is a difference there of only 2 *s.* 6 *d.*

1529. Sir *T. Bazley.*] Supposing you and Mr. Fletcher received appointments to-day from the Board of Trade to become superior boiler inspectors, would you on the morrow deem yourselves to be more talented than you now are, or more competent to perform your duties?—No, certainly not.

1530. You owe your appointment to the local authorities only, do you not?—Yes.

1531. From my own knowledge, I believe I may take the liberty of saying that I do not think that two more competent engineers for that duty could be found in the country; but when you were first connected with the Steam Users' Association, you said that you were limited to a circle of 35 miles round Manchester for the duty of inspection?—Yes.

1532. How many boilers may there be within that district?—That is a very difficult question to answer; I should say that there might be 20,000 or 30,000, but it is merely a rough guess.

1533. What proportion of your own boilers may there be in the county of Lancashire?—That I cannot say off-hand.

1534. You have rejected upwards of 3,000 boilers, you say?—Yes.

1535. That is to say, you have declined to insure them?—Yes.

1536. Have any accidents occurred to those boilers, or any portion of them?—Yes.

1537. I mean any serious accidents?—Yes.

1538. Then a fair inference may, I think, be established by the fact that compulsory examination is necessary for the public safety, is it not?—I do not consider it necessary to have a compulsory inspection, nor do I think it advisable.

1539. Then why are not the whole of the boilers now under inspection?—Because many people consider it unnecessary; they think that they have competent men of their own; others will not do it on account of the expense.

1540. But the public safety is more important than the question of expense, is it not?—Yes; I think the steam users should be held responsible for the safety of the workpeople.

1541. You thought it necessary to establish an insurance association rather than a steam users' association, for the purpose of increasing the desire for examination?—Yes, I found that the majority

majority that joined that association when I was connected with it, joined more particularly to have their engines inspected and indicated, in order to economise fuel; because we not only inspected the boilers, but we inspected and indicated the engines, pointing out the defects and how they were to be remedied, and they found that they could reduce the consumption of fuel materially. The chief inducement to join the association was with regard to the engine, and not with reference to the boiler. After they had obtained that information they gave up their connection with the association. Many of them joined for a single year, or possibly for two years, and then left.

1542. By establishing the principle of insurance, are you not rather indicating that profit more than safety is the object of the steam users generally?—No; we hold out inducements to them to join. Many of the lower class of steam users are induced to join with the view of obtaining compensation in case of accident.

1543. Have you reason to believe that there are many boilers in a dangerous state?—Yes, I believe there are.

1544. Then what less than compulsion do you think would induce those owners to appeal to a competent examination?—I think that if they knew that there was a probability of being imprisoned for manslaughter, if an accident occurred, that would be sufficient. At present they know that any accident may occur with impunity, and no one is ever punished, the matter is passed over.

1545. But is there not prevalent a degree of ignorance that induces people to withhold an inspection?—No; I think among many of them it is simply because they think it is not worth while to incur an expense of 20 *s.*

1546. But, at all events, you are in favour of a general system of inspection, are you not?—Yes; I am in favour of a general system of inspection, certainly.

1547. Dr. *L. Playfair.*] Is not the number of accidents that occur chiefly connected with the ignorance of the men, and their want of education?—No; I think it is chiefly carelessness and sometimes intemperance.

1548. Do you think if a man thoroughly understood the nature and the danger of steam-power, he would not take precautions to prevent the loss of his own life?—Many of those explosions that I have alluded to were cases where the men thoroughly understood their duty, but still they occurred through some negligence or oversight.

1549. Mr. *Hermon.*] I understand you to say that in case of an accident from deterioration of the iron, the deterioration of the iron cannot be detected?—Yes; that is what I said.

1550. I asked you, "Could it not have been found out by boring?" and you said, "No"?—Just so.

1551. Could it not have been found out by the water test?—No, a new boiler may bear the water test perfectly well, but after some time the plates will be so very brittle that when they come to work it, and the boiler is exposed to an unequal strain, you may have a rupture.

1552. There is no possible manner, in fact, of detecting deterioration in the iron plates of boilers, is that your opinion?—None but cutting out a piece of the plate, and testing it after you have taken it out.

1553. Mr. *Platt.*] We have had evidence given to us that the force pump is one of the best means of discovering bad workmanship and bad material?—It is one of the best tests for good and bad workmanship, but not always to find out the quality of the material; for instance, you may have a plate that has great tensile strength, steel for example, and yet it may be so brittle as to be quite unfit for steam boilers. The strain in working is very different from the strain in testing a boiler, because under hydraulic pressure it is subject to a uniform strain, but when it is at work, owing to unequal expansion, a rupture may take place on account of the excessive strain on one particular part.

1554. Mr. *Lancaster.*] We have it in evidence that if hydraulic pressure was used to twice the working pressure, that would always detect any weakness from whatever cause, are you of that opinion?—No, I am not.

1555. You do not think that the hydraulic test would detect a defect in the quality of the iron?—No, not in all cases; it might in some cases.

1556. Whatever margin you fixed above the working pressure with that test, you do not think that would be a sufficient test?—No, in many cases it would do a great injury to the boiler, subjecting it to double the working pressure.

1557. You believe that that would leave a permanent strain upon the boiler?—In many cases it would.

1558. There is prejudice in the minds of engineers against carrying out these tests too far, is there not?—Yes.

1559. It is a strong prejudice in the minds of a great many engineers that you permanently injure the boiler, is it not?—Yes, it is.

1560. Mr. *Platt.*] Have you ever known any explosion to occur from testing with water power?—If you mean any collapse or injury to a boiler by testing, that could be traced to the result of the testing, I cannot say that I can mention one.

1561. I think there was one at Messrs. Sharp's, was there not?—Yes, that was one instance where a boiler exploded under the pressure of testing, but that was steam-pressure, and not hydraulic pressure.

1562. Mr. *Lancaster.*] Was that under an increase of steam-pressure?—No; it had been tested by steam-pressure two or three times, and it was never tight, and on the last occasion, the boiler-maker was caulking a seam, while it was subjected to a pressure of about 120 lbs., and the plate gave way.

1563. Mr. *Platt.*] Was he hammering the plate?—He was caulking the seam at the time, and there was a fracture in the plate. The plate which ruptured and caused the explosion was perfectly good at one end, but at the other end it would only bear about one-fourth or one-fifth the pressure that it would bear at the other.

1564. Mr. *Lancaster.*] You do not think that hydraulic pressure would have detected that?—It would have detected a leakage, but not the quality of the iron.

1565. That is to say, not the weakness of the iron?—No.

1566. Dr. *Lyon Playfair.*] In the examination which you make of the boilers for your association, before you insure a boiler, is it always an internal flue examination?—No, not always. The examination is an external examination. The

Mr. *R. B. Longridge.*

7 July 1870.

inspector takes the dimensions of the boiler and all the fittings and the mode of setting it, and all the particulars that it is possible to take while a boiler is working.

1567. But it is not necessarily an internal examination?—No, not necessarily so. If it is a new boiler, made by some well-known boiler-maker, we do not require a thorough examination at once. If it is an old boiler we will not insure it without a thorough examination.

1568. Mr. *Tipping.*] Your idea is, is it not, that very few Government inspectors would be required?—I think one would suffice, or at the most, two.

1569. So that it is quite clear that anything like a general compulsory inspection, under Government, is quite foreign to your idea, is it not?—Entirely.

1570. But you think that the fear of punishment would replace anything like compulsory inspection?—Quite so.

1571. Captain *Beaumont.*] I should like to ask you this: from your extensive experience with respect to boilers, how far have you observed what is known as grooving in boilers?—We find an immense number of boilers grooved.

1572. Would you be kind enough to describe in a few words the appearance of grooving with respect to the position you would generally look for it in?—One of the commonest cases is in boilers with internal flues. You will find the grooving in the root of the angle iron at the end where the flue is attached. When the boiler is working, the expansion of the flue causes it to rise up in the middle, and when it is cold it goes back, so that it is working up and down. We find in a 30 feet boiler that the tube will rise as much as from five-eighths of an inch to three-fourths of an inch in the middle, and that repeated bending causes a grooving sometimes in the root of the angle iron, and sometimes in the end plate close to the angle iron.

1573. Have you seen that frequently in the middle of the plate?—We often find corrosion in the middle of the plate, which arises from acids in the water. We often find the grooving also at many of the circular seams in the shell, which is partly owing to vibration of the plate, and partly from some acid; if there be acid present as well, the grooving is very rapid.

1574. Dr. *L. Playfair.*] What kind of acids do you mean?—Vegetable acids principally.

1575. Captain *Beaumont.*] You have never seen grooving in the middle of a plate, as has been described by previous witnesses?—No.

1576. You think it is the result of bending; your experience shows that it is only found where the bending of the iron takes place?—Precisely.

1577. You do not believe in chemical or electrical action?—There may be electrical action; but I do not think that has much to do with it.

1578. Assuming it to be clearly proved that grooving had been seen in the middle of a plate, how would you account for it then?—I have never found such a thing, and I think we should have had some opportunity of seeing it if it had taken place. But with regard to the acids, we sometimes find sulphuric acid when the feed-water has been obtained from old workings, such as coal mines. A good deal of pit water contains acid which is very destructive to boilers.

1579. But if it is in the boiler, and pervades the whole substance of the water, why should it attack the plates locally?—It will attack in patches; there may be greater impurity in one part of the plate than in another. The next part of the plate may be free from any action of the acid; that is frequently seen.

1580. Dr. *L. Playfair.*] All the witnesses have spoken of that. Now I can understand a case of sulphuric acid; but how do you detect the acid in the water?—We get it analysed by a chemist.

1581. Do you never test with litmus paper?—Yes, and sometimes we find the acid very strong. You may find the water apparently very pure; but if you take water from a boiler after the boiler has been working about a week, you find the presence of acid by litmus paper.

1582. Of course, acid could not exist in the presence of ordinary lime in the water?—No; where we find a thick incrustation of lime, we do not find the acid, only occasional spots; but generally, where acids exist, as for instance in the Rochdale Canal water, there is little or no deposit. The iron is eaten away, and you find the red oxide at the bottom of the boiler.

1583. You believe that it is really acid?—I am quite certain of it. It has been analysed by Dr. Angus Smith, Dr. Roscoe, and others.

1584. Did they find it to be sulphuric acid?—No, it was chiefly humic acid.

1585. Mr. *Lancaster.*] You consider that the grooving is mainly due to mechanical action, do you not?—The worst grooving is due to two causes, namely, mechanical action and acid; when there is no acid it is not so rapid.

1586. But mainly due to mechanical?—Yes, the great cause is this mechanical action.

1587. *Chairman.*] Have you any further observations which you wish to address to the Committee?—No.

Mr. Lavington E. Fletcher, recalled; and further Examined.

Mr. *L. E. Fletcher*

1588. *Chairman.*] With regard to the number of explosions that you have had in a certain number of years in the Steam Users' Association, have you any statement which you wish to make to the Committee?—We have had but one explosion of a guaranteed boiler since the system of guarantee was founded five and a half years ago, and that explosion was quite a peculiar one.

1589. You have only had one explosion?—That is the only guaranteed boiler, *i.e.*, the only one which the association has pledged itself to, which has ever exploded. The left-hand furnace tube was overheated, but the boiler was not stirred, and nobody was hurt; the boiler was repaired at our expense, because we had guaranteed it. It was fed with very large quantities of caustic soda and arsenic; blowing out was given up; the boiler was completely choked with sediment; we set ourselves very much against those compositions, still we do not tie people's hands up. The use of the soda and arsenic was adopted without our approval. We have met with a number of cases in which furnace crowns have been overheated and bulged simply from the peculiar character of the feed water. In May 1869 I presented a long report on this subject, of which this is a copy, giving a sketch of the ruptured furnace crown in question (*producing a report, and*

and describing sketches to the Committee.) Some of the analyses of water were made by Dr. Angus Smith. That is the only boiler guaranteed by our association that has ever exploded, and which brings the proportion up to one in 10,000.

1590. Mr. *Platt.*] Have you had any boilers which are not guaranteed, but still, under your examination, that have exploded?—Yes, one. When the owner entered his boilers, I said to him, "We cannot guarantee these boilers; the sides of the oval flues are weak." He replied, "I only want to be safe." I reported to him at once on the danger. He called on me with the boiler maker, and arranged to have them strengthened; he delayed to strengthen them, and the boiler burst, as I told him it would; we had not pledged ourselves that the boiler was safe, but that it was weak. We said it would burst, and it did. You must not debit us with the explosions that we have predicted, because we do not reject any one. The worse they are, the greater the reason for coming to us; but we plainly tell them if their boilers are going to explode, and if they are all right we endorse the report with a 300 *l.* guarantee.

1591. You do not refuse them even though you know that they are in a dangerous state—Decidedly not; we take the lame and the halt, and keep on helping them. We are not founded to raise a fund, and if any person knows of a bad boiler he will, perhaps, say, "go to the association." We take them at once, point out the defects, and take all the trouble we can to remedy them. But I found it necessary to draw a line, because we were debited with explosions against which we had warned our members; therefore I pressed on our committee to make a line of demarcation by a guarantee, and since we have done that we have shut off explosions, because we are now able to induce our members to afford us better opportunities of making examinations than we had before.

1592. All your money is devoted to the inspection of boilers?—Exclusively to inspections or scientific investigations; it is merely for the prevention of boiler explosions.

1593. You do not divide any money?—No.

1594. Mr. *Hermon.*] You have said that you have only had one accident in five and a half years among the guaranteed boilers?—Only one guaranteed boiler has exploded.

1595. And how many cases among the others that you have not guaranteed?—Only one; we have only had two altogether in the five and a half years.

1596. Dr. *L. Playfair.*] Have you many unguaranteed boilers on your register?—Very few, but some may be unguaranteed in this way. The members pay their subscriptions in January for the whole year, but directly the anniversary of examination dies out the guarantee dies out. With us, examination is essential to guarantee. We write to the party, "Your period of guarantee will expire at such a date, and the inspector will come at any time you like." If the member does not avail himself of that the guarantee drops at the end of the term.

1597. Mr. *Lancaster.*] I suppose you heard Mr. Longridge's evidence on the grooving of boilers being due to mechanical action mainly; do you concur in that opinion?—Yes, I think so. I have a specimen here which will perhaps illustrate the subject (*producing a piece of iron*). This plate is an illustration of the constant action of grooving that we find going on in our own boilers.

Mr. *L. E. Fletcher.*

7 July 1870.

1598. Is there anything else which you wish to state to the Committee?—I should like to state that we find the position of the grooving can be predicted; there is nothing mysterious about it; it never occurs where you cannot anticipate it; it always can be grappled with.

1599. The point of expansion and contraction will answer another question, namely, whether this grooving occurs above or below the water. The flue being always below the water (or, at all events, it ought to be), of course it exists there, but the expansion might take place in other parts above the water, and then the same results could never occur to the same extent?—I have never known it to occur in the steam-way. In building locomotive boilers they now make the barrels in one single length of plate circumferentially, having the joints in the steam, and made with a double butt strip, one inside and one outside. When this is done, no grooving takes place; added to which, the joint is more accessible to examination than when at the sides or bottom of the barrel as it used to be. Some time ago an explosion took place at Rugby to the limited Irish mail, going at express speed, and several persons were injured. I was one of the witnesses who gave evidence on the trial, and, in reporting upon that case, I recommended that, instead of having these overlap joints that cause the grooving, butt joints should be adopted, with one strip outside and another inside, so as to keep the true circle, and maintain the plate *in equilibrio*, whatever changes there might be in the strain. I believe that the Great Western Railway Company adopt that plan, and I am told with very great success. Perhaps the Committee will kindly allow me to read a short letter from Mr. Armstrong on the subject, because the source of weakness in locomotive boilers is the longitudinal groove. Mr. Armstrong writes as follows: "I beg to acknowledge the receipt of your favour of the 28th instant, and, in reply, have to inform you that we tried the description of boiler to which you allude eight or 10 years ago, and for the last six years have constructed all our boilers in this way. They work up to 140 lbs. pressure, and, in my opinion, it is the best boiler that is made. The late Mr. Richard Roberts, of the firm of Sharp, Roberts, & Co., constructed boilers on this principle 30 years ago, and we have taken some of them out (4 feet boilers 5-16th plates) which have been working 24 years, and the joints are as good as when they were first made." That, of course, is long before my suggestion, and it only corroborates the value of that plan. The boilers alluded to in this letter are those made with one length of plate circumferentially, and with one inside and one outside butt strip placed in the steam space.

1600. Are there any further observations that you wish to make to the Committee?—There is one point with regard to locomotive boilers with reference to which it would be very valuable if evidence could be obtained. The difficulty in detecting these grooves arises from the number of tubes, which prevents a complete internal examination of the boiler. Now it is thought that those tubes cannot be easily taken out, but I have consulted several parties of great experience, and they say that the tubes could be removed and replaced at a cost of about 30 *l.*, so that if this were done every three years, which might be often enough, it would not cost more than about 10 *l.* a year.

Thursday, 14*th July* 1870.

MEMBERS PRESENT:

Mr. Armitstead.	Mr. Hermon.
Sir Thomas Bazley.	Mr. Hick.
Captain Beaumont.	Mr. Laird.
Mr. Cawley.	Mr. Lancaster.
Mr. Joshua Fielden.	Mr. Pim.
Colonel Gray.	Mr. Platt.
Lord John Hay.	Dr. Lyon Playfair.

JOHN HICK, Esq., in the Chair.

Mr. George Barker, called in; and Examined.

Mr. *G. Barker.*

14 July 1870.

1601. *Chairman.*] You are the Chairman, I believe, of the Midland Steam Boiler Inspection and Insurance Company?—Yes.

1602. How long has your association been in operation?—About 8 or 10 years; I may add that I am senior partner in the Chillington Iron Works, Wolverhampton, and I am the owner and user of about from 80 to 100 steam boilers. Our association has been in operation since May 1862.

1603. What was the origin of the association?—There had been a good many boiler explosions in different parts of the country, and the attention of the iron trade was directed to them. There had been one explosion in South Staffordshire, just before the formation of this company, in which 25 or 30 persons had been killed, and that more particularly directed the attention of the iron trade to the subject, in order to see whether some steps could not be taken, at all events, to mitigate the evil, if not to prevent it. At one of the meetings of the iron trade which are held quarterly, this subject was brought under the consideration of the trade, and information was directed to be obtained as to what was being done with reference to this matter. It was found that there were one or two other companies in existence in Manchester who had undertaken the inspection of boilers with the object of endeavouring to prevent explosions; but it appeared to us that either their attempts to introduce this into the South Staffordshire district generally, into the iron trade had been unsuccessful, or, at all events, that they had done very little indeed from Manchester in endeavouring to extend their system into South Staffordshire. It was therefore decided that we should establish a company ourselves, and so this company was founded having a capital of 50,000 *l.*; that is to say, 5,000 shares of 10 *l.* each.

1604. Did you commence originally as an insurance company?—Yes, as an inspection and insurance company. The directors are, all of them, connected with the iron trade, and I suppose the directors certainly are owners and users of something like 1,000 boilers.

1605. How many boilers have you insured?—We have insured and inspected about 3,000 boilers.

1606. Mr. *Cawley.*] And the directors have, you say, about 1,000 of them?—Yes.

1607. Then there are 2,000 outside?—Yes; we have issued about 3,000 of those shares out of the 5,000. We have called 10 *s.* a share, which is all that has been paid up, and the shareholders are nearly all of them interested in the use and ownership of steam boilers; so that our directors, our company, and all of us, are practically and immediately interested in the question.

1608. *Chairman.*] What description of boilers generally are under your insurance?—We have every variety of boilers under our insurance and inspection.

1609. Are they boilers in connection with iron works principally?—Yes; it is principally with the iron trade and coal trade; there are, of course, some other boilers under our inspection, but the great bulk of them are used by the iron and coal trade.

1610. Have you many factory boilers insured in your association?—Not a great many; the main trade of the district is the iron trade, and trades in connection with it.

1611. You do not insure many boilers beyond your own district, I presume?—This company went on very well in connection with South Staffordshire for three years, and then we extended its operation to the North of England, to the Cleveland district. The board of management there are two of the directors of the central board, and they also have extended their operations almost exclusively in connection with the iron and coal trades.

1612. Have you had any explosions of boilers insured with you?—Yes; we have had three explosions of insured boilers.

1613. From what causes did those explosions arise?—One boiler was a plain cylindrical boiler, and had been reported as needing thorough repairs by our inspector, extensive repair was at once done, but the boiler gave way where the new work in joining the old had caused a seam rip; a stranger passing by happened to be killed by that explosion. Two other explosions have caused considerable damage without any loss of life. The first boiler was a tubular boiler which had been reported unfit to work, but the owner was persuaded by his own men that this report

was

was exaggerated, and the consequence was that this boiler burst; the other was a plain cylindrical boiler which was being worked at more than double the proper pressure for a temporary purpose.

1614. The results of a good many explosions have been brought under your notice in boilers not insured, I suppose?—Yes.

1615. Were they mainly in connection with iron and coal works?—We keep a register of all the explosions throughout the country, whether they are locomotive or other boilers.

1616. But your attention would be more drawn to those in your own immediate neighbourhood, would it not?—Yes, to some extent, but at the same time we obtain information of the explosion of every boiler, in order to arrive at some formula by which they can be prevented if possible.

1617. Mr. *Cawley.*] Have you kept records of the proportion of explosions per 1,000 or 100 boilers, in your own trade, as compared with other trades?—Yes, Mr. Marten, our engineer, has got the whole of the facts, and he will give them to the Committee.

1618. *Chairman.*] What is your opinion with regard to the advantage of inspection in preventing explosions; do you think it would be the means of preventing explosions generally, or a great portion of them?—It depends so much on what is meant by "inspection." It strikes me that there are several large establishments in South Staffordshire, whose works are not inspected or insured with anyone; they say, "We have now within ourselves, by means of our own staff, a complete system of inspection." There are a certain number of men appointed for that purpose, because some of the large works have from 80 to 100 boilers. In the iron districts it is very different from Manchester; it is really a separate department of the works. You have your own boilermaker, you have your own engineer, and you have your own inspector; and then some people say, "We have the most complete system of inspection which anyone can give to us." I always reply on the other side, "I have got all this in my own works, but I would rather also have the independent inspection of some one else."

1619. I mean by inspection, such inspection as your association would give; do you believe that would prevent a great proportion of the explosions?—I believe it would have a great tendency to do that. We have got a staff of organised inspectors, and we have now been at work for a number of years. We have such an experienced set of men (I speak almost exclusively with regard to the iron and coal trade), that such inspection as we could give would be extremely advantageous to those trades particularly, because our men have devoted themselves mainly to the inspection of those particular boilers.

1620. You think that it would prevent a large proportion of those explosions?—Yes; explosions will sometimes take place; some of the best boilers will explode in spite of all the care in the world.

1621. Do you think that the inspection of boilers should be compulsory?—No, not at present; I am not inclined to say that.

1622. Then, how would you propose that the inspection should be carried out?—I think with regard to the iron and coal trade this Midland Company are fully competent to undertake it; we are in a position to undertake the inspection of boilers mainly connected with the iron and coal trade better than any government staff could do it.

1623. But suppose parties owning steam boilers in your neighbourhood are not disposed to have your inspection, what would you propose then?—Difficulties will arise, but I am not one to say that the inspection should be compulsory; people say, "I consider my inspection is now as good as it can be; I keep men for that purpose." I think it would be interfering too much with the liberty of the steam users to make the inspection compulsory.

1624. But a great proportion of the explosions occur, do they not, where parties have not such an efficient superintendence as you speak of?—That would follow as a matter of course, and I think proper pressure should be brought to bear on those people; but I am not going to say that you should compel them to be inspected. I should hardly be inclined to justify that; I think that a very strong recommendation should be made, but not an Act of Parliament; it is interfering too much, I think, with one particular class of trade.

1625. You object to Government interference?—Yes, I do object to Government interference most particularly. No man criminally, to the full extent of the word, causes his boilers to explode; we are in our works daily, and owing to the peculiar construction of the works, the boilers are close to the operations and the workmen; it is different in a factory where the boilers are some distance off, but here the waste heat from the furnace causes a very considerable proportion of the steam we use, so that boiler explosions are often very fatal. No man who is the owner of works, and constantly in the habit of visiting the works, with offices right on to the works, would do it criminally; it is done from negligence, and, perhaps from want of knowledge; and I think it would be too much to say that the Government should interfere.

1626. That applies to gentlemen like yourself and your partners, who use proper precautions, but that would not exist with parties who are not in the same position, and who have not the same means, and who go on recklessly from day to day without having their boilers inspected, would it?—I scarcely think anyone goes on recklessly, the danger is so great. There are, no doubt, extraordinary instances in which you find people do it, just as miners working in a coal pit without proper precautions.

1627. But there is a class of men who will put an additional brick on the end of the safety valve lever, is there not?—Yes, but those instances are diminishing very much. If we had got a more intelligent and better class of engineers to attend to boilers, it would be a great advantage, it is often the carelessness of those men; for instance, if a man puts another brick on the safety valve, it is most likely done on his own responsibility.

1628. It is done from ignorance, in fact?—Yes, from ignorance, in fact.

1629. Mr. *Hermon.*] You say that you have had three explosions since you have begun this society. At what time did those three explosions occur?—It is since the year 1862.

1630. Yes, but I want to know whether they happened recently or not; have you the dates of them?—Mr. Marten will have the dates of them.

Mr. G. *Barker*. 14 July 1870.

1631. Has your society refused to insure any boilers?—Yes, that is one of the great advantages of insurance. I am strongly in favour of insurance.

1632. Have any of those boilers burst after having been refused by your society?—Yes.

1633. That would rather tend to confirm the view of the Committee, that compulsory inspection is necessary, would it not; I do not mean compulsory inspection by the Government, but compulsory inspection of some kind?—Yes, that is the necessary consequence, but you find that the scientific evidence varies so much. One engineer comes and says it is one reason, and another man comes and says it is another reason, and perhaps the explosion does not result from the reason after all, for which our inspector refused to insure it.

1634. You say that there are 80 or 100 boilers at some of the large works in that neighbourhood?—Yes.

1635. Of what dimensions would they be?—They vary very much.

1636. At what pressure would they work?—That varies very much; there is no class of manufactures where there is such a variety.

1637. Provided there was a Government inspector appointed to act somewhat on the same principle as that on which a railway takes place before it is opened, namely that he should inspect each boiler prior to its departure from the makers, would you approve of that?—No, I think not.

1638. Mr. *Laird*.] You do not seem to approve of Government interference at all?—No.

1639. Nor of any compulsory inspection?—I am hardly prepared to say at present, because there are a great number of people who do not need it, and would consider it a great interference with their liberty to be compelled to have their boilers inspected.

1640. At those large works they have large staffs, but there are a great variety of small manufactories where they have no system of that kind, and they are more subject I suppose to explosions?—The explosions take place as well in the large works.

1641. At all events you do not wish to see the Government interfere?—No, not at all events until these societies have still further tried the matter. I think the Government might do a great deal in assisting. I think a very strong recommendation from this Committee to the owners of boilers would have very great weight; for instance, if the Committee were to say that inspection was a very necessary thing, we, as the Midland Company, should take an opportunity of bringing that home to the knowledge of everyone with boilers in the iron and coal trade.

1642. But still although people know that this society does exist, they do not avail themselves of it very much, do they?—No, not all of them, because some of them say they do not want it.

1643. Colonel *Gray*.] Can you inform the Committee anything near the number of boilers in your district?—I should say 10,000 at a rough guess.

1644. Of that number, do you say that 3,000 are insured with your association?—No, 3,000 includes the number in the North of England; we have 3,000 altogether insured with us.

1645. Perhaps there are not more than 2,000 boilers in your own district?—It is nearly half-and-half, but as I said before, we have 10,000 boilers in South Staffordshire and in the district immediately around there, and I suppose they may have as many in the North of England, so that out of 20,000 boilers, we have not got more than 3,000.

1646. Do you not think it is necessary to have some compulsion applied to them, as no recommendation seems to have any effect upon them?—As I said before, the difficulty is that some people say "We are sufficiently inspected now by our own system;" and it seems to me rather interfering with their liberty to compel them to have their boilers inspected.

1647. That is their statement, is it?—Yes, that is their statement, and I know it to be true.

1648. Do you think that some of them are sufficiently inspected?—Yes, I do indeed.

1649. What is your rate of insurance per boiler?—It varies according to the nature of the boiler; we have a variety of rates which are published in our tables.

1650. But then there would be a general rate; one of the Manchester companies have 20 *s.*?—Yes, our rates and their rates are very similar.

1651. You have stated that one of the chief objects of your society was to prevent boiler explosions; is not the object of the society in carrying on its business rather with a view to profit?—No, it is not; we have always been careful to let that be thoroughly known; the association was got up by the iron masters entirely, from an earnest desire on their part to endeavour by the best means in their power to prevent the recurrence of these accidents, and I think the best plan is to do it by means of a company, and that that company should pay its expenses. We have only called up 10 *s.* a share, and we have paid 10 per cent. dividend on that. Our whole dividend is only 150 *l.* a year. We have capitalised the money we have received, and we have about 1,600 *l.* now invested in consols; we only divide 150 *l.* a year amongst the shareholders, but by means of that we have a guaranteed capital of 30,000 *l.*, 9 *l.* 10 *s.* not being called up. We think that is the readiest, the best means, and the cheapest means of raising a guaranteed capital and a large sum.

1652. Are boiler explosions diminishing, in your opinion?—I can hardly answer that question; all I can say is, that the number of boilers is increasing very fast.

1653. But taking the country generally, do you think that the number of explosions is diminishing?—I do not think that our statistics have been very carefully kept until within the last few years.

1654. Do you insure any locomotive boilers?—Yes; we have some locomotive boilers insured with us.

1655. Mr. *Cawley*.] Are those locomotive boilers belonging to private firms?—Yes, belonging to private firms.

1656. Colonel *Gray*.] You have no locomotive boilers insured with you that are used on railways, I suppose?—No; only boilers used by private firms.

1657. But seeing that a large number of boilers are uninspected, would it not be desirable to have some kind of compulsion, even if you are opposed to Government inspection?—I would try the effect of a strong recommendation at first. I am not in favour of compulsion to be particularly directed

directed against the users of steam boilers; I think there are many other things that also might be made compulsory if the inspection of boilers were made compulsory. Why should that particular trade be picked out?

1658. Mr. *Cawley.*] But is it the fact that that particular trade is being particularly picked out; is it not rather the fact that there are a great many trades which are under inspection where the arguments you use equally apply; that is to say, that inspection is perfectly unnecessary with regard to those who wish to do right, but necessary because there are a number of persons who do not wish to do right; take weights and measures, the inspection of meat, the inspection of factories, and the inspection of coal mines, are not those things open to precisely the same argument; the inspection is for the man who is careless and indifferent about doing right, is it not?—That of course is one way of looking at it, but at the same time there is already a very considerable amount of inspection going on; we are not without inspection. You have got inspectors of coal mines, but that does not prevent explosions, and I do not think the best inspection in the world will prevent the explosion of boilers.

1659. But I understood you to say that you considered an efficient inspection would at all events greatly diminish the number of explosions?—It is the best means that we know of at present of preventing them.

1660. Is it not also true in your own experience, that hitherto the inspection is limited to those parties who, like yourselves, rather wish to have an efficient inspection of their own boilers?—Yes, an independent inspection; I see so much difficulty in the word "inspection," because in many of those large works they are inspected; in fact I do not believe that there is a boiler in use that is not inspected; a man has got perhaps two boilers at work, and the engineer in charge will tell you that they are inspected every Monday.

1661. But that is not what we mean by "inspection." The Manchester Steam-boiler Association is clearly a mere combination of gentlemen who wish to have their boilers efficiently inspected, and who think it is better done by combining together, and employing one staff to do the whole work than by separate inspection?—Yes.

1662. You seem to a large extent to have adopted the same principle, but you add a kind of guarantee by way of insurance?—Yes.

1663. You do not do that for the sake of profit you say?—No.

1664. Then the parties who have come in on your own showing, are really those who wish to have their boilers perfect and in good order?—Yes.

1665. But there is a large margin of people who do not come within that category, is there not?—Yes, and for two reasons; some of them say, "We have got sufficient inspection now, and we do not want you;" and others, again, perhaps do not come in, because they do not like to pay the money.

1666. Is not that the major proportion?—I daresay it is; they have a small number of boilers, and they inspect them by their own engineers, and they repair them when they can.

1667. But taking it as a fact that such a system of inspection as yours would diminish the number of explosions, and taking it also as a fact that the larger number of those who do not insure are really the owners of the most dangerous boilers, what is the reasonable prospect of getting inspection made general by any recommendation?—I should like to see the effect of it tried; we are getting fresh boilers every month. The result of an accident is generally to drive more boilers to us; I should not like boilers to explode in order to obtain more business, but that is the result of it.

1668. But when you refuse a boiler, still, if a man chooses to think he knows as well as you do, and he goes on until an accident happens, what then?—Then, at the coroner's inquest, they say the boiler was a very good boiler; there is scientific evidence to that effect, and the result is that they come to a verdict of "accidental death;" we have had an instance of that within the last two or three months.

1669. I suppose that is not the only boiler which you have refused?—No.

1670. You refuse a good many boilers, I presume?—Mr. Marten will tell you more about that than I can; we have refused them because we would not insure them.

1671. Mr. *Platt.*] Have you ever insured a boiler without inspection?—Never.

1672. Do you not find in practice that the owner of an insured boiler becomes more careless?—I think not; I never heard that charge made.

1673. Do you not think that when they have got their boiler insured, they think they have done all that is necessary?—I do not think that that feeling exists in our district; I have not heard of it.

1674. You seem to be very much opposed to compulsory inspection, and yet the very existence of your society, and all other similar societies, shows that some coercion is absolutely necessary, does it not?—I feel a great difficulty about that question; I should like to see the whole of the boilers inspected, if it can be done, in a manner which would not be felt by the trade as being a special hardship and annoyance upon them.

1675. You have already stated that you have refused to insure many boilers, and, in doing so, you have in a measure put a ban upon those boilers; do you think it is for the safety of the public that boilers of that kind should be in use; your objection to insure those boilers must be that you believe they are insecure, is it not?—Yes, that is our opinion.

1676. You having that opinion, do you think that it is in the interest of the public that those boilers should be continued in use?—It is quite possible that those owners might get hold of some other engineer who would say that such and such a repair was necessary, and that then they would go on safely.

1677. The owner might call in a very inferior engineer, might he not?—Yes.

1678. But of course the Committee want to bring the best minds of the country to bear, not only on the construction of boilers, but also upon the inspection of boilers after they are in use, and in order to do that the Committee wish to elicit the best means of doing it?—No doubt you know that there are a great many boiler-makers who are good ones, and there are a great many boiler-makers who are inferior ones, and who would equally give you a certificate of the soundness of a boiler for carrying a certain pressure.

Mr. *G. Barker.* 14 July 1870.

1679. Then your association and other associations are brought into play for the purpose of bringing to bear the accumulated experience of a number of engineers to inspect the boilers of those parties who might be using what we should suppose to be inferior boilers?—Yes.

1680. You have already stated that they are so in some cases?—Yes.

1681. Under those circumstances do you not think that some kind of compulsory inspection is really necessary?—I should like very much myself to see it carried out, if it can be done without being considered at all a hardship by those people, who think that they are doing their work well. You can get gentlemen in this Committee-room who will tell you that they do not need inspection, so that it would be rather too much to say that there should be compulsory inspection extended to them.

1682. But what the Committee have to look at, is the safety of the public, is it not?—Just so.

1683. One man will make a boiler for 300 *l.*, and another will make a boiler for 200 *l.*, and very likely it is the same thickness of plate, but not the same description of metal?—Yes.

1684. If the public is to be quite certain that the boilers which are in use, and now carrying a high pressure, should be subjected to some test, by whom should that test be applied?—That is a very great difficulty. I feel confident of the great advantage of inspection, and I should like to see it extended to every boiler in the district, but I do not see my way to do it.

1685. You know very well that in your firm, and in all large and good firms, with a number of boilers, they generally have some very competent person of their own to inspect; but on the other hand what you have to consider is the enormous extension of boilers for all purposes, not merely for works like yours and cotton factories and engineering places, but also that boilers are being extensively used in agricultural districts throughout the country for local purposes?—Yes; and for domestic purposes also.

1686. You cannot bring a competent engineer to every one of those small places, can you?—No.

1687. Then your object is to have an association like yours, in which you have the accumulated experience of 50 or perhaps 100 firms?—Yes.

1688. If any of those small people would join those associations, they would obtain the benefit of your accumulated experience, would they not?—Yes.

1689. Therefore you think there is a necessity for societies like yours and others?—Yes; that is my own idea, but when you ask if everybody is to be compelled to have his boiler inspected, I find a difficulty in answering the question; I should like to see every one independently inspected by experienced people.

1690. Why cannot that be carried out by associations like yours?—We are prepared to do it.

1691. You say that you could take the whole of the boilers in your district with your competent staff?—Yes.

1692. Then if you had some general pressure put upon those people to make them come to you, it would be an advantage to the district, would it not?—It would be a very great advantage, and I should like to see it done if it could be done.

1693. Mr. *Lancaster.*] You say that people are debarred from joining the association from fear of the cost of inspection?—Yes; I think with very small manufacturers that is the case; I do not remember any particular instance of that, but I think that would be the effect of it.

1694. Do you not think there is a fear on the part of those small manufacturers, that you may put them to expense in pulling down the brickwork of the boiler, and causing repairs that are useless in their opinion?—Yes; very likely there is that feeling too.

1695. You cannot overcome that difficulty, except by some system of compulsion, can you?—They would object to submit to it, of course, in that case.

1696. Is there any other way of overcoming that difficulty without compulsory inspection, do you think?—No; I do not see how it can be done otherwise, but I should like it to be done without compelling them.

1697. But you do not see any other way of doing it?—I think that the number of inspections is increasing.

1698. I suppose some of the boilers that do not come to you are of the worst kind?—Yes, and some of the best kind.

1699. But as a rule you would say that they are the worst kind, would you not?—That would be a very difficult question to answer, but no one would keep a boiler that he knew would blow up the next day; he would be afraid of being blown up himself.

1700. You mean that he would not do it wilfully?—No, he would do it from ignorance.

1701. Sir *T. Bazley.*] Is the average size of the boilers in your district as much as 50 horses?—Mr. Marten will answer that question better than I can.

1702. Have you any personal knowledge of any number of accidents to boilers?—Yes, we have had one at our own works.

1703. And your neighbours' works?—Yes.

1704. How many accidents have you a recollection of?—I may have gone myself to the explosions of about half a dozen boilers.

1705. You are aware that the legislature does afford redress for negligence on railways, and that railway proprietors are forced to pay parties for personal injuries sustained on their lines?—Yes.

1706. Are you aware that a greater number of deaths occur from boiler explosions than from accidents on railways?—No, that seems to me to be quite an error. I believe the total number of deaths by railway accidents to be four times greater than those by boiler explosions.

1707. What number do you presume that to be?—The Board of Trade Returns give the total number of deaths from all causes as 1,585 on railways.

1708. In what time have those accidents occurred?—From the year 1863 to the year 1869. The average during that period seems to have been 200 deaths, I hear, which is about four times a greater number than those by boiler explosions.

1709. The deaths from boiler explosions are about 75 per annum, are they not?—Yes, I believe there are about 75 deaths a year from boiler explosions, and by railway accidents the deaths from all causes average 200 per annum.

1710. Seeing

1710. Seeing that the Legislature does enforce the preservation of life in manufactories and on railways, do you think that boiler users who have been, perhaps, accessory to the death of as many people as there are in a regiment of soldiers (taking those that have been killed by boiler explosions in the last 10 years) should be exempt from responsibility?—No, I think they should not be exempt from some responsibility.

1711. Would you go to the extent of inspection previous to the use of a boiler which inspection should be made on the part of some local government authority?—I think that explosions occur generally in boilers after having been in use.

1712. Would it not be desirable to have, not only a preliminary inspection, but also a constant inspection afterwards to ensure safety?—A constant inspection afterwards is much more beneficial, I think.

1713. But seeing the injury to life and property is it not in your opinion desirable that boiler users should be under local or government inspection?—They should be under some kind of inspection.

1714. That is to say, an inspection that would have the power to correct the tendency to these disasters?—Yes.

1715. Then I think you are arriving very much at the conclusion that compulsory inspection is inevitable; if all the boiler users in the whole of the United Kingdom were under the discipline which you subject your boilers to, would there not be greater safety to the public, do you think?—I think there would.

1716. Mr. *Hermon.*] You say you are not in favour of an Act of Parliament making it compulsory that boilers should be inspected?—I cannot say that I am.

1717. Are you not aware that by the Act of the insurance company it becomes compulsory; for instance, you refuse to insure a boiler, unless it is inspected by some of your staff?—Yes.

1718. Consequently the Act of the insurance company makes it compulsory, does it not?—Yes.

1719. Why should you object to an Act of Parliament making it compulsory, the same results being arrived at in each case?—You would wish to see every boiler insured, if I rightly understand your question.

1720. No, I wish to see every boiler inspected; you have a great many boilers of your own?—Yes.

1721. I need hardly ask you if you have a very efficient engineer who can inspect your boilers as well as anybody else, perhaps?—Yes.

1722. But I presume that you have your boilers inspected by the officers of your company also?—Yes, certainly. It is so great an advantage to have an independent inspector; he gives us a report upon every boiler four times a year, and I hand it over to our own engineer.

Mr. *G. Barker.*
14 July 1870.

1723. But my point is this; by the action of your company, you make it compulsory that every boiler should be inspected that is insured by you?—Yes.

1724. Then why do you object to an Act of Parliament making it compulsory that every boiler that is not inspected by you should be inspected by some independent party; not necessarily a Government inspector?—I think it would be attended with very great advantage, but I do not see my way clear to it; you cannot compel everybody to insure his own life even.

1725. You are aware that all cotton factories are obliged to be inspected by a Government inspector, with regard to fencing the machinery, and so on?—Yes.

1726. Where do you draw the distinction with regard to having machinery inspected and having boilers inspected; is not the disagreeable part of the business, so to speak, the same to the employer of labour in each case?—It might be attended with very great harass to the manufacturer. One inspector might come and say, "You shall not work that boiler without a peculiar class of fittings"; and to which the owner might object, and that is the point where I fear Government inspection very much.

1727. But I am not asking you whether you wish for Government inspection; my question is confined to an independent inspection of the boilers; I do not say a Government inspection?—I am very much in favour of an independent inspection.

1728. Are you quite in favour of an independent inspection of every boiler?—Certainly.

1729. But you do not wish to have that inspection made compulsory at present?—No, I cannot see my way to it at present.

1730. Mr. *Cawley.*] You mean an inspection by a competent person, not having charge of the boiler, do you not?—Just so.

1731. Colonel *Grey.*] You say that the number of boilers put under inspection is increasing?—Yes.

1732. The Committee know that the number of boilers is increasing in England; do you mean that the number put under inspection is increasing, as compared with the increase in the number of boilers in the country?—Yes, I should say that the proportion was increasing.

1733. *Chairman.*] Have you any other observations that you would wish to make to the Committee?—No.

Mr. Edward Bindon Marten, called in; and Examined.

1734. *Chairman.*] You are Chief Engineer to the Midland Steam Boiler Inspection and Insurance Company, are you not?—Yes.

1735. How long have you occupied that position?—Since the commencement of the association, eight years ago.

1736. We have heard from the last witness the number of boilers that you have under inspection; do you think the number of explosions has diminished since the formation of the company in your neighbourhood?—I think they have.

1737. Do you think that the explosions throughout the country generally are fewer than they were, taking into consideration the increased number of boilers; I do not mean to ask whether they are abstractedly fewer, but are they of less frequent occurrence than they were formerly, as compared with the number of boilers which are now in use in this country?—We get particulars of so many more explosions now than we used formerly, so that it is very difficult to judge; I think as a rule they are slightly on the increase, but

Mr. *E. B. Marten.*

Mr. *E.B. Marten.*

14 July 1870.

but then a great many used to happen that we never heard of.

1738. Do you think that the inspection of boilers by independent parties before being set to work, would be an advantage; I mean the inspection of new boilers?—It is an advantage, because one has then the best opportunity of judging of the construction of the boiler.

1739. That would provide against accidents likely to arise from mal-construction, would it not?—Yes, it would; the chief accidents that have taken place from mal-construction are in altered boilers; boilers that have been altered from one shape to another.

1740. We have heard of an insured boiler which exploded after being repaired?—Yes.

1741. Do you recollect what kind of boiler it was?—It was a plain cylindrical boiler, with longitudinal seams.

1742. It exploded at the connection of the new part with the old part, did it not?—Yes, where the new part was joined to the old; the old part gave way.

1743. What sized boiler was it?—About 30 feet long by 6 feet diameter.

1744. That boiler could not have been inspected by a competent person, I suppose?—The boiler was inspected, and it was in consequence of the report of the inspector that the repair was commenced and done; it was not inspected after those repairs, but the boiler exploded after having been at work for two or three days.

1745. I believe that you have a record of the number of exploded boilers extending over a considerable length of time, have you not?—I have; I go back as far as I can obtain records. These 11 volumes (*pointing them out*) contain all the records commencing from the year 1800.

1746. Where are those records obtained from?—From all the available sources; from all the magazines published at the time; from the "Times" and several other daily newspapers; from the records of the societies, and also from a former inquiry before this House about steamboat boilers.

1747. Are they confined to English boilers, or do they extend to foreign boilers as well?—Both foreign and English boilers; foreign boiler explosions are as instructive as English.

1748. But what description of boilers generally were the English?—I have a list of them, with regard to their description; of the English boilers out of 936, 207 were not sufficiently described; 70 were marine boilers of various forms; 219 were Cornish boilers; 106 were locomotive boilers; 172 plain cylindrical boilers externally fired; 70 balloon, haystack, Butterby, waggon, British tube, elephant, and Trevethick boilers; 46 portable or agricultural boilers; 28 domestic boilers; 18 upright furnace boilers.

1749. Having gone back as far as the year 1800, you would get boilers of all descriptions perhaps, excepting that there would be a small proportion of locomotive boilers, and a very small proportion of portable agricultural and crane boilers, of which you said there were 46?—Yes.

1750. Locomotive boilers, agricultural boilers, and others have only been in use a comparatively short time, have they not?—Just so.

1751. So that that would be scarcely a fair criterion to go upon, would it?—No.

1752. Mr. *Cawley.*] Have you any idea of the number of boilers in the country?—My own idea is that there were about 100,000 two years ago.

1753. *Chairman.*] Have you made any record of the causes of boiler explosions?—Yes; as the Committee think going back so many years may be misleading, I will give the Committee the figures within the last four years. In the four years ending the 30th of June, out of 217 explosions, of four I had not enough particulars to place them under any head; 13 were marine boilers; 79 were Cornish, Lancashire, or others, internally fired; 15 were locomotive and other multitubular boilers; 58 were plain cylinder or others, externally fired; 8 were balloon, haystack, Butterby, waggon, British tube, elephant, and Trevethick boilers; 18 portable agricultural, upright, crane, very small and fire engine boilers; 10 were heating, kitchen, or domestic, 8 furnace upright boilers; rag steamers or kiers, 4; making in all 217.

1754. Now with regard to the causes, will you be kind enough to favour the Committee with that?—The causes of the explosions may be arranged under the following general heads: uncertain, 12; worn out, corrosion, deteriorated plates, 88; undue pressure, overloaded valves, intentional or careless, 23; bad construction, fittings, or stays, or want of repair, 52, weak tubes, 12, making 64 in all under that head. Short of water, deposit of scurf, or flues set too high, 28. The flues set too high produces the same effect as shortness of water; it scarcely amounts to mal-construction perhaps, for by keeping the water very high you could prevent danger.

1755. Then there are extraneous causes, are there not?—Yes, from extraneous causes; such as fall of buildings by lightning, coal gas in boiler flues, &c.

1756. That is in the last four years?—Yes; it is for the last four years ending the 30th June.

1757. Now are all the boilers inspected which are enrolled with you?—Yes, they are.

1758. What is your system of inspection; what do you call an ordinary inspection, and what do you call a thorough inspection?—An ordinary external inspection is one where only that is examined which can be seen when the boiler is at work; an internal inspection is when a boiler is emptied; and a thorough inspection is when also the flues are examined.

1759. How many thorough inspections do you give in the year?—We give one thorough inspection and three ordinary inspections.

1760. Does every boiler receive a thorough inspection every year?—Yes, if an opportunity is given us.

1761. But does it or not take place once a year?—No; we do not examine them all once a year thoroughly.

1762. You have not the opportunity of doing so, you say?—No; we have not the opportunity.

1763. But every boiler enrolled with your association receives at least three general inspections?—If they are insured, we insist on a thorough inspection to begin with; if they are inspected only, we do whatever the owner of the works gives us leave to do; we would inspect them thoroughly four times a year, if the opportunity was given to us.

1764. But if you are requested do you make a special visit to the works?—Yes; we make as many special visits as we are asked to do.

1765. Without extra charge?—Yes, always hitherto.

1766. Do

1766. Do you ever inspect a boiler without insuring it?—Yes.

1767. Have you a special payment for it?—Yes.

1768. What is that scale of payment?—For one boiler 1 *l.* a year; but if there are more than 10 boilers it is 13 *s.* a boiler.

1769. For that you would give not only one thorough inspection a year, but three general inspections?—Yes.

1770. Besides any other that might be asked for?—Yes; besides any other that might be asked for in reason.

1771. What is the average cost of inspection?—Seventeen and sixpence.

1772. Do you happen to know the amount of revenue derived from the inspection?—The average amount of revenue derived from the inspection is 13 *s.* per boiler.

1773. Mr. *Cawley.*] Of course you have no cases where there are less than 10 boilers, have you?—No, or only one two cases.

1774. *Chairman.*] The revenue from insurances, is how much?—About 1 *l.* 12 *s.* per boiler per annum.

1775. What is the average revenue?—£. 1. 3 *s.*

1776. What has been the average number of explosions in, say, 12 months; I mean explosions among your inspected boilers?—The average number among the insured boilers has been 1 in 2,600.

1777. You are now speaking of your own insurance company, are you not?—Yes; we have 1,000 boilers inspected, and 1,000 insured with our company on the average of eight years.

1778. Now inasmuch as you stated before that, two years ago, there were 100,000 boilers in the country, and that explosions were taking place at the rate of about 50 a year, what proportion is that?—That is 1 in 2,000.

1779. You do not seem to have done a very great deal by your inspection, particularly when you take into consideration that you have taken the best boilers; is not that so?—My object is to give the Committee the exact facts. I have tried to estimate the number of boilers in that particular district; I have taken out the number of explosions in the district where we now inspect, and it used to be, during the eight years, on an average, one in 1,221.

1780. That was before your system of insurance commenced in your district, was it not?—Yes.

1781. And you have reduced them to one in 2,600; is that it?—No, I take an estimate of the boilers in the district we work in. I think there are about 10,000 in one half, and about 10,000 in the other half; and the number of explosions that have taken place during the eight years past is one in 1,221.

1782. Is that including your own?—Yes, including our own; among our insured boilers, which averaged 1,000, it has been one in 2,600, on an average, per annum; whereas, among the inspected boilers, it has been one in 1,333.

1783. *Chairman.*] What is your view with regard to compulsory inspection?—The difficulty is in the form of the compulsion to be applied for fear fresh evils should be introduced by the form of compulsion, because I think the system of Government inspectorship would not have that hearty co-operation that the inspectors under the society would meet with.

1784. Do you fear that it would be harassing to the steam users?—Yes, I do fear that it would be harassing to the steam users.

1785. But are you of opinion that a periodical and general inspection throughout the country would prevent most of the explosions?—I am.

1786. Have you any recommendations to make to the Committee with regard to the inspection, or any means of doing away with the great bulk of these deplorable accidents?—I would say that if this Committee arrived at the conclusion that a periodical inspection was the greatest preventative to explosions, the influence of that recommendation would very much increase the inspection by those societies that undertake it, postponing legislation for the present, because coercion cannot produce the effect that a recommendation from the Committee might.

1787. But you having given the matter a good deal of consideration, will you please favour the Committee with any specific suggestion which you have to make on the subject?—My recommendations are; first, that the Select Committee should express a decided opinion that periodical inspection is the best means of preventing boiler explosions, but that this inspection should not be undertaken by Government until the employers of steam shall have had reasonable time to adopt inspection for themselves; secondly, that in order to inform the Government whether this warning is having effect, it should be temporarily arranged that reports should be made on each case of explosion, whether fatal or not, by two independent engineers of some experience in the subject; and that these reports should give a concise statement of the facts, and the evidence as to previous inspection, and the means taken to remedy any faults. That these reports should be printed and sold, as in the case of railway accidents. That no alteration should be made in the coroner's inquiry, but that the evidence of these engineers may be used if needed; thirdly, that information being sworn before two justices, that any boiler was dangerous, they might order inspection by competent persons, and, if the information was confirmed, order the boiler to be stopped, as is done now where reservoirs are said to be in danger of bursting.

1788. That embodies all that you have to recommend to the Committee, does it?—I think so.

1789. Would you recommend a penalty for non-compliance with those instructions?—I think that it would help us very much to attach a penalty if a boiler was found not to have been inspected, and perhaps a heavier one if the reports had been neglected.

1790. Mr. *Fielden.*] Would you have an inspection by a Government Inspector after every explosion, whether there was a loss of life or not?—No, not necessarily a Government Inspector, but somebody who was acquainted with the subject, who might be appointed to that office by the magistrates, or by the Inspector of Mines if it was a colliery boiler, or the Inspector of Factories if it was a factory boiler.

1791. Then he would be a Government Inspector, would he not; that is only another way of putting it; by adopting that you would have an inspection in the case of all explosions, would you not?—Yes, we should have an inspection in the case of all explosions for the sake of a record being kept by the Government with respect to what is being done in the way of inspection.

1792. But

Mr. *E.B.Marten.* 14 July 1870.

1792. But you are are not in favour of compulsory inspection except in that way?—I am not in favour of the Government having a system of inspecting all boilers indiscriminately when at work.

1793. You would only allow that inspection after an explosion has taken place, I suppose?—Only after an explosion has taken place.

1794. Or on evidence given that the boiler is unsafe?—Or on evidence given that the boiler is unsafe.

1795. Mr. *Hermon.*] Do you make it a rule that every boiler should be inspected before you insure it?—Yes.

1796. Colonel *Gray.*] You have mentioned 100,000 boilers as the probable number in the country, does that estimate apply to the present time, or to a year or two back?—I made it about two years ago; it is a mere guess, and I expect it is about the same now.

1797. But there is a considerable increase in the number of boilers every year, is there not?—Yes, and that is so much a guess that it is hardly fair to base anything upon it.

1798. Would it not be very desirable to have a complete register of the boilers in the country, and make it compulsory on the steam users to see that they were registered?—A boiler census of the numbers now employed would, of course, be useful in order to compare the number of explosions of each kind, and for the purpose of basing other calculations upon it; I do not think it would be necessary to do it perpetually.

1799. But if you had a return each year, that would be useful, would it not?—Yes.

1800. And would it not be desirable to make it compulsory, in some way or other, to have the boilers inspected?—It would be desirable, I think, to make it compulsory; but inspection, as a means of prevention of accidents is comparatively a new idea, and after an expression of opinion by such a Committee as this, the prejudice of a great many people would give way, and they would take that as the authoritative means of prevention.

1801. But is it not your opinion that there would be great danger that people would pay no attention to any recommendation of any committee whatever?—I think they would be fewer than some people estimate them at.

1802. You say that an inspection should not take place until a reasonable time had been afforded to have the boilers inspected?—Yes, after the declaration of that opinion.

1803. What would be a reasonable time, in your opinion?—You can judge of the effect after the first year's return of accidents after that declaration of opinion.

1804. You suggest that an information of the state of a boiler ought to be sworn before two justices, but at whose instigation would that take place; independent persons would not be likely to take it up, would they?—When people are in fear of a boiler that is working near them, they ought to have some means of stopping it.

1805. By what means?—By a magistrate ordering an inspection, and peremptorily stopping the boiler if it is found to be dangerous.

1806. But I scarcely understand how the proceedings are to be commenced?—If a man has a fault to find with a boiler that is at work in his neighbours' works, and that it is likely to do him an injury, he gives information before the magistrates, and then they order an inspection to ascertain whether or no the boiler is safe; that would be the process.

1807. But who is to give information; do you mean the people employed in the works?—Either the workmen in the works, or those employed in neighbouring works, or a dweller in a cottage near, or those who own other works near.

1808. Do you not think that the people who are employed in the works would be very unlikely to give information; would it not be as much as their place was worth, especially supposing the boiler was found to be safe?—The information is sure to spread to the neighbours, and if any workman knew of a dangerous boiler, some of the neighbours would take the initiative, I think.

1809. Do you think that is likely to be done if some person is not appointed as an authority to look after the thing?—I think it probably would be done.

1810. Mr. *Cawley.*] Do you think that, in ordinary cases, anybody except the man in charge of the engine or boiler has the means of knowing whether it is dangerous or not?—I think that others sometimes have the means of knowing it.

1811. But ordinarily is that the case?—The reason of that recommendation is from my knowledge of cases where there seems to be no law to prevent the use of a dangerous boiler.

1812. The initiative must be taken by some one who is to give the sworn information to the magistrates?—Yes.

1813. You do not mean by that, that if a man has got a boiler next to my office, that I am to go before a magistrate and swear that I believe he is using a dangerous boiler, and that, when I am asked how I know the boiler is dangerous, I am simply to say I fear so?—If you satisfied the magistrates that it was necessary to have it inspected all would be well.

1814. But how is a man to satisfy the magistrates, unless he can swear to some personal knowledge of the state of the boiler itself?—I think the magistrates ought to have power, even if a man wishes to have information with regard to whether a boiler is safe or not.

1815. But would not it be giving the magistrates power at the mere whim of any timid person, to enforce an inspection? That would be compulsory inspection, would it not?—Of a very limited character, I think.

1816. Do you think that timid people are very limited in number?—Timid people who live so close to boilers are limited in number.

1817. In large towns, there are a great many I think. You used the illustration of reservoirs, but in that case a man must show from his knowledge of the reservoir some reason, must he not?—Yes.

1818. The magistrates do not act on the man simply saying, "I am afraid;" do they?—The magistrates would have to satisfy themselves whether the complaint was reasonable or no.

1819. What kind of evidence, do you think, would justify the magistrates in enforcing an inspection. I think you have not told us the number of explosions that you have had in inspected boilers; you gave us three as those of insured boilers?—Yes, three insured boilers.

1820. How many explosions have you had in inspected boilers?—Six.

1821. The number of explosions of inspected, and the number of insured boilers being about equal?—Yes, it is about equal on the average.

1822. Therefore the inspection, without insurance

insurance has not been as efficacious as it has been with insurance?—Decidedly not.

1823. You said that you inspected boilers as much as you had an opportunity of inspecting them?—Yes.

1824. Now, will you be kind enough to tell the Committee what kind of inspection that has really been; I want it in general terms, if you please; you told us, with regard to insured boilers, that you always made a thorough inspection before accepting them?—Yes.

1825. With regard to the inspected boilers, you said you gave such an inspection as you had an opportunity of giving?—Yes.

1826. Will you tell the Committee in general terms what kind of inspection it is, and to what extent it goes?—The company make no distinction whatever in the inspection; the inspectors do not know whether the boilers are inspected or insured; we have no means, however, of enforcing by refusing the insurance when a boiler is only under inspection; if we come to inspect a boiler thoroughly in the flues, if the boiler is intended to be insured, we can say, "We will not insure it unless you allow that to be done."

1827. But that being so, as a matter of fact to what extent has the inspection gone with boilers only inspected, and not insured?—I should think that 70 per cent. of the inspected boilers are thorougly inspected.

1828. Then is the cost of the inspection of the merely inspected boilers about equal to that of the insured boilers?—It is just the same.

1829. Then, according to your evidence, you seem to be very kind to the persons whose boilers you only inspect, because you lose 4*s.* 6*d.* a boiler per annum; you say the average cost is 17*s.* 6*d.*, and you receive 13*s.*?—Yes; that is taking the average; the reason that the inspected boilers can be done at rather a less price is that they almost always belong to large firms with a great number together, whereas the insured boilers are much more scattered, and in smaller numbers.

1830. Then your former answer was not quite correct when you said that the cost of inspection was about the same?—I give you the average cost correctly.

1831. I asked you whether the cost of an inspected boiler was about the same as the insured boilers, and you said it was?—Yes.

1832. And I said, if that were so, you were losing by those boilers?—Yes; we do lose by the inspection alone; we adopted the rates that were then prevalent in other societies, and we find on taking out these figures that they tell thus much against us.

1833. Can you give any explanation to the Committee why the ratio of explosions in the inspected boilers only should be double what it is in the insured boilers?—Six boilers under inspection without insurance have exploded; five of them exploded through seam rips; one just after being enrolled, and before internal examination, only about two months after it had been enrolled; another while the fire was being drawn, in conseqnence of our report that repairs were needed; two others were reported as needing repairs which had not been done, and in the last the weakened state of the boiler had been pointed out, and an opinion expressed by the refusal of the insurance.

1834. What are those "seam rips"?—Seam rips are where the old iron is cracked from rivet-hole to rivet-hole, generally by the addition of a new plate.

1835. Would not that be detected by inspection?—It is a most difficult thing to detect, because it may exist without showing itself on either side of the plate. In most of the cases the danger had been detected and reported.

1836. But can you give any explanation why the ratio should be double in the case of inspected boilers?—It is because we have more power over the boilers which we insure.

1837. Does it not then come back to this, that inspection only is not so efficient?—It is not so efficient, of course, and the inspection is of no use if the report is not attended to.

1838. Does it not follow from that that inspection without compulsory power is comparatively useless?—No, it is not perfectly useless, because when an accident does happen, as in the last case, the evidence of the inspector is, of course, available, and it leads, or should lead, to a very strong condemnation of the steam user.

1839. But with regard to the prevention of explosions, apart from any indirect results of that kind, does not it follow that for the purpose of prevention of explosions mere inspection without compulsory power is comparatively valueless; you exercise a compulsion over those insured which is a compulsion given you by voluntary agreement?—Yes.

1840. In the other case, you have not got that compulsion, and the ratio of explosions is double?—Yes.

1841. Is not that because you have not got that compulsory power?—Yes; no doubt it is because we have not got that compulsory power.

1842. Mr. *Platt.*] What is your mode of inspection when you inspect boilers?—The mode of inspecting boilers is first to notice all that can be seen from the outside, and make a note of it at the time on a form prepared for the purpose, then to enter the boiler and make similar remarks on everything that can be seen on the inside, and then to traverse the flues and note everything that is to be seen there.

1843. Do you use the water test at all?—We do at times, but not as a regular thing; we put the water test on during the examination, if we have an opportunity, or if we have any reason for wishing to do so.

1844. But when you use the water test what pressure do you put on?—About half as much again as the working pressure.

1845. Then in some cases you do use the water test, and when you do so, you apply about 50 per cent. more than the pressure which the boiler is made to carry usually?—Yes.

1846. You recommend that a Government inspector should be sent down after an explosion; would it not be better that the inspection should take place before the explosion?—If a perfect system of inspection, perfectly administered, could be brought about, that would be so, but the question is as to a Government inspection being perfect.

1847. You are not then so much against compulsory inspection, as against the mode of it, or the parties to whom that office should be entrusted, is that so?—That is so; it is the difficulty of bringing about even as good an inspection as the societies give at present that I look to.

1848. Do you think that if a local body could be formed to bring it about properly, compulsory

Mr. *E.B.Marten.*

14 July 1870.

inspection should be entrusted to that body?—I do.

1849. What is your opinion with regard to corporate towns; would you have any objection to trust that power to corporations?—A corporate town is such a very small district generally.

1850. But I speak now in the first place of large boroughs or corporate towns; what do you say to that; take Manchester or Liverpool, or any of the large towns in the north of England; do you not think that if the power of enforcing compulsory inspection were entrusted to the corporations of those boroughs which I have named, that would be an effectual mode of doing what is necessary?—It might work in a very few exceptional places; say in 10 or a dozen large towns, but small towns and boroughs would be too small.

1851. But at all events in large towns you think that they would be the proper parties?—I think that they might answer the purpose.

1852. Then outside corporate towns you would have the counties and divisions of counties, I suppose?—I would not have it all one system; but I would divide it something like the inspection of mines and factories, into districts.

1853. And so you would if you had it divided into boroughs and counties, would you not; you would have a large number of associations throughout the county, would you not?—Yes, not so subdivided as division into boroughs would make it, but about as much divided as it is for the inspection of mines.

1854. Then I take it to be that you see no objection at all to compulsory inspection, if means could be devised so that the thing could be done by the local authorities residing in those particular districts?—If the system can be made a good one; it all depends upon the system that can be adopted.

1855. If the system is good, then your answer would be that you think it would be a proper thing to enforce inspection?—Yes.

1856. Mr. *Lancaster.*] Do you say that you would have a competent engineer to attend and give advice to coroners juries in case of explosions?—No, I would not interfere with the coroner's inquest at all; not in any way whatever; but that in every case of accident, whether fatal or no, there should be an engineer who had had some experience on the subject, who should draw up a concise statement of facts, and that that statement might be published to inform the Government and the public what was being done towards general inspection, but his evidence might be used by the coroner, if he so desired it.

1857. Are you aware that the coroner has the power to call in such persons now, and that he does do it occasionally?—Yes, I have been very often called in myself.

1858. Then that system is now in operation?—Not in cases where there is no death. I think that the coroner's inquest is not the best tribunal to inquire into those cases, because the very fear of a verdict of manslaughter before witnesses eyes, who may say too much, makes it very difficult to elicit the truth. An inspector who makes his own private examination, gets his information in conversation, and then draws up his report, would be much better.

1859. Do you think the corporations an county authorities could properly appoint inspectors to perform those duties permanently?—What I suggest is only a temporary arrangement, and temporarily, I think, the corporations would do.

1860. But temporarily or not, would not, in your judgment, the corporation be a competent authority to appoint persons to act in that capacity?—Not so competent, I think, as the Secretary of State, or the magistrates.

1861. But do you think that a corporation, such as Birmingham for instance, cannot command the necessary talent for that purpose?—No doubt they could do so perfectly.

1862. You are aware that the magistrates in quarter sessions appoint bridgemasters to look after the bridges of the county?—Yes.

1863. Do you not think that that tribunal could appoint also competent men to perform that duty in the country with regard to boilers?—Yes, they could appoint such an inspector as I have alluded to.

1864. Do you see any harm in investing the corporations or the court of quarter sessions with that power instead of the Government?—No, I do not.

1865. Would you prefer that to Government inspection, do you think?—I think I would.

1866. Mr. *Fielden.*] Am I to understand that you think corporations are fit persons to appoint inspectors of boilers?—I was not alluding to a system of inspection, but to those temporary inspectors whom I have spoken of.

1867. Are you not aware that political feeling often runs high in corporations or town councils, and do you not think it possible that appointments might be made from political considerations?—The case would only arise quite suddenly, perhaps 50 times a year, and as it would be spread over the whole of the united kingdom; political considerations could hardly influence more than perhaps one appointment in the whole year.

1868. Suppose the officer had to inspect the boiler of a steam owner, and was a strong partisan on the same side, would he be as independent as a Government officer?—Nothing follows on his action except the information that is published and open to the criticism of the whole kingdom; it is to elicit information with respect to what is being done towards inspection.

1869. But the inspection might be to ascertain the cause of an accident, might it not?—Quite so.

1870. Might not that involve a man being put on his trial for manslaughter?—Yes.

1871. Would a local man then be so independent as a Government inspector coming from a distance?—The report would be only an individual opinion, and it would be published for the benefit of all steam users who like to buy it.

1872. But here is a man who knows that the effect of his evidence is to put another man in a very awkward position, and who is a very strong partisan on his behalf; how would that work?—No one man could have the appointment if it was an appointment from a corporate body.

1873. But one man could do a great deal towards it, could he not?—I think that men would be selected with sufficient talent to be above all that.

Monday, 18*th July* 1870.

MEMBERS PRESENT:

Mr. Armitstead.
Mr. Cawley.
Colonel Gray.
Mr. Hermon.
Mr. Hick.
Mr. Laird.
Mr. Lancaster.
Mr. Pim.

JOHN HICK, Esq., IN THE CHAIR.

Mr. ROBERT GALLOWAY, called in; and Examined.

1874. *Chairman.*] You are the Chief Surveyor of Steam Vessels to the Board of Trade?—Yes.

1875. Your inspection is confined to steam vessels, is it not?—Yes, in that department, it is.

1876. What is the nature of the examination that you give to the boilers?—We open the boilers so as to make a thorough inspection of the interior, and also the exterior as far as possible; then we measure the distance of the stays apart (if it is a square-sided boiler), and the size of the stays, and from these figures we regulate the pressure at which it is to be allowed to work.

1877. Do you examine the boilers before they are set to work?—Yes.

1878. Do you do so before they leave the maker's yard?—No, not before they leave the maker's yard; in some cases we do when the owners give us an opportunity of doing so; in other cases we go over the boiler when it is received.

1879. And by that means you are enabled to detect any defect in the construction?—Yes.

1880. Or in the material?—Yes, we find out very many defects in construction.

1881. And in the event of finding out defects and points of malconstruction, what is the course pursued by you?—We point them out to the owner, and if he will have them remedied we continue our inspection and give him a declaration to the effect that we are satisfied that the boiler is sufficiently strong to work, and he forwards it to the Board of Trade, and the Board of Trade grants a certificate allowing the vessels to carry passengers for a certain time.

1882. Until that certificate is granted the boiler cannot go to work, I suppose?—The owner can work the vessel, but he cannot carry passengers; only if anything happened to the boiler after that he would be in a very awkward position. It is compulsory that the owner of a steam vessel should have a certificate only when it takes passengers.

1883. You have certain rules with regard to the staying, and the number of the safety valves?—Yes; the Act of Parliament compels the safety valves to every boiler to be out of the control of the engineer while steam is up, so that he cannot put additional weight to them.

1884. Do you insist upon fusible plugs over the furnaces?—No; they would not answer in a marine boiler.

1885. On account of the deposit, I suppose?—Yes, on account of the deposit.

1886. They would become inoperative by means of the deposit?—Yes.

1887. How do you detect deterioration in your examination afterwards, I mean external deterioration, when the boiler comes in contact with places where you cannot well get at it?—We examine all the parts we can get at, and if they are in good condition we take it for granted that the other parts must be in the same condition.

1888. Reasoning by analogy, in fact?—Yes; it is impossible to examine the whole exterior of a boiler in steam vessels unless you pull the bulkheads down and break the deck up; but we make a thorough inspection of the inside of the boiler.

1889. You give such an inspection as enables you to have the boilers put in such a state as to make explosions very rare?—Yes, it is very seldom that we have an explosion now; we had one about six weeks ago in a small boiler in one of the Harwich boats, "The City of Rotterdam," but no inspection could have prevented it.

1890. Have you had any explosions of boilers under your inspection?—Yes, we have had three or four.

1891. What kind of boilers were they?—They were square-sided boilers, with the exception of this last one which I have referred to. That was a small cylindrical boiler, a donkey boiler, in the engine-room. That accident occurred in a way which it was not possible to prevent. This boiler was in the stokehole of the vessel, and the water-line of the boiler was about the level of the water-line of the ship when afloat. When they wanted to get the steam up their custom was to open the cock, so that the water could run up to its proper level, the man did that in this case and forgot to close the tap, and when he had got the steam up, the steam displaced the water; there was sufficient time for the steam to be got rid of and the inside of the boiler to get red hot, the water then returned on the red hot plates and the boiler exploded and killed the man instantly. I examined that boiler afterwards and I found that it was very strong, and that the working pressure might be 50 lbs., whereas it was only working at 20 lbs.

1892. You say that no inspection could have guarded against that explosion?—None.

Mr. *Galloway.*
18 July 1870.

Mr. *Galloway.*

18 July 1870.

1893. It was a matter of sheer neglect on the part of the attendant?—Yes.

1894. Were there any other lives lost in that case?—Yes, the second engineer was also killed.

1895. How long ago is that?—Six weeks ago.

1896. What do flat-sided boilers explode from?—We had one a few years ago which was a flat-sided boiler, in which the cause of explosion was wear and tear; there was no question about it.

1897. Mr. *Hermon.*] An inspector could have detected that?—Yes.

1898. *Chairman.*] Do you think that your system operates to the prevention of accidents generally, or, at least, that it operates very favourably in preventing them?—Yes, I think it does; but at the same time we do not relieve the owner from the responsibility of seeing that everything is in proper condition.

1899. You think that your system is a satisfactory system?—I do not think it is sufficiently strict.

1900. How would you make it more so?—Suppose a vessel arrives to-day; there is a great hurry to get her away, the survey is made in a hurried manner, too much so to be a proper survey; there is not time allowed sufficient, in my opinion. I believe the Board of Trade intend that the inspection should be once a year instead of every six months, so that there would be more time given, and the owners would be able to manage it very much better; for once a year it is their custom to stop their vessels for a general overhaul on their own account.

1901. Is yours a compulsory system?—No; if you make it compulsory, you must relieve the owner of all the responsibility.

1902. You would object to relieve the owners of all responsibility?—Yes, I should object to relieve the owners of all responsibility; for although the thing may be perfect to-day, yet without proper supervision and employing proper people to conduct the machinery, it would be very soon out of condition.

1903. Could such a system as that adopted by the Board of Trade for marine vessels be carried out with regard to land boilers?—I think it could; and it would work very well, in my opinion. If the buyer of a boiler had the power to call in a Government inspector, and to say, "I am going to purchase such a boiler; I want you to satisfy me as to its efficiency before I purchase it;" I think that would be one great safeguard.

1904. You would not make it compulsory, because it would remove the responsibility from the owner of the boiler?—Yes, just so.

1905. Will you be kind enough to state generally to the Committee what system you recommend to be adopted by the users of land boilers?—We will take the directing power to be in the Board of Trade; I think they should appoint inspectors to districts, dividing England, Ireland, and Scotland into districts, and then the owner, or intended purchaser, of a boiler, should be able to call in an inspector to certify to the condition of the boiler before it left the makers' premises; and again when it was fitted and ready for work, the Government inspector should also attend and see that it had its proper fittings; then he would give a declaration to the owner, to say he was satisfied that the boiler was thoroughly sound and properly fitted. That would be forwarded to the Board of Trade, or any other department appointed for that purpose, and a certificate would be granted enabling the owner to work that boiler at a given pressure for a given period.

1906. The Board of Trade would give that certificate?—Yes.

1907. Who should pay for that inspection?—The owner of the boiler; the same as the owners of steam vessels now pay.

1908. But when he had obtained that certificate, in the event of any accident, it should not free him from responsibility?—No, I think not, because he might employ an incompetent man. I would go beyond that. We examine the engineers of steam vessels, and give them a certificate of competency; I would in this case let every engine driver apply to the inspector of the district to be examined, and if the inspector thought the man sober and competent to manage a boiler, he should certify to that effect; and then the Board of Trade, or some other department, would grant a certificate. That, in addition to the inspection of the boiler itself, should free the owner from resposibility in the case of accidents; I mean with regard to an investigation before a jury; it would go a great way with a jury, who would then consider that the owner had done all that was possible.

1908.* In your opinion, should it be incumbent on every user of a boiler to ask for an inspection; that is to say, should he apply to the Government, or should the Government insist on sending an inspector, whether he asked for it or not?—No, that would make it compulsory; I would make it a voluntary act, that if the owner liked to ask for an inspection he should get it.

1909. It would require a very large staff to enable the Board of Trade to carry out all that, would it not?—Yes; any system of management would require a large staff, and whether it is the Board of Trade or any other Government department, I think it should be a Government department to manage it.

1910. But you would not have the inspectors to be Government men, but simply certificated men?—Yes; I think the chief inspectors should be appointed by the Government.

1911. But should the inspectors be chosen from the different districts?—I think the Government department should pick out the most eligible men for that service. They would have many applications, no doubt.

1912. What would you propose to do in case of accidents to certified boilers?—I think in case of loss of life the coroner should hold an inquest in the usual way, and the chief inspector of the district should attend and give him every assistance, and then it would be for the jury to arrive at the conclusion whether the owner had done all that he possibly could or not to avoid danger. I think if it was shown to the jury that the owner had done that, they should bring in a verdict of accidental death.

1913. Should the owner be responsible for any act of his servant?—I think if he employed an incompetent man he should be answerable for his actions, whether he had had his boiler inspected or not.

1914. How should the boiler attendant become certificated?—He would make an application to the chief inspector of the district; the chief inspector of the district would examine him, and the applicant would also have to produce certificates to show that he was a sober man. Then upon that the chief inspector would certify that he was sober and competent, and the Government

Government department would then give the man a certificate. That is on the principle that we adopt with the engineers of steam vessels.

1915. Do you think that a very large proportion of the accidents are caused by the want of such men?—Many of them are caused by negligence on the part of the attendants. There are three causes which create accidents; that is to say, deficiency in construction, want of proper fittings, and inattention on the part of the attendants.

1916. You are not able to state to the Committee what proportion of accidents occur from want of care on the part of the attendants?—No, I am not able to say.

1917. But it is a very large proportion?—Yes.

1918. Suppose an accident happened to a boiler that was not certified, and loss of life occurred, what would you propose in that case?—Then I think the coroner should hold an inquiry, with the assistance of the chief inspector of the district, and if it is shown there has been want of care on the part of the owner, and that he has in some way caused the accident, he should be liable, on the same principle that railway companies are liable now.

1919. Whether caused by want of care in not providing proper fittings, or in not providing proper attendants?—Yes.

1920. Mr. *Hermon.*] Should he be held liable, in your opinion, for money damages or for the crime of manslaughter?—He should be liable for money damages, I think.

1921. *Chairman.*] You think that such an inspection as that would meet the difficulty?—Yes; if the owners of boilers knew their pockets would have to suffer in case of damage, they would come forward voluntarily and have the inspections made.

1922. Mr. *Hermon.*] You think that if a boiler were regularly inspected by a Government inspector, and the engine attendant or stoker was furnished with a certificate, the steam user would be relieved from responsibility, do you?—No, I do not go to that extent, because it would be a voluntary act on their part to seek Government inspection; it would merely be putting themselves in as good a position as they possibly could be in before a jury, to show that they had done all they possibly could to avoid accidents.

1923. How often do you inspect marine boilers and river boilers?—Every six months.

1924. Do you find that the sea water deteriorates the boilers, or does the fact of blowing the steam through, remove the deposit of salt water?—Not at all.

1925. Is it not the practice to blow steam through in many cases?—Yes, but there is always a deposit except where they have surface condensers; in almost all sea-going vessels now they are fitting surface condensers.

1926. The inspection is compulsory where passengers are concerned, you say?—Yes, the inspection is compulsory where a vessel carries passengers.

1927. You think that the Government should appoint the inspector, do you not?—Yes.

1928. And you would give the steam users no part in the selection of the inspectors?—None whatever.

1929. And you would give them no part in providing boards of management, or anything of that kind?—None whatever; they might have an inspection if they thought proper, but they should have no voice in the selection of the inspectors.

1930. You are of opinion that the Government would do it much better than the steam users, I suppose?—I think that the public would have more confidence in Government management than in that of an association; a private association with power such as would be necessary to enforce inspection would be irksome to the steam users.

1931. You prefer the Government having the direct appointment of the inspectors, rather than the steam users selecting the inspectors to be approved by the Government?—Yes; I would make them perfectly independent of the steam users.

1932. Mr. *Laird.*] You say that your system of compulsory inspection is only applicable to passenger steamers?—Only to passenger steamers.

1933. And do the others ever apply to you for certificates?—Sometimes they do.

1934. But not as a general rule?—No, not as a general rule; sometimes when they are building a vessel there is a clause in the contract that the vessel shall be fitted according to the Board of Trade's regulations, and in those cases we attend.

1935. They do not seem to think that it is of much consequence whether they have your certificate or not, do they?—It is for the protection of the owner.

1936. But you say that they do not generally require a certificate unless they are compelled to do so under the Passengers Act?—No.

1937. Then do you think that the owners of land boilers would apply for an inspection?—Yes, I think so; they would be afraid of the consequences; but even a certified steam boiler may burst, and we hold an inquiry, and if it is shown that the owner is wrong, and there is loss of life, a jury may bring in a verdict of manslaughter.

1938. The owner might bring witnesses to prove the contrary; but, however, you consider that the Board of Trade, having examined the boiler, should give the engineer a certificate as well?—I think it goes a great way to satisfy the jury that the owner has taken all possible care in keeping the machinery right.

1939. Colonel *Gray.*] Are there a great number of marine steam boilers in which explosions take place?—No; within the last 20 years I think I remember about seven.

1940. There is not the same number of explosions in marine boilers as there is in land boilers, then?—No; but marine boilers are taken more care of than the land boilers, I think, and as a rule the owners look more after them.

1941. But the proportion of explosions in marine boilers is much lower than in land boilers, is it not?—Yes, I should say so.

1942. But of course there are a great many more land boilers than there are marine boilers?—Yes.

1943. Do you think that there should be a register of all boilers kept in the country?—That would be entering into the compulsory question. I think that when the owner came forward voluntarily to ask for an inspection, then his boiler should be registered, but not otherwise. I would have power to hold an inquiry

Mr. *Galloway.*

18 July 1870.

into every boiler explosion, whether they took a certificate out or not.

1944. Are you at all aware what proportion of marine boilers not used for passenger traffic are inspected?—I am not able to say.

1945. I thought from that, you might form some judgment with regard to the number of owners of land boilers who would take out a certificate, though they were not compelled to do so; do you not think that a very large proportion of marine boilers not used for passenger vessels are not inspected?—Yes, a very large proportion.

1946. That is to say, because it is not compulsory?—Yes.

1947. But it is compulsory for passenger vessels?—Yes.

1948. Do you not think that the same motive, whatever it is, would operate with the owners of land boilers to prevent their being inspected?—If you make it compulsory, you say this, "You shall do a certain thing and yet you shall be responsible." I do not think you can do that very well: you must either make it voluntary or withdraw the responsibility.

1949. In fact, the inspection is compulsory for passenger vessels, is it not?—Yes.

1950. Then I want to know what you think would be a sufficient motive to induce people to have their boilers inspected where they were not passenger vessels?—If there were an accident they would be called upon to pay damages in case of loss of life or injury to property.

1951. That is only the same as it is now; the boiler owner is liable for that now, is he not?—Yes.

1952. Then how would you have any more boilers inspected, under your proposed system, than you have now?—I think you would, because in case of loss of life there would be an inquiry held.

1953. You say that there are some explosions of marine boilers that could not be prevented by inspection?—Yes.

1954. But the Committee have been given to understand that that is not the case with land boilers, but that if there were proper inspection boiler explosions could be prevented almost to a certainty?—I do not think that is so.

1955. In the case of the explosion you mentioned, it was not altogether the attendant's fault, was it?—Yes, it was entirely the attendant's fault.

1956. It was not the way in which the boiler was fixed?—No; the boiler was very strong, and fitted in every way in a proper manner.

1957. You think that the inspectors should be appointed for certain districts?—Yes.

1958. Have you gone into the matter of how you would apportion the country; how many inspectors you would require, and what their qualification would be?—No.

1959. They would have to pass some examination, I suppose?—They would have to prove their knowledge of such matters. There would be no difficulty in obtaining a proper number of men for that purpose.

1960. But you are not aware what the cost of the inspection would be, are you?—No, I have not gone into that matter.

1961. You would place the cost on the steam users, would you not?—Yes.

1962. That would be a tax on them, would it not?—Yes, according to the number of boilers.

1963. A single boiler might not be much, but 80 or 100 boilers would be a good deal?—Yes; but it would be less in proportion; if you charged 5*l.* for one, then you would not charge 5*l.* apiece for 20 boilers.

1964. But you think that they would not object to that; would you make it compulsory on them?—I do not think the compulsory plan would answer very well; you would have to engage an immense staff to carry that out.

1965. I thought that it was a compulsory plan that you recommended?—No.

1966. Then what is the good of this Government inspection being adopted?—The owners of boilers would come forward and ask for inspections to be made, still keeping the responsibility on their own shoulders.

1967. You are opposed to the compulsory system?—Yes.

1968. Mr. *Laird.*] Would the present inspectors appointed by the Board of Trade be able to undertake the duties of inspecting land boilers at the places where they are stationed, in addition to their present duties?—There would be a new set of inspectors entirely. I do not propose that the marine inspectors should take upon themselves the duty of inspecting land boilers; I look forward to a new set of men entirely.

1969. Mr. *Cawley.*] Will you be kind enough to explain to the Committee why you think compulsory inspection must of necessity remove the responsibility from the owner?—I think the owner of the boiler would say, "I am forced to do a certain thing whether I like to do it or not, and in that case I do not care about taking any further interest in the matter."

1970. But suppose the inspection, instead of forcing him to do a certain thing, is rather the other way, namely, to prevent his doing a certain thing, the object of the inspection is to prevent a certain thing being done, is it not?—Yes, whichever way you take, I think the jury would say, "You force that man to meet your views, to do what you require, and he has done so; we do not think he is now liable."

1971. But leaving the view of the jury out of consideration altogether (because that is a question of criminal liability, and there is no doubt a disposition frequently existing to bring in a verdict of accidental death when perhaps it should not be so), why should a man be relieved from responsibility because he is prevented from using a boiler which competent persons know to be dangerous?—But if you make a man put that boiler in a proper condition, and an accident occurs through the neglect of any person on his premises, he is still morally responsible.

1972. But are you not now mixing up two things which are essentially different; the carelessness of the men we all admit cannot be prevented by inspection, and the steam user would be liable under the common law of the land with regard to the act of his servants, but the other causes of explosions which are due to improper or inefficient construction are not within the same category; probably such explosions would not occur, but suppose they did occur, why should the steam user be relieved from responsibility?—I think that if you force an inspection upon a man you must relieve him of all responsibility.

1973. But are you not putting a very extreme case; would accidents be likely to occur from those causes with competent inspection?—I should

should meet that case in this way, that if an accident occurred to a boiler, although the owner had not a certificate, there should be an inquiry held, and if it was found that he was in fault then he should be made to pay.

1974. That probably may be so now, but the object of inspection is to prevent accidents, is it not?—Yes.

1975. I assume that if the inspection was efficient, so far as accidents from malconstruction go, they would be pretty nearly reduced to nil; if that were carried out, a man's risk must be very small, must it not; why should that be an objection to compulsion in that sense?—If by inspection you made the boiler perfect, so that there would be no chance of explosion, it would not matter, but I think it would be an undue interference with the works of a manufacturer. If you made that compulsory the inspector would have to go at a certain time and make his inspection irrespective of the convenience of the owner of the boiler. He might say, "I am coming on so-and-so; you must stop your works." Whereas, if it is voluntary, the owner must suit himself, and he might say to the inspector, "I give you notice that I shall be ready on such-and-such a day."

1976. We have obtained these facts from other witnesses, that there are a very large number, probably 100,000 boilers in the kingdom; that there is a very small per-centage of those boilers that are under any sort of inspection whatever, and further, that those parties who voluntarily put themselves under inspection, are the parties who least require it?—Yes.

1977. And that we have a very large per-centage of parties who, from some motive or other, work their boilers dangerously, and work dangerous boilers; now the object in view is, if possible, to put some control over those parties; as voluntary inspection seems to fail, what is the real objection to making it compulsory?—I do not think that the voluntary system has had a fair trial.

1978. But it has been open to everybody ever since steam boilers were put down, has it not?—Yes, the inspection by the associations.

1979. But we find that it is only those who least require it who do it; is not that so. Take factory inspection, for example; there is no question, I suppose, that a certain portion of factory owners never required inspection, and a great many others did, and it is now made universal?—If you make it compulsory, you must make everybody abide by the law, and send in inspectors to Messrs. Maudslay's and Messrs. Napier's factories, and so on, and say to them, "We know better than you do about your boilers."

1980. That surely does not follow; take factory inspection with regard to the protection of machinery, which I remember a great deal of when I was a boy; the same objection might have been raised by first-class spinners, "You compel us to do that which we are perfectly willing to do;" but it is nevertheless done. When you suggest that there should be a Government inspector, and that the man who purchases the boiler may get a certificate, are you carrying it further than it is now carried, when it is already open to any prudent man to obtain such an inspection, and it is, in fact, sometimes done?—That is in the usual way of trade; I do not think that that would have very great weight with the jury.

1981. But never mind the jury; look at it as a question of protection to the public, first of all? In many cases that inspection is very effective, in other cases it is not so effective; with an independent man not connected with the trade, such as a Government officer, there is more dependence to be placed on his inspection, I think.

1982. But would not the same man who, under your system, might require that certificate from a Government officer for his boiler before he paid for it, be precisely the same man who now refers to some competent man before he takes the boiler?—Of course it is done in some cases; but I do not think that it adds anything to the protection of the user of the boilers.

1983. You think not, do you?—Just so; because in some cases he does not get an independent opinion.

1984. But I assume, of course, that he calls in a competent party?—If he calls in a competent party, and an independent man, then no doubt it is in a great measure the same thing as I suggest, only that the man is not answerable to anybody if he gives a wrong opinion.

1985. *Chairman.*] Messrs. Penn and Messrs. Maudslay, and other engineers, are subject to compulsory inspection now with regard to boilers for passenger ships?—Yes, but the boilers are out of their hands when that inspection takes place; it is the owners who call upon us to make an inspection.

1986. There is no compulsory inspection before the boiler leaves their works?—No.

1987. Mr. *Laird.*] But if Messrs. Penn build a ship for the passenger trade, it has to go through an inspection by the Board of Trade before the ship can go to sea?—Yes.

1988. Mr. *Armitstead.*] What is the reason that there are fewer explosions in marine boilers than there are in land boilers?—I do not know the proportion; in fact, I do not know the number of marine boilers, and so I am unable to answer that question; but I may say that we have had very few explosions with marine boilers.

1989. Can you give the Committee any reason for the difference in the proportion of explosions?—I think that marine boilers are better looked after than land boilers, as a rule.

1990. Mr. *Pim.*] Do you think that the inspection of marine boilers has any effect in preventing explosions?—In some measure it has, no doubt, but I think that the great point is that they employ more competent men to work them.

1991. What amount of pressure is usual for a marine boiler?—We work as high as 100 lbs.

1992. That is with as high a pressure as that used in boilers on land, is it not?—Yes.

1993. You are not in favour of compulsory inspection, as I understand you?—No, I am not.

1994. You think that the system of voluntary inspection has not been properly tried?—Just so.

1995. How do you propose to try it more efficiently?—By appointing a Government officer instead of associations.

1996. You think that the Government officer would be more likely to be sought for voluntarily?—Yes, I think the users of boilers would look upon him as a man of independent authority, whereas the public look upon these associations more in the light of a commercial speculation, though in some cases they are not so.

1997. How often do you think that boilers should be inspected?—They are inspected every

Mr. *Galloway.*

18 July 1870.

six months, but they might go for a longer period than that.

1998. Do you propose under your system that the boiler users should pay for the inspection?—Yes, they should pay for the inspection.

1999. And, in fact, that there should be no cost to you?—No, it would be a self-paying department, and the fees should pay for the whole working of the establishment.

2000. You said something with regard to the want of care on the part of the attendants; am I right in supposing that you think the attendants ought to undergo some examination, and receive certificates?—Yes.

2001. In a similar manner to that in which the mates of vessels receive their certificates?—Yes, we examine all marine engineers now of the first and second class, and grant certificates.

2002. You think that the kind of certificates now granted to marine engineers ought to be required of the boiler attendants on land?—Yes; I should go to the extent of saying that a boiler attendant should be a sober and intelligent man, and fit for the duty.

2003. But you would not make it compulsory on the owner of the boiler to have a certified attendant?—Yes, I would.

2004. You think, both with regard to the inspector and to the attendant, that the boiler user would be induced to apply to the Government inspector, by feeling that he would be less severely dealt with in case of accident?—Yes; he would think that he would save his pocket, should an accident occur, if he had a certified boiler and a certified attendant.

2005. But every boiler user knows that in case of accident it would be a very great cost to him, even though no damage were done to anyone else?—Yes, but a certified engine-driver would be in this position; if an accident was occasioned through his carelessness, his certificate would be withdrawn, and he would not be able to obtain further employment in that capacity.

2006. *Chairman.*] You have stated that there have been only seven explosions of steam boilers in 20 years?—That is all, I think.

2007. But you are not sure?—No.

2008. How many deaths were caused by those explosions; do you know?—No, I cannot say.

2009. Colonel *Gray.*] You said that you thought one reason for the few explosions of marine boilers was the great competency of the men who attend to them?—Yes.

2010. And you said also that the Board of Trade granted certificates of competency to those engineers?—Yes.

2011. Can you inform the Committee what proportion of engineers take out those certificates?—All of them take out certificates, whether they are in passenger ships or not.

2012. Is it compulsory?—Yes.

2013. Mr. *Laird.*] That applies to captains, and mates also, does it not?—Yes.

2014. Mr. *Lancaster.*] Is there any limitation with regard to the horse power?—Yes; a seagoing ship, with a boiler of about 100-horse power, must carry two certificated engineers; but below that, one certificated engineer.

2015. At what point, if any, does the necessity cease?—It ceases nowhere; they must all carry a certificated engineer.

2016. Must a 60-horse power engine, for instance, have a certificated engineer?—Yes, it does not matter about the horse power.

2017. Mr. *Hermon.*] You have stated that you are in favour of a compulsory system of examination of stokers and attendants of boilers?—Yes, that would go a great way to prevent a great number of accidents.

2018. You approve of the compulsory examination of the people who mind those boilers, but you do not approve of the compulsory examination of the boilers themselves?—No, I object to that, because I think it is an undue interference with trade; if you employed a certificated engine-driver, and made that compulsory, he would then draw attention to the state of the boiler; and if anything happened to it, and it could be shown that the engine-driver had drawn attention to it, it would go very hard with the owner; he would run the risk of a verdict of manslaughter.

2019. Do the Board of Trade refuse to give certificates to men who apply for them, if they are incompetent?—Yes; I am myself the chief examiner, and perhaps 5 or 6 per cent. of them fail in the examination, but we give them a chance of coming up again, perhaps, in five or six months.

2020. *Chairman.*] Have you any further observations to make to the Committee?—No.

Mr. William Jackson Rideout, called in; and Examined.

Mr. *Rideout.*

2021. You are extensively engaged as a Paper Maker?—Yes.

2022. And also as a cotton spinner?—I have got a mill, but it is not at work now.

2023. You are proprietor of the Farnworth Paper Mill, near Bolton, in Lancashire, and the Standish Paper Mills, near Wigan?—Yes.

2024. Your cotton mills are at Prestolee?—Yes.

2025. You have a number of boilers in those different establishments?—I have 21.

2026. Are they large ones?—They vary from 30 feet to 36 feet in length, and from 6 feet 9 inches to 7 feet 9 inches in diameter.

2027. You have paid considerable attention to the management of boilers?—Yes, for upwards of 20 years I had them under my own personal control, and I felt the responsibility so great that I have given the subject a great deal of consideration.

2028. Have you also taken care to have competent men in charge of the boilers?—The most competent men we could get, but there is a great difficulty in obtaining competent men.

2029. Have you ever had an explosion?—Never, further than this, that I once saw one of the flues collapse; the boiler makers had been at the boiler and repaired it, and had left, and had said it was all right; they put the fire in, and I went to see it, and I got there just too late. I saw the fire rush out into the river.

2030. That is only one explosion, if it must be called so, in how many years?—In about 30 years.

2031. To what system of management do you attribute this immunity from such frightful catastrophes as we often hear of?—Constant examination,

examination, and making the several managers responsible.

2032. You take care that your boilers are all properly provided with safety valves and water gauges?—There are two safety valves to each boiler, and two glass water gauges to each boiler, and on the steam mains we have a large safety valve, and all those safety valves are weighted valves, free from leverage as far as possible. We have a pressure gauge on each boiler.

2033. Do you adopt fusible plugs?—We had fusible plugs to all the large boilers, but we have now only six, because an incrustation formed on the tops of the plugs and of course they were inoperative, so we took them out. We let them wear out, and we have not replaced them. At Prestolee we have six, but they would have been taken out if the mill had been working.

2034. Do you think that boiler explosions, as a rule, could be prevented by proper inspection?—Yes, I would have all boilers made under inspection in the first instance, beginning in the boiler-maker's yard. I have seen a boiler where a plate has been split up in the longitudinal strain of the boiler, and where from using the drift the whole plate has been split up for a foot in length.

2035. Many explosions occur from corrosion after the boilers have been at work for a length of time?—No doubt.

2036. Is it easy to detect that, or is it impossible to detect that?—We have a little machine that we use whenever we are in doubt with regard to the thickness of the plate. We use the hammer where we suspect the plate is thin, and if we find it so we drill a hole the size of a rivet hole; we then take a gauge and measure the plate to the 20th part of an inch.

2037. Is that such a gauge as you hold in your hand?—This is the gauge we use to all the boilers (*producing a gauge*).

2038. That gauge will enable you to ascertain exactly the thickness of a plate?—Yes, to the 20th part of an inch.

2039. Having drilled a hole you insert the gauge, and by moving the slide on the gauge you get at the thickness of the plate exactly?—Yes.

2040. Do you use the water pressure test?—We always use it in the first instance, but not to double the extent of the working pressure. I do not see the necessity for that.

2041. Why not?—I think that is putting the boiler to an unnecessary strain. If it will stand the pressure we are going to work at, that is enough: if it lifts the safety valve, I know there will be no greater pressure, and why should I go beyond that?

2042. Mr. *Cawley.*] What would you consider the proper ultimate strength of a boiler that you were going to work at, say, 50 lbs.?—It depends on the diameter of the boiler.

2043. But what should you consider ought to be the bursting power of that boiler? — Sir William Fairbairn's calculation is three times in excess of the working pressure; that is the datum we take. Our plates are 7-16ths of an inch in thickness, and in one set of boilers of the largest diameter they are half an inch thick, and the ends are 9-16ths of an inch thick.

2044. *Chairman.*] From the evidence which has been brought before this Committee, it is pretty clear that those who are careful, like yourself, do not need inspection; but we want some mode of inspection which shall go beyond and apply to the careless people who do not take the same pains?—Yes, no doubt.

2045. Have you any plan that you can recommend to the Committee for bringing the careless people into a similar system to that used by yourselves?—I would have a registration of every boiler; that is very easy, because the machinery is there in the factory inspectors, which is applicable to all factories that employ above a certain number of hands. Why should not the inspector, when he visits the premises, make a registration of the boilers. In the next place, I would have every stoker undergo an examination, and have a certificate just the same as the mate of a ship does, and if he was guilty of any misconduct I would have it endorsed on the back of his certificate. If he was convicted of drunkenness the magistrate should endorse that; if there was an inquest, the foreman of the jury should endorse it; and so men of good character would get the benefit of their certificates; and men of bad character could not be passed on from one place to another as they now are, to the great risk of life and property.

2046. Would you make it compulsory to have boilers inspected and certified?—I for myself would be very glad to have a certificate, but I am afraid that when I obtained such certificate I should remove the responsibility from my manager as between him and myself. At present he has no appeal from me, but if he obtained a certificate he would. I might require a more critical examination than an inspector would make, but my manager might put forward the certificate and say, "That was enough." If he obtained a certificate he might rely upon it, and it might make him less watchful. If we are to have an inspector, I should like him to be a thoroughly practical man, not a briefless barrister, but a man who has worked at the business; not a theorist nor an idealist. This is what I am afraid of; they ask the most absurd things, things you cannot comply with, because they often ask an impossibility.

2047. Have you any of your boilers insured?—None.

2048. Do you think that insurance has the effect of removing responsibility?—Yes, I think it is one great cause of explosions; because it is like insuring your house, the owner is not so careful; it relieves his mind from a certain feeling of responsibility; it is just like insuring a house from fire; a man who is not insured takes greater care than a man who is fully insured.

2049. You do not approve of insurance?—Not to more than three-fourths of the value; that is the rule with me; I insure no property to more than three-fourths its value, and then I share the responsibility with the assurers.

2050. You strongly object to removing the responsibility from the attendants or the owners?—I do.

2051. What is the longest time, of your own knowledge, that you have worked a boiler?—I took out some boilers that had been at work for upwards of 20 years, because I felt that it was time to renew them; that was in 1858 and 1859. As we could not take them out whole they were cut into pieces, and I was surprised to see many of the plates as good as when they were put in, and much of the rivetting was better than the ordinary rivetting of the present time.

2052. What pressure had those boilers been working

Mr. *Rideout.*

18 July 1870.

working at?—At the time we took them out, they were working at from 35 lbs. to 40 lbs.

2053. What diameter?—Six feet six inches.

2054. And what thickness of plate?—Three-eighths of an inch, originally; they had been made on the old principle, but they had hod the ends taken out, and two new flues put in.

2055. The outside plates were the original plates, then?—Yes.

2056. Mr. *Hermon.*] Were many of the plates very much deteriorated?—Very few indeed.

2057. *Chairman.*] Your water is very good indeed, I suppose?—Up to that period we had had very good water.

2058. Mr. *Hermon.*] Do you attach much importance to having two glass water gauges, both being acted upon by the water in a similar manner?—Sometimes one glass will burst, or it fractures from some cause or other, and during the time you are replacing it the other gauge shows you the height of the water in the boiler.

2059. You have stated that in your experience you find it quite possible to gauge the thickness of a boiler plate, in order to ascertain whether it is deteriorated by corrosion, or any other cause?—I do.

2060. You have done it?—Yes; not with my own hands, but it has been done by my managers.

2061. A previous witness stated that it was impossible; but you not only state that it is possible, but that you have done it yourself?—Yes; I have had the reports of the thickness of plates, ascertained in that way and brought to me frequently.

2062. You state that you would have all stokers and boiler attendants under certificates; who would you say should be the party authorised to grant the certificates?—In towns I would let the town clerks do it; I would have a board constructed precisely the same as the Maritime Board for the examination of captains and mates.

2063. Would you recommend that that board should be a board composed of steam users?—I think the steam users are so interested in arriving at correct results, that they are the most practical men; and therefore that board, in my opinion, should be composed of steam users.

2064. Mr. *Laird.*] How do you examine a boiler imbedded in brickwork?—If it is in the flue, we have a space of four and a half inches on each side of the flue; therefore it is not difficult to examine the sides or the top, because you can remove a brick or two: there are a few places, for instance, where it rests on the chair that you you cannot examine it, but you may judge from analogy; if the plate on one side the chair is right, you may assume that it is right on the chair.

2065. A question was asked the last witness about the examination of boilers, and he said that they could not get at them on board ships; do you know how that is?—I have had no experience of ships' boilers.

2066. You know that they are buried close down to the bottom, do you not?—Yes, I know that; but I have never had anything to do with them.

2067. Suppose a boiler was embedded in that way, it would be impossible to examine it, would it not?—In that case I would drill a hole, as I have already described; and I would then with an auger cut away a little beyond it. All that you want to do is to get beyond the burr made by the drilling, and that does not extend more than an eighth of an inch.

2068. With regard to firemen and engineers, you would have them all examined as the Board of Trade now examine engineers, masters, and mates of vessels?—Yes; I think we should save many explosions if our firemen, engineers, and stokers were examined.

2069. That is to say, you think no one should be allowed to work an engine or boiler without having a certificate?—Just so.

2070. With regard to boilers, you would not make it compulsory on the owner to have his boiler examined and a certificate given to him by any public officer?—No; I would not make it compulsory. Where the owner feels his responsibility he takes far greater interest in it than any Government inspector would.

2071. It has been proved before the Committee that many owners are most careful in having their boilers examined by the Manchester Steam Users Association, and other bodies?—Yes, no doubt.

2072. But they are only a very few among a great number of boiler users, I suppose?—I have refused to join that association because I do not see any practical good in it. It merely brings in a third person whose judgment is not, perhaps, very much superior to that of those who are working the boilers, and who has no interest whatever afterwards in the vitality of the boiler beyond his character of an inspector.

2073. Colonel *Gray.*] You are not in favour of the compulsory inspection of boilers?—No, I am not in favour of compulsory inspection.

2074. But I think you have stated that you would be in favour of all boilers being registered?—Yes.

2075. What is the registration for unless it is with a view to inspection?—We have the tonnage of vessels and many other statistics, and I would register boilers also for the purpose of statistics; I would register not only the boilers but engines, so that we should know exactly what power we were working.

2076. It is not with the view of inspection that you would register them?—No.

2077. But merely as a matter of statistics?—Merely as a matter of statistics, the machinery being already provided for it.

2078. You have stated that it might be done by the factory inspectors?—Yes.

2079. Of course in the mining districts there are no factory inspectors?—No, but mines are already inspected; and I say, let the boilers be registered in a similar way, under the Mines Inspection Bill.

2080. In addition to that, you say that you would have the boilers made under inspection?—Yes, certainly; I think that every boiler should be inspected during its construction and stamped afterwards.

2081. Do you not think that that would be a great interference with the boiler makers?—There is just the same difficulty here that there is with the boiler user; for instance, there is one boiler maker who requires no control and inspection, and there are other boiler makers who make boilers at 15 or 20 per cent. less than common sense tells us they can be produced at, and those men require to be placed under inspection, first with regard to the quality of the plates, and

and secondly with regard to proper workmanship. Using the drift to make the rivet fit tears a great many plates. I have had my attention called to this even after repairs have been made; the workmen have been negligent and the plate has come out; in one or two instances the foreman has said that the plate was cracked.

2082. How would you have your inspectors appointed?—That is a thing I have not thought over, but what I want is a thorough practical man as inspector; not to have some *protégé* of the Government (who has never been able to get his living in his own profession) forced upon us, and for us to know that his inspection is useless; it is that which is galling to us. We should be glad to have competent inspection.

2083. But there are a great many people in this country who would not like to pay for inspection under any circumstances, are there not?—No doubt. I once saw premises on fire in three places; there were the dead and wounded lying there, and the boiler was lifted from its seat.

2084. How many lives were lost in that case?—There were three or four lives lost, I think, but I do not recollect; I was called to the fire within a quarter of an hour after it broke out; I had heard the noise of the explosion, and took two fire engines there; we got the dead and wounded out first, and then put the fire out.

2085. You do not seem to think that steam users associations and insurance companies are of much value?—I attach no value to them myself.

2086. Not to either of them?—I may state in proof of this, that though we have been often invited to join them we have never done so.

2087. *Chairman.*] You thought that your own inspection was sufficient?—I thought that our own inspection was sufficient, and superior to what a stranger's would be.

2088. Colonel *Gray.*] You prefer it being compulsory on the engineers and stokers to have certificates, to having any compulsion for the inspection of boilers?—I think we should have fewer explosions if the engineers and stokers underwent an examination, and were duly certificated, rather than that we should have an inspection.

2089. Mr. *Cawley.*] Previous witnesses have stated that the causes of explosions might be divided into three classes, namely, original defects in the construction of the boiler; defects consequent on using or misusing the boiler; and accidents consequent on the negligence of the men in charge; I gather that your evidence is, that the first and the last causes you would place under a certain compulsion, that is to say, you would have a compulsory examination, and a certificate of the fitness of the boiler before it was ever used?—I would.

2090. And you would have a compulsory examination with regard to the competency of the men who were to work it?—Yes.

2091. But you at present object to the compulsory inspection of the boiler during its use, so as to detect any defects which had originated during its use?—If I could see that an examination such as you speak of, would detect defects in a boiler, I would accept it with pleasure; but let a man come down to our works, with 21 boilers going; I want to know whether he is as likely to detect a weak place in a boiler as the man who is daily at work there.

2092. Am I right in supposing that you think that if the man in charge were a competent and certificated man he would be in fact a sufficient inspector for the defects which would arise from the use of the boiler?—Just so; because he is the first man to suffer in case of accident. What I want is to have, is responsibility. The difficulty with the inspector is, when he has to come to your premises to inspect the boilers, he has to stop the works; with us it would be immaterial, because we have always one boiler off, but he could not inspect the boilers on successive days. If we take A, B, C, and D, and he began with A, B would not be cool enough the next day for him to examine it, and in some cases the flues are so arranged that he could not do it without all the boilers being stopped, and that would be a far more serious loss to the manufacturer than anything else.

2093. But is it not necessary, in your opinion, that somebody should frequently make such an examination?—I think it is; but no doubt the best report comes from those who clean the flues.

2094. Then you think it is necessary that at some period of the year the boiler should be cooled for that purpose?—Yes.

2095. That being so, would it be possible for any given inspector, appointed for that purpose, to make that inspection during that time?—We stop working on Good Friday, and consequently on Saturday the boilers cool, and an inspection is made by ourselves. In the Whitsun week an inspection is made, and we take that opportunity of cleaning out all the flues, and making a thorough inspection of all the brickwork. If you called in an outside inspector to inspect the whole of those boilers, Whitsuntide, Easter, and Good Friday are, probably, the only periods at which you could have an inspection.

2096. The objection on your part is, that there is a practical difficulty?—Yes, there is a practical difficulty in most concerns, not in all.

2097. In the great majority of cases, without interfering with the working of the mills or works, that inspection could only be done at times of general holidays, you think?—Yes, certainly.

2098. And, therefore, it could not be done by one or two individuals?—Just so.

2099. But with regard to the first inspection, there would be no difficulty in carrying out that inspection as far as the setting of the boiler, would there?—Certainly not. I would have every boiler inspected during its construction, and I would have it inspected during its erection, because I believe that many explosions take place from defective erection. At Prestolee, we had one or two very heavy floods that got into the flues and filled them with water. We took the first opportunity of lifting all those boilers, so that such a mishap can never occur again, because if the structure below the boiler is not perfectly dry, you will have very rapid oxidation indeed.

2100. With regard to the inspectors who should inspect the boilers in the making, and the fittings before they are used, you have not considered the best mode of appointing them?—No.

2101. All you desire is, that they should really be competent men, and not fancy men?—Just so, that is what I want. We have had too many dilettanti men, and it is the ruin of Government inspection.

2102. And you insist on certified competency in

Mr. *Rideout.*
18 July 1870.

in the man who is to work the engine and boilers?—Yes; we have nine boilers all under the control of one man; it is not necessary that his deputies should be so competent or certified.

2103. But you think that there should be one man in charge of the boilers who should have a certificate of competency?—Yes, I think he should be directly responsible to his employer, and to no one else, for the working of the boilers. Suppose a man obtains a certificate, and you say to him, "You are neglecting your duty," he says, "I am very sorry, but I have a Government certificate."

2104. But that certificate of the boiler would only relate to the boiler itself, and it could only relate to the state the boiler was in when the certificate was granted, is not that so?—First of all there is the certificate to the man, and next there is the inspection of the boiler, and a certificate given with respect to the suitability of such boiler for the pressure at which it is working. Suppose I go to a man and say, "I am not satisfied with this;" and he says, "When the inspector was here he passed it," then he has an answer ready for me as his employer.

2105. But supposing that a boiler was certified to you as a boiler that was capable of working at 50 lbs. pressure, no doubt that would be strong evidence in your favour and not in the man's favour in case an explosion happened; but it could not be any answer for your man who was your servant, and who was supposed to do your bidding, if you had told him to work at only 40 lbs. pressure?—You forget that our workmen are not sufficiently educated to draw that distinction; that would be the workman's reply to you. You must deal with men just as you find them; they are not logical.

2106. But when you give an order to your man, do you not insist upon his obeying it?—Yes, or I should discharge him.

2107. If you told him to work at 40 lb. pressure, and he worked at a pressure of 45 lbs., you would send him about his business, I suppose?—Yes, I would send him about his business, and I would next have the pressure reduced.

2108. The certificate would not protect him, would it?—No; and I should endorse it with his misconduct, for his negligence of my orders might cause me an explosion, and do me several thousands of pounds damage.

2109. Suppose a boiler thoroughly inspected before it is put up and then worked by a competent man, do you think we should have many explosions?—No, certainly not.

2110. Mr. *Lancaster.*] You have had a boiler working for 20 years, you say?—Yes.

2111. And at the end of that time it was in good condition?—Yes; I saw the plates when they were cut out.

2112. What was done with them?—At first I contemplated making them into a pan for boiling rags; afterwards I sold them.

2113. What pressure was that boiler working at?—It was working at a pressure of 30 to 35 lbs. when we took it out.

2114. Now you have stated that you would have certificated men in charge of all boilers?—Yes, I would.

2115. Now, if in a man's judgment 30 lbs. pressure was too much to work at, and the owner insisted on working at 35 lbs. pressure, where would the responsibility rest, in your judgment?—Certainly with the owner.

2116. Do you think that men of that class would have the moral courage to tell their employers that the boiler was carrying 5 lbs. too much?—Yes, I think he would; it is the ignorant man that conceals things; the intelligent man tells you as much for your sake as for his own.

2117. You think that that class of men might be trusted to say what was a proper pressure for a boiler to work at?—Certainly not; that is to be done by a certificate in the first instance.

2118. But afterwards, supposing the boiler became weaker, do you think he might?—Yes. If any foreman or person in charge of a boiler came to any of my managers, or to myself and said, "I think this pressure is too great," I should send for a boiler maker of reputation to examine the boiler, and I would fortify myself with his report; and if he said it was working at too great a pressure, I should ask him at what pressure it was perfectly safe to work at.

2119. I understood from your answer to one of the honourable Members that the boiler having been certified when first set to work, after that period the man in charge should be the sole inspector, and should determine how much the boiler had been deteriorated, or in what state the boiler was?—No, hardly that. The manager is the first person responsible to me, and the foreman is the one who reports to the manager. But, of course, the first inquiry would naturally arise with the manager, and he would go himself and examine the boiler. Such managers as I have are men who might be trusted in that capacity; they are thorough practical men, and know far better than most inspectors would; but if there is a doubt I would send for the inspector voluntarily. I should send for an inspector by sending to the most competent boiler maker I know of.

2120. Would you insist on the manager having a certificate?—I do not think that is necessary, because if he is not competent to take care of the boilers he is not fit to have the management of the works.

2121. In that case you would send for the boiler maker?—Yes, but if another man preferred a government inspector let him have a government inspector, only let it be voluntary.

2122. You would have the boiler inspected previous to its being set to work?—Yes.

2123. That would be by some person appointed by some authority or other, would it not;—Yes.

2124. Do you see any difficulty in corporations or magistrates in quarter sessions appointing such men over their respective districts?—I do not think that the magistrates are competent men for that purpose; by all means let one or two magistrates form a portion of the board, let it be duly constituted as this Committee is constituted, and let them, through the chairman, or through the town clerk, or the clerk at quarter sessions, give the certificates.

2125. I am speaking now of the persons appointed to inspect, do you see any difficulty in those authorities appointing competent men to fill those offices?—No, certainly not.

2126. Either the corporation or the magistrates in quarter sessions, the same as they appoint bridge masters?—I would prefer having it among the steam users, but as many owners of boilers are magistrates, I think that we might safely leave it in the hands of the magistrates.

2127. I speak of a corporation in its capacity as a corporation?

a corporation?—I have no great faith in borough magistrates as a body.

2128. Mr. *Pim.*] You said that so many boiler owners were magistrates, that the inspectors might be fairly appointed by the magistrates; that would apply to Lancashire and other parts of England; but there are other places where that is not the case, are there not?—Yes, of course. I gave that as a general answer with regard to the manufacturing districts.

2129. You stated that you did not value, for instance, the inspection of the Manchester Steam Users Association; but the question I ask is this, is there any mode in your judgment by which you could obtain more competent practical men than are likely to be appointed by, say, the Manchester Steam Users Association?—If a strange inspector comes to examine the boiler he is not so likely to find out the weak place as the daily user of that boiler; that is to say, the man who is constantly using the boiler and who is familiar with it, is a better inspector than a man who makes only a periodical or casual visit.

2130. Yes, I understand that; but I was referring to the inspection of the boiler at the time of its being made?—I should say that the inspector of the Manchester Steam Users Association is as competent to inspect a boiler as any man; I am not quite sure whether the present inspector is a practical engineer, or not, but one of their early inspectors I know was a practical engineer.

2131. Judging from the ordinary class of persons that receive appointments under Government, do you think that an inspector appointed by the Government would be as likely to be a good practical man as a man appointed by a committee of steam users?—I think not; I should prefer a man appointed by a committee of steam users.

2132. You said that the caretaker of the boiler should have a certificate of competency, did you not?—Yes.

2133. In a case in which the manager of the works was thoroughly competent, would you consider it necessary that he should have under him a man who had a certificate of competency; in fact, if there was one man who was thoroughly competent upon your works, and who had a certificate, would you consider that enough, or would you require that the man directly in charge of the engine should have a certificate of competency?—In small works, where you use boilers of under 20-horse power, I would be content with one person having a certificate; but I think we have 23 steam engines, and those are divided under three managers, and those three managers are all as familiar with steam engines as any practical engineer, and thoroughly competent to say what repair is necessary, and to direct those repairs; in fact, the repairs are very often directed by them, and done on our own premises, by our own mechanics; and so again with the fittings of our boilers; it is only when the boiler wants serious repairs that we call in the service of the boiler makers.

2134. But wherever a boiler is employed there should be some man who should have a certificate of competency, you say?—Yes, all boilers above 20-horse power. Take those small engines that you find on farms, I do not think all the explosions are recorded, but you often hear of explosions of agricultural engines, because they are managed by incompetent people.

2135. Then would you compel them to have certificates?—I do not think that you can reach those small people.

2136. But take those of a higher class, how would you reach them?—The men should not be employed as stokers without certificates, just as you cannot employ a mate on board a ship without a certificate.

2137. Would you impose a fine?—Yes, you may impose whatever penalties you please; it would be a misdemeanour, and it should come before the magistrates; on anyone giving information that So-and-so was employing a man without a certificate, you could bring him before a magistrate and fine him.

2138. Mr. *Hermon.*] I understand you distinctly to state that should inspection become compulsory by law, you would very much prefer the inspectors being chosen by a body of steam users than being appointed by the Government?—Certainly; I have no hesitation in saying that. They may be responsible to the Government afterwards, but in every case the man appointed should be a practical man.

2139. Colonel *Gray.*] With regard to the certificate to the engineer, do you not think that the engineer who obtained a certificate would try to obtain higher wages?—Yes, and I think it is a very good premium of insurance.

2140. Yes, to people on a large scale like yourself; but take small users, with only one boiler, it might be a heavy tax on them, might it not?—I think there is more risk of an explosion where there is only one boiler than where there is a great number; generally you have an engineer and a stoker, and they act independently of each other; something occurs in the manufactory and the engine is stopped without a moment's notice to the stoker, and the first intimation he gets is steam blowing away through the safety valve; he opens the door wide, the engine starts again, and there is an altercation between the stoker and the engineer, because they have not steam enough; he will serve him out the next time, and so it goes on. But where you have four or five, or more boilers together, it does not affect them if one engine is shut down. And then again, you have not that variation in the pressure; 2 lbs. or 3 lbs. is a large variation in large manufactories, but in small manufactories you may have 6 lbs. or 7 lbs. variation.

2141. You do not think that would be any objection?—No, but I think the man should be certificated; we have a great difficulty in getting sober men, but if we had certificates I would bring the man up before a magistrate and endorse it if he was drunk, and by that means you would check drunkenness to a certain extent, and give a status to steady sober men.

2142. Would there be any difficulty in getting a sufficient number of respectable men, do you think?—I have no doubt it would be a troublesome thing at first, but I would give a reasonable time, in order that the men should learn. If I may be pardoned for an illustration, in yachting, nearly every yachtsman sees that he has a certified captain, but he is not so careful to get a certified mate, yet he picks out a good mate, and, if he can, he encourages that mate to study and obtain a certificate, so that he might become a captain. I had the misfortune to get a drunken captain, and I brought him before the Board of Trade; they suspended his certificate for three months, and he has never been able to

Mr. *Rideout.*

13 July 1870.

get another situation, because on the back of the certificate is this, that he has been suspended for drunkenness and improper conduct, and the consequence is, that no one will employ him, except in a subordinate capacity; so I would deal with these men, and the consequence would be, that good men would obtain good situations, and bad men would be weeded out.

2143. In that case it would be better for that captain to try and get a subordinate situation without showing his certificate, would it not?—He is asked if he has got a certificate.

2144. Mr. *Lancaster.*] Supposing the case of a dairy farm, with a 1-horse steam engine, would you insist on the person in charge of it having a certificate?—No; I would exempt all those small concerns under 20-horse power; it would be unreasonable to ask for it; I should not like to do anything Utopian.

2145. Mr. *Cawley.*] Do you not think there is an enormous amount of mischief done by those agricultural engines?—Yes; some eight or nine cases have come under my notice.

2146. Should you not rather suspect that there is a special necessity for dealing with that small class of boilers, because the employers themselves are often ignorant of their nature?—Certainly; but I can only call to mind two cases where there has been loss of life; at present I do not think that they are ripe for legislation. Look, for example, at the little pumping engines that contractors are using; they are always coming to grief, for want of water or nobody attending to them, but there is no record of it, and it is scarcely known beyond the attendants.

2147. Mr. *Pim.*] Take the case of a district in which there are a very few boilers; if a man discharged his stoker, and was bound to take a certificated stoker, he would be, to some extent, under the power of the stoker, would he not?—Yes, for the time being; I should not subject a practised man to examinations, because that is like asking you if you can read. I would give him a certificate of competency if he has been in charge of a manufactory for a certain number of years, but if he is only about 22 years of age, there is no hardship in imposing upon him an examination.

2148. But practically, in many of those cases may we not say the manager is perfectly competent?—I would assume that.

2149. The stoker misbehaves himself, and is turned away, and they take in a new man who has never worked a boiler before, and he is the only man of his class; would not that be a difficulty?—What should I care if all the stokers in my employ were turned out; I should be on the spot, and I should get all the men I could; the manager is supposed to be competent to take charge of his boilers in all cases if the power is above 20 horse.

2150. In that case you would consider the manager's competency to be sufficient?—Certainly; because he would be liable for the consequences of any accident.

2151. *Chairman.*] Have you any further observations which you wish to make to the Committee?—No.

Thursday, 21*st July* 1870.

MEMBERS PRESENT:

Sir Thomas Bazley.
Mr. Birley.
Mr. Cawley.
Mr. Joshua Fielden.
Colonel Gray.
Mr. Hermon.
Mr. Hick.
Mr. Laird.
Mr. Lancaster.
Mr. Pim.
Mr. Platt.
Dr. Lyon Playfair.
Mr. Tipping.

JOHN HICK, Esq., in the Chair.

Mr. Charles Frederick Beyer, called in; and Examined.

Mr. *C. F. Beyer.*
21 July 1870.

2152. *Chairman.*] You are one of the firm of Beyer, Peacock & Company, Locomotive Engine Makers, Manchester?—Yes.

2153. And you are a member of the committee of the Manchester Steam Users' Association?—I am.

2154. You are, of course, aware of the constant occurrence of steam boiler explosions, and the consequent loss of life?—Yes.

2155. Do you think that careful periodical inspection would tend very much to prevent the majority of those explosions?—I think it would.

2156. Are you of opinion that all boilers ought to be placed under inspection?—Yes; I think that all stationary boilers should be inspected.

2157. Would you include locomotive boilers?—I think it would not be wise to do that at present.

2158. Why would not that, in your opinion, be wise at present?—The principal railway companies have got all the means of inspecting boilers, and I think it is their interest to look after them.

2159. You think they have careful men in charge of their engines (which include boilers) usually?—The locomotive superintendent or mechanical engineer of a railway is supposed to be well acquainted with boilers and their construction, or at least ought to be.

2160. Yes, but I mean the man in charge; and if he suspects or knows that anything is wrong with his engine, when it is brought into the shed or station for the night, he would report any suspected damage or defect to his superior?—I believe that is the present practice on all railways.

2161. Of course, any repairs required would be done?—Yes; any repairs required would be done, and done efficiently.

2162. Your opinion is that they have such a careful surveillance at present, that any other inspection is unnecessary?—Yes; I think there is no need for it.

2163. Have you stationary boilers in your own establishment?—We have.

2164. And those boilers are carefully inspected by yourselves, I suppose?—Yes.

2165. Have you also had them inspected by any independent party?—Yes; they are under the inspection of the association for preventing boiler explosions, in Manchester; the Steam Users' Association.

2166. Although you have had competent inspectors, and although you are an engineering firm, you still deem it necessary to have those boilers placed under an independent inspection?—I think we are quite competent to do it, but if somebody helps us it is a comfort to me; I know it is well done. Every possible care should be taken of steam boilers.

2167. Do you think that this independent inspection removes in any degree the responsibility from yourselves?—No; I do not consider it so; it is as much my duty as it was before, that we should look after the boilers also.

2168. Knowing the importance of periodical inspection, you not only inspect your boilers yourselves, but you take the additional care of getting this independent inspection?—We do.

2169. As to any independent inspection beyond that of the parties themselves, do you consider that it should be compulsory?—Yes; I think so.

2170. By whom should that duty be carried out, do you think?—I think it should be carried out by those that own the boilers.

2171. But independently of that inspection by the owner of the boiler, do you think it should be undertaken by any governmental authority?—Certainly not by Government; by the owners of the boilers. I mean that it should be done by private inspection.

2172. Mr. *Laird.*] You mean such an inspection as that which is made by the Manchester Steam Users' Association?—Yes, just so.

2173. *Chairman.*] Do you think that the extension of that kind of association all over the country would tend to do away with the great majority of the explosions?—I am satisfied that it would.

2174. How would you propose that that extension should be carried out?—As far as I am able to judge of it, I would establish a number of associations all over the country, similar to the one that we have in Manchester.

2175. Would you propose to have a central board?—Yes, I think it needs some central board. The central board would enable those associations to bring all their information together, and comparing it. We should gain valuable in-

Mr. *C. F. Beyer.*

21 July 1870.

formation for our guidance for constructing new boilers.

2176. How should that central board be appointed, in your opinion?—I think it ought to be appointed by those district associations; perhaps that each district or association should send a member, or two members, to the general board.

2177. And the general board, I presume, should issue orders to the district boards?—It should approve of the orders, and the orders should be issued in their name.

2178. Do you think that they should appoint inspectors under them?—I think it is immaterial who appoints the inspectors; but I think the district associations should do it.

2179. Do you think that the effect of such a board would be the means of affording and extending practical information on the subject of steam boilers generally, and also on the use of steam?—I am of opinion that much valuable information would be collected in that way, and that it would be for the benefit of those that use steam boilers, and for that of the country at large.

2180. And the dissemination of such information would be, of course, very valuable, would it not?—Yes, I think so.

2181. Sir *T. Bazley.*] Does that answer refer to the sectional board or to the central board?—The central board would be for the purpose of disseminating it to the public; the local boards would send in their reports to the central board, and the central board should communicate with the public at large.

2182. *Chairman.*] So that the central board would be the nucleus of all this information?—Yes, I think we need some centre, for the purpose of being the nucleus of such information.

2183. Are the Committee to understand that your suggestion is, that this board should be appointed by members chosen from each district?—Yes; suppose, for the sake of argument, there was one of those associations formed for Lancashire, and one for Yorkshire, and so on, each separate association would send a member, and thus the central board would be constituted.

2184. In fact, so satisfied are you with the working of the Steam Users' Association in Manchester, that you would try as far as possible to extend its operations?—The Manchester Steam Users' Association has worked so well, and I believe so usefully, that I can think of nothing better than the extension of a similar arrangement.

2185. Mr. *Hermon.*] You are of opinion that the district board should be chosen by the steam users themselves, are you not?—Yes.

2186. And you are of opinion that each district board should delegate one of its number to compose a part of the central board?—Yes, that is it.

2187. You are not in favour of any Government interference in the matter, are you?—None at all.

2188. Colonel *Gray.*] What is your objection to Government interference?—I think the best management is that of private individuals. I think the Government has quite enough to do, and the less Government interferes with manufacturers the better.

2189. Only you say that you think there should be a central board, to be composed of members from the different districts?—Yes.

2190. Would it not be necessary to have some directing head to it, or do you think they would manage themselves?—Yes, I think they would. The association in Manchester has managed its affairs now for a considerable number of years, and so far it has done very well; and why should it not do if it was made more general?

2191. But you are quite aware, are you not, that a very small proportion of the boilers are under the inspection of that association?—I suppose a great many are not insured, because some people like to save money, and do not like to be interfered with; and I believe that those who know the least about boilers are the most indifferent.

2192. You are quite ready to admit that a systematic inspection of boilers would contribute very much to lessen the number of explosions, are you not?—Yes.

2193. Then, inasmuch as there are very few boilers enrolled now in proportion to the whole, is it not necessary in some way to force people to do it?—There should be a law by which everyone should be obliged to place his boiler under inspection; I think it needs something of that kind, and I believe you will have to make a law of that sort in order to meet the evil.

2194. Then do you not think it would be desirable to have some order from the Board of Trade or some Government department in order to do that?—The Government will have to say whether they shall all be under inspection; but all the rest of the work can be done by private associations.

2195. You think that it would be desirable to compel everyone to register his boilers, do you not?—Yes, it would be very desirable.

2196. You have less experience among stationary boilers than among locomotive boilers, I presume?—Yes; my experience in locomotive boilers is extensive.

2197. The Committee have been informed that it is very expensive to inspect properly a locomotive boiler?—It depends on how you do it.

2198. But take a thorough inspection of a locomotive boiler, for instance, is not that very expensive?—A locomotive boiler is rather a peculiar boiler; there is something in the inside of a locomotive boiler which prevents you looking into it at any time you like; you must remove it, and therefore it is very expensive.

2199. Those inspections could not be carried out with regard to locomotive boilers, in the same way as stationary boilers, could they?—No, they could not.

2200. Would you propose to have locomotive boilers inspected?—I think there is no need for it; in practice, every locomotive boiler that is made, whether it is made by a private firm, or, I believe, by the railway company, is tested. All locomotive boilers are more or less similar in construction; that is to say, there is not the same variety of boilers there is in stationary boilers, consequently the locomotive boiler is much better understood. Railway companies know whether a locomotive boiler is likely to fail according to its construction, and other circumstances.

2201. You do not think that there is the same necessity for inspecting periodically locomotive boilers, as there is for inspecting other boilers; the locomotive boilers being better looked after by the companies themselves?—Yes, I think they are in much better hands than stationary boilers.

2202. Mr. *Cawley.*] After all you would give compulsory

compulsory inspection, would you not?—Yes, without that I do not see how you can do it.

2203. In fact, you would compel the inspection of every boiler?—Yes.

2204. That is to say, of course, because the great majority do not voluntarily place themselves under inspection?—Yes, I think so.

2205. And having got to that point you would have the inspectors appointed by the owners of the boilers?—Yes.

2206. With respect to the majority who in practice do not willingly adopt the inspection; would you leave them to decide on the kind of inspection that they would have?—Do you mean the boiler owner or the society?

2207. An association is a voluntary combination of persons; but we are beginning now with this proposition, that everyone is to be compelled to have this boiler inspected?—Yes.

2208. My next question is with regard to those parties who are now to be compelled to come together, and have their boilers inspected; would you leave them to decide on the kind of inspection that they would have?—No, that must be settled by the association.

2209. But what association is to do it?—The association, or a number of men appointed by the boiler owners to form a court to manage the inspection, assisted by engineers and others.

2210. Then it comes back to this, that the boiler owners who are at present not willing to have their boilers inspected, are to elect the board?—Yes.

2211. Would you entrust that board with the entire regulation of the kind of inspection they would have?—Yes, I think so.

2212. You think that although those parties would not voluntarily put themselves under competent inspection, they would elect a board that would carry out a competent inspection?—I think you must look at it from another point of view. Why do not certain parties have their boilers inspected? I presume that they save a pound, and they choose to run the risk rather than pay that pound; but if they are obliged to pay the pound, my opinion is that they will see that they get value for it.

2213. Is there not something beyond the pound that they are afraid of?—There may be in some cases.

2214. But are they not also afraid of having to spend money in repairing their defective boilers?—Decidedly so. I think the mere fact of our having so many explosions proves that.

2215. Then it would entirely depend on whether they elected a competent board, and not only a competent but a *bonâ fide* board, intending to carry out the inspection, whether the inspection would be valuable or not?—I think there is no fear on that point; it might be so; but it is not likely to go wrong in that direction, I think.

2216. You think that the minority would govern the rest?—No, the unwilling would become the minority then, I think.

2217. But they are the great majority now, are they not?—Yes; it must be remembered that boiler inspection in this country is quite a new thing, I think that the public would soon find the benefit of inspection.

2218. Did I undertand you to say that you do not think that any authority, either governmental or otherwise, above this board, should have a veto, or anything to do with the fixing of the regulations?—I do not know that anything of that kind is needed. If this private management does not do well, there is always time to look after it.

2219. Then you would leave this, without any interference of any superior authority, as an experiment for a number of years, would you?—I think it would prove permanent; but that is what I propose.

2220. At all events, do you think that it is absolutely necessary if inspection is to be carried out, that it should be done by competent parties, and under proper and efficient regulations?—Yes, decidedly.

2221. And you think it right that every boiler should be inspected?—Yes, decidedly.

2222. Have you paid any attention to the new class of boilers, or rather the new application of boilers, now becoming common; namely, for agricultural purposes; I mean those semi-locomotive boilers?—They are very much like locomotives, so far as I know.

2223. There have been several explosions of those agricultural boilers, have there not?—There have been some.

2224. Do you think that those agricultural boilers should be under inspection?—I think there is a difficulty in catching them; they travel about the country, and you do not know where to find them.

2225. But if they were registered we should know that they belonged to somebody, should we not?—Yes.

2226. But you have not considered that point, perhaps?—I have thought about it, but I do not see how to do it.

2227. Now with regard to parties in charge of boilers, have you anything to state to the Committee as to whether they should submit to any examination, or have a certificate of fitness?—Perhaps it would be as well if they underwent a certain examination; but this is an age of examination; everything is to be done by examination, and I do not see the good of it.

2228. But are there not a great many explosions in consequence of negligence or ignorance on the part of the men in charge of boilers?—Yes.

2229. That is a fact beyond all doubt, is it not?—Yes.

2230. Do you think that any previous examination, and certificate to the men, would be any additional security?—Yes, I think it would, though it might very well become a dead letter.

2231. How would it become a dead letter?—An examination is one thing, and knowing the business is another.

2232. Of course, if an incompetent man obtained a certificate it would be worse than valueless?—No doubt.

2233. Mr. *Hermon.*] A man might be crammed up to it, I suppose?—Yes, I think the better way would be to increase the firemen's wages, instead of paying them only 5 *s.* or 10 *s.*; if you pay them fair wages you will obtain good men.

2234. Mr. *Cawley.*] But take the case of a steam user who wishes to have a good man, would not a competent examination (not merely questions and answers) be really a mode of ascertaining whether he knew his business or not?—I have no objection to an examination if a man knows what he is examined upon.

2235. Would not that tend to prevent the employment of a great many incompetent men?—Perhaps I am transgressing, but I may state that I remember,

Mr. *C. F. Beyer.*

21 July 1870.

I remember, many years ago, some of my friends from Prussia told me that examination for locomotive enginemen did not furnish better men.

2236. How would you ascertain whether a man was a good man for a locomotive engine driver or not?—I have no rule for it; I select in the best way I can.

2237. You do not take them hap-hazard I am sure?—I look at a man, and I ask him some questions, then I try him.

2238. And you then find whether he is competent or incompetent?—Yes.

2239. And having proved his competency you would not object to grant him a certificate, I suppose?—In these days a great many young engineers come with certificates which are perfectly satisfactory, and when I try them I find them of no use; how that would act with steam boilers I do not know.

2240. You cannot, in fact, at this moment hit upon such an examination as, in the hands of a concientious man, would secure the certificate being of value?—That is precisely it.

2241. Mr. *Lancaster.*] You think that the employer or steam user is the best person to examine his own workman?—I think so.

2242. You would hold the employer responsible to the public for employing proper persons, would you not?—Yes, I would.

2243. You think that is a safe plan, do you not?—Yes; that is safer than laying down any rule.

2244. You would have all boilers registered?—Yes.

2245. And before the registration, I take it that you would have them examined to see if they were properly constructed and fit to be set to work?—Yes, that is very essential.

2246. And you would make it compulsory that those examinations should be carried out in some form similar to that of the Steam Users' Association, and you would embody that in an Act of Parliament?—Yes; I think that it should be done in the Act of Parliament.

2247. If I understand the matter rightly, the Manchester Steam Users' Association have about one-fifteenth part of the boilers in use under their inspection?—Yes; I believe so.

2248. You would simply extend that association by 50 times its staff and its representation?—Yes; it would be something like that.

2249. You have about 10 directors in the present association, have you not?—Yes, I think it is about that, but I really do not know.

2250. Assuming that there are 10 directors or managers in your association, in that case you would want 500 for the whole country, supposing the extension were upon the same scale?—Yes.

2251. And you would let each of those associations send a representative to the central association?—Yes.

2252. You would make that central association appoint all the principal engineers connected with the Steam Users' Association, I suppose?—Yes; only the engineers; I should like it to represent all the bodies.

2253. But any new rules or law should emanate from that central body?—Yes.

2254. And the local association should only have the carrying out of those instructions?—Yes; I think it would come to that.

2255. You see no difficulty, without Government interference, in carrying that out thoroughly, do you?—No; I do not see any difficulty in it; I think it could be done.

2256. Now, if it was necessary to have any interference you would prefer the municipal or country authorities rather than that it should be the Government direct?—I pay little attention to these matters. I am hardly prepared to answer that question, but I certainly would not have the Government.

2257. But if it was required to have an authority, you would rather have a local borough or country authority than a Government authority, would you not?—I would.

2258. Mr. *Tipping.*] I think you are aware that the number of locomotive explosions, or the total number of locomotives in existence, is excessively small?—I have no statistics upon that subject, but there are not many explosions of locomotive boilers, I believe.

2259. On that ground you would say at once there was no necessity for interference, because you would consider that the result was the best proof that railway companies manage their own affairs pretty well; that is your argument, is it not?—Yes; and it is a very proper argument, too, I think.

2260. Sir *T. Bazley.*] You said, in answer to the honourable Member for Wigan, that you thought a national organisation, founded on the principle of the Steam Users' Association in Manchester, would be desirable, and you assented to the suggestion that there should be 50 such associations in the country?—Yes, there might be.

2261. The Manchester Steam Users' Association take charge of about 2,000 boilers, do they not?—Yes.

2262. Do you not think it possible that that association, being exceedingly well managed, could control 10,000 boilers?—Yes; it is only an extension of means that is required.

2263. Therefore, a smaller staff and fewer establishments than has been hinted might be required in the country?—Yes.

2264. And a higher class of engineering skill could so be employed and paid for, could it not?—Yes; that is a very important point. With regard to the proposition of having 50 associations, perhaps 10 would do very well.

2265. You have also said that you think the orders emanating from the central board should be obeyed by the sectional boards in the country?—Yes.

2266. But does it not occur to you that in country districts there may be found engineers of skill and genius whose suggestions on the spot ought to be immediately adopted, and that it would be a waste of time to make a communication from a country district to the central board of an important discovery, and that the discovery should be returned officially from the central body?— But I presume that if any changes took place they would be made perodically; those boards would meet every three, or six, or 12 months, and if any improvement had been made in the meantime it would come before those men, who would settle whether it was to be adopted at once or to wait.

2267. But it might be so apparent and so important that the local board might say that this valuable discovery must be spread in every direction at once, might it not?—We need not be in such a hurry as to that; there is no improvement likely to be made that could not wait six months.

2268. But a good many improvements have been

Mr. *C. F. Beyer.*

21 July 1870.

been made in the last quarter of a century, have they not?—Not a very great many.

2269. But from your point of view, you are in favour of local boards taking the control of boilers in their respective districts?—I am.

2270. Mr. *Hermon.*] You object to a superficial examination of a fireman, and you would place no dependence upon it?—No.

2271. But suppose you or your chief engineer told the fireman to go about his duty, and you examined his method of doing it, do you not think that after he had done that to your satisfaction, that you gave him a certificate, that certificate would be a great recommendation to him to find employment with another steam user?—Yes; but that is the way we have done it all along; if a man wants a situation he obtains an introduction from some practical man.

2272. You are in favour of an examination of the fireman, if the examination is a practical one?—Yes, if it leads to some practical results.

2273. Mr. *Cawley.*] And not a mere theoretical examination?—No, not a mere theoretical examination.

2274. Mr. *Birley.*] Would you debar a man from working as a fireman, unless he had passed some examination?—If you did that it would be an injury to many men, because there are, very often, men who do not belong to a trade who are much better men than those who are in the trade.

2275. Mr. *Cawley.*] But supposing there were examination and certificates required, is it not fair to assume that competent men would be able to obtain certificates?—Yes, if that examination was effectual; but I suspect the value of the examination.

2276. Your difficulty is with regard to the mode of carrying out the examination, is it not?—Yes, just so.

2277. *Chairman.*] Are there any further observations which you would like to make to the Committee in connection with the subject of steam boiler explosions?—No.

Captain Robert Robertson, R.N., called in; and Examined.

Captain *R. Robertson,* R.N.

2278. *Chairman.*] You are Surveyor General of Steam Vessels under the Board of Trade, are you not?—I am.

2279. How long have you occupied that position?—For 16 years; and previous to that I had charge of the steam reserve and steam trials under the Admiralty, at Woolwich.

2280. I need hardly ask you if you are aware that a number of steam boiler explosions are constantly occurring?—Yes.

2281. And I presume that your attention has been called to that fact?—Yes.

2282. Those explosions resulting in the loss of many lives?—Yes.

2283. Has it occurred to you that many of those explosions might be prevented?—Certainly; by proper inspection of boilers the explosions might have been prevented in many cases.

2284. You think that a periodical inspection by competent persons would prevent most of those explosions?—Yes.

2285. Would you make the inspection of boilers compulsory?—Yes, certainly, otherwise you would not get it.

2286. How often would you propose to have boilers inspected?—I would have them inspected once a year, and I would have a certificate given with regard to the sufficiency of the boiler for a year.

2287. By whom would you have that inspection carried out?—By competent surveyors; my idea is that the local bodies in different parts of the country should appoint local inspectors, subject to the approval of the Board of Trade or some other public department, perhaps the Board of Trade would be the best; I think the Board of Trade should have the power of removing any of those men if they found out a man was incompetent, or for any other good cause; they should be appointed in the same way as the board of guardians appoint medical officers and others, subject to the approval of the Poor Law Board; as the local marine boards appoint examiners in navigation, and others, under the Board of Trade. That is to say, that the different local authorities should ascertain the number of inspectors necessary in their respective districts and should select proper men, and nominate them to the Board of Trade for approval. The Board of Trade, in case of misconduct or incompetency, should have the power, as the Poor Law Board would have under present circumstances with respect to medical officers and others, to remove them; that is with regard to local inspection. Now, I think, that all new boilers before they leave the works of the maker should be inspected by a Board of Trade surveyor; that is, of course, presuming that the Board of Trade is the Government department chosen to undertake that duty; the surveyor should examine the boiler under the directions of the Board of Trade, and should see that it was properly constructed, and had all the necessary appliances, such as steam-gauges, safety-valves, and so on.

2288. Then would you propose to have the thing entirely under the Board of Trade, or simply that they should exercise a certain surveillance over the inspectors?—I would propose that the Board of Trade should have a general supervision over the inspectors, and also that a register should be kept at the Board of Trade of every boiler, with the maker's name, the date of the construction of the boiler, and other particulars.

2289. And that the inspector should be appointed subject to their approval?—Yes.

2290. But not necessarily by the Board of Trade?—No; they should be appointed by the different local authorities, only subject to the Board's approval; but I think the Board of Trade should appoint some small number of inspectors for the inspection of new boilers, so that every boiler would have the approval of a Government inspector.

2291. From whom should the recommendation with regard to the appointment of those inspectors come in the first instance, do you think?—From the corporation or local body of the district; for example, in Manchester, the corporation of Manchester would make that recommendation. They should ascertain the number of boilers in the locality, and select an adequate number of men to survey those boilers, and nominate

Captain *R. Robertson*, R.N.

21 July 1870.

nate them to the Board of Trade, and the Board of Trade would app ove the selection, unless they were aware of some objection.

2292. Do you think that the owner of the boiler should be relieved from any responsibility in consequence of an inspection taking place?—Not the least. The inspections are for the protection of the public, and they are, morally speaking, for the advantage of the owners, because in the event of an accident happening after a boiler had been certified, I think the jury would consider that in the amount of damages which they gave.

2293. Any inspection which relieved the owners of boilers from responsibility would be objectionable, in your opinion?—Certainly. The Board of Trade now survey all passenger steamships, and the owners are not relieved from liability, except to a small extent.

2294. How should the inspectors be paid, in your opinion?—I think they should be paid either by the Board of Trade directly, or by the local authorities; that is to say, a fee should be charged on every survey, which should be paid to the local authorities, and then the Board of Trade would pay the inspectors, either by fees or salaries.

2295. The fees being obtained from the parties who had the boilers inspected, I suppose?—Yes. Suppose the case of a boiler being inspected by a Board of Trade surveyor, or a local surveyor, whoever it was, he should send a declaration of sufficiency, stating the maximum pressure which could be allowed to the boiler. That should be sent to the Board of Trade and registered there, and then the owner would have a certificate for 12 months on payment of such a fee as might be determined upon.

2296. But you make it a strong point, do you not, that the party having a boiler inspected should not pay the inspector at all?—Certainly not, because there might be collusion: it would never do, in my opinion, to let the owners of boilers employ their own people.

2297. You think that the fee should be determined upon and received by the Board of Trade?—Yes, by the Board of Trade, or the local authority who appoints the inspector.

2298. In case of any person using an uncertificated boiler, what penalty would you propose to impose upon him?—£. 100.

2299. In every case where a person used an uncertificated boiler you would impose a penalty of 100*l.*?—Yes, in every case; and in case of any surveyor receiving a fee, or any owner giving a fee, I would have a penalty of 50*l.* on the giver as well as on the receiver.

2300. Would you consider an examination by a local inspector sufficient in the case of a new boiler?—I should say that he ought to be competent to do it, but I would rather see all new boilers surveyed by an inspector appointed by the Board of Trade, who would be a superior man.

2301. The Board of Trade have at present an efficient staff, have they not?—Yes, we have a large number of inspectors, and that is why I think the Board of Trade would be a proper department to undertake that duty, because we have the machinery already; and in order to carry it out, I do not think it would be necessary to appoint more than four or five inspectors in the first instance, as far as the Board of Trade is concerned, to inspect new boilers.

2302. I suppose that general rules for the guidance of the inspectors would be laid down by the Board of Trade?—General rules for the guidance of the inspectors would be laid down by the Board of Trade; if you had not a central board of that kind, I do not see how it could work; questions will arise in numerous cases as to, for instance, what the pressure should be, and the Government surveyor might want to reduce it; then the owner says, perhaps, "I will not do it." Other things, too, might arise which must be referred there and then to some department; those are things which occur daily with regard to passenger ships. The owners object to the pressure being reduced, and the surveyor insists upon it, and then, of course, there is a necessity for referring it to a higher authority; that authority is the Board of Trade, who take it into consideration and determine the point; that difficulty would arise in the same way with regard to land boilers; there are a very large quantity of land boilers where the first step would be to reduce the pressure.

2303. Should there be a chief or head inspector, do you think?—Yes; but I think he should not be a mechanical engineer; my own idea is, that it should be an officer of engineers of some rank, like the inspectors of railways at the Board of Trade, and he should have the general supervision; I would not put one engineer over another engineer.

2304. For how long should you recommend the local inspector to be appointed?—I think the local inspector should be appointed for not more than three years certainly, because there is a danger of collusion between him and the owners of boilers; the more frequently you remove him the better; of course I mean that the corporation, or the local authorities, should have the power of re-appointing him.

2305. But it should be a three years' appointment, in the first instance, at the outside, you think?—Yes; it should be a three years' appointment.

2306. Would you exempt locomotive boilers?—Yes; I think that the different companies may be safely trusted with the charge of locomotive boilers; I think the supervision which they have is sufficient, and there are not many serious accidents with locomotive boilers.

2307. You attribute that to the present efficient management of locomotive boilers, do you not?—Yes, I think so; I do not think you could make it better; to some extent that applies to all large companies, but in this country we have such a number of small owners that they require looking after.

2308. And your surveyor or inspector should forward a certificate of the sufficiency of the boiler to the Board of Trade?—I think the surveyor, when called upon by the owner to survey a boiler, should send in a declaration on a form that would be made out by the Board of Trade; that would be sent to the Board of Trade, and the Board of Trade would then stamp it and register it, and on the payment of a fee from the owner they would grant a certificate for 12 months, or for a less time if they thought necessary.

2309. Dr. *L. Playfair.*] A boiler lasts from 15 to 20 years, does it not?—I think that they sometimes last much longer than that, but 20 years is a fair average.

2310. Taking 20 years as the average duration of

of a boiler, there would be about 5,000 new boilers annually made in the country?—I suppose it would be perhaps about 10 or 15 a day.

2311. Now you are to have only four inspectors, you say?—I only meant a limited number of inspectors; I did not want to appoint more at first than were absolutely necessary.

2312. But if it was anything like 5,000 new boilers a year, it would require a very considerable number of inspectors to inspect them, would it not?—It depends on where they are situated; the inspectors should be locally fixed in different places.

2313. Not central officers of the Board of Trade?—They should be officers of the Board of Trade, but located in neighbourhoods where the boilers are situated; then, of course, the Board of Trade would soon find out the number required.

2314. The other inspection you would make purely local and municipal?—Yes, I think so. My opinion is that new boilers should be surveyed by officers of the Board of Trade and the rest by local inspectors; but the inspector of the Board of Trade should occasionally go round and see that things are working properly, and also assist on coroners' inquests and inquiries into accidents.

2315. You would make him a responsible officer of the Board of Trade?—Yes, I would make him directly responsible to the Board of Trade.

2316. Mr. *Hermon.*] Would you make it imperative that every new boiler should be examined and certified by one of those inspectors appointed by the Board of Trade, before it was delivered to the steam user?—Yes, before it leaves the maker's premises, the Board of Trade inspector should survey the boiler and see that it is properly fitted with safety valves and so on. There should be a Government safety valve independent of the working valve, and cut of the control of the engine man when the steam is up.

2317. You say that you would have every boiler examined once a year?—Yes, I would have them all examined once a year.

2318. Supposing you were dealing with a manufacturer who had only one boiler, how would you provide for it; you would stop his works, I suppose?—Of course the owner would have to give notice to the surveyor when the boiler was ready for inspection, and of course the works would have to stop; in fact, the boiler could not be examined until it was cool.

2319. In large establishments, of course, they could avoid the necessity of stopping the works by always having a spare boiler?—No doubt it would be harder upon people who have only one boiler than on the others.

2320. Mr. *Birley.*] Is it not necessary that boilers should be occasionally stopped, and even if a man is working only one boiler, is it not desirable that it should have a holiday now and then besides Sunday?—Yes, I suppose from time to time it is desirable, and I do not think it would be any great inconvenience to the owner if he knew when his boiler was going to be inspected.

2321. Should you provide that all boilers should be stamped and numbered, so that they might be identified?—Yes, and that all boiler plates should have the maker's name or mark on them, with the date, and that a register should be kept at the Board of Trade of all boilers; every boiler should be registered at the Board of Trade, and they should know all particulars.

2322. So that its history could be traced in fact?—Yes, so that its history could be traced, and if an explosion took place the manufacturer of the plate would be known.

2323. Colonel *Gray.*] Your experience is more of marine boilers than steam boilers, is it not?—Yes, my experience is confined to marine boilers only.

2324. And marine boilers are more difficult to inspect than other boilers, are they not?—They are much larger, generally speaking, and of course a steam ship has three or four boilers instead of one; when you speak of surveying a steam ship, you have to survey two, three or four, or perhaps more boilers.

2325. Is there any Government inspections of marine boilers after they are first set to work?—Every passenger steamer in the kingdom is inspected once in six months by a Government surveyor. At the present moment the surveyors of the Board of Trade are engineers, and they are also acquainted with the construction of ships, and they examine both.

2326. Is it not inconvenient to shipowners having this inspection so often?—No doubt it is attended with some inconvenience, and I am very doubtful whether the inspection is so thorough as it should be. I doubt whether there is time enough allowed for the inspection.

2327. How is the cost of that inspection met?—It is on the owners of the vessels, according to the tonnage.

2328. What is the amount of the fee?—It varies from 2 *l.* to 10 *l.*, according to the tonnage; I think the fee for the Great Eastern was more than that even.

2329. Mr. *Cawley.*] Is there any examination of stokers or firemen on board steam ships?—No. There is an examination of the engineers, but not of the stokers.

2330. The engineer is, in fact, in charge of both the engine and the boiler?—Yes.

2331. The stokers are merely working under him?—Just so.

2332. The engineer has to pass an examination and to take a certificate, has he not?—Yes; he has to pass a Board of Trade examination, on which he is granted a certificate of competency.

2333. And that certificate you consider of great importance, do you not?—Yes; it is as important that the engineer should have a certificate as the officer or mate of a vessel, and the engineer is in consequence liable to be punished the same as the master or mate.

2334. Should you apply the same thing to land boilers?—That is a very difficult question to answer, but I think that owners of boilers should be very careful to put competent men in charge of their boilers.

2335. The Committee have it as a matter of fact before them, that one-third of the number of explosions are the result of negligence, or of incompetency on the part of the men in charge of boilers; do you think that is so?—Yes, I think it is so.

2336. Do you think, with that fact before us, that anything could be done in the way of securing more competent men?—It is very difficult to say. It is very desirable no doubt to have competent men, but whether it is necessary that the men should undergo an examination is another question.

Captain *R. Robertson*, R.N. 21 July 1870.

2337. We have the facts staring us in the face, that a large number of explosions result from carelessness or ignorance, have we not?—Carelessness I think is the cause of explosions in many cases.

2338. In many cases it is incompetency on the part of the men, but of course the inspection of a boiler would not touch that cause of accidents?—No, certainly not.

2339. And then the question arises, could the legislation do anything which would secure more competent attention to the working of boilers?—I think that an examination of the men would do good, but there may be difficulties attending it.

2340. Mr. *Lancaster.*] You think that an inspection should be made of a boiler before it is set to work?—Yes.

2341. And that a certificate should be granted to the owner of the boiler for not exceeding 12 months?—Yes; for not exceeding 12 months.

2342. And you think the owner having complied with that, is not relieved from any responsibility?—Certainly not.

2343. Supposing the day following the boiler being set to work, an explosion should occur from mal-construction, you think that the owner is not relieved from responsibility?—I think it would never do to relieve the owner from responsibility; because the tendency would be to make him careless. He would say, "I have got a Government certificate, and I do not care;" but, of course, you put a very strong case.

2344. You think that in such a case the owner should not be relieved from responsibility?—No; but I think he would be morally relieved; if any accident happened, and the case came before a jury, the jury would take all that into consideration.

2345. Would not the public and the jury say that the moral responsibility would rest with the inspectors?—I think it is very likely that the jury would say so, and it would go very far in mitigation of damages, but I do not think that is a probable case.

2346. You say that you would have a separate tax on the steam users for the cost of those inspections?—Yes; I think a fee should be charged on the survey of every boiler.

2347. Is that the way in which it is done with steam vessels?—Yes; every steam vessel pays a fee for a survey from 2 *l.* to 10 *l.*, and the travelling expenses besides, if any.

2348. That covers the expense, does it?—Yes, that covers the expense.

2349. You think that there is no intermediate course, but that an absolute Government inspection is necessary for land boilers as well as steam boilers?—I think that the compulsory examination of boilers is absolutely necessary, and I think it should be done by a Government officer, whether by the Board of Trade, or the Home Office, or any Government department, I give no opinion; my own reason for mentioning the Board of Trade is, that we have already the machinery necessary for the work.

2350. Mr. *Tipping.*] Do you think accidents are prevented in your own department rather through the annual inspection, or through the fact that the engineers who manage those boilers are certificated men, and therefore, so far competent men?—I think the reason we have so few accidents (for I only remember about six explosions in 16 years) is to some extent the Government inspection; I also think from the very fact of the machinery of a boiler being inspected by the Government surveyor; the owners who are interested in the matter take very good care to have it so prepared and so sufficient, that when the inspectors come they know that they will pass it; it has the effect of making the owners take care to keep up the efficiency of the boilers.

2351. Am I to understand you to say that the men who manage the smallest boats, such as ferry boats for example, are certificated?—No, only passenger steamers.

2352. But a great many ferry boats take passengers; do they not take the passenger boats across the Mersey, for example; are they certificated?—Yes, they are all certificated; no steamer can carry any other persons than the owner, his family, and servants without a certificate from the Board of Trade.

2353. Mr. *Pim.*] Do steamers generally work at as high a pressure as land boilers?—Generally speaking, they do not; but just now and for some years past they have been working at a very high pressure, at from 60 lbs. up to 80 lbs., and even more than that, but that is, of course, not general.

2354. But there are some working up to that pressure?—Yes, but the generality of them work up to 25 lbs. or 30 lbs.

2355. The boilers in all steam vessels are not examined, are they?—In all passenger vessels.

2356. Only in passenger vessels?—In passenger vessels only.

2357. Would you consider it necessary to extend that inspection to all boilers in other steam vessels?—I think all boilers should be examined whether they carry passengers or not.

2358. Whether on land or at sea?—Whether on land or at sea.

2359. You except locomotive boilers?—Yes.

2360. Take moveable boilers, such as agricultural boilers, do you think they should be examined?—Certainly, they should come under survey; I know of none that require it more; those boilers go round the country, and get knocked about.

2361. They should be compulsorily inspected, you think?—Yes, they should be compulsorily inspected.

2362. That is to say, you think they should be compulsorily inspected, in the same way as all other boilers?—Yes, in the same way as all other boilers.

2363. Are accidents with those moveable boilers common?—They have not been in use for many years, but there have been several accidents.

2364. They work at a high pressure, I believe?—They work at about a pressure of 40 lbs.

2365. And when accidents have occurred have they been usually fatal?—I have not had much experience of them.

2366. Sir *T. Bazley.*] How many marine boilers may you have under inspection at the Board of Trade?—I cannot tell you the number, but we survey about 2,251 vessels every six months; but the number of boilers I cannot tell you, because in some ships there are two, or three, or four boilers.

2367. You do not know the number of marine boilers in existence now?—No.

2368. Do you think you could take the care of the 100,000 boilers which exist in the United Kingdom at the Board of Trade?—Yes, in the way I suggest, partly by the local authorities and partly by the Board of Trade.

2369. Would

Captain *R. Robertson*, R.N.

21 July 1870.

2369. Would you propose to give your inspector the power of stopping a boiler whenever it was thought to be needed in the opinion of the local inspector or in the opinion of the Board of Trade?—If a local inspector was called upon to inspect a boiler and he found he could not pass it, if the owner attempted to work the boiler, I would put a penalty of 100 *l.* upon him for using it without a certificate.

2370. Of course you would give the amplest notice of an intention to examine a boiler, would you not?—It would be the duty of the owner to give notice to the surveyor of the time of the expiration of the certificate, and ask him to come and make the examination, and if he found that a boiler was not sufficient he would point out to the owner why it was not so, and suggest that such-and-such things must be done. If the owner objected to do that and then worked the boiler in defiance of that suggestion I would subject him to a penalty of 100 *l.*

2371. That is subjecting the owner to compulsory inspection?—Yes, I would subject every owner to compulsory inspection.

2372. Would it not be probable that where those boilers were made, and the skill and ingenuity were exercised in their construction, the practical knowledge required in working them would give to the parties resident in the district greater skill than would be possesssed by parties appointed by the Board of Trade?—No, I think that the inspectors appointed by the Board of Trade, who are daily in the habit of inspecting boilers, have a greater knowledge than the constructors very often.

2373. But you would only take your professional gentlemen from the same market or field as the local associations take them?—Yes, but probably the Government inspector might be a man rather superior to those found in most other places.

2374. What is the fee charged for the inspection of steam packet boilers?—From 2 *l.* up to 10 *l.*, according to the tonnage of the ship; with regard to the question of fees, I think the question of fees would have to be arranged so as to pay all the expenses of the surveyors.

2375. Mr. *Pim.*] What scale of fees would you propose for the inspection of land boilers?—We should have to consider, first, the number of boilers and the expenses of surveyors; I am not prepared to answer that question off-hand; I suppose 2 *l.* or something of that kind would be about the figure, but I cannot tell.

2376. Would you propose a fee, varying according to the size of the boiler; you would not charge as much for a 5-horse boiler as for a larger one, would you?—The inspector might have more trouble with a 5-horse power engine boiler than with a larger one.

2377. *Chairman.*] Do you wish to state anything to the Committee in addition to the evidence you have already given?—No.

Mr. Lavington E. Fletcher, re-called; and further Examined.

Mr. *L. E. Fletcher.*

2378. *Chairman.*] The Committee understand that you wish to say a few words with regard to your strong conviction that the verdicts generally given at coroners' inquests are not correct, and that explosions, as a rule, are not accidental?—I did not expect to be called on this morning; the other day when I gave my evidence I was provided with several drawings of exploded boilers in illustration of cases in which the verdicts of coroners had been glaringly opposed to the truth; in one case the coroner went out of his way to say that there had been no want of skill, care, or caution, although the boiler was so deeply grooved through defective staying that it was reduced in places to the thickness of a sheet of paper, and hence the explosion. The coroner's remarks were taken up by the engineering press, and shown to be quite absurd. Before any legislation can take place upon this matter it seems that at least six months or more must elapse. Now, from past experience it is but too likely that some 40 more lives will be lost in that time. If, therefore, any expression of opinion could be given by this Committee that would tend to draw the attention of the public to the fact that competent inspection is adequate to prevent explosion, and that would also draw the attention of coroners to the importance of returning sound verdicts, clearly stating the cause of the explosions, rather than the stereotyped verdicts of "accidental death," it appears to me that good might be done. At all events, such a course seems worth a trial.

2379. Mr. *Cawley.*] What you wish to convey to the public at large is this, that instead of looking at it, perhaps, simply as a question of criminality (coroners' juries desiring not to bring parties in criminally guilty), coroners' juries should inquire with regard to the causes of the accidents, you being satisfied that in the majority of cases it is not accident, but negligence or defect in the boiler?—Yes. Boiler explosions are not, as a rule, accidental, but preventable.

2380. And if parties would take more complete means of supervision themselves, accidents would be prevented?—Yes, I think so.

2381. And you think if that were done during the next six months, it would save a number of lives apart from any Report of this Committee?—It is to be hoped that it might. It is fearful to think that 40 men may lose their lives from boiler explosions while legislation is in progress. It seems to me, therefore, worth while to make a trial. In one or two cases the following form of verdict was adopted at my instance: "The jury, while they do not attribute the explosion to culpable negligence, find that the explosion arose from the corroded state of the boiler, which might have been detected by competent inspection, in time to have prevented the catastrophe." Verdicts plainly stating the cause of every explosion in this way would undoubtedly tend to educate the public mind, and do good.

LIST OF APPENDIX.

Appendix, No. 1.

Suggestions for the Guidance of the Committee, handed in by the Chairman - - p. 113

Appendix, No. 2.

Papers handed in by Mr. Fletcher:

No. 1.—Tabular Statement of Explosions from 1 January 1870 to 18 June 1870, inclusive - - - - - - - - - - - - - p. 115

No. 2.—Table showing the Number of Explosions recorded by the Manchester Steam Users' Association from the commencement of 1855 to 31st of December 1869 - - - - - - - - - - - - - p. 116

No. 3.—Return of the Number of Persons Killed and Injured by Steam Boiler Explosions from the Year 1865 to 1869, inclusive - - - - - p. 117

Return of the Number of Railway Passengers Killed and Injured by Circumstances beyond their own Control, from the Year 1865 to 1869, inclusive - - - - - - - - - - - - - p. 117

No. 4.—Table showing the Causes from which Explosions arose in the Year 1869 - p. 118

No. 5.—Table showing the Causes of the Steam Boiler Explosions that occurred from the 1st of January 1861 to the 18th of June 1870 - - - p. 118

APPENDIX.

Appendix, No. 1.

Steam Boiler Explosions Committee.

SUGGESTIONS for the Guidance of the Committee, handed in by the Chairman.

The purpose for which this Committee has been appointed is, as you are aware, "To inquire into the cause of steam boiler explosions, and the best means of preventing them." Appendix, No. 1.

Of the necessity of this inquiry there can be no doubt. The most casual readers of the public newspapers must have had forced upon their attention the constant recurrence of boiler explosions, with the distressing consequences attendant thereon. It is not long since a most disastrously fatal explosion occurred at Bingley, killing as many as 15 persons, and injuring 33 others, the greater part of whom were women and children. But the other day we heard of another destructive catastrophe of the same description, which occurred at a brewery at Southsea, whereby three persons were killed, and four others seriously injured. Scarcely was the coroner's inquiry on this catastrophe concluded, when another explosion took place at Warrington, killing six persons, and injuring three others; and immediately after that, another again happened at Dublin, under, as I am informed, very aggravating circumstances, resulting in the death of three persons, and in serious injury to six others. Immediately upon the heels of this explosion, another of an alarmingly fatal character occurred at Kidsgrove Iron Works, Staffordshire, killing as many as 13 poor fellows, and injuring five others. Indeed, so rapid has been the succession of one explosion after another, that it would weary you were I to attempt to recite them at all in detail, but I am informed that since the Kidsgrove explosion, though so recent, four others have taken place.

These catastrophes do not happen just now and then; they are constant. Explosions have come to be an established institution in this country, and a sad accompaniment to the use of steam. Looking not at the last few months only, but at several years, it appears that, on striking an average, as many as 50 explosions occur every year, killing 75 persons, and injuring at least as many others, if not more. On comparing this with the loss of life consequent on railway travelling, it appears that for every railway passenger killed from circumstances beyond his own control, three persons are killed by boiler explosions.

The number of lives lost, however, from boiler explosions, is not the limit of the suffering entailed by these catastrophes, since many of those killed are heads of families, and thus "breadwinners," as they are expressively termed, so that, in consequence of their death, many families are deprived of their principal means of support, many women are widowed, and many children orphaned.

We have therefore clearly before us a national calamity, which calls for our most earnest consideration, and it appears to me that in dealing with it we have in the first instance to ascertain whether this national calamity is beyond the power of man to avert, or whether it is remediable, and should it prove to be remediable, either partially or totally, it will then be our duty to consider in the second place what measures can best be adopted to prevent its continuance.

I trust I shall not be considered premature in avowing that I entertain the most sanguine hope that the examination of competent witnesses will show that the constant recurrence of these catastrophes is not unavoidable but preventible; that explosions, though so disastrous in their results, are by no means mysterious, but are due to the simplest causes; that they are governed by known laws, and can be grappled with and prevented by the exercise of common knowledge and common care. Further, I may perhaps be permitted to state that there has arisen in Manchester a system of periodical inspection of steam boilers, which has proved itself adequate to the prevention of these catastrophes so far as it has been adopted, and I believe it can be shown to the satisfaction of this Committee, that if this system of periodical boiler inspection were adopted by every steam user in the country, that explosions would be brought to an end.

Appendix, No. 1.

Arriving at this point, we shall then have before us the disease with which we have to grapple, viz.: the occurrence of 50 steam boiler explosions every year, and the remedy which we have to apply, viz.: competent periodical inspection. After this there will remain for us to consider how the adoption of periodical inspection can best be rendered general, and so administered that while it shall extinguish explosions on the one hand, it shall not prove burdensome or in any way cramping to the steam user on the other.

Various plans have been proposed for securing the adoption of boiler inspection by every steam user in the kingdom. These plans may be classed under two heads: First, those which are preventive *indirectly*; and secondly, those which are preventive *directly*.

Those who recommend the adoption of *indirectly* preventive measures, propose that a penalty should be attached to explosion, so that every steam user that burst his boiler should have to pay a heavy deodand. This, it is thought, would drive steam users to adopt precautionary measures, and to enrol themselves either with such inspecting associations or insurance companies as exist at present, or might subsequently arise, and thus secure, without further legislative enactment, the inspection of all the boilers in the country.

Those who recommend the adoption of *directly* preventive measures, propose that inspection should be enforced by legislative enactment in every case, though they vary in their views as to how that inspection should be provided, and also as to how it should be administered. One plan proposed is, that all the boilers in the kingdom should be consigned to the supervision of the Board of Trade. A second plan is, that instead of the inspection being carried out by the Imperial Government from one centre, that it should be carried out by town councils or other local authorities, such authorities appointing their own inspectors. A third plan is, that while no inspection shall be undertaken by the Government, whether Imperial or local, the Government should render it an imperative condition, upon the enjoyment of the use of steam, that every boiler owner should have his boiler examined at least once a year, and certified as safe and trustworthy, the certificates to be granted by such boiler inspection and insurance companies as at present exist, as well as by others which might spring up in future, and also by any other parties deemed suitable. But in order to secure the integrity of the inspections, only those authorised by the Government to be allowed to grant certificates, so that the Government, while it enforced the general adoption of inspection, would not undertake the duty itself, but instead of inspecting the boilers would inspect the inspectors.

These are some of the plans already proposed for rendering the adoption of steam boiler inspection universal, while others will no doubt be suggested during the course of the inquiry.

All these plans will, it appears to me, demand our attention, and in weighing them it should be borne in mind that three conditions have to be complied with. The first,—that inspection should be rendered general; the second,—that it be rendered efficient; and the third,—that the steam user be protected from harassing interference.

Such, gentlemen, is in brief the way in which the present inquiry appears to me to shape itself. The whole may be put in a word. It is reported that there are 75 lives lost every year through steam boiler explosions, and that the remedy for this is periodical boiler inspection. Is this true or not? If true, then the task that devolves on us is to contrive a measure to secure the periodical inspection of every boiler throughout the entire kingdom, and also that this inspection be carried out in such a manner that while explosions are extinguished the steam user is not injured. That this Committee, with the active co-operation of its members, will succeed in this endeavour, I entertain the most sanguine hopes, believing that its labours will not only result in ridding the country of the present scourge of boiler explosions, but at the same time in aiding the progress of science and the use of steam.

Appendix, No. 2.

PAPERS handed in by Mr. *Fletcher*, 23 June 1870.

No. 1.

TABULAR STATEMENT of EXPLOSIONS from 1 January 1870 to 18 June 1870, inclusive.

Progressive Number for 1870.	Date.	General Description of Boiler.	Persons Killed.	Persons Injured.	TOTAL.
1	11 Jan. -	Single flued or "Cornish": Internally fired - - - -	3	1	4
2	15 „ -	Plain cylindrical egg-ended: Externally fired - - -	1	4	5
3	4 Feb. -	Single flued or "Cornish": Internally fired - - - -	1	–	1
4	8 „ -	Boiling pan or "Kier": Heated by steam - - -	2	6	8
5	14 „ -	Circulating for heating purposes: Externally fired - - - -	2	1	3
6	27 March -	Particulars not fully ascertained -	–	1	1
7	27 „ -	Marine: Internally fired - - - -	–	–	–
8	29 „ -	Single flued or "Cornish": Internally fired - - - -	3	4	7
9	13 April -	Double flued or "Lancashire': Internally fired - - - -	6	3	9
10	18 „ -	Plain cylindrical egg-ended: Externally fired - - - -	–	–	–
11	18 „ -	Single flued or "Cornish": Internally fired - - - -	1	1	2
12	12 May -	Plain cylindrical egg-ended: Externally fired - - - -	2	–	2
13	18 „ -	Single flued or "Cornish": Internally fired - - - -	4	5	9
14	26 „ -	Upright furnace or "Rastrick": Heated by flames from puddling furnaces.	13	5	18

		TOTAL - - -	44	34	78

Appendix, No. 2.

No. 2.

TABLE showing the Number of EXPLOSIONS recorded by the Manchester Steam Users' Association from the commencement of 1855 to 31st of December 1869.

YEAR.	Number of Explosions.	Persons Killed.	Persons Injured.	TOTAL.
1855 - - - -	10	10	1	11
1856 - - - -	31	58	70	128
1857 - - - -	27	67	58	125
1858 - - - -	33	78	100	178
1859 - - - -	26	57	65	122
1860 - - - -	22	45	36	81
1861 - - - -	22	30	51	81
1862 - - - -	28	87	89	176
1863 - - - -	48	76	80	156
1864 - - - -	33	65	91	156
1865 - - - -	48	46	79	125
1866 - - - -	72	87	108	195
1867 - - - -	36	60	67	127
1868 - - - -	45	57	60	117
1869 - - - -	58	86	126	212
TOTAL, Fifteen Years -	539	909	1,081	1,990

Note.—The above Return does not by any means include the total number of explosions, or the total number of persons killed and injured during the period referred to, since, in the early years of the Association's operations, such complete records were not kept as is now the case, so that many escaped its notice. At the present time, there occur on an average 50 explosions a year, killing about 75 persons, and injuring as many others.

No. 3.

RETURN of the Number of Persons Killed and Injured by Steam Boiler Explosions from the Year 1865 to 1869, inclusive.

Year.	Number of Explosions.	Persons Killed.	Persons Injured.	Total.
1865 - - - -	48	46	79	125
1866 - - - -	72	87	109	196
1867 - - - -	36	60	67	127
1868 - - - -	45	57	60	117
1869 - - - -	58	86	126	212
Total, Five Years - -	259	336	441*	777

* This includes only those seriously injured, and does not give a full return.

RETURN of the Number of Railway Passengers Killed and Injured by Circumstances beyond their own Control, from the Year 1865 to 1869, inclusive.

Year.	Number of Catastrophes.	Passengers Killed.	Passengers Injured.	Total.
1865 - - - -	92	22	1,034	1,056
1866 - - - -	69	15	540	555
1867 - - - -	95	19	689	708
1868 - - - -	87	40	519	559
1869 - - - -	98	16	688	704
Total, Five Years - -	441	112	3,470*	3,582

* This is a full return, and includes those passengers injured slightly only as well as those injured seriously.

From the above Returns it will be seen that while 112 passengers were killed by railway travelling during the last five years from circumstances beyond their own control, as many as 336 persons were killed by boiler explosions.

Appendix, No. 2.

No. 4.

TABLE showing the CAUSES from which EXPLOSIONS arose in the Year 1869.

CAUSE OF EXPLOSIONS.	Number of Explosions.	Persons Killed.	Persons Injured.
Malconstruction:			
External firing - - - - - - - 11			
Collapse of flue tubes - - - - - 7			
Weak manholes - - - - - - 4			
Want of stays - - - - - - - 4			
	26	28	43
Defective Condition:			
External corrosion - - - - - - 8			
Internal corrosion - - - - - - 7			
	15	33	56
Overheating through shortness of water - - - -	7	10	11
Overheating from the use of boiler compositions - -	1	—	—
Overheating, but cause of overheating requires further investigation.	1	11	7
Cases in which full particulars have not been obtained -	8	4	9
TOTAL - - -	58	86	126

No. 5.

TABLE showing the CAUSES of the STEAM BOILER EXPLOSIONS that occurred from the 1st of January 1861 to the 18th of June 1870.

CAUSE OF EXPLOSIONS.	Per-centage of whole Number.	Number of Explosions.	Persons Killed.	Persons Injured.
Malconstruction of the boilers, either in the shells or fittings.	40	120	216	268
Defective condition, either in the shells or fittings -	29	88	188	239
Failure of the seams of rivets at the bottom of externally fired boilers.	15	44	64	67
Overheating of the plates from shortness of water -	10	30	23	23
Overheating of the Plates:				
From incrustation, 6 - - - - -				
From the use of boiler compositions, 1 - -	3	8	14	12
From causes requiring further investigation, 1 -				
Excessive pressure through attendants tampering with safety valves.	2	5	10	12
Explosion of economiser, but whether from gas or over-pressure of steam is uncertain.	½	1	–	–
Cause entirely independent of the condition or construction of the boiler, and may be termed "accidental."	½	1	1	1
Number of cases in which the cause has been investigated.	100	297	516	622
Number of cases in which the cause could not be investigated for want of sufficient particulars. - -		114	123	160
Total Number of Explosions - - -	- -	411	639	782

Appendix, No. 3.

PAPERS handed in by Mr. *Hiller*, 30 June 1870.

Appendix, No. 3.

THE EXPLOSIONS reported to me during the Five Years ending 31st December 1869 were 288; of these I have obtained reliable particulars of 223, which are tabulated below.

Index No.	CAUSE OF EXPLOSION.	Number of Explosions.
1	External corrosion	36
2	Deficiency of water	36
3	Fracture at riveted seams at the lower part of boiler, generally over the furnace (externally fired boilers)	29
4	Insufficient staying, or malconstruction	29
5	Weakness of internal flue tubes	29
6	Overpressure	24
7	Internal grooving	9
8	Internal corrosion	8
9	Weakness of shell at manhole	8
10	Fracture through flaws in iron, *i.e.* defective material	5
11	Unusual accumulation of deposit on furnace plates (plain cylindrical boilers)	2
12	Collapse of tube through deposit	1
13	Thinning of copper fire-box, external wear (locomotive boilers)	1
14	Defective fire-box stays - - - - ditto	1
15	Weakness of manhole cover	1
16	Defective manhole mouthpiece	1
17	Fracture in flangeing of an end plate (plain cylindrical boiler)	1
18	Defective arrangement of external flues	1
19	Boiler without safety valve	1
	TOTAL	223

Particulars of remaining 65 Explosions not obtained.

CAUSE.	Number of Explosions.	Proportion.
1. Explosions due to defects of construction, either of material or workmanship	80	36 per cent.
2. Supervening defects	87	39 „
3. Negligence of user	56	25 „
TOTAL	223	100 per cent.

In the first, I include those arising from weak form, insufficient staying, defective fittings or setting up.

In the second, defects arising during ordinary use of the boilers, such as corrosion, fracture, and grooving.

In the third, those explosions directly due to actual neglect of owner or his servants, as deficiency of water, and most cases of overpressure.

Appendix, No 4.

PAPER handed in by Mr. *Nasmyth*, C.E.

Appendix, No. 4.

PROBABLE CAUSES of BOILER EXPLOSIONS may be classed as under:—

First.—Deterioration of Original Strength.
Second.—Original Malconstruction.
Third.—Defective Materials.
Fourth.—Defective Workmanship, Original or in Repairs.
Fifth.—Short Supply of Water.
Sixth.—Undue Pressure.

First.—*Deterioration of Original Strength.*

Decay by general or local corrosion, often resulting from an unseen or inaccessible leakage; defective repair or tinkering of parts difficult of access, and therefore liable to be effected in an imperfect manner, often done in haste, and generally under circumstances adverse to the production of sound and careful work.

Second.—*Original Malconstruction.*

All the causes named in No. 1 would be much aggravated by original malconstruction. By malconstruction I refer to the existence of forms and arrangements of parts ill-adapted to withstand the strains they are naturally subject to.

Third.—*Defective Materials.*

Such as inferior and brittle quality of the plates and rivets, rendering them liable to crack under the continual action of the expansion and contraction to which the material of all boilers is naturally subject to. A frequent result of this incessant expansion and contracting action is the creation or dangerous development of cracks from rivet-hole to rivet-hole, as also from the rivet-holes outwards to the edge of the plates.

Fourth.—*Defective Workmanship.*

Defective workmanship most generally manifests itself in leakages, which, when they occur in parts of the boiler difficult of inspection and access, produce local corrosions that become a fertile source of danger; all the more so as such corrosions may reach a most riskful point, and yet escape observation; a small unseen leakage is on this account more riskful than one which, from its greater extent as a leakage, would naturally call attention to it ere serious risk had been induced. One class of defective workmanship which is fertile in disaster results from inaccurate punching of rivet-holes, to bring which to a better agreement by the use of the conical or drift punch, cracks and weakness are induced, which in time develope into very serious sources of disaster. Brittle plates cracked in bending, in like manner, result in mischief. Rivets hammered until they are nearly cold may also be classed as one of the sources of dangerous weakness in a boiler, as such undue hammering renders the rivets brittle. Repairs, or "tinkering," done, as they often are, under circumstances adverse to the production of sound and careful workmanship, is likewise a frequent source of disaster.

Fifth.—*Short or Inadequate Supply of Water.*

This cause of explosions may not always, in the first instance, result in an explosion; but the effect of short supply of water generally results in such a loss of the strength of the

the material of the over-heated part, as well as a loss of the original power, as to induce dangerous weakness that sooner or later may result in disaster. "Flued boilers" are specially liable to serious damage from the over-heating of the plates, resulting from short supply of water.

Sixth.—*Undue Pressure.*

This cause of explosion may, and indeed generally does, result from defective safety-valves, in combination with the existence of general or local deterioration of the material and strength of the boiler.

The subject of boiler explosions, in reference to the investigation of the causes of such explosions, is one of great complexity and difficulty in tracing the result to its true cause, inasmuch as the disaster may be, and generally is, the result of a more or less complex combination of the above-named causes.

4 July 1870. *James Nasmyth.*

ON

STEAM BOILER EXPLOSIONS.

Ordered, by The House of Commons, *to be Printed,*
21 *July* 1870.

370.

I N D E X.

[*N.B.*—In this Index the Figures following the Names of the Witnesses refer to the Questions in the Evidence; and those following *App.* to the Pages in the Appendix.]

A.

AGRICULTURAL BOILERS. Few agricultural boilers insured by the National Boiler Insurance Company; obstacles to their inspection, *Hiller* 859, 860——Difficulty in applying compulsory inspection to agricultural boilers, *Beyer* 2222–2226——Importance of a survey of agricultural boilers, *Robertson* 2307. 2360–2365.

Anderson, John. (Analysis of his Evidence.)—As Superintendent of Machinery to the War Department explains the careful system adopted in testing and inspecting the boilers of the department, the result being an immunity from explosions, 1022 *et seq.*——Simple and preventible causes from which explosions occur, 1027–1029. 1122, 1123——Thorough inspection yearly, or oftener, of the War Department boilers by the Manchester Steam Users Association, an annual fee of three guineas being paid for each boiler; importance attached to this inspection, in addition to the test and inspection by the department, 1030, 1031. 1038. 1043, 1044. 1049. 1079–1085. 1103–1106. 1112–1125.

Reference to some rules in force as regards the War Office boilers, which might be adopted generally, 1039, 1040. 1050——Decided approval of compulsory inspection, 1041. 1075–1078——Beneficial operation generally of the Manchester Association, witness approving of an extension of the system as a means of providing universal inspection, 1042–1049. 1073–1078. 1107–1114.

Opinion that certain internal defects which show themselves in the plates in the shape of grooving are due to inferiority of the iron, 1056–1065. 1087–1091——Probability of explosions which occur when the engine has just started being due to lowness of water, 1066–1067——Frequent detection of defects in the War Department boilers which, but for inspection, would cause explosions, 1116, 1117——Uselessness of insurance as a means of securing safety, 1126–1130.

Attendants. Doubt as to the necessity of an examination of persons in charge of boilers, competent inspection being a sufficient safeguard, *Fletcher* 322–325——Numerous explosions on account of the neglect of attendants, inspection being no check in these cases, *Hiller* 692. 698; *Longridge* 1526. 1547, 1548——More competent men in charge where there are several boilers than where there is only one, *Longridge* 1412——Incompetent persons sometimes in charge of boilers, *ib.* 1447, 1448.

Inadequacy of inspection as a means of preventing explosions arising from the carelessness of attendants; illustration hereon, *Galloway* 1889. 1891–1893. 1953–1956——Proposal for an examination of engine attendants or stokers by the Government inspectors, certificates being given, as in the case of engineers of steam vessels; important advantages expected, *ib.* 1908. 1914–1922. 1989, 1990. 2000–2005. 2009–2019——Large proportion of accidents from want of care of attendants, *ib.* 1915–1917.

Proposal that all stokers and attendants be examined and certified, and that any subsequent misconduct be marked on the certificate; how the examination might be conducted, *Rideout* 2045. 2062, 2063. 2068, 2069. 2088. 2090. 2106–2119——Further suggestions on the subject of managers and stokers being certificated; expediency of some exceptions being allowed to this rule, *ib.* 2119, 2120. 2132–2137. 2139–2150.

Slight value attached to an examination of all men in charge of boilers, the question of competency being best left to the owners and employers, *Beyer* 2227–2243. 2270–2276——Doubt as to the expediency of requiring an examination of the men in charge of boilers, *Roberts* 2329–2339.

Report, 1870—*continued.*

B.

Barker, George. (Analysis of his Evidence.)—Is Chairman of the Midland Steam Boiler Inspection and Insurance Company, and is owner and user of from 80 to 100 steam boilers, 1601, 1602——Origin of the Company in order to extend the advantages of inspection and insurance to the boilers used in the South Staffordshire iron and coal trade; subsequent extension of the Company to the Cleveland district, 1603. 1608–1611——Total of about 3,000 boilers insured by the Company, about 1,000 of which are owned by the directors, 1604–1607——Particulars relative to three explosions of boilers insured by the Company, 1612, 1613. 1629–1633.

Examination in approval of a general inspection of boilers, but in disapproval of a compulsory system or of Government interference, 1618 *et seq.*——Efficient inspection already carried out by numerous steam users, there being, however, very many who do not take proper precautions; question hereon whether a compulsory system is not desirable as regards the latter, 1618. 1623 *et seq.*——Opinion that by a strong recommendation from the present Committee, and by the action of associations like the Midland Company voluntary inspection would rapidly spread, and would render compulsion unnecessary, 1619. 1622 *et seq.*

Impracticability of preventing all explosions by means of inspection, 1620. 1658——Estimate of about 20,000 boilers in the districts dealt with by the Midland Company, of which 3,000 only are insured and inspected by the Company, 1643–1645——Insurance rates of the Company adverted to; very small profits divided, this being a secondary consideration, 1649–1651. 1662, 1663——Very few locomotive boilers insured by the Company, 1654–1656——Increasing number of boilers put under inspection, 1667. 1731, 1732——Much larger number of deaths from railway accidents than from boiler explosions, 1705–1709.

Beyer, Charles Frederick. (Analysis of his Evidence.)—Represents the firm of Beyer, Peacock & Company; is a member of the committee of the Manchester Steam Users Association, 2152, 2153——Considers that all stationary boilers should be placed under compulsory inspection, 2154–2156. 2169. 2193–2195. 2202–2204. 2246——Opinion that there is already an efficient inspection of railway or locomotive boilers, 2157–2162. 2196–2201. 2258, 2259——Careful inspection exercised by witness's firm; assistance derived also from the Steam User Association, 2163–2168.

Evidence in favour of inspection being exercised by the owners of the boilers, upon compulsion, and of inspection also by local bodies formed on the principle of the Manchester Steam Users Association, which works admirably, 2163 *et seq.*——Objection to Government inspection or interference, save that Government should require inspection, 2171. 2187, 2188. 2255–2257——Suggestions in detail for the establishment of associations all over the country, like that at Manchester, and for the formation of a central board by means of members from the local boards; competent inspection to be thus secured, 2173 *et seq.*

Advantage of all boilers being registered, and of inspection before registration, 2195. 2244, 2245——Difficulty in applying compulsory inspection to agricultural boilers, 2222–2226——Slight value attached to an examination of all men in charge of boilers, the question of competency being best left to the owners and employers, 2227–2243. 2270–2276.

Board of Trade. See *Inspection*, 4, 5. *Marine Boilers. Responsibility. Rules and Regulations.*

Boiler Insurance and Steam Power Company. Explanation relative to the origin of this Company, and of the Steam Users Association, respectively, *McNaught* 1247–1251. 1299–1302——Details relative to the operations of the company, *ib.* 1253 *et seq.*——Refusal of about fifteen or twenty applications in every 100, *ib.* 1255, 1256. 2271. 1317, 1318. 1344–1346——Particulars relative to the inspection; competent staff employed for the purpose, *ib.* 1259–1263. 1286–1288——Very few explosions of boilers inspected by the company, *ib.* 1264–1266.

Statement of the insurance rates charged by witness's company, and of the practice of insuring for loss of life as well as for damage, *McNaught* 1289, 1290. 1304–1316——Doubt as to the effect of Government, or compulsory inspection upon the operations of the company, *ib.* 1292, 1293. 1335–1340——Good dividends paid by the company, *ib.* 1303, 1304——Fair average of the boilers (as regards quality) of the country insured by the company, *ib.* 1354.

Statement of the number of proposals by boiler owners to the Boiler Insurance Company, and the proportion refused through the owners not complying with the conditions required, or refusing to remedy the defects pointed out, *Longridge* 1391–1396. 1471–1474. 1534–1538——Total of twenty explosions of boilers insured by the company; several causes

Report, 1870—*continued.*

Boiler Insurance and Steam Power Company—continued.

causes to which attributable, *Longridge* 1397-1402——Total of 12,688 boilers under the company's inspection, *ib.* 1407—— Average of one explosion annually in 4,600 boilers insured by the company, *ib.* 1419, 1420.

Main object of witness's company to prevent explosions rather than to make profit, *Longridge* 1463, 1464. 1541, 1542——Statement as to internal inspection not being necessarily made by the company before insuring each boiler, *ib.* 1566, 1567.

C.

Causes of Explosions. Simple and ascertainable causes from which explosions occur, the chief causes being malconstruction of the boiler, and defective condition, *Fletcher* 136, 137——Enumeration of the various causes of explosions, with particulars as to the number and character of explosions under different heads, *Hiller* 679-698——Origin of explosions chiefly from weakness in the boiler and from inattention, *Richardson* 876-880——Preventible character of a very large number of explosions, *ib.* 955——Simple and preventible causes from which explosions occur, *Anderson* 1027-1029. 1122, 1123.

Enumeration of six different heads under which boiler explosions arise, it being possible in the great majority of cases to prevent explosion by means of inspection, *Nasmyth* 1135 *et seq.*——Number of explosions under different heads, *Longridge* 1421-1423—— Statistics of explosions since the year 1800; particulars more especially relative to the explosions within the last four years, and their causes, *Marten* 1745-1756.

Table submitted by Mr. Fletcher showing the causes from which explosions arose in the year 1869, *App.* 118—— Statement of the causes of explosions from the 1st January 1861 to the 18th June 1870, *ib.*

Paper submitted by Mr. Hiller containing information relative to the cause of explosion in the case of 223 explosions, *App.* 119.

Statement laid before the Committee by Mr. Nasmyth, showing under different heads the origin of explosions, *App.* 120, 121.

Paper handed in by Mr. Marten containing records of explosions arranged in periods of ten years from the year 1800 up to the end of 1869, *App.* 122, 123.

See also *Attendants. Corrosion. Fittings. Flues. High Pressure. Inspection. Iron Plates. Malconstruction. Manholes. Pressure. Repairs. Safety Valves. Setting of Boilers. Water Supply.*

Central Board. Suggestion that a central board be elected by the steam users throughout the country, and that this board should appoint centres for carrying on the work of inspection, and should have the entire administration and control, *Fletcher* 189 *et seq.*—— The board should consist of men of science and men of commerce in equal proportions, *ib.* 189——Advantage of local representation and central administration, *ib.* 195-198. 209-212——Consideration of the details of election of members of the proposed central board, *ib.* 201-203. 253-257——Contemplated honorary character of the central board; belief that eminent persons would gladly serve gratuitously, the labour being light, *ib.* 207, 208. 214-216. 228——The honour of a seat on the board would be considerable, *ib.* 207. 361.

Witness submits a plan of election and constitution of the central board, involving certain control in the Board of Trade, but explains that such plan is not his own, and that he prefers entirely to dispense with the latter authority, *Fletcher* 258, 259. 287-297. 327, 328. 402-421——Proposal that in the election of members of the central board every steam user should have a vote for every boiler, *ib.* 260-265. 275-279. 364-366—— There might be twenty members, *ib.* 271. 326——Witness repeats that the services of the board should be gratuitous, *ib.* 272. 360, 361——Belief as to the efficiency of the control to be exercised by the central board over the inspectors acting locally, *ib.* 306-317. 326-328——Opinion that quarterly meetings of the central board would suffice, *ib.* 326. 354-359.

Objection to a central inspection control in London, *Thompson* 624, 625——Evidence opposed to central or Government control of the proposed inspection, it being much better to leave the matter to the local authorities, *Richardson* 906-921. 936-941. 1015-1020.

Suggestions for the formation of a central board by means of members from local associations to be established throughout the country, *Beyer* 2173 *et seq.*

See also *England and Wales.*

Chadderton Explosion. Recent explosion near Chadderton, the insurance of the boiler having previously fallen through, *Thompson* 644, 645. 651-658.

Report, 1870—*continued.*

Collieries and Iron Works. Frequent explosions of boilers used in collieries and iron works, *Hiller* 684-690. 802-807; *Longridge* 1461, 1462——Negligence and ignorance owing to which explosions of colliery boilers chiefly occur, *Hiller* 850-853.

Compensation. Explanation that payment of compensation is not proposed under witness's scheme of a central board, *Fletcher* 373—— Amount of compensation paid by the National Boiler Insurance Company, *Thompson* 643——Expediency of applying Lord Campbell's Act in cases of culpable negligence, and of otherwise rendering boiler owners liable to heavy penalties and responsibilities, *McNaught* 1282. 1319-1325. 1355, 1356. 1358; *Longridge* 1426. 1459, 1460. 1520-1525. 1527. 1570.

Compulsory Inspection. See *Inspection* 3, 4.

Condemned Boilers. Contemplated disuse, compulsorily, of every boiler condemned on inspection, *Sir W. Fairbairn* 127, 128——Contemplated suspension of boilers from use if found dangerous on inspection, and until they were certified as fit for use; difficulty in some cases through the works being stopped, *Fletcher* 298-305. 321-325. 362, 363. 401——Expediency of large powers in the proposed government inspectors in stopping the use of boilers, *Longridge* 1479-1483.—— *See* also *Penalties. Stoppage of Works.*

Construction of Boilers. See *Iron Plates. Malconstruction.*

Cornish Boilers. Frequent explosion of Cornish boilers from collapse of furnace tubes, *Fletcher* 139.

Coroners' Inquests. Exceptions taken to the system of inquiry by coroners, and to the verdict of accidental death uniformily returned, *Sir W. Fairbairn* 31-33. 83, 84—— Dissent from the conclusions generally arrived at by coroners' juries, the explosions being for the most part preventible, *Hiller* 753-755——Suggestion that at inquests there be a strict investigation into the cause of explosion, and that engineering evidence be always taken, *Hiller* 868.

Proposal that competent persons be appointed by Government for attending coroners' inquests, who should act as public prosecutors, *McNaught* 1272. 1275-1284. 1319-1325. 1347-1350. 1356. 1371-1374. 1379, 1380——Unsatisfactory working of coroners' juries, *Longridge* 1440-1442——Advantage of power to use the evidence of the proposed engineers at coroners' inquests, *Marten* 1787. 1856-1858——Further statement as to the improper verdicts often returned by coroners' juries, and as to the importance of prompt amendment in this respect, *Fletcher* 2378-2381.

Corrosion. Information on the subject of corrosion as a fruitful source of explosions; great importance of careful periodical inspection as a means of detecting this danger, *Sir W. Fairbairn* 8. 20-31. 34-37——Evidence as to the great abuse which prevails in boilers being worked in a most defective condition, the plates sometimes being so wasted by corrosion as to be no thicker than a sheet of paper, *Fletcher* 148-176——Details relative to sundry explosions due to corrosion, showing the great destruction of life and property caused by this evil, for which a remedy is urgently required, *ib.* 148-176—— Frequent explosions from corrosion, *Penn* 476——Corrosion is sometimes induced by the character of the water, *Thompson* 498.

Numerous explosions from internal and external corrosion; how this arises and how it may best be detected and prevented, *Hiller* 680, 681. 693-697. 737, 738. 747-750. 808, 809—— Frequency of explosions from corrosion, which often results from unseen or unaccesible leakage; suggestions for the detection and removal of this source of danger, *Nasmyth* 1136. 1143-1154. 1158-1172. 1202-1202——Considerable difficulty, by means of inspection, in always detecting corrosion or leakage, *ib.* 1152-1154. 1170-1172. 1201——Means by which witness is enabled to gauge the thickness of plates and to detect whether they have become deteriorated by corrosion, *Rideout* 2035-2039. 2059-2061.

Statistics showing the large number of explosions from corrosion, *App.* 118, 119.

See also *Grooving.*

Cost of Inspection. Proposal that the inspectors or cost of inspection be paid by the owners of the boilers, *Sir W. Fairbairn* 38. 112-114; *Richardson* 894; *Galloway* 1907. 1960-1963. 1998, 1999——Proposal that every steam user shall pay towards the expenses, *Fletcher* 206. 213-218——Estimate of 1 *l.* as the cost of a competent internal examination of a boiler, *ib.* 380——Estimated total of a guinea and a half as the cost of examination per boiler, including establishment charges and everything; this would amount to 157,500 *l.* a year for 100,000 boilers, *ib.* 394-399——Calculation that each boiler costs witness's company from 12 *s.* to 15 *s.* a year in inspection, *Thompson* 591-602. 608. 673.

Estimate of from 17 *s.* to 20 *s.* as the cost of one thorough inspection, and two or three general inspections yearly, *Hiller* 704-706——Contemplated payment of a fee for inspection undertaken by firms which supply boilers: expected readiness of such firms

to

Report, 1870—*continued.*

Cost of Inspection—continued.

to inspect, and of steam users to accept the inspection, *Hiller* 773–786——Estimate of 15 *s.* as the cost of a thorough inspection, comprising report and plan, *ib.* 833–838.

Estimate of 10 *s.* per boiler per annum as the average cost of inspecting and testing the boilers in Oldham, *Richardson* 900–905. 992–997. 1005. 1011——Explanation as to the less cost of the proposed inspection than of that carried out by the Steam Users Association, *ib.* 1005–1014——System of inspection by witness's company without insurance; rate of charge in such case, *Marten* 1766–1775. 1819–1832——Suggestion that the inspectors be paid by means of fees to be charged for each survey; practice hereon in the survey of marine boilers, *Robertson* 2294–2297. 2327, 2328. 2346–2348. 2374–2376.

Cylindrical Boilers. Frequent explosion of cylindrical boilers as used in collieries and iron works; particulars hereon, *Hiller* 684–690. 802–807——Causes of explosion of cylindrical boilers, *Longridge* 1401——Instances of explosion of a cylindrical boiler after some repairs had been done, *Marten* 1740–1749.

D.

Damages to Boilers. Insurance by witness's company against small or partial damage to boilers as well as against explosions; much larger sums paid by the company for such damages than for exposions, the former being greatly more numerous, *McNaught* 1251, 1252. 1341–1343. 1351–1353.

E.

England and Wales. Suggestion that for the present the proposed central board should act only for England and Wales, *Fletcher* 268. 318–320. 339.

Examination of Attendants. See *Attendants.*

F.

Fairbairn, Sir William, Bart. (Analysis of his Evidence.)—Has had considerable experience in the investigation of steam boiler explosions, 1–6——Very rare occurrence of explosions previously to the introduction of high pressure steam, about forty years ago, 6. 50——Formation several years ago of the Manchester Steam Users Association, in accordance with suggestions by witness, as a means of providing a careful inspection of boilers, 6——Details relative to the constitution and mode of operation of this association, there being about 2,000 boilers subject to its inspection, and the result being a complete immunity from explosions, 6. 72–74. 80–82. 87–91. 103–111.

Evidence as to the importance of a periodical and careful inspection of boilers throughout the kingdom by competent inspectors, witness believing that explosions would be thereby reduced to a minimum, 6 *et seq.*——Objection to the system of boiler insurance companies as a means of dealing with the question of explosions; inadequate inspection provided, 6. 74——Average of about fifty explosions in England annually, whereby about 160 persons are killed and wounded, 6–8.

Reference to undue or dangerous pressure as one cause of explosions; remedies suggested, an important precaution being that the pressure of steam should never exceed one-fourth the pressure that would burst the boiler, 8. 51, 52——Numerous explosions arising also from collapse of flues; suggestions hereon for the introduction of two or more hoops of angle-iron round the flues, 8–19——Information on the subject of corrosion as a fruitful source of explosions; great importance of careful periodical inspection as a means of detecting this danger, 8. 20–31. 34–37.

Exceptions taken to the system of inquiry by coroners, and to the verdict of accidental death uniformly returned, 31–33. 83, 84——Proposal that the inspectors be paid by the owners of the boilers, 38. 112–114——Explanation that witness is not prepared with detailed suggestions as to the mode of providing inspectors, nor does he suggest that they should be Government officers, but merely that Government should make it compulsory upon all persons using boilers to have them regularly inspected, 40–46. 63 *et seq.*

Question of responsibility considered in connection with a system of compulsory inspection, 42–49. 63–71——Expediency of not testing boilers much in excess of their working pressure, 53–58. 126——Proposed inspection quarterly, 59–62——Contemplated formation of voluntary associations for carrying out compulsory inspection, 63 *et seq.*

Necessity of the inspectors being well paid, and being practical and competent men, 75. 115–122——Objection to a municipal inspection, 86——Advantage if the proposed associations were registered, 123–125——Contemplated disuse, compulsorily, of every boiler condemned on inspection, 127, 128.

Report, 1870—*continued.*

Fittings. Large number of explosions due to the defective condition of the boilers, either in the shells or fittings, *Fletcher* 136, 137——All the fittings should be tested, *Richardson* 896.

Fletcher, Lavington E. (Analysis of his Evidence.)—Is chief engineer to the Manchester Steam Users Association: has paid great attention to the subject of steam boiler explosions, 130, 131——Submits statistics of explosions recorded by the Association from 1855 till the end of 1869; 131–135——There are now about fifty explosions annually, killing about seventy-five persons, and injuring as many more, 132——The deaths from explosions are far in excess of those from railway accidents, where the latter arise from circumstances beyond the passengers' control, *ib.*

Great destitution frequently caused by the explosions, 132——Numerous instances of the destruction of life and property extending beyond the works where the explosions occur, 133, 134. 175, 176——Enhanced importance of preventive measures since boilers have been so universally adopted, 134.

Simple and ascertainable causes from which explosions occur, the chief causes being malconstruction of the boiler, and defective condition, 136, 137——Comparatively few explosions through the water being allowed to run short, *ib.*——Frequent malconstruction through the omission of encircling hoops or other appliances for securing furnance tubes from collapse: details relative to explosions from such collapse, 138, 139.

Occurrence of many explosions through weak manholes, the plates not being strengthened round the opening with a substantial mouthpiece, 139–141——Particulars of explosions from defective stays, and from malconstruction in other ways, 142——Instances of bad safety valves and bad water gauges, as having caused explosions, 142–148.

Evidence as to the great abuse which prevails in boilers being worked in a most defective condition, the plates sometimes being so wasted by corrosion as to be no thicker than a sheet of paper, 148–176——Details relative to sundry explosions due to corrosion, showing the great destruction of life and property caused by this evil, for which a remedy is urgently required, *ib.*

Remedy available by means of competent inspection, 177——Contemplated testing of boilers by hydraulic pressure before leaving the maker's yard, *ib.*——Proposed periodical inspection of boilers when in use, both when under steam and when at rest, *ib.*——Importance of at least one entire examination every year, when the boiler is at rest, *ib.*——Illustration afforded by the inspection under the Manchester Association of the great value of a general inspection in detecting sources of danger and in preventing explosions, 177–184——Exceptional instances of explosion in the case of boilers under the inspection of the Association, 178–180.

Probability of there being as least 100,000 boilers throughout the kingdom, 181, 182——Grounds for the conclusion that every steam user should be compelled by law to place his boilers under competent periodical inspection, 182–188——Illustration of the inadequacy of voluntary inspection, 184——Estimate of 20,000 boilers now under inspection or insurance, being only about one-fifth of the entire number, *ib.*

Opinion adverse to Government interference or control as regards the proposed system of inspection; that is, beyond rendering it compulsory, 189. 191. 205. 207. 228——Suggestion that a central board be elected by the steam users throughout the country, and that this board should appoint inspecting centres for carrying on the work, and should have the entire administration and control, 189 *et seq.*—— Advantage of local representation and central administration, 195–198. 209–212——Objection to local or sectional boards with independent powers of action, 199, 200. 209–212. 218–225. 229–241.

Consideration of the details of election of members of the proposed central board, 201–203. 253–257——Proposal that every steam user shall pay towards the expenses ,206. 213. 248—— Contemplated honorary character of the central board: belief that eminent persons would gladly serve gratuitously, the labour being light, 207, 208. 214–216. 228——Question of responsibility or liability considered, in the event of explosions under the proposed system of inspection, 228. 242–252.

[Second Examination.]—Witness submits a plan of election and constitution of the central board, involving certain control in the Board of Trade, but explains that such plan is not his own, and that he prefers entirely to dispense with the latter authority, 258, 259. 287–297. 327, 328, 402–421.

Proposal that in the election of members of the central board every steam user should have a vote for every boiler, 260–265. 275–279. 364–366——Further statement opposed to local boards, witness recommending that the central board should act locally by means merely of a paid staff of inspectors and others, 266–270. 306–317. 329–331. 337, 338. 374–376——He suggests that for the present the board should act only for England and Wales, 268. 318–320. 339——He repeats that the services of the board should be gratuitous, 272. 360, 361——Essence of the scheme that all boilers be compulsorily registered and placed under inspection, 273, 274.

Report, 1870—*continued.*

Fletcher, Lavington E. (Analysis of his Evidence)—*continued.*

Circumstance of owners of inferior boilers holding aloof from the Manchester Association, 281-286——Contemplated suspension of boilers from use if found dangerous on inspection, and until they were certified as fit for use; difficulty in some cases through the works being stopped, 298-305. 321-325. 362, 363. 401——Belief as to the efficiency of the control to be exercised by the control board over the inspectors acting locally, 306-317. 336-338.

Doubt as to the necessity of an examination of persons in charge of boilers, competent inspection being a sufficient safeguard, 332-335——Opinion that quarterly meetings of the central board would suffice, 336. 354-359——Importance of an inspection of small boilers as well as of large ones, 340-346. 367-369——Very efficient action of the Manchester Association, whereas witness objects to the formation of similar associations or boards locally, and prefers one board for the whole country, 347-353. 370, 371. 380.

Long distances to which inspectors are sent by the Manchester Association, 370, 371——Doubt as to the number of inspecting centres to be required, 372——Explanation that payment of compensation is not proposed as any part of witness's scheme of a central board, 373——Operation of three boiler insurance companies in Manchester, 377-379——Fallacy in relying upon insurance companies as any remedy for the evil of explosions: neglect of efficient inspection by the companies on account of the expense, 380-387.

Estimate of 1 *l.* as the cost of a competent internal examination of a boiler, 380——Instances of explosions of insured boilers, 386, 387——Separate insurance required by the companies as regards loss of life from explosions, 388-393——Estimated total of a guinea and a half as the cost of examination per boiler, including establishment charges and everything; this would amount to 157,500 *l.* a year for 100,000 *l.* boilers, 394-399——Large dividends paid by some of the insurance companies, 400.

[Third Examination.]—Explanation that the Steam Users Association have had but one explosion during the last 5½ years in respect of guaranteed boilers; occurrence also of one explosion of an unguaranteed boiler, 1588-1595——Unfairness of debiting the Association with explosions where the boilers are unguaranteed; very few such boilers, 1590, 1591. 1596——Application of all the receipts of the Association to inspections and scientific investigations, 1591-1593.

Concurrence in the opinion as to the grooving of boilers being due chiefly to mechanical action, 1597——Facility of detecting grooving and of remedying the evil; suggestions on this point, 1598-1600—— Means of constructing locomotive boilers so that no grooving will take place, 1599——Moderate expense at which locomotive boilers may be examined as regards grooving, 1600.

[Fourth Examination.]—Further statement as to the improper verdicts often returned by coroners' juries, and as to the importance of prompt amendment in this respect, 2378-2381.

Flues. Numerous explosions arising from collapse of flues; suggestions hereon for the introduction of two or more hoops of angle iron round the flues, *Sir W. Fairbairn* 8-19——Frequent malconstruction through the omission of encircling hoops or other appliances for securing furnace tubes from collapse; details relative to explosions from such collapse, *Fletcher* 138, 139——Advantage if it were prohibited to set any boiler with flues of such a size that they cannot be entered for inspection, *Hiller* 737, 738.

Fusible Plug. Value of a patent plug used by the National Boiler Insurance Company, in preventing explosions from shortness of water, *Thompson* 642. 663, 664——Explanation as to the advantages of the fusible plug in case of internally fired boilers, *Hiller* 729-736. 824, 825——Opinion that 100 boilers have been saved from damage since the adoption of the plug, *ib.* 824.

Uselessness of the fusible plug, when it becomes coated with deposit, *Longridge* 1437-1439; *Rideout* 2033——Objection to fusible plugs for marine boilers, *Galloway* 1884-1886.

G.

Galloway, Robert. (Analysis of his Evidence.)—Is Chief Surveyor of steam vessels to the Board of Trade, 1874, 1875——Particulars relative to the inspection to which marine boilers are subjected by the officers of the Board of Trade, the inspection being compulsory only as regards passenger vessels, 1876-1883. 1887-1889. 1923-1926——Control exercised as regards the safety valves to marine boilers, 1883——Objection to fusible plugs for marine boilers, 1884-1886——Rare instances of explosion of marine boilers; particulars of some which have occurred, 1889-1898. 1939-1942. 1988-1990. 2006-2008.

Inadequacy of inspection as a means of preventing explosions arising from the carelessness of attendants; illustration hereon, 1889. 1891-1893. 1953-1959——Advantage of the Board of Trade inspection as not relieving the owners from responsibility, it not

Report, 1870—*continued.*

Galloway, Robert. (Analysis of his Evidence)—*continued.*

being compulsory save in the case of passenger vessels, 1898. 1901 *et seq.*——Improvement if the inspection were once a year instead of every six months, so as to be more thorough, 1899, 1900.

Examination opposed to a compulsory inspection of land boilers, as relieving the owners or users from responsibility, 1901 *et seq.*——Suggestions for applying to land boilers the system adopted as regards marine boilers, inspectors being appointed for the purpose by the Board of Trade, whose services might be called in by the owners in order that certificates might be obtained, 1903 *et seq.*——Proposal that the inspection be paid for by the owners, 1907. 1960–1963. 1998, 1999.

Proposal also for an examination of engine attendants or stokers by the Government inspectors, certificates being given as in the case of engineers of steam vessels; important advantages expected, 1908. 1914–1922. 1989, 1990. 2000–2005. 2009–2019——Increased liability or responsibility contemplated in the event of explosions of boilers not inspected or certified; at the same time the certificate should not exempt from responsibility, 1908. 1912, 1913. 1918–1922. 1932–1938. 1950–1952. 1973.

Advantage of Government inspectors rather than of inspectors appointed by the steam users or by insurance associations, 1927–1931. 1957–1959. 1980–1984. 1995–1997——New set of Government inspectors necessary, 1968——Way in which compulsory inspection is undesirable as interfering with the owners' responsibility, 1969–1979.

Government Inspection and Control. See *Inspection,* 4, 5. *Marine Boilers. Responsibility.*

Grooving. Opinion that certain internal defects which show themselves in the plates in the shape of grooving are due to inferiority of the iron, *Anderson* 1056–1065. 1087–1091——Difficulty in accounting for the grooving or corrosion which shows itself in the plates; opinion that it arises from chemical rather than mechanical action, *Nasmyth* 1162–1172. 1218–1229——Explanation on the subject of grooving in boilers, this arising mainly from mechanical action, but being partly due to chemical causes, *Longridge* 1571–1586——Concurrence in the opinion as to the grooving of the boilers being due chiefly to mechanical action, *Fletcher* 1597——Facility of detecting grooving and remedying the evil; suggestions on this point, *ib.* 1598–1600.

H.

High Pressure. Very rare occurrence of explosions previously to the introduction of high pressure steam about forty years ago, *Sir W. Fairbairn* 6. 50——Reference to undue or dangerous pressure as one cause of explosions; remedies suggested, an important precaution being that the pressure of steam should never exceed one-fourth the pressure that would burst the boiler, *ib.* 8. 51, 52——Over-pressure adverted to as a source of danger, *Nasmyth* 1137.

Hiller, Henry. (Analysis of his Evidence.)—Is Chief Engineer to the National Boiler Insurance Company; has had large experience as to the causes of boiler explosions, 675–678——Enumeration of the various causes of explosions, with particulars as to the number and character of the explosions under different heads, 679–698——Numerous explosions from internal and external corrosion; how this arises, and how it may best be detected and prevented, 680, 681. 693–697. 737, 738. 747–750. 808, 809——Suggestion for preventing the use of inferior materials in construction, 684.

Frequent explosion of cylindrical boilers as used in collieries and iron works; particulars hereon, 684–690. 802–807——Liability to explosion where the safety-valve is bad, 691——Occurrence of some explosions through the water gauges being fixed too low, 692——Numerous explosions on account of the neglect of attendants, inspection being no check in these cases, 692. 698.

Evidence in favour of boilers being visited three or four times a year, and of a thorough inspection at one of these visits, 699. 712 *et seq.*——Considerable difficulty experienced by witness's company in obtaining facilities for thorough inspection, about one-half of the boilers insured not receiving a thorough inspection yearly, 700–703. 707–711. 771——Estimate of from 17*s.* to 20*s.* as the cost of one thorough inspection and two or three general inspections yearly, 704–706——Proposed system of compulsory registration as a means of securing efficient inspection, 712–718.

Penalty necessary in order to secure compliance with the proposed regulations, 719——Suggestions as to the provision of inspectors by companies, by steam users, and by boiler makers respectively, it being undesirable to remove private inspection and responsibility, 720, 721. 740–746. 761–763——Small proportion of boilers insured, there being a very large number to be brought under inspection, 722–728.

Explanation as to the advantages of the fusible plug in the case of internally fired boilers, 729–736. 824, 825——Advantage if it were prohibited to set any boiler with flues of such a size that they cannot be entered for inspection, 737, 738——Proposed definition of

Report, 1870—*continued.*

Hiller, Henry, (Analysis of his Evidence)—*continued.*

of the class of boilers to be placed under compulsory inspection, 739——Suggestion that there be a thorough inspection by a public officer once a year, the boiler to be stopped for the purpose, 745, 746. 751, 752. 857, 858.

Dissent from the conclusions generally arrived at by coroners' juries, the explosions being for the most part preventible, 753-755——Contemplated inspection before any boiler is used, but not during construction, 756-760——Practice generally of witness's company not to insure any boiler beyond 500*l.*, 764, 765——Grounds for objecting to Government taking the responsibility of inspection, 766-770——Valuable operation of witness's company in preventing explosions and loss of life, 772.

Contemplated payment of a fee for inspection undertaken by firms which supply boilers; expected readiness of such firms to inspect, and of steam users to accept the inspection, 773-786——Information relative to an explosion near Middleton, in which case the boiler had been accepted for insurance by witness's company at 60 lbs. pressure, but through some difficulty as to a thorough inspection the insurance was withdrawn, 787-801. 826-832——Great importance of a check upon the materials used in construction, and upon the setting up of the boiler before it is used, 810-823.

Reference to certain inspection reports, as showing the character of the inspections, 832——Estimate of 15*s.* as the cost of a thorough inspection, comprising report and plan, 833-838——Doubt as to the actual number of thorough inspections made by witness's company; considerable number of insured boilers not yet thoroughly inspected, 839-848——Negligence and ignorance owing to which explosions of colliery boilers chiefly occur, 850-853.

Difficulty as to a systematic or public inspection of railway or locomotive boilers, it being desirable to leave the inspection with the companies, 854-856. 861-865——Few agricultural boilers insured by witness's company, there being much difficulty as to inspection, 859, 860——Exceptional instances of Sunday inspection by witness's company, 866, 867——Suggestion that at inquests there be a strict investigation into the cause of explosion, and that engineering evidence be always taken, 868.

Hydraulic Test. See *Testing of Boilers.*

I.

INSPECTION:

1. *Generally as to the great importance of a Systematic Inspection of Boilers.*
2. *Number of Boilers now under Inspection.*
3. *Question whether Inspection should be Compulsory or Voluntary.*
4. *Question whether Inspection should be administered by Government or by Local Authorities and Associations.*
5. *Suggestions as to the detailed Arrangements to be adopted.*

1. *Generally as to the great importance of a Systematic Inspection of Boilers:*

Evidence as to the importance of a periodical and careful inspection of boilers throughout the kingdom by competent inspectors, witness believing that explosions would be thereby reduced to a minimum, *Sir W. Fairbairn* 6 *et seq.*——Remedy available by means of competent inspection for the great majority of the explosions which occur, *Fletcher* 177; *Penn* 432 *et seq.*——Witness considers that careful periodical inspection would prevent nearly all the explosions occurring from carelessnesss and from neglect to remedy defects, *Thompson* 491-497. 506, 507——Several respects in which external inspections are valuable, *Hiller* 699——Opinion that efficient inspection throughout the country would prevent three-fourths of the explosions, *McNaught* 1267-1270——Opinion that explosions may be reduced to one in 5,000 boilers by careful inspection, *Longridge* 1428——Impracticability of preventing all explosions by means of inspection, *Barker* 1620. 1658.

Views of the Chairman of the Committee as to the great importance of competent periodical inspection as a means of preventing explosions and loss of life, *App.* 113, 114.

2. *Number of Boilers now under Inspection:*

Estimate of 20,000 boilers now under inspection or insurance, being only about one-fifth of the entire number, *Fletcher* 184——Small proportion of boilers inspected out of the total number in the country, *Thompson* 584, 585——Increasing number of boilers put under inspection, *Barker* 1667. 1731, 1732.

3. *Question whether Inspection should be Compulsory or Voluntary:*

Explanation that witness is not prepared with detailed suggestions as to the mode of providing inspectors, nor does he suggest that they should be Government officers, but merely that Government should make it compulsory upon all persons using boilers to have them regularly inspected, *Sir W. Fairbairn* 40-46. 63 *et seq.*——Grounds for the conclusion that every steam user should be compelled by law to place his boilers under competent

INSPECTION—continued.

3. *Question whether Inspection should be Compulsory or Voluntary*—continued.

competent periodical inspection, *Fletcher* 182–188——Illustration of the inadequacy of voluntary inspection, *ib.* 184——Essence of witness's scheme that all boilers be compulsorily registered and placed under inspection, *ib.* 273, 274.

Conclusion that compulsory inspection would prevent the great majority of explosions, witness not being prepared however to suggest how such inspection should be carried out, *Penn* 432 *et seq.*——Concurrence of opinion as to the necessity of compulsory regulations, *Penn* 432 *et seq.*; *Richardson* 885. 954; *Anderson* 1041. 1075–1078; *Nasmyth* 1140. 1179.

Examination favourable on the whole to inspection being made compulsory, that is, as preferable to no inspection at all, *McNaught* 1272–1285. 1294–1298. 1326–1340——Witness would like to facilitate spontaneous inspection, *ib.* 1375——Conclusion that compulsory inspection would not be necessary, and that voluntary inspection would soon become general, if owners were liable to prosecution and punishment, as suggested by witness, *Longridge* 1426 *et seq.*

Examination in approval of a general inspection of boilers, but in disapproval of a compulsory system or of Government interference, *Barker* 1618 *et seq.*——Opinion that by a strong recommendation from the present Committee, and by the action of associations like the Midland Company, voluntary inspection would rapidly spread and would render compulsion unnecessary, *ib.* 1619. 1622 *et seq.*

Grounds for objecting to a compulsory or Government inspection of boilers; difficulty as to the mode of carrying it out, *Marten* 1783–1786. 1792. 1800. 1846–1855——Benefit anticipated from a recommendation by the Committee in favour of periodical inspection, *ib.* 1786, 1787. 1800–1803——Examination opposed to a compulsory inspection of land boilers as relieving the owners or users from responsibility, *Galloway* 1901 *et seq.*; 1969–1979; *Rideout* 2046. 2050. 2070–2073. 2091–2098.

Witness considers that all stationary boilers should be placed under compulsory inspection, *Beyer* 2154–2156. 2169. 2193–2195. 2202–2204. 2246——Conclusion that compulsory periodical inspection should be applied, *Robertson* 2280–2285. 2349, 2350.

4. *Question whether Inspection should be administered by Government or by Local Authorities and Associations:*

Conclusions adverse to Government interference or control, as regards the proposed system of inspection; that is, beyond rendering it compulsory, *Sir W. Fairbairn* 40–46. 63 *et seq.*; *Fletcher* 189. 191. 205. 207. 228——Contemplated formation of voluntary associations for carrying out compulsory inspection, *Sir W. Fairbairn* 63 *et seq.*——Advantage if the proposed associations were registered, *ib.* 123–125.

Examination to the effect that witness prefers to dispense with the Board of Trade in carrying out a central control over local inspection, *Fletcher* 258, 259. 287–297. 327, 328. 402–421——Grounds for objecting to the inspection being undertaken by Government, *Hiller* 720, 721. 740–746. 761–770——Disapproval of Government control, it being better to leave the inspection to the local authorities, *Richardson* 906–921. 936–941. 1015–1020; *Nasmyth* 1180–1184.

Exceptions taken to Government inspection; expediency rather of using the machinery and staff of voluntary and local associations, as at Manchester, *McNaught* 1273. 1281. 1285. 1292, 1293. 1357–1370. 1375–1378——Witness contends that a Government system is not required nor desirable, *Longridge* 1537–1546. 1568–1570.

Suggestions for applying to land boilers the system adopted as regards marine boilers, inspectors being appointed for the purpose by the Board of Trade, whose services might be called in by the owners in order that certificates might be obtained, *Galloway* 1903 *et seq.*——Advantage of Government inspectors rather than of inspectors appointed by the steam users or by insurance associations, *ib.* 1927–1931. 1957–1959. 1980–1984. 1995–1997——New set of Government inspectors necessary, *ib.* 1968.

Objection to Government inspection or interference, save that Government should require inspection, *Beyer* 2171. 2187, 2188. 2255–2257.

Suggestions as to the functions to be exercised by the Board of Trade, *Robertson* 2287–2290. 2302, 2303. 2321, 2322. 2349.

5. *Suggestions as to the detailed Arrangements to be adopted:*

Proposed inspection quarterly, *Sir W. Fairbairn* 59–62——Necessity of the inspectors being well paid, and being practical and competent men, *ib.* 75. 115–122——Proposed periodical inspection of boilers when in use, both when under steam and when at rest, *Fletcher* 177——Importance of at least one entire examination every year, when the boiler is at rest, *ib.* 177——Doubt as to the number of inspecting centres to be required, *ib.* 372.

Suggestion as to the provision of certified inspectors under a compulsory system, *Thompson* 575–588. 586. 633–637——Firms might register their engineers as competent inspectors,

Report, 1870—*continued.*

INSPECTION—continued.

5. *Suggestions as to the detailed Arrangements to be adopted*—continued.

inspectors, but these should not inspect their own employers' boilers, *Thompson* 576–583. 586. 633–637.

Evidence in favour of boilers being visited three or four times a-year, and of a thorough inspection at one of these visits, *Hiller* 699. 712 *et seq.*——Considerable difficulty experienced by witness's Company in obtaining facilities for thorough inspection, about one-half of the boilers insured not receiving a thorough inspection yearly, *ib.* 700–703. 707–711. 771——Suggestion as to the provision of inspectors by companies, by steam users, and by boiler makers, respectively, it being undesirable to remove private inspection and responsibility, *ib.* 720, 721. 740–746. 761–763. 766–770——Definition of the class of boilers desirable to be placed under inspection, *Hiller* 739; *Nasmyth* 1153——Suggestion that there be a thorough inspection by a public officer once a year, the boiler to be stopped for the purpose, *Hiller* 745, 746. 751, 752. 857, 858——Contemplated inspection before any boiler is used, but not during construction, 756–760.

Expediency of a thorough inspection, inside and outside, every year, *Richardson* 883, 884. 892. 972–974——Limited time necessary for inspection by competent persons, *ib.* 949–953——Suggestion that one or more Government inspectors be appointed, who should investigate the cause of every explosion which occurs, and should have power to prosecute, *Longridge* 1426, 1427 *et seq.*——Explanation as to the proposed power in the Government inspector to appoint men for examining boilers in certain cases, *ib.* 1492–1497——Practical men necessary for inspectors; how they might be appointed, *Rideout* 2046. 2100, 2101. 2122–2131. 2138.

Evidence in favour of inspection being exercised by the owners of the boilers, upon compulsion, and of inspection also by local bodies founded on the principle of the Manchester Steam Users' Association, which works admirably, *Beyer* 2163 *et seq.*——Proposed compulsory inspection once a year, a certificate being given for a year, *Robertson* 2286. 2295. 2308——General supervision proposed to be exercised by the Board of Trade, rules and regulations being laid down, and a register being kept of all boilers, *ib.* 2287–2290. 2302, 2303. 2321, 2322. 2349.

See also *Boiler Insurance and Steam Power Company. Causes of Explosions. Central Board. Corrosion. Cost of Inspection. Insurance. Local or Municipal Inspection. Magistrates. Manchester Steam Users' Association. Marine Boilers. Midland Steam Boiler Inspection and Insurance Company. National Boiler Insurance Company. New Boilers. Owners of Boilers. Penalties. Railway Boilers. Responsibility. Stoppage of Works. War Department.*

Insurance. Objection to the system of boiler insurance companies as a means of dealing with the question of explosions; inadequate inspection provided, *Sir W. Fairbairn* 6. 74——Operation of three boiler insurance companies in Manchester, *Fletcher* 377–379——Fallacy in relying upon insurance companies as any remedy for the evil of explosions; neglect of efficient inspection by the companies on account of the expense, *ib.* 380–387——Instances of explosions of insured boilers, *ib.* 386, 387——Separate insurance required by the companies as regards loss of life from explosions, *ib.* 388–393——Large dividends paid by some of the insurance companies, *ib.* 400.

Witness submits that the system of insurance, as involving inspection, is a legitimate and useful mode for the prevention of explosions, *Thompson* 498–505——Instances of boilers worked after their insurance has been refused by witness's company; practice of the company as to declining insurance if their requirements are not complied with, hazardous risks not being taken, *ib.* 559–568. 648, 649. 655–662——Several boiler insurance associations at Manchester, *ib.* 621–623—— Small proportion of boilers insured, there being a very large number under inspection, *Hiller* 722–728.

Exceptions taken to the operation of steam-boiler insurance associations, as regards the matter of inspection, *Richardson* 942–945. 979–981——The system of insurance is detrimental rather than conducive to the public safety, the making of profit being the chief consideration, *ib.* 942–945——Uselessness of insurance as a means of securing safety, *Anderson* 1126–1130——Decided objection to compulsory insurance as a means of safety, *Nasmyth* 1232–1241.

Statement as to the value of the insurance element in causing boilers to be placed under inspection, there being about 12,500 boilers now insured and inspected by witness's company, *McNaught* 1253–1258——Inducement to boiler owners to insure even if examination were compulsory, *Longridge* 1506–1514——Small charge for insurance over and above the cost of inspection, *ib.* 1528——Statement as to inspection without insurance being less effectual than with insurance, there being more power over the boilers in the latter case, *Marten* 1819–1841——Refusal of witness to insure his boilers; tendency of insurance to lead to explosions, *Rideout* 2047–2049.

See also *Boiler Insurance and Steam Power Company. Midland Steam Boiler Inspection and Insurance Company. National Boiler Insurance Company.*

Report, 1870—*continued.*

Iron Plates. Suggestion for preventing the use of inferior iron or plates in construction, *Hiller* 684; *Richardson* 1002——Great danger from the use of defective materials, such as inferior and brittle iron in the boiler plates and rivets, *Nasmyth* 1136, 1137——The iron manufacturer who supplies the plates should guarantee the quality, *ib.* 1216.

Inadequacy of inspection as a means of detecting deterioration in the tensile strength of the plates; conclusion that hydraulic pressure is also inadequate for the purpose, *Longridge* 1403, 1404. 1428, 1429. 1526. 1549. 1565——Importance of a check on the use of faulty material; approval of a requirement that the plates be marked with the maker's name, *ib.* 1405, 1406. 1475–1477.

Long period for which some of witness's boilers have worked without deterioration of the plates, *Rideout* 2051–2057——All boiler plates should have the maker's name on them, *Robertson* 2321.

L.

Licensing of Boilers. Suggestion that no boiler be used save it be licensed by the local authority, *Richardson* 969–971.

Local or Municipal Inspection. Objection to a municipal inspection, *Sir W. Fairbairn* 86——Disapproval of local or sectional boards with independent powers of action, *Fletcher* 199, 200. 209–212. 218–225. 229–241——Further statement opposed to local boards, witness recommending that the central board should act locally by means merely of a paid staff of inspectors and others, *ib.* 266–270. 306–317. 329–331. 337, 338. 374–376——Very efficient action of the Manchester Steam Users' Association, whereas witness objects to the formation of similar associations or boards locally, and prefers one board for the whole country, *ib.* 347–353. 370, 371. 380.

Proposal that the inspection and tests be carried out under the corporaton or local board of the district in which the boiler is situated, or under the county authorities in some cases, a competent engineer being kept for the purpose, *Richardson* 886–888. 897–899. 913–921. 960–962. 982–990. 1002–1004——Approval of the inspection being undertaken by the local authorities rather than by Government, *Richardson* 906–921. 936–941. 1015. 1020; *Nasmyth* 1180–1184.

Grounds for objecting to inspectors being appointed by municipal bodies or the county magistrates; more competent men to be appointed by the steam users, *Longridge* 1484–1491. 1515–1519. 1529–1531.

Suggestions in detail for the establishment of associations all over the country, like that at Manchester, and for the formation of a central board by means of members from the local boards; competent inspection to be thus secured, *Beyer* 2173 *et seq.*

Proposition that the local bodies throughout the country should appoint inspectors, subject to the approval of the Board of Trade; the latter should have power also to remove incompetent inspectors, *Robertson* 2287–2291. 2304, 2305. 2314.

See also *Central Board. Inspection,* 4, 5.

Locomotive Boilers. Increased test suggested for locomotive boilers, *Richardson* 994——Means of constructing locomotive boilers so that no grooving will take place, *Fletcher* 1599——Moderate expense at which locomotive boilers may be examined as regards grooving, *ib.* 1600——Very few locomotive boilers insured by witness's company, *Barker* 1654–1656.——*See* also *Railway Boilers.*

Longridge, Robert Bewick. (Analysis of his Evidence.)—Is a mechanical engineer, and is chief engineer and manager of the Boiler Insurance and Steam Power Company 1382–1384.—— Was chief engineer to the Steam Users' Association from 1855 to the end of 1858; explanation as to his reasons for leaving the Association 1385–1390——Statement of the number of proposals by boiler owners to the Boiler Insurance Company, and the proportion refused, through the owners not complying with the conditions required, or refusing to remedy the defects pointed out, 1391–1396. 1471–1474. 1534–1538.

Total of twenty explosions of boilers insured by witness's company; several causes to which attributable, 1397–1402——Inadequacy of inspection as a means of detecting deterioration in the tensile strength of the plates; conclusion that hydraulic pressure is also inadequate for the purpose, 1403, 1404. 1428, 1429. 1526. 1549–1565.

Importance of a check on the use of faulty material; approval of a requirement that the plates be marked with the maker's name, 1405, 1406. 1475–1477——Total of 12,688 boilers under the inspection of witness's company, 1407——Estimate of about 100,000 boilers in the country, 1408–1411——More competent men in charge where there are several boilers, than where there is only one, 1412——Average of about fifty explosions and eighty deaths annually, 1413–1418——Average of one explosion annually in every 4,600 boilers insured by witness's company, 1419, 1420——Number of explosions under different heads, 1421–1423.

Suggestion that one or more Government inspectors be appointed, who should investigate the cause of every explosion which occurs, and should have power to prosecute,

1426,

Report, 1870—*continued.*

Longridge, Robert Bewick. (Analysis of his Evidence)—*continued.*

1426, 1427. 1440 *et seq.*——Expediency also of applying Lord Campbell's Act in cases of culpable negligence, and of otherwise rendering boiler owners liable to heavy penalties and responsibilities, 1426. 1459, 1460. 1520–1525. 1527. 1570——Conclusion that compulsory inspection would not be necessary, and that voluntary inspection would soon become general, if owners were liable to prosecution and punishment, as suggested by witness, 1426 *et seq.*

Opinion that explosions may be reduced to one in 5,000 boilers by careful inspection, 1428——Total of seven explosions and nine deaths in the case of the Steam Users' Association, during 15 years, 1435, 1436——Uselessness of the fusible plug, when it becomes coated with deposit, 1437–1439——Unsatisfactory working of coroners' juries, 1440–1442——Incompetent persons sometimes in charge of boilers, 1447, 1448.

Advantage of inspection before boilers leave the works, and of manufacturers being held responsible: it should, however, be left to the purchasers to select their own inspectors, 1449–1457. 1466–1470. 1498–1507. 1527—Frequent explosions of boilers used in collieries and iron works, 1461, 1462——Main object of witness's company to prevent explosions rather than to make profit, 1463, 1464. 1541, 1542——Expediency of large powers in the proposed Government inspectors in stopping the use of boilers, 1479–1483——Grounds for objecting to inspectors being appointed by municipal bodies or the county magistrates; more competent men to be appointed by the steam users, 1484–1491. 1515–1519. 1529–1531.

Explanation as to the proposed power in the Government inspector to appoint men for examining boilers in certain cases, 1492–1497——Inducement to boiler owners to insure even if examination were compulsory, 1506–1514——Inadequacy of inspection as a check upon explosions through carelessness, these being numerous, 1526. 1547, 1548——Small charge for insurance over and above the cost of inspection, 1528.

Admission as to the great value of inspection, witness contending, however, that a compulsory Government system is not required nor desirable, 1537–1546. 1568–1570——Statement as to internal inspection not being necessarily made by witness's company before insuring each boiler, 1566, 1567——Explanations on the subject of grooving in boilers, this arising mainly from mechanical action, but being partly due to chemical causes, 1571–1586.

Loss of Life. Total of about 160 persons killed and wounded yearly by explosions, *Sir W. Fairbairn* 6–8——About 75 persons are killed yearly, *Fletcher* 132——Numerous instances of the destruction of life and property extending beyond the works where the explosions occur, *ib.* 133, 134. 175, 176——Loss of 922 lives in 11½ years, or about 80 lives annually, *Longridge* 1413–1415.

Statistics relative to the loss of life in different years, *App.* 115, 116.

See also *Railway Accidents.*

M.

McNaught, William. (Analysis of his Evidence.)—Long experience of witness as a practical and consulting engineer; he is now Chairman of the Manchester Boiler Insurance and Steam Power Company, 1243–1246——Explanation as to the origin of this company, and of the Steam Users' Association, respectively, 1247–1251. 1299–1302——Insurance by the company against small or partial damage to boilers as well as against explosions: much larger sums paid by the company for such damages than for explosions, the former being greatly more numerous, 1251, 1252. 1341–1343. 1351–1353.

Statement as to the value of the insurance element in causing boilers to be placed under inspection, there being about 12,500 boilers now insured and inspected by witness's company, 1253–1258——Refusal of about 15 or 20 applications in every 100: 1255, 1256. 1271. 1317, 1318. 1344–1346——Particulars relative to the inspection; competent staff employed for the purpose, 1259–1263. 1286–1288——Peculiarly few explosions of boilers inspected by the company, 1264–1266.

Opinion that efficient inspection throughout the country would prevent three-fourths of the explosions, 1267–1270——Examination favourable on the whole to inspection being made compulsory: that is, as preferable to no inspection at all, 1272–1285. 1294–1298. 1326–1340——Suggestion that competent persons be appointed by Government for attending coroners' inquests, who should act as public prosecutors, 1272. 1275–1284. 1319–1325. 1347–1350. 1356. 1371–1374. 1379, 1380.

Exceptions taken to Government inspection: expediency rather of using the machinery and staff of voluntary and local associations, as at Manchester, 1273. 1281. 1285. 1292, 1293. 1357–1370. 1375–1378——Advantage of increasing the responsibility of boiler-owners, as by an application of the provisions of Lord Campbell's Act, 1282. 1319–1325. 1355, 1356. 1358——Statement of the insurance rates charged by witness's company,

Report, 1870—*continued.*

McNaught, William. (Analysis of his Evidence)—*continued.*

and of the practice of insuring for loss of life as well as for damage, 1289, 1290. 1304–1316.

Doubt as to the effect of Government or compulsory inspection upon the operations of witness's company, 1292, 1293. 1335–1340——Importance of every boiler being inspected and certified before it is used, 1294–1298——Good dividends now paid by witness's company, 1303, 1304——Approval of the system of inspection of marine boilers being extended to other boilers, 1326–1334——Very large proportion of explosions arising from want of water, or from carelessness in some shape, 1351–1353——Fair average of the boilers (as regards quality) of the country insured by witness's company, 1354.

Magistrates (*Inspection of Boilers*). Proposal that on sworn information the justices might order an inspection of any boiler that was dangerous; persons likely to give such information, *Marten* 1787. 1804–1818.

Malconstruction. Original malconstruction adverted to, as causing many explosions, *Nasmyth* 1136; *Fletcher* 136, 137; *Penn* 423-431. 475, 476; *Hiller* 680. 683; *Richardson* 876–880——Particulars of explosions from defective stays, and from malconstruction in other ways, *Fletcher* 142——Obstacle, by means of inspection, to an avoidance of the danger from defective construction, *Nasmyth* 1173–1175——Advantage of an inspection before boilers are set up, in order to detect malconstruction, *Marten* 1738, 1739——Advantage if all boilers were made under inspection, as a check upon malconstruction; suggestions hereon, *Rideout* 2034. 2045. 2080, 2081. 2089. 2099.

Manchester Steam Users' Association. Formation several years ago of the Manchester Steam Users' Association, in accordance with suggestions by witness, as a means of providing a careful inspection of boilers, *Sir W. Fairbairn* 6——The association has been in operation since 1855, and is strictly voluntary, *ib.*——Details relative to the constitution and mode of operation of the association, there being about 2,000 boilers subject to its inspection, and the result being a complete immunity from explosions, *ib.* 6. 72–74. 80–82. 87–91. 103–111——Inspection of boilers in Ireland by the Manchester Association, *ib.* 111.

Illustration afforded by the inspection under the Manchester Association of the great value of a general inspection in detecting sources of danger and in preventing explosions, *Fletcher* 131. 177–184——Great pains taken by the association to obtain information as to the cause of explosions, and to disseminate such information as widely as possible, *ib.* 131——Exceptional instances of explosion in the case of boilers under the inspection of the association, *ib.* 178–180——The total explosions have averaged only one in 10,000 boilers per annum, *ib.* 180——Long distances to which inspectors are sent by the association, *ib.* 370, 371.

Very beneficial operation of the inspection by the Manchester Steam Users' Association, it being desirable to extend this system and to make it compulsory, *Penn* 441, 442. 447–455. 479–481——Beneficial operation generally of the Manchester Association, witness approving of an extension of the system as a means of providing universal inspection, *Anderson* 1042–1049. 1073–1078. 1107–1114——Beneficial testimony to the inspection exercised by the association, *Nasmyth* 1142, 1143.

Witness was chief engineer to the Steam Users' Association from 1855 till the end of 1858; explanation as to his reasons for leaving the association, *Longridge* 1385–1390——Total of seven explosions and nine deaths in the case of the Steam Users' Association, during 15 years, *ib.* 1435, 1436.

Explanation that the Steam Users' Association have had but one explosion during the last 572 years in respect of guaranteed boilers; occurrence also of one explosion of an unguaranteed boiler, *Fletcher* 1588–1595—— Unfairness of debiting the Association with explosions where the boilers are unguaranteed; very few such boilers, *ib.* 1590, 1591. 1596——Application of all the receipts of the association to inspections and scientific investigations, *ib.* 1591–1593.

See also *War Department.*

Manholes. Occurrence of many explosions through weak manholes, the plates not being strengthened round the opening with a substantial mouthpiece, *Fletcher* 139–141.

Marine Boilers. Information relative to, and approval of, the Government inspection of marine boilers, *Penn* 456–474. 478——The inspectors are appointed by the Board of Trade at the principal ports, *ib.* 457. 463, 464——Belief that there is a quarterly inspection, *ib.* 478——Approval of the system of inspection of marine boilers being extended to other boilers, *McNaught* 1326–1334.

Particulars relative to the inspection to which marine boilers are subjected by the officers of the Board of Trade, the inspection being compulsory only as regards passenger vessels, *Galloway* 1876–1883. 1887–1889. 1923–1926——Rare instances of explosion of marine boilers; particulars of some which have occurred, *ib.* 1889–1898. 1939–1942.

Report, 1870—*continued.*

Marine Boilers—continued.

1939–1942. 1988–1990. 2006–2008——Advantage of the Board of Trade inspection as not relieving the owners from responsibility, it not being compulsory, save in the case of passenger vessels, *ib.* 1898. 1901 *et seq.*——Improvement if the inspection were once a year instead of every six months, so as to be more thorough, *ib.* 1899, 1900.

Practice of inspection of marine boilers; improvement if all steam-vessels, as well as passenger vessels, were subject to inspection, *Robertson* 2323–2326. 2350–2358

Marten, Edward Bindon. (Analysis of his Evidence.)—Is chief engineer to the Midland Steam Boiler Inspection and Insurance Company, 1734, 1735——Beneficial operation of the company, 1736. 1776–1782—— Difficulty in judging whether explosions generally are on the increase or decrease, 1737——Advantage of an inspection before boilers are set up, in order to detect malconstruction, 1738, 1739——Instance of explosion of a cylindrical boiler after some repairs had been done, 1740–1744.

Statistics of explosions since the year 1800; particulars more especially relative to the explosions within the last four years, and their causes, 1745–1756——Estimate of 100,000 boilers in the country, 1752. 1796, 1797——Number and character of the inspections made by witness's company, 1757–1765. 1795. 1819–1827. 1842–1845——System of inspection without insurance, and rate of charge in such case, 1766–1775. 1819–1832.

Grounds for objecting to a compulsory or Government inspection of boilers; difficulty as to the mode of carrying it out, 1783–1786. 1792. 1800. 1846–1855——Benefit anticipated from a recommendation by the Committee in favour of periodical inspection, 1786, 1787. 1800–1803——Suggestion that each explosion be reported on by two independent engineers or inspectors; approval of these being appointed by the local authorities rather than by Government, 1787. 1790–1794. 1856–1873——Advantage of power to use the evidence of the proposed engineers at coroners' inquests, 1787. 1856–1858.

Proposal that on sworn information the justices might order an inspection of any boiler that was dangerous; persons likely to give such information, 1787. 1804–1818—— Approval of a penalty for non-compliance with the instructions laid down, 1790—— Statement as to inspection without insurance being less effectual than with insurance, there being more power over the boilers in the latter case, 1819–1841.

Materials. Construction of Boilers. See *Malconstruction. Iron Plates.*

Midland Steam Boiler Inspection and Insurance Company. Origin of this company in order to extend the advantages of inspection and insurance to the boilers used in the South Staffordshire iron and coal trade; subsequent extension of the company to the Cleveland district, *Barker* 1603. 1608–1611.——Total of about 3,000 boilers insured by the company, about 1,000 of which are owned by the directors, *ib.* 1604–1607——Particulars relative to three explosions of boilers insured by the company, *ib.* 1612, 1613. 1629–1633—— Estimate of about 20,000 boilers in the districts dealt with by the Midland Company, of which 3,000 only are insured and inspected by the company, *ib.* 1643–1645——Insurance rates of the company adverted to; very small profits divided, this being a secondary consideration, *ib.* 1649–1651. 1662, 1663.

Beneficial operation of the company as tending to reduce the number of explosions in the district where it works, *Marten* 1736. 1776–1782 ——Information relative to the number and character of the inspections made by the company, one thorough inspection being insisted on as a condition of insurance, *ib.* 1757–1765. 1795. 1819–1827. 1842–1845.

N.

Nasmyth, James. (Analysis of his Evidence.)—Has had great experience as an engineer and boiler maker, 1132–1134 —— Enumeration of six different heads under which boiler explosions arise, it being possible, in the great majority of cases, to prevent explosion by means of inspection, 1135 *et seq.*—— Frequency of explosions from corrosion, which often results from unseen or inaccessible leakage; suggestions for the detection and removal of this source of danger, 1136. 1143–1154. 1158–1172. 1200–1202—— Occurrence of many explosions from defective repairs, 1136, 1137.

Original malconstruction adverted to as causing many explosions, 1136—— Great danger from the use of defective materials, such as inferior and brittle iron, in the boiler plates and rivets, 1136, 1137——Frequency of bad workmanship in rivetting and putting plates together, this being a further cause of explosions, 1137. 1151–1154. 1156, 1157 ——Dangerous results of short supply of water, both directly and indirectly, 1137. 1192 Over-pressure adverted to as a further source of danger, 1137.

Expediency of the owners of boilers being under the strongest possible pressure, in the shape of self-interest, to carry out an efficient inspection, 1138–1141. 1176–1178. 1185, 1186——Necessity of the inspection being compulsory, 1140. 1179 —— Beneficial inspection exercised by the Manchester Steam Users' Association, 1142, 1143——Severe test suggested

Report, 1870—*continued.*

Nasmyth, James. (Analysis of his Evidence)—*continued.*

suggested by means of water-pressure; consideration of the mode of applying this test, 1147–1150. 1187–1191. 1200–1210.

Considerable difficulty, by means of inspection, in always detecting corrosion or leakage, 1152–1154. 1170–1172. 1201——Definition of the class of boilers desirable to be placed under inspection, 1155——Difficulty in accounting for the grooving or corrosion which shows itself in the plates; opinion that it arises from chemical rather than mechanical action, 1162–1172. 1218–1229——Obstacle, by means of inspection, to an avoidance of the danger from defective construction, 1173–1175.

Approval of the inspection being undertaken by the local authorities rather than by Government, 1180–1184——Advantage of rules being laid down, and of penalties for their infraction, 1184. 1211——Possibility of explosion through vibration arising when the steam is being let out of the boiler at the starting of the engine, 1192–1199——Expediency of responsibility attaching to the boiler maker as well as the boiler user, 1213–1217——Decided objection to compulsory insurance as a means of safety, 1230, 1231——Approval of compulsory inspection of railway engines; suggestion as to the test desirable, 1232–1241.

National Boiler Insurance Company. Explanation of the charges of witness's company for insurance of boilers, there being an enhanced charge where the pressure is above 40 lbs. for the inch, *Thompson* 508–514. 526–539——Particulars relative to the number and character of the inspections made by the company, there being always an inspection of each boiler before insurance, and three or four inspections during the year, *ib.* 515–517. 521–523. 540–543. 571–574. 603–607. 613. 638–641——System of inspection, without insurance, for which the company charge from 15 *s.* to 18 *s.* per boiler per annum, including about three visits from the inspector, *ib.* 518–520.

Total of 2,000 boilers now insured by the company, the number having decreased of late, *Thompson* 524, 525. 589, 590——Responsibility of the company to the extent of the insurance, for damage done by explosions to surrounding property, *ib.* 537. 539——Inspection by the company of boilers over the whole country; particulars hereon as to the inspecting staff, and the expenses of inspection, *ib.* 544. 591–608. 618–620——Good dividends paid by the company, there being also a reserve fund, *ib.* 545–551. 646–650.

Circumstance of about half the shareholders in the company being steam users, *Thompson* 569, 570——Absence of liability for loss of life, *ib.* 609–612——The boilers are not always thoroughly inspected internally every year, *ib.* 573——Occurrence of an explosion last year, in the case of a boiler insured and inspected by the company; this was through carelessness as to the water, *ib.* 614–617——Total of three serious explosions, in six years, of boilers insured by witness's company, *ib.* 642——Calculation that the explosions are less than one in 1,000 boilers annually, *ib.* 665–672.

Practice generally of witness's company not to insure beyond 500 *l.*, *Hiller* 764, 765——Valuable operation of the company in preventing explosions and loss of life, *ib.* 772——Information relative to an explosion near Middleton, in which case the boiler had been accepted for insurance by witness's company at 60 lbs. pressure, but through some difficulty as to a thorough inspection the insurance was withdrawn, *ib.* 787–801. 826–832——Reference to certain inspection reports, as showing the character of the inspections, *ib.* 832——Doubt as to the actual number of thorough inspections made by the company; considerable number of insured boilers not yet thoroughly inspected, *ib.* 839–848.

New Boilers. Proposal that all new boilers be tested by the makers, who should give a certificate, to be checked by subsequent official inspection, *Richardson* 997–1002——Advantage of inspection before boilers leave the works, and of manufacturers being held responsible; it should, however, be left to the purchasers to select their own inspectors, *Longridge* 1449–1457. 1466–1470. 1498–1507. 1527——Approval of inspection of new boilers before they are set up, *Marten* 1738, 1739——Proposal that surveyors or inspectors appointed directly by the Board of Trade should examine and certify every new boiler before it is used, *Robertson* 2287. 2290. 2300, 2301. 2308–2316. 2349. 2372, 2373.

Number of Boilers. Enhanced importance of preventive measures since boilers have been so universally adopted, *Fletcher* 134——Estimate of about 100,000 boilers in the country, *Fletcher* 181, 182; *Longridge* 1408–1411; *Marten* 1752. 1796, 1797.

Number of Explosions. Average of about fifty explosions in England annually, whereby about 160 persons are killed and wounded, *Sir W. Fairbairn* 6–8——Statistics of explosions recorded by the Manchester Steam Users' Association from 1855 till 1869, *Fletcher* 131–135——There are now about fifty explosions annually, killing about seventy-five persons, and injuring as many more, *ib.* 132——Average of about fifty explosions and eighty deaths annually, *Longridge* 1413–1418——In 1869 there were sixty-three explosions, *ib.* 1421——Difficulty in judging whether explosions generally are on the increase or decrease, *Marten* 1737.

Tabular

Report, 1870—*continued.*

Number of Explosions—continued.

Tabular statement of explosions from 1st January 1870, to 18th June 1870, showing the description of boiler, and the number of persons killed or injured in each case, *App.* 115.

Table showing the number of explosions recorded by the Manchester Steam Users Association from the commencement of 1855 to the end of 1869, together with the number of persons killed, and the number injured in each year, *App.* 116.

O.

Owners of Boilers. Circumstance of owners of inferior boilers holding aloof from inspection by the Manchester Association, *Fletcher* 281–286——The owners of boilers are often culpable in not applying proper supervision, *Thompson* 506——It should be imperative on steam users to report defects, *Richardson* 892. 973, 974——Objection to the inspection being controlled by the steam users, instead of by the local authorities, *ib.* 977, 978. 982–990.

Expediency of the owners of boilers being under the strongest possible pressure in the shape of self-interest, to carry out an efficient inspection, *Nasmyth* 1138–1141. 1176–1178. 1185, 1186.——Efficient inspection already carried out by numerous steam users, there being however very many who do not take proper precautions; question hereon whether a compulsory system is not desirable as regards the latter, *Barker* 1618. 1623; *et seq.*

Immunity of witness's boilers from explosion, owing to the great care taken, and the employment of competent managers, *Rideout* 2027–2032——Opinion as to an inspection by the Steam Users Association, or by any strange inspector, being of little use, in witness's case, *ib.* 2071, 2072. 2085–2087. 2129, 2130——Careful inspection exercised by witness's firm; assistance derived also from the Steam Users Association, *Beyer* 2163–2168.

See also *Central Board.* *Compensation.* *Cost of Inspection.* *Manchester Steam Users Association.* *Responsibility.*

P.

Penalties. Approval of several penalties under a system of compulsory inspection, if uninspected boilers are used, *Thompson* 557, 558. 628–630——Necessity of penalties in connection with the proposed inspection, *Hiller* 719; *Richardson* 891. 975, 976; *Marten* 1790——Proposed penalty of 100 *l.* in the event of owners using uncertificated boilers, *Robertson* 2298, 2299. 2369–2371.

Penn, John. (Analysis of his Evidence.)—Malconstruction of boilers and carelessness of management adverted to as causing the chief explosions which occur, 423–431. 475, 476——Conclusion that compulsory inspection would prevent the great majority of explosions, witness not being prepared however to suggest how such inspection should be carried out, 432 *et seq.*——Very beneficial operation of the inspection by the Manchester Steam Users Association, it being desirable to extend this system and to make it compulsory, 441, 442. 447–455. 479–481——Information relative to, and approval of the Government inspection of marine boilers, 456–474. 478.

Plans. Advantage if there were plans or diagrams for public inspection in each town, showing full details in connection with each boiler, *Richardson* 947. 1002.

Platt Brothers & Co. There are about forty boilers in use by the firm, no explosion having ever occurred, *Richardson* 874, 875.

Pressure. See *High Pressure.*

R.

Railway Accidents. The deaths from explosions are far in excess of those from railway accidents, where the latter arise from circumstances beyond the passengers control, *Fletcher* 132——Much larger number of deaths from railway accidents, than from boiler explosions, *Barker* 1705–1709.

Return of the number of railway passengers killed and injured by circumstances beyond their control in each year, from 1865 to 1869 inclusive, as compared with the deaths from explosions in the same period, *App.* 117.

Railway Boilers. Difficulty as to a systematic or public inspection of railway or locomotive boilers, it being desirable to leave the inspection with the companies, *Hiller* 854–856.

Report, 1870—*continued.*

Railway Boilers—continued.

861–865——Approval of compulsory inspection of railway engines; suggestion as to the test desirable, *Nasmyth* 1232–1241——Opinion that there is already an efficient inspection of railway or locomotive boilers, *Beyer* 2157–2162. 2196–2201. 2258, 2259; *Robertson* 2306, 2307. 2359.

Re-appointment of Committee. Recommendation that the Committee be re-appointed early next Session, in order to complete the inquiry and report thereon, *Rep.* iii.

Registration of Boilers. Conclusion favourable to a compulsory registration of all boilers, and of certain arrangements in connection therewith for insuring inspection, *Thompson* 552–556. 575–583. 626–637; *Hiller* 712–718——Objection to a compulsory registration of boilers, *Galloway* 1943——Suggestions for a registration of every boiler, *Rideout* 2045. 2073–2079——Advantage of all boilers being registered, and of inspection before registration, *Beyer* 2195. 2244, 2245——Advantage of a register at the Board of Trade of all new boilers, *Robertson* 2288. 2321, 2322.

Repairs. Occurrence of many explosions from defective repairs, *Nasmyth* 1136, 1137.

Reports. Contemplated report by the local inspection authorities to the Board of Trade, *Richardson* 963–966. 1015–1020.

Suggestion that each explosion be reported on by two independent engineers and inspectors; approval of these being appointed by the local authorities rather than by Government, *Marten* 1787. 1790–1794. 1856–1873.

Responsibility. Question of responsibility considered in connection with a system of compulsory inspection, *Sir W. Fairbairn* 42–49. 63–71. 182; *Fletcher* 228. 242–252——Grounds for objecting to Government taking the responsibility of inspection, *Hiller* 720, 721. 740–746. 761–763. 766–770——Expediency of responsibility attaching to the boiler maker as well as the boiler user, *Nasmyth* 1213–1217——Advantage of increasing the responsibility of boiler owners, as by an application of the provisions of Lord Campbell's Act, *McNaught* 1282. 1319–1325. 1355, 1356. 1358; *Longridge* 1426. 1459, 1460. 1520–1525. 1527. 1570.

Way in which compulsory inspection is undesirable as interfering with the owner's responsibity, *Galloway* 1901 *et seq.* 1969–1979; *Rideout* 2046. 2050. 2070–2073. 2091–2098——Increased liability or responsibility contemplated in the event of explosions of boilers not inspected or certified; at the same time the certificate should not exempt from responsibility, *Galloway* 1908. 1912, 1913. 1918–1922. 1932–1938. 1950–1952. 1973——Explanation that the proposed inspection should not relieve the owner from any responsibility, *Robertson* 2292, 2293. 2340–2345.

See also *Inspection. Owners.*

Richardson, William. (Analysis of his Evidence.)—As one of the firm of Platt Brothers & Co., and as a member of the Steam Users Association, has had considerable experience on the subject of boilers, 869–875——Origin of explosions chiefly from weakness in the boiler, and from inattention, 876–880——Suggestion for testing boilers by hydraulic pressure at fifty per cent. above the working pressure; detection thereby of any weakness or defect likely to cause explosion, 881, 882. 884. 889, 890. 928–935. 967, 968. 991–996——Expediency also of a thorough inspection, inside and outside, every year, 883, 884. 892. 972–974.

Necessity of compulsory regulations, 885, 954——Proposal that the inspection and test be carried out under the corporation or local board of the district in which the boiler is situated, or under the county authorities in some cases, a competent engineer being kept for the purpose, 886–888. 897–899. 913–921. 960–962. 982–990. 1002–1004——Necessity of penalties in connection with the proposed inspection, 891. 975, 976——The owners of the boilers should pay the cost of inspection, 894——Estimate of 10*s.* per boiler per annum as the average cost of inspecting and testing the boilers in Oldham, 900–905. 992–997. 1005–1011.

Objections to central or Government control of the proposed inspection, it being much better to leave the matter to the local authorities, 906–921. 936–941. 1015–1020——Suggestion as regards the making of rules and regulations for inspection, to be sanctioned by the Board of Trade, 936–941. 1004——Exceptions taken to the operation of steam-boiler insurance associations, as regards the matter of inspection, 942–945. 979–981.

Occurrence of several accidents from corrosion in the setting of boilers, 946–948——Advantage if there were plans or diagrams for public inspection in each town, showing full details in connection with each boiler, 947. 1002——Limited time necessary for inspection by competent persons, 949–953——Preventible character of a very large number of explosions, 955——Necessity, where there is only one boiler, of stopping work whilst internal inspection is being made, 956–959.

Contemplated report by the local authorities to the Board of Trade, 963–966. 1015–1020——Suggestion that no boiler be used, save it be licensed by the local authority, 969–971

Report, 1870—*continued.*

Richardson, William. (Analysis of his Evidence)—*continued.*

969-971——Objection to the inspection being controlled by the steam users, instead of by the local authorities, 977, 978. 982-990——Increased test suggested for locomotive boilers, 994.

Proposal that all new boilers be tested by the makers, who should give a certificate, to be checked by subsequent official inspection, 997-1002——Suggestion for preventing the use of inferior iron or plates in construction, 1002——Explanation as to the less cost of the proposed inspection than of that carried out by the Steam Users Association, 1005-1014.

Rideout, William Jackson. (Analysis of his Evidence.)—Is owner of extensive paper mills in Lancashire: has twenty-one boilers at his different works, 2021-2026——Immunity of these boilers from explosion, owing to the great care taken and the employment of competent managers, 2027-2032——Ample provision of safety valves and water gauges, 2032. 2058——Uselessness of fusible plugs when incrustation forms, 2033.

Advantage if all boilers were made under inspection; suggestions hereon, 2034. 2045. 2080, 2081. 2099——Means by which witness is enabled to gauge the thickness of plates and to detect whether they have become deteriorated by corrosion, 2035-2039. 2059-2061——Objection to using the water test at double the working pressure, 2040, 2041.

Suggestions for a registration of every boiler, 2045. 2073-2079——Proposal that all stokers and attendants be examined and certified, and that any subsequent misconduct be marked on the certificate; how the examination might be conducted, 2045. 2062, 2063. 2068, 2069. 2088. 2090. 2102-2119——Evidence opposed to a compulsory periodical inspection of boilers, as beset with many difficulties, and as interfering with the owners' responsibility, 2046. 2050. 2070-2073. 2091-2098.

Practical men necessary for inspectors: how they might be appointed, 2046. 2100, 2101. 2122-2131. 2138——Refusal of witness to insure his boilers: tendency of insurance to lead to explosions, 2047-2049——Long period for which some of witness's boilers have worked without deterioration of the plates, 2051-2057.

Means of examination of boilers embedded in brickwork, &c., 2064-2087——Opinion as to an inspection by the Steam Users Association, or by any strange inspector, being of little use in witness's case, 2071, 2072. 2085-2087. 2129, 2130——Expediency of inspection during the erection of boilers, 2099——Further suggestions on the subject of managers and stokers being certificated: expediency of some exceptions being allowed to this rule, 2119, 2120. 2132-2137. 2139-2150.

Robertson, Captain Robert, R.N. (Analysis of his Evidence, &c.)—Is Surveyor General of Steam Vessels under the Board of Trade, 2278, 2279——Considers that many boiler explosions may be prevented by inspection, and that compulsory periodical inspection should be applied, 2280-2285. 2349, 2350——Proposed compulsory inspection once a year, a certificate being given for a year, 2286. 2295. 2308——Suggestion that the local bodies throughout the country should appoint inspectors, subject to the approval of the Board of Trade: the latter should have power also to remove incompetent inspectors, 2287-2291. 2304, 2305. 2314.

Proposal that surveyors or inspectors appointed directly by the Board of Trade should examine and certify every new boiler before it is used, 2287. 2290. 2300, 2301. 2308-2316. 2349. 2372, 2373——General supervision proposed to be exercised by the Board of Trade, rules and regulations being laid down, and a register being kept of all boilers, 2287-2290. 2302, 2303. 2321, 2322. 2349——Explanation that the proposed inspection should not relieve the owner from any responsibility, 2292, 2293. 2340-2345.

Suggestion that the inspectors be paid by means of fees to be charged for each survey; practice hereon in the survey of marine boilers, 2294-2297. 2327, 2328. 2346-2348. 2374-2376——Proposed penalty of 100 *l.* in the event of owners using uncertificated boilers, 2298, 2299. 2369-2371——Efficient inspection already in the case of railway or locomotive boilers, 2306, 2307. 2359——Necessity of survey in the case of agricultural boilers, 2307. 2360-2365.

Difficulty of an annual inspection in some instances, as where there is only one boiler in use, 2317-2320——Practice of inspection of marine boilers; improvement if all steam vessels, as well as passenger vessels, were subject to inspection, 2323-2326. 2350-2358——Doubt as to the expediency of requiring an examination of the men in charge of boilers, 2329-2339.

Rules and Regulations. Suggestions as regards the making of rules and regulations for inspection, to be sanctioned by the Board of Trade, *Richardson* 936-941; *Robertson* 2302——Reference to some rules in force as regards the War Office boilers, which might be adopted generally, *Anderson* 1039, 1040. 1050.

S.

Safety Valves. Instances of bad safety-valves, and bad water gauges, as having caused explosions, *Fletcher* 142–148——Liability to explosion where the safety valve is bad, *Hiller* 691——Control exercised as regards the safety valves to marine boilers, *Galloway* 1883——Ample provision of safety valves and water gauges for witness's boilers, *Rideout* 2032, 2033——Precaution suggested on the subject of safety-valves, *Robertson* 2316.

Setting of Boilers. Great importance of a check upon the materials used in construction, and upon the setting up of the boiler before it is used, *Hiller* 810–823——Occurrence of several accidents from corrosion in the setting of boilers, *Richardson* 946–948——Expediency of inspection during the erection of boilers, *Rideout* 2099——Belief that many explosions take place from defective erection, *ib.*

Small Boilers. Importance of an inspection of small boilers as well as of large ones, *Fletcher* 340–346. 367–369.

Steam Users. See *Central Board. Manchester Steam Users Association. Owners of Boilers. National Boiler Insurance Company.*

Stokers. See *Attendants.*

Stoppage of Works. Necessity, where there is only one boiler, of stopping the works whilst internal inspection is being made, *Richardson* 956–959——Difficulty of an annual inspection in some instances, as where there is only one boiler in use, *Robertson* 2317–2320.

Sunday Inspection. Exceptional instances of Sunday inspection by witness's company, *Hiller* 866, 867.

T.

Testing of Boilers. Expediency of not testing boilers much in excess of their working pressure, *Sir W. Fairbairn* 53–58. 126——Contemplated testing of boilers by hydraulic pressure before leaving the maker's yard, *Fletcher* 177——Suggestion for testing boilers by hydraulic pressure at fifty per cent. above the working pressure; detection thereby of any weakness or defect likely to cause explosion, *Richardson* 881, 882. 884. 889, 890. 928–935. 967, 968. 991–996.

Severe test suggested by means of water pressure; consideration of the mode of applying this test, *Nasmyth* 1147–1150. 1187–1191. 1200–1210——Conclusion as to the inadequacy of hydraulic pressure as a means of detecting deterioration in the plates, *Longridge* 1551–1565——Objection to using the water test at double the working pressure, *Rideout* 2040, 2041.

Thompson, Charles, J. P. (Analysis of his Evidence.)—Is chairman of the National Boiler Insurance Company, at Manchester, which has been in operation since 1864; 489, 490——Considers that careful periodical inspection would prevent nearly all the explosions occurring from carelessness and from neglect to remedy defects, 491–497. 506, 507——Submits that the system of insurance, as involving inspection, is a legitimate and useful mode for the prevention of explosions, 498–505——The owners of boilers are often culpable in not applying proper supervision, 506.

Explanation of the charges of witness's company for insurance of boilers, there being an enhanced charge when the pressure is above 40 lbs. to the inch, 508–514, 526–539——Particulars relative to the number and character of the inspections made by the company, there being always an inspection of each boiler before insurance, and three or four inspections during the year, 515–517. 521–523. 540–543. 571–574. 603–607. 613. 638–641——System of inspection, without insurance, for which the company charge from 15*s.* to 18*s.* per boiler per annum, including about three visits from the inspector, 518–520.

Total of about 2,000 boilers now insured by the company, the number having decreased of late, 524, 525. 589, 590——Responsibility of the company, to the extent of the insurance, for damage done by explosions to surrounding property, 537. 539——Inspection by the company of boilers over the whole country: particulars hereon as to the inspecting staff, and the expenses incurred in inspection, 544. 591–608. 618–620——Good dividends paid by the company, there being also a reserve fund, 545–551. 646–650.

Conclusion favourable to a compulsory registration of all boilers, and of certain arrangements in connection therewith for insuring inspection, 552–556. 575–583. 626–637——Approval of several penalties, under a system of compulsory inspection, if uninspected boilers are used, 557, 558. 628–630——Instances of boilers being worked after their insurance has been refused by witness's company; practice of the company as to declining insurance if their requirements are not complied with, hazardous risks not being taken, 559–568. 648, 649. 655–662.

Report, 1870—*continued.*

Thompson, Charles J. P. (Analysis of his Evidence)—*continued.*

Circumstance of about half the shareholders in the company being steam users, 569, 570——Suggestion as to the provision of certified inspectors under a compulsory system, 575-583. 586. 633-637——Small proportion of boilers inspected out of the total number in the country, 584-588——Calculation that each boiler costs witness's company from 12*s.* 6*d.* to 15*s.* a year in inspection, 591-602. 608. 673——Absence of liability for loss of life, 609-612.

Occurrence of an explosion last year in the case of a boiler insured and inspected by the company; this was through carelessness as to the water, 614-617——Several boiler insurance associations at Manchester, 621-623——Objection to a central inspection control in London, 624, 625——Total of three serious explosions, in six years, of boilers insured by witness's company, 642.

Value of a patent plug used by the company in preventing explosions from shortness of water, 642. 663, 664——Amount of compensation paid by the company, 643——Recent explosion near Chadderton, the insurance having previously fallen through, 644, 645. 651-658——Calculation that the explosions are less than one in 1,000 boilers annually in the case of witness's company, 665-672.

V.

Vibration. Possibility of explosion through vibration arising when the steam is being let out of the boiler at the starting of the engine, *Nasmyth* 1192-1199.

Voluntary Inspection. See *Inspection*, 3, 4. *Local or Municipal Inspection. Manchester Steam Users Association.*

W.

War Department. As superintendent of machinery to the War Department, witness explains the careful system adopted in testing and inspecting the boilers of the department, the result being an immunity from explosions, *Anderson*, 1022 *et seq.*——Thorough inspection, yearly or oftener, of the War Department boilers by the Manchester Steam Users Association, an annual fee of three guineas being paid for each boiler: importance attached to this inspection, in addition to the test and inspection by the department, *ib.* 1030, 1031. 1038. 1043, 1044. 1049. 1079-1085. 1103-1106. 1112-1125——Test of each boiler at double the working pressure after every 500 hours, *ib.* 1030-1034. 1092-1102——Competent men by whom the departmental inspection is carried on, *ib.* 1069-1072——Frequent detection of defects in the War Department boilers, which, but for inspection, would cause explosions, *ib.* 1116, 1117.

Water Gauges. Occurrence of some explosions through the water gauges being fixed too low, *Hiller* 692.

Water Supply. Comparatively few explosions through the water being allowed to run short, *Fletcher* 136, 137——Probability of explosions which occur when the engine has just started being due to lowness of water, *Henderson* 1066, 1067——Dangerous results of short supply of water, both directly and indirectly, *Nasmyth* 1137. 1192——Very large proportion of explosions arising from want of water, or from carelessness in some shape, *McNauyht* 1351-1353.

See also *Fusible Plug.*

Workmanship. Frequency of bad workmanship in rivetting and putting plates together, this being one cause of explosions, *Nasmyth* 1137. 1151-1154. 1156, 1157.

INDEX

TO THE

REPORT

FROM THE

SELECT COMMITTEE

ON

STEAM BOILER EXPLOSIONS.

Ordered, by The House of Commons, *to be Printed,*
21 *July* 1870.

370. *Under* 3 *oz.*

REPORT

FROM THE

SELECT COMMITTEE

ON THE

TELEGRAPH ACTS EXTENSION BILL:

TOGETHER WITH THE

PROCEEDINGS OF THE COMMITTEE,

AND

MINUTES OF EVIDENCE.

Ordered, by The House of Commons, *to be Printed,*
5 *July* 1870.

Friday, 10*th June* 1870.

Ordered, That the Telegraph Acts Extension Bill be read a second time, and committed to a Select Committee.

Monday, 20*th June* 1870.

Ordered, That the Select Committee do consist of Seven Members:—Marquis of Hartington, Sir Stafford Northcote, and Five to be nominated by the Committee of Selection.

Tuesday, 21*st June* 1870.

The following Members are added by the Committee of Selection to the Select Committee on the Telegraph Act Extension Bill:—

Sir Lawrence Palk.
Mr. Hurst.
Mr. Neville-Grenville.
Mr. J. D. Lewis (Devonport).
Mr. Muntz.

Monday, 27*th June* 1870.

Ordered, That all Petitions presented on or before Monday, the 27th instant, against the Telegraph Acts Extension Bill, be referred to the Select Committee on the said Bill; and that such of the Petitioners as pray to be heard by themselves, their Counsel, or Agents, be heard upon their Petitions, if they think fit, and Counsel heard in favour of the Bill against the said Petitions.

Ordered, That the Committee have power to send for Persons, Papers, and Records.

Ordered, That Three be the Quorum of the Committee.

Friday, 1*st July* 1870.

Ordered, That the Petition of the Jersey Railway Company [presented 29th June], praying to be heard by Counsel against the Bill, be referred to the Select Committee on the Bill.

Monday, 4*th July* 1870.

Ordered, That the Parties appearing before the Select Committee on the Telegraph Acts Extension Bill, have leave to print the Minutes of the Evidence taken before the Committee day by day, from the Committee Clerk's Copy, if they think fit.

Tuesday, 5*th July* 1870.

Ordered, That the Committee have power to report the Minutes of Evidence taken before them to the House.

REPORT - - - - - - - - - - - - p. iii
PROCEEDINGS OF THE COMMITTEE - - - - p. iv
MINUTES OF EVIDENCE - - - - - - - - p. 1

REPORT.

THE SELECT COMMITTEE on the TELEGRAPHS ACTS EXTENSION BILL have considered the said Bill and taken Evidence thereon, which they have agreed to Report to the House; and have examined the Allegations of the Bill and found the same to be true, and have gone through the Bill, and made Amendments thereunto.

5 *July* 1870.

PROCEEDINGS OF THE COMMITTEE.

Friday, 1*st July* 1870.

MEMBERS PRESENT:

The Marquis of Hartington.	Mr. Hurst.
Sir Stafford Northcote.	Mr. Muntz.
Sir Lawrence Palk.	Mr. J. D. Lewis (Devonport).
Mr. Neville-Grenville.	

The MARQUIS of HARTINGTON was called to the Chair.

TELEGRAPH ACTS EXTENSION BILL.

Preamble read the first time.

Counsel:—Mr. *Denison*, Mr. Serjeant *Sargood*, Mr. *C. J. Simpson*, and Mr. *T. W. Wheeler*.

Agent:—Messrs. *Wyatt & Co.*

The following Petitions were read:—

1. Submarine Telegraph Company.

   Counsel:—Mr. *Merewether*.

   Agent:—Messrs. *Dorington*.

2. Channel Islands Company.

   Counsel:—Mr. *Webster*.

   Agent:—Messrs. *Manning & Co.*

3. William Thomas Henley.

   Counsel:—Mr. *Bidder*.

   Agent:—Mr. *Gale*.

4. Jersey and Guernsey Company (Limited).

   Counsel:—Mr. *Johnson*, and Mr. *Ledgard*.

   Agent:—Messrs. *Wilson & Co.*

Mr. *Denison* was heard to open the case in support of the Preamble, and to object to the *locus standi* of the Channel Islands Company.

Mr. *Merewether* was heard in support of the Petition of the Submarine Telegraph Company and submitted a Clause, and called Mr. *Stephen M'Donnell Clare*, who was examined.

Mr. Serjeant *Sargood*, in support of the Preamble, called Mr. *Frank Ives Scudamore*.

Room cleared.—The Committee deliberated.

Preamble read a second time and verbally amended.

Question, That the Preamble as amended is proved,—put, and *agreed to*.

The Committee decided that they could not agree to the Clause submitted by Mr. Merewether.

Parties called in and informed thereof.

Adjourned till Monday next, at Eleven o'clock.

Monday, 4th July 1870.

MEMBERS PRESENT:

The MARQUIS of HARTINGTON in the Chair.

Sir Stafford Northcote.	Mr. J. D. Lewis (Devonport).
Mr. Neville-Grenville.	Sir Lawrence Palk.
Mr. Muntz.	Mr. Hurst.

Jersey Railway Company:—

Counsel:—Mr. *Freeman.*

Agents:—*Tilleard & Co.*

Mr. *Webster* was heard in support of the *locus standi* of the Channel Islands Company, and called—

Mr. *David De Quetteville,* and Mr. *Frederick William Lewis,* who were severally examined.

Mr. Serjeant *Sargood* was heard in reply.

Room cleared.—The Committee deliberated, and determined that the *locus standi* of the Channel Islands Company was not proved to their satisfaction.

Parties called in, and informed thereof.

Mr. *Johnson* was heard in support of the Petition of the Jersey and Guernsey Company, and submitted a Clause for the consideration of the Committee.

Mr. Serjeant *Sargood* was heard on behalf of the Promoters of the Bill.

Mr. *Johnson* was heard in reply.

The Committee decided that they could not agree to the proposed Clause.

Mr. *Bidder* was heard on behalf of William Thomas Henley, and submitted a Clause.

[Adjourned till To-morrow, at Eleven o'clock.

Tuesday, 5th July 1870.

MEMBERS PRESENT:

The MARQUIS of HARTINGTON in the Chair.

Mr. Neville-Grenville.	Mr. J. D. Lewis (Devonport).
Mr. Lawrence Palk.	Mr. Hurst.
Mr. Muntz.	

Mr. *Bidder* on behalf of the Petition of William Thomas Henley, called—

Mr. *Nathaniel John Holmes,* who was examined.

Mr. *David De Quetteville,* who was further examined; re-called.

Mr. *William Thomas Henley*, who was examined.

Mr. *Nathaniel John Holmes*, who was further examined; re-called.

Mr. *William Henry Preece*, who was examined.

Mr. *Frank Ives Scudamore*, who was further examined; re-called.

The Committee decided that they could not agree to the proposed Clause.

Mr. *Freeman* was heard in support of certain Clauses on behalf of the Jersey Railway Company, and called Mr. *William Henry Lefeuvre*, C.E., who was examined.

The Committee decided against the admission of the proposed Clauses.

The Committee went through the Bill, Clause by Clause, and made amendments.

Several new Clauses added.

Schedule considered, amended, and *agreed to*.

Ordered, "That the Bill, as amended, together with the Minutes of Evidence, be reported to the House."

MINUTES OF EVIDENCE.

LIST OF WITNESSES.

Friday, 1*st July* 1870.

MINUTES OF EVIDENCE.

Friday, 1*st July* 1870.

MEMBERS PRESENT:

Marquis of Hartington.	Mr. Neville-Grenville.
Mr. Hurst.	Sir Stafford Northcote.
Mr. J. D. Lewis.	Sir Lawrence Palk.
Mr. Muntz.	

THE RIGHT HONOURABLE THE MARQUIS OF HARTINGTON, IN THE CHAIR.

Mr. *Stephen McDonnell Clare*, called in; Examined by Mr. *Merewether*.

Mr. *S. M. Clare.*

1 July 1870.

1. ARE you Secretary to the Submarine Telegraph Company?—Yes.

2. And you know all about their affairs; is there still existing a Submarine Telegraph Company and a French Company, or are they one?—They are perfectly one.

3. Therefore my learned friend, Mr. Denison, was not correct in saying there were two companies?—No; they are two distinct capitals, but they are identically one. We are under a working agreement, which makes us identically one; we work under the same concessions.

4. How long has that agreement been in existence?—For many years, but I cannot tell you exactly the date of the agreement.

5. You are now carrying messages from England to France, are you not?—Yes.

6. Did the French Company ever traverse that same route?—The French Company was established, I think, in the year 1851 or the year 1850, under a concession granted by the Emperor of the French, and the Chartered Company had a concession to Belgium incorporated by Royal Charter. The concessionaires of the French line were in some cases, or perhaps in all, the concessionaires of the Belgium line, and they entered into a practical working agreement together, with a joint purse, taking out all the expenses, and they are managed by a joint board of management, and composed of the gérants of the French Company and the directors of the English Company.

7. Did the French Company ever pass messages from France to England, and the reverse?—I do not know that I can answer that question, because it was before my time; but I think not.

8. I do not think it is necessary to prove that agreement through you, because it is going to be confirmed by a clause; but is it the fact, that you have been in the habit of transmitting by your submarine telegraph to France messages for Jersey, which have been worked back to Jersey from France?—Yes, we send all messages from Jersey by France.

9. Have you four miles of land line in Jersey?—We have a land line between Gorey and St. Helier's, and, I dare say, it is four miles.

10. Being possessed of those lines, and so working that telegraph, if you recollect, this morning my learned friend, Mr. Denison, mentioned a telegram, and I asked you at the time whether you brought that telegram, and you answered, "Yes"?

Mr. *S. M. Clare.*

1 July 1870.

"Yes"?—Yes, that is the case, because there is no other means of bringing telegrams.

11. Have you made an arrangement with the Postmaster General by which there is a division of the sums received by you, at present, for sending those messages from England to Jersey?—Certainly.

12. Without troubling you with the details of what they produce, would you tell the Committee what proportion each takes of the receipts of that telegram?—Yes, under the agreement of 1868 the Submarine Telegraph Company are to receive one-fourth for their expenses, and the Postmaster General takes one-fifth for the rental of his land line, and then, after deducting the sum of the one-fourth and the one-fifth from the total charge, the remainder is divided equally between the Postmaster General and ourselves, so that practically you may say that the Postmaster General gets rather more than we do.

13. That is to say, that on your present line to Jersey the Postmaster General gets rather more than half the receipts on the messages?—Yes.

14. Has that worked fairly and well?—We have worked it since the Postmaster General acquired the lines of the various telegraph companies; and we have divided the traffic in that proportion.

15. You have had your money, I presume, and have paid him his?—It is a matter of account. We have had no money yet, but we shall get it, of course, by-and-by.

16. However, there is no complaint about it?—No, there is no complaint. The Postmaster General is, unfortunately, our debtor, and we are not his; but I am quite satisfied that we shall be paid.

17. But there has been this arrangement going on, about which neither has expressed any discontent?—Yes.

18. Then is it true, that you, hearing, since January, that my learned friend, Mr. Johnson's company, the new company, was proposing to lay its cable, have entered into negotiations with them for certain purposes?—Yes, certainly; they were going to lay this cable down, and it was understood that they had entered into some agreement with the Postmaster General, and we proposed to enter into a working agreement with them; and, in fact, an agreement was approved by my board, and approved, also, by the Jersey Board, as I understand.

19. Did your board approve of the heads of this agreement?—Yes.

20. Was there a board resolution?—Undoubtedly.

21. As far as you know and have ascertained from Mr. Lefeuvre, did the other company also approve?—Yes, certainly.

22. Have you your books here?—I have not, but I could supply it; I was not aware that it was required, or I could have produced it; I am quite prepared to say that there is a resolution of our board.

23. Of course, you cannot speak of having seen the resolution of the other company, the new company; but, so far as you know, you have never heard of anything urged by them as disapproving of those heads of agreement?—On the contrary; all that I have heard goes to show that their board approve of the agreement.

24. You being satisfied yourself, and, as far as you know, the other company being satisfied, did you send those to the Postmaster General?—Our solicitor sent the heads of this agreement to Mr. Ashurst, I believe, the solicitor to the Post Office, but I do not know the date.

25. As far as you recollect, was that about the 6th of April?—I should think it was about that time.

26. At that time had you any knowledge that the Government proposed to adopt this line to Jersey?—Undoubtedly not.

27. Mr. Scudamore says that he has told you, "We do not complain of his holding any information back;" did you receive a letter on May the 16th, saying that the Government had come to that conclusion?—Yes, I received the letter, and I dare say you are right as to the rate; I think, a day or so before I had the letter, he told me so verbally.

28. That would make a difference in the interval in which you were left, since you had written on the 6th of April, of a month and eight days instead of a month and ten days?—Yes.

29. However, there was a considerable interval, and it was only about that date, or say two days before that, Mr. Scudamore told you in conversation?—Yes.

Mr. *S. M. Clare.*

1 July 1870.

30. As part of the heads of that agreement did you look to getting a rent from the New Jersey Telegraph Company, which, without troubling the Committee with the figures, would have given you a considerable amount per annum?—Yes, we were to have a commission, I think, of 6 *d.* per message, and then a minimum sum of 800 *l.* a year. You seem to think that we were only to have 800 *l.* a year, but we might have had considerably more under that agreement.

31. Of course all that is now at an end, provided the Government are invested with these telegraphs?—Yes.

32. So that you would lose all that you have been making. They would lose their share of the telegrams to France and Jersey, and you would lose the effect of the bargain, whatever it might be, be it 1 *s.*, or be it 1,000 *l.* a year?—We should lose our proportion, but I think the Postmaster General would get more by laying down this cable than he would if the agreement between ourselves and the Postmaster General had not been disturbed.

33. That is to say, he will get all?—Yes, and that all will be considerably more than the half which he gets now.

34. My learned friend is anxious that those heads of agreement should be put in; if there is any doubt about it will you read it?—I will: "Heads of a proposed agreement between the Jersey and Guernsey Telegraph Company and the Submarine Telegraph Company, April 1870. The Jersey and Guernsey Telegraph Company to lay down a cable between some point on the English coast, near Dartmouth, and Guernsey, and from thence to Jersey; the Jersey and Guernsey Telegraph Company to erect a land wire in connection with the cable at Dartmouth, to bring the same from Dartmouth into the Submarine Telegraph Company's office in London, and to supply the necessary instruments for working the same; the Jersey and Guernsey Telegarph Company to place a wire in connection with the cable at Jersey, to bring the same into the Submarine Telegraph Company's office at Jersey, and to supply the necessary instruments for working the same; the Jersey and Guernsey Telegraph Company to establish an office at Guernsey, and to provide clerks and messengers and everything necessary for working the cable or cables, or collecting and delivering messages at Guernsey, and pay the salaries and wages of such clerks and messengers and all other incidental expenses; the Jersey and Guernsey Telegraph Company to pay to the Submarine Telegraph Company a commission of sixpence per message of 20 words, increasing by threepence for every addition of 10 words or less than 10 words, upon all messages transmitted over the Jersey and Guernsey Telegraph Company's cable or cables, but the sum to be thus paid by the Jersey and Guernsey Telegraph Company to the Submarine Telegraph Company shall never be less than 66 *l.* 13 *s.* 4 *d.* for each and every month during the continuance of this agreement, the first month to be calculated from the day upon which the cable is open for traffic. The Jersey and Guernsey Telegraph Company at their own expense to repair and maintain the cable or cables and the land lines connected therewith, and to pay all charges or demands that may be made on the Submarine Telegraph Company by the Postmaster General in respect of messages transmitted by means of the Jersey and Guernsey Telegraph Company's cable or cables. In consideration whereof, the Submarine Telegraph Company undertake to work the cable of the Jersey and Guernsey Telegraph Company between London and Guernsey and Jersey, and provide all clerks and messengers at London and Jersey necessary for this purpose, and pay the salaries and wages of such clerks and messengers and all incidental expenses. The Submarine Telegraph Company undertake to transmit all messages received by them originating in the United Kingdom or elsewhere, and destined for Jersey or Guernsey, and all messages received by them at Jersey destined for Guernsey, or any place in the United Kingdom, by the cable or cables of the Jersey and Guernsey Telegraph Company so long as such cables are in working order. The Submarine Telegraph Company to render accounts at the end of each and every month, showing the sum collected by them in that month for the transmission of messages by the lines of the Jersey and Guernsey Telegraph Company between London and the Channel Islands, and *vice versâ*, and to pay over to the Jersey and Guernsey Telegraph Company, in the course of the succeeding month, such sum, less the sum due to the Submarine Telegraph Company for commission, as aforesaid, upon all messages transmitted by the cable or cables of the Jersey and Guernsey Telegraph Company, or the sum of 66 *l.* 13 *s.* 4 *d.*, whichever is the larger; and the sum collected by the Jersey and Guernsey Telegraph Company for the trans-

Mr. *S. M. Clare.*

1 July 1870.

mission of messages beyond the United Kingdom. This agreement to be in force for seven years from date of opening of cable for public traffic, terminable by a notice to be given in writing six months before the termination of the seven years, and, failing such notice, the agreement to be in force for another seven years, to be terminated by a similar notice."

35. Had you, prior to presenting those heads of agreement to the Jersey Company, had a communication from Mr. Ashurst, of the Postmaster General's Office, of the heads of agreement which he had made, that is to say, which the Postmaster General had made with the Jersey and Guernsey Company?—I do not recollect that paper at all. I do not think that I have ever seen any paper of the kind to which you are referring.

Mr. *Scudamore.*] It could not be so, because we never made an agreement with the Jersey and Guernsey Company.

36. Mr. *Merewether* (to the *Witness*).] Have I used the wrong word in speaking of the Jersey Company?—I cannot say that I have seen any documents from Mr. Scudamore, or from the Post Office, or any arrangement entered into or intended to be entered into between the Postmaster General and our Company.

37. If you do not know it I will not ask you about it. Is it upon that condition of things that you are here to ask for compensation to your company for losing that which you are carrying out in conjunction with the Postmaster General, and which you believe, as far as you know, if the Postmaster General, had not interfered, you would have carried out in conjunction with him?—Exactly so.

Cross-examined by Mr. *Simpson.*

38. You do a considerable traffic, I think, with France and the Continent generally?—Yes, a large traffic.

39. Has the Postmaster General anything to do with that traffic; does he derive any benefit from it?—Yes, he takes the same proportion as he would of the Jersey cable.

40. I mean traffic which never comes to England; traffic between the Channel Islands and France, the ultimate destination of which is not England?—Between Jersey and the rest of the world except England. Yes, certainly, we should take one-fourth, and after deducting that he would have a half.

41. Take the case of a message between Jersey and Paris?—I will take that case between Jersey and Paris. If you refer to the agreement of the 11th of July 1868, you will find that it is distinctly stated in the preamble of that agreement, that the traffic in the Channel Islands cable is to be put into the joint purse in the same way as the traffic earned by all the other cables belonging to the Submarine Telegraph Company. That being the case, he would be naturally entitled to his proportion of the traffic between Jersey and Paris.

42. Just as if Jersey had been the Isle of Wight?—Just so.

43. In truth, for all purposes of your agreement with the Postmaster General, the Channel Islands are treated as if they formed part of the United Kingdom, are they not?—Exactly, only you must make this distinction; that between Jersey and Paris, the case you cited, the Postmaster General has no land wire, and therefore he gets nothing. We should take a fourth for our expenses, and then we should take half of the three-fourths.

44. And that traffic will not be interfered with?—Of course not.

45. And you do not claim, and cannot claim, of course, any compensation for that?—I am not asking for compensation for that.

46. Under your agreement with the Postmaster General, the Channel Islands are practically treated as part of the United Kingdom, are they not?—Yes.

47. Then as to the land line, is it in Jersey or is it in Guernsey?—It is in Jersey, between a place called Gorey and St. Heliers.

48. That is the only land line?—That is the only land line.

49. And you have the free use of that notwithstanding the monopoly Bill of last year?—Yes, and we have been sending messages by it.

50. You are not aware of anything, I suppose, either in the proposed Bill or in the Bill of last year, which will prevent your continuing to have the free use of that land line for all purposes after this Bill has passed?—No; I take it, that if this

Bill

Bill is passed, we shall not be allowed to send any local messages between Gorey and St. Heliers, because if the Postmaster General is to have the monopoly, we are denied the right of sending messages, I take it.

51. My learned friend, Mr. Merewether, asked the question whether the Postmaster General wished to buy any portion of your undertaking. Of course, until your undertaking is bought, the Act of 1869 will not come into effect?—If the Postmaster General is to be the only person to send messages in the Channel Islands, I do not see how I can send messages.

52. What I wish to get out is this: whether the compensation which you are asking in respect of land lines is required for local messages?—The agreement which I have referred to does not refer to that local line at all; but when we come to the question of compensation, we shall certainly take the loss of that traffic, whatever it may be, between St. Heliers and Gorey, into consideration.

Re-examined by Mr. *Merewether.*

53. I understand that you do not put that four miles of line as the main ground of your compensation, but it is an additional ground?—It undoubtedly is; it supplements the other claim.

54. When I asked Mr. Scudamore just now whether there was not a doubt whether they might desire to purchase our line, I was referring not to that, but to the whole line from England to France?—I took that to be the meaning of your question.

55. Now, supposing this Bill is passed, do you believe that you should be enabled to send any messages by that telegraph which comes back from Jersey, inasmuch as you would have so much shorter a route?—No doubt; but again, suppose that the cable which the Postmaster General lays down between Jersey and England, is broken, then it seems to me very doubtful if the Postmaster General is to have a monopoly of the Channel Islands, whether we could send a message by our own route.

56. I will not give you an off-hand opinion upon that, but I think you could?—Then how does this infringe on the privileges of the Postmaster General applying for a telegraphic communication between Great Britain and the Channel Islands?

57. Are these the two alternatives, that you will either, if you are right, not be able to send any messages at all, or at any rate, that you will send very much fewer than you have hitherto done in conjunction with the Postmaster General?—I take it that we shall not send any.

58. Are not these the two alternatives, that you either will, if you are right, be not able to send any, or that if you were entitled to send any, you would send very much fewer than you had hitherto done in conjunction with the Postmaster General?—Yes.

59. *Chairman.*] You maintain, I understand, that you could have prevented the Jersey and Guernsey Company from connecting their lines with ours, supposing this Bill had not been introduced, and the Jersey and Guernsey undertaking had been carried out?—Do you put this question; supposing the Jersey and Guernsey Telegraph Company had laid down that line, could we, the Submarine Company, have protested against the Postmaster General connecting the land line, so as to form a communication between London and the Channel Islands? I think we could.

60. Is not that what you rest your claim on altogether?—No.

61. Sir *Stafford Northcote.*] But on what ground could you have made that protest?—It would have been under the agreement of the Magnetic Telegraph Company, between the Magnetic Telegraph Company, and the Submarine Company, incorporated with the agreement of the 11th of July 1868, between the Submarine Company, and the Postmaster General.

62. That is the same that we have heard read?—Yes.

63. Mr. *Muntz.*] In your proposed resolution, or agreement, I think you stated that you had on your minutes a resolution to receive the 800 *l.* a year?—To the best of my belief the minute ran somewhat in this way: "Considered and approved of heads of the agreement submitted by the secretary to be entered into between this Company, and the Jersey and Guernsey Telegraph Company."

64. You are not aware whether the same resolution was entered on the books of

Mr. *S. M. Clare.*
1 July 1870.

of the company which was to pay you?—I do not know of my own knowledge, but I believe it to be so from the statement that I have heard.

65. With regard to the 800 *l.* you were to receive annually as the minimum, what was that for?—We had so much per message, and we made the best bargain that we could; and these gentlemen agreed to give us 800 *l.* a-year as the minimum, and we took it.

66. What did they getfor their 800 *l.*?—They got the messages, and we did the work for them.

67. You mean that they could not have laid down their wire without your consent?—I cannot say that. I mean to say this: that we undertook, instead of sending messages by our own line, to send them by theirs, and that we would pay all the expenses for working the wire here and in Jersey, and therefore we stipulated for this 800 *l.* to pay us those expenses.

68. You were to bear the expenses of the company here?—We were to bear the expenses of working the wire.

69. Sir *Lawrence Palk.*] And the laying the wire?—No; the Jersey and Guernsey Company were to lay the cable and to make the arrangement with the Postmaster General to take this wire from the landing-place in England and to bring it to our office.

70. Mr. *Muntz.*] The 800 *l.* would not have been a clear profit to you; you would have had to deduct certain expenses?—Yes; no doubt there are certain expenses that would have had to be deducted.

[The Witness withdrew.

Mr. *Frank Ives Scudamore*, called in; and Examined by Mr. Serjeant *Sargood.*

Mr.
F. I. Scudamore.

71. You are one of the Secretaries of the Post Office?—I am.

72. And I think that you have had, I may say, pretty well the conduct of all the inquiry in 1868 and 1869, when the Government Acts were brought in?—Yes.

73. With the knowledge which you then had, and your experience acquired since, is it, in your opinion, advisable for the purpose of protecting the public revenue that the provisions of the Telegraph Acts of 1868 and 1869 should be extended to the Channel Islands?—It is.

74. And you propose for that purpose by this Bill, to bring them within the description of the United Kingdom, which is the neatest way of making them subject to the provisions of those two Acts?—I do.

75. I think that there are some other alterations that are deemed to be necessary; perhaps you will just mention them to the Committee?—The chief alteration is to include the Isle of Man also within the provisions of the Bill.

76. I think it is a very short Bill; a very practicable one. I believe that is about all the subject-matter?—It is.

Cross-examined by Mr. *Bidder.*

77. Mr. Denison told the Committee in his opening that there have been negotiations between what we call the new company (the Jersey and Guernsey Company, I think they call themselves) the Channel Telegraph Company, and your department, in the year 1869?—I did not understand him to say that.

78 It will be in the recollection of the Committee, Mr. Denison said, to show that they had been in the field before us, that even early in 1869 there had been negotiations between them and the Post Office. Now, I ask you whether you have any knowledge of any such negotiations?—My memory does not serve me quite precisely as to that date, because there has been a perfect shifting kaleidoscope of companies about this Channel Islands cable for the last two years. To the best of my belief it was the old Channel Islands Company that negotiated with us in 1869, and it did not rise out of the larva of the old company into the fly of the new company till 1870.

79. Mr. Denison was incorrect, therefore, when stating that you had been in negotiation with the Jersey and Guernsey Company in the year 1869?—I did not understand him to say so.

80. There were communications, were there not, with Mr. Lefeuvre representing the

the old company, up, I think it was stated, to January 1870?—There were communications with Mr. Lefeuvre, as the representative of the old company, but up to what precise date I cannot say, without reference to the documents.

81. Are they all in the room?—I am not sure. If we have another meeting, I will produce the precise dates.

82. Will you produce the correspondence?—Yes (*producing the same*).

83. Now will you tell me, so far as you know, the earliest date upon which any communication was made by, or on behalf of the Jersey and Guernsey Company, to the Post Office, in respect of anything connected with cables to the Channel Islands?—I should not like to give you the earliest dates without reference to all the documents; but I should think very early in the beginning of this year, in the month of January, if not rather earlier than that.

84. I should be glad to have this rather precisely, because you see the date of their registration; we know that they were registered as a company on the 20th of January 1870?—You shall have it with the utmost precision when I have been able to refer to the documents.

85. That also you promise to give me at our next meeting?—Certainly.

86. Now will you tell me this, whether you are not aware that an application was made to the Post Office for permission to complete the arrangements in respect of laying down a line of cable in connection with the old company, to the start point, by Mr. Stoffel in December 1869?—Mr. Stoffel made an application, which is in the room, and which has been read; being asked whether he made that application as the representative of the old company, he distinctly said, in writing, that he did not.

87. Will you produce the letters?—That is his first application (*handing it in*), and my answer is on the back of it.

88. This I see is dated the 21st December 1869?—Yes.

89. He stated that he was then "completing the necessary arrangements for laying a new and efficient submarine telegraph cable;" he made "application to you for information as to the terms upon which the Government would be willing to receive messages;" then you said that you would give me the answer?—My reply is on the back.

90. "I am directed by the Postmaster General to acknowledge the receipt of your letter," and so on; that was read by my learned friend Mr. Denison?—Yes.

91. Will you give me his answer?—"In answer to your favour of the 28th ultimo, I beg to inform you that the letter I addressed on the 21st ultimo was not as representative of the Channel Islands Telegraph Company; but as a principal, connected with the majority of the commercial interest of the Islands, who are completing arrangements with me for making and laying an efficient submarine cable."

92. Now can you tell me what further answer was given to that application?—None.

93. Then will you explain to the Committee the reason why that application being made, and it being stated that the arrangements were being completed, no answer whatever was given by your department to the application?

Mr. Serjeant *Sargood* objected to the question, on the ground that Mr. Bidder was not entitled to ask it as representing Mr. Henley.

94. Mr. *Bidder.*] Is it usual in your office when a communication is made to the department in a public capacity upon a public subject, that answers should be given to such communications?—There are occasions on which it is not desirable to reply to letters.

95. Was this considered by the department an occasion on which it was not desirable to make any answer?

Mr. Serjeant *Sargood* objected to the question.

96. Mr. *Bidder.*] I may take it, however, that whatever was the reason of the decision, no answer whatever was given to that application?—No answer was given.

97. *Chairman.*] What is the date of that last letter?—The 5th of January 1870.

98. Mr. Stoffel's second letter?—Yes.

Mr. *F. I. Scudamore.*

1 July 1870.

99. Mr. *Bidder.*] And I may take it that many weeks elapsed and no answer was given?—No answer has been given up to the present time.

100. Were further applications made to your department by Mr. Stoffel?—Here is one other letter of the 30th of January.

101. That was a letter of his, calling your attention to the prospectus of a new public company: "Since I had the honour of last addressing you, several public meetings have been held in Jersey, in favour of my proposal, and I have secured the co-operation of the chief commercial interests of the island. I have, you are doubtless aware, received the necessary letters of authority for landing the cable, from the Board of Trade and the Office of the Woods and Forests." Now, it was stated by Mr. Denison that that was not true; have you made any application to the Board of Trade or the Office of the Woods and Forests, to ascertain whether that statement was correct or not?—If the Board of Trade had given that permission, they would have communicated it to the Post Office, and they have not.

102. My question was, have you made any application to the Board of Trade or the Woods and Forests, to ascertain whether that statement was correct or not?—I have made no application, it not being necessary to do so.

103. Looking at that letter, I see in a note in your own handwriting, that "this is utterly untrue;" what was the source of your information from which you made that note?——

104. Sir *Stafford Northcote.*] I wish to ask you why the Channel Islands were not included in the Act of 1869?—The real cause was inadvertence. We did not consider, until it was extremely late; so late that to have put them in and brought forward fresh opponents, would have been to imperil the Bill, that the Channel Islands and the Isle of Man were not part of the United Kingdom.

105. If they had been included in that Act, this question of compensation would not have arisen?—No, except from the old Channel Islands Telegraph Company, and the Submarine Company.

106. Taking the situation as it stands at present, you have said that you are satisfied that it is expedient now to extend the provisions of the Act, to the Channel Islands. Would you shortly state why?—I am perfectly satisfied of this, that the people of the Channel Islands and the Isle of Man, who for postal purposes are included in the United Kingdom, and have the benefit of the uniform penny rate of postage, will never rest until they have in some way or other got themselves brought within the uniform shilling rate for telegraphic communication. It is only a question of time as to how soon they would be able to put sufficient pressure on the Government to bring them within the operation of that rate. All the while that they were doing that, we should be exposed from day to day to the starting up of fresh companies to carry on the communication which the Government had not established. I think there are other reasons, Imperial reasons, why it is desirable to bring all parts of what you may really call the United Kingdom, although it is not legally so, within telegraphic communication. Alderney is an important station; it is very desirable indeed that the Government should, in case of war, have communication with that station, instead of being obliged, as at present, to send its communications through France. Somewhat similar reasons, would, no doubt, apply to bringing the Isle of Man within the definition of the United Kingdom.

107. Practically the Government have the power, have they not, of preventing any company from laying a cable to the Channel Islands from having the power of preventing them from landing?—It is not quite clear that they have that power absolutely. There are parts of the foreshore which are not in the possession of the Government, and where a company might obtain the consent of private individuals.

108. Upon the whole, you are satisfied that the only good way of bringing the Channel Islands into communication with the United Kingdom through the telegraph, subject to the control of the Government, is by a Bill of this character?—Yes.

109. Mr. *Hurst.*] Are there not some other islands besides Guernsey, Jersey, Alderney, and Sark in that group, islands not inhabited, I mean, which this Bill ought to be extended to, because cables might be landed there and carried on from there to the other islands, and so escape this Bill?—I am not able to say that, but I will make inquiry before the Committee meet again on that point.

110. Sir

Mr. *F. I. Scudamore.*

1 July 1870.

110. Sir *Lawrence Palk.*] Why do you not put "all other rocks and islands"? —That is rather wide. We will get an engineer's opinion or an Admiralty opinion.

111. Mr. *Muntz.*] Supposing we were to allow all these applications to make lines for the Channel Islands in competition one with the other, would not the price be reduced as low as your shilling?—No.

112. Not by competition?—It would not pay.

113. It certainly would not pay, but might they not do it?—They would not do it, except in the hope of eventually coming to Government and saying "Buy."

114. *Chairman.*] Would there be a considerable inconvenience to the department if two cables were permitted to be laid between the Channel Islands and this country; would you not be obliged to unite the land wires with both of them? —Certainly, and we should be exposed to continual complaints from both of them. They would say that messages that had gone by the one ought to have gone by the other, although the public had expressed no preference that they should go by the other. The same thing arises in the case of the lines to India; scarcely a day passes without our being accused of having favoured the Indo-European or the Falmouth, Malta, and Gibraltar Company. And we are also put to additional expense by the duplicate lines.

[The Witness withdrew.

Monday, 4th July 1870.

MEMBERS PRESENT:

Marquis of Hartington.	Mr. Neville-Grenville.
Mr. Hurst	Sir Stafford Northcote.
Mr. J. D. Lewis.	Sir Lawrence Palk.
Mr. Muntz.	

THE RIGHT HONOURABLE THE MARQUIS OF HARTINGTON, IN THE CHAIR.

Mr. *David De Quetteville*, called in; Examined by Mr. *Webster*.

Mr. *D. De Quetteville.*

4 July 1870.

115. You are the Deputy Chairman of the Channel Islands Company, are you not?—I am.

116. How long have you been a director of that company?—Since 1858.

117. I presume from that that you were one of the promoters?—I was.

118. Are there a number of other inhabitants of Jersey interested in it?—Half the shares were taken up in the Channel Islands between Jersey and Guernsey.

119. I think that your first capital was 25,000 *l.*, increased——

Mr. Serjeant *Sargood* objected to the question.

120. Mr. *Webster* (to the *Witness*).] The company was duly registered, was it?—It was.

121. And, so far as you know, have all the Acts of the Registration Office been properly complied with?——

Mr. Serjeant *Sargood* objected that the documents must be called for and put in.

122. Mr. *Webster* (to the *Witness*).] Is it within your knowledge that authority was from time to time given for the proper documents being prepared?—I believe it was.

123. And you believe that they have been done?—I believe they have.

124. You were registered in 1858, and I think your capital was subsequently increased?—It was.

125. I presume that that was one of the facts duly returned to the Registration Office?—I believe so.

126. Is it within your recollection that that increase of capital was authorised?—It is.

127. Mr. *Webster* (to the *Witness*).] You made an agreement with the Government, I think?—We did.

128. And you laid lines of telegraph wires?——

Mr. Serjeant *Sargood* objected to the question.

129. Mr. *Webster* (to the *Witness*).] Will you tell us in your own way, so that I may not go wrong, to satisfy my learned friend, if possible, what has become of the seal?—As the learned gentleman has stated, I have been travelling on the Continent, and, consequently, we could not get a meeting of the board in Jersey, but I received a letter——

130. Just tell us what became of the seal?—The seal remained with our secretary, Mr. Bennett; when I applied for it Mr. Bennett told me that it was no more in his possession, but had been taken possession of by the Post Office authorities.

131. Mr. Serjeant *Sargood*.] At what date did he tell you this?—A few days ago,

Mr. *D. De Quetteville.*
4 July 1870.

ago, on my arrival in London, he said that it had been taken possession of by the Post Office authorities, when they took over the International Companies' offices. I then applied to the Solicitor of the Post Office, Mr. Ashurst, who very kindly gave me this paper, dated the 27th June 1870 : "I see no objection to the seal of the Channel Islands Telegraph Company (Limited) being delivered up to the representatives of that company." This was signed by Mr. Ashurst, the solicitor, and approved by Mr. Scudamore. With that document I went back to Mr. Bennett, who then came over with me to the offices of the International Company, and ordered a search to be made for this seal. Mr. Bennett's impression was that it had remained in his desk. However, that desk could not be found, and, I must add, that the Solicitor of the Post Office was kind enough to say, that if the seal could not be found, no objection would be taken to the absence of the seal.

132. Mr. *Webster.*] This Bill was introduced on the 25th of May, I think ?—Yes.

133. When did you first hear of it ?—I really could not say.

134. Were you abroad at that time ?—No, I was not abroad in May.

135. Did you shortly afterwards hear of it from two of your colleagues ?—I heard of it from two of my colleagues since my arrival in London ; they could not communicate with me whilst I was on the Continent, for the very reason that nobody knew exactly where I was ; I had been travelling about, moving from one place to another.

136. Did you receive authority from them to sign this petition ?—I did ; it is a letter from our solicitor, Mr. Hawksworth.

137. Is Mr. Hawksworth the solicitor to the company ?—He has been employed by us.

Mr. Serjeant *Sargood* objected that this letter could not be evidence.

138. Mr. *Webster* (to the *Witness*).] Had you authority from your two colleagues to sign that petition ?—I had.

139. Are three a quorum ?——

Mr. Serjeant *Sargood* objected to the question.

140. Mr. *Webster* (to the *Witness*).] Had you the authority of those two colleagues ?—I had the authority of the only acting directors of the Channel Islands Telegraph Company.

141. *Chairman.*] Who are they ?—Messrs. Gosset and Carrel.

142. Will you explain what you mean by the acting directors ?—I mean this : that the other directors, particularly those connected with the International Company, resigned their seats the moment that the International Company had sold their interest in the company to the Government.

143. Mr. *Webster.*] Was Mr. Lefeuvre chairman of the rival company ?—Yes.

144. Was he formerly a director of your company ?—He was.

145. Mr. *Neville-Grenville.*] When was the last regular meeting of the company prior to this Bill held ; can you produce a minute of it ?—The last meeting was, as far as I can remember, held in Jersey in the early part of this year ; it must have been in the latter part of last year.

146. I suppose that there is some minute of that meeting ?—There is some minute of that meeting. Those books are now in the room, I believe, in possession of gentlemen connected with the rival company.

147. Mr. *Muntz.*] When was the meeting before that held, as nearly as you can remember ?—There was a meeting before that. A few months before that, when Mr. Grimstone resigned, I was here in London, and I was then trying to get up a cable, and with every chance of success.

148. Mr. *Webster.*] The honourable Member asked when the last meeting was ; do you know in whose possession the minute books are ?—The minute books, I believe, are in this room, and in possession of gentlemen connected with the rival company.

149. Is Mr. Lefeuvre the chairman of that company ?—He is.

150. Was he in this room on Friday ?—Yes, he was.

151. I hold here a return to the Joint Stock office, of the 9th of July 1869——

Mr. Serjeant *Sargood* objected that this was not the issue.

Mr. *D. De Quetteville.*

4 July 1870.

152. Mr. *Webster* (to the *Witness*).] I need hardly ask you whether the introduction of this Government Bill has practically suspended your proceedings?

Mr. Serjeant *Sargood* objected to the question.

Witness.] There has been worse than that; there has been an illegal interference of the Government.

The *Chairman* intimated that the Committee could not go into this point.

153. Sir *Lawrence Palk* (to the *Witness*).] Was there any meeting of the directors by which you were authorised to put your signature to this petition?—I received an authority——

154. Was there any meeting of the directors of the board, at which meeting you were authorised by the board to put your name to this petition?—I am not aware that there was.

155. Mr. *J. D. Lewis.*] Do you produce the minute books of your meetings?—They are in the room, but in the possession of gentlemen connected with the other company.

156. Mr. *Webster.*] Had you any opportunity of calling a meeting of the directors?—I think that I have explained that that could not be; I was travelling on the Continent. Had I been in Jersey I would have called a meeting, undoubtedly.

157. Sir *Lawrence Palk.*] But no meeting was called?—There was no possibility of calling a meeting in my absence.

158. Mr. *Webster.*] I think that Mr. Bennet, your secretary, had left you?—The fact is that Mr. Bennet has not acted for the company for a great many years, although he has nominally remained the secretary.

159. Mr. *Muntz.*] Who is the secretary?—Mr. Bennet. He was the cashier, I believe, or the accountant of the International Company.

160. Is he still your secretary?—Nominally; but he has not acted as secretary.

161. Mr. *Webster.*] I think he signed the returns to the Joint Stock Office?—

Mr. Serjeant *Sargood* objected to the question.

162. Mr. *Webster* (to the *Witness*).] Do you know anybody else who would sign if it was not Mr. Bennett?—No; the fact is that the papers were always signed.

Cross-examined by Mr. Serjeant *Sargood*

163. You have spoken of some minute books of which some one else has possession?—Yes.

164. You do not suppose that any of your proceedings with regard to this petition are to be found in those minute books, I suppose?—No.

165. Do you know down to what date the absent minute books do record your proceedings?—I think I have already explained that there had been no proceedings latterly on account of my absence.

166. Down to what date do you think the absent minute books record your proceedings?—I think I have already stated, that so far as I can recollect, the last regular board meeting we held was in Jersey, at the latter end of last year.

167. And you think that the minutes are in those absent books?—I believe so, up to that date.

168. You have been told by somebody some tales about those books getting into the possession of the Post Office; at what period do you suggest that they came into the possession of anybody else?—I never said it about the books; I merely mentioned the seal.

169. Then the books had, down to the end of last year, been in your possession?—I can easily explain, if you will allow me, how it is that they are in the possession of the gentlemen to whom I have alluded.

170. That I did not ask you to explain, and I do not much care about it for the present. My learned friend will ask you, when he re-examines you, if he wants it, but down to that period they were in the possession of you and your friends?—They were in the possession of Mr. Bennett, the secretary.

171. Of the authorised people?—Yes.

172. Since then has there ever been a directors' meeting, the minutes of which were

were capable of being put into those books, supposing that you had had possession of them?—No, for this reason, that the books were in London.

173. But that is not a reason?—It appears to me to be a very valid reason. We could not insert the minutes of our proceedings in books which were not in our possession.

174. You have mistaken my question entirely. My question to you was since that period which you have suggested; has there ever been a meeting of your board, the minutes of which could have been put in those books if you had had them?—I believe that we have had several meetings.

175. Then probably, the regular books being absent, some other books were used for the purpose?—I do not know that there were. Perhaps there may have been some minutes of proceedings taken at the time, but of that I could not be positive; it was done generally.

176. Did your secretary attend the meetings?—The secretary was in London.

177. Did he attend the meetings?—No.

178. Where were the meetings held?—In Jersey.

179. Have your board meetings been always held there?—They have been, I should say, generally held in London. We have had a few meetings in Jersey.

180. Up to the end of last year, did you ever know of meetings of your board being held anywhere except in London?—We have had, at different times, meetings in Jersey among the local directors.

181. I said a board meeting of your directors?—No.

182. Where was your office in London at the time the last entry was made in your minute book?—With the International Company, at the International Company's offices.

183. At the telegraph office?—Yes.

184. And pursuant to Act of Parliament you had your name indicated on the door or post, I suppose?—We had.

185. Is it there now?—I believe it is; but I will not be positive.

186. Tell me why you believe it is; because you have never been there to look?—I have; I have not been there to look, but I remember that it used to be at the door, and I think I saw it, but I will not be positive. I did not pay sufficient attention.

187. You are quite right, because I am told it has long ceased to exist there?—I would not state positively that of which I was not sure.

188. Do you know of a board meeting of your directors ever having been held in Jersey prior to the end of the year 1869; you will not venture to say that any board meeting has been held either in Jersey or in London since that date?—I have already explained that the only meetings which could have been held were held in Jersey.

189. That is not an answer to my question; I dare say you intended to answer it?—I did.

190. You do not intend to suggest to the Committee that any board meeting of your directors has been held in Jersey?—No.

191. Then I need not ask you what occurred or who attended it; your putting your name to this petition was done, you say, at the request of two gentlemen interested in the company like yourself?—Who are directors of the company.

192. I did not say so, because my learned friend has not proved that either you or they are directors yet; at any rate it was done at the request of two friends of yours who are interested in the welfare of the company?—At the request of two gentlemen whom I considered equally with myself, directors of the company; and I add that we three directors are the only acting directors of the Channel Islands Telegraph Company at present.

193. And you had not been acting until you took your pen in hand and began to act, had you?—I have acted at all times when I thought it was for the benefit of the company.

194. But what I call acting as a director, is attending at board meetings and doing things legally and officially; when you do things as an amateur official, I do not call it acting as a director; now, drawing that distinction, you had no authority from anybody to sign this petition, except that which you gave to yourself, had you?—The only authority I had was from those two gentlemen who concurred with me as to the steps to be taken.

195. Do you mean to say that the two gentlemen authorised you?—They did.

Mr. *D. De Quetteville.*

4 July 1870.

196. And then you and the others authorised a third, and then the third authorised the others?—No; there was no one else to authorise.

197. If you signed it on their authority, on whose authority did they sign it?—They signed it, believing as we did, that they had authority to sign.

198. I asked you on whose authority did they sign it?—They did not do so at all.

199. Sir *Stafford Northcote.*] They did not sign it?—No.

199*. Mr. Serjeant *Sargood.*] I was thinking that all three had signed it, but you signed it at the request of those two gentlemen on behalf of the company?—Yes.

200. Who authorised them to request you to sign it?—I have no doubt they considered themselves, as I did, authorised to request me to sign it.

201. They did it then of their own motion, thinking that they had a right to do so?—Yes.

202. And you perhaps not doubting their right to ask you, any more than you doubted your own right to sign, signed it at their request?—I signed it, not doubting my own right, but I was glad to have their concurrence; I could do nothing without their concurrence.

203. Why could not you do it without their concurrence?—Because they had an equal right with myself in representing the company.

204. I quite agree in their equality with you in representing the company, that is to say, none of you had any right at all as representing the company?—I do not admit that.

205. Will you tell me the date when you did sign it?—If you will show me the document signed by Mr. Ashurst, I will give you the date.

206. You mentioned the date of it as being the 27th of June?—I believe it was the next day that I signed the petition; I must have signed it on the 28th, I suppose.

207. There is no "must" about it; you might have signed it on the 26th?—No; it was not signed on the 27th, I know.

208. You had not signed it when you saw Mr. Ashurst?—No.

209. What did you tell him about the petition?—I showed Mr. Ashurst the petition, and I added that I thought that if the Government acted justly with us, they would pay us back our capital, as they had been the cause of our misfortune.

Mr. *Webster* stated that the solicitor who saw the witness sign the petition was present, and could be called if necessary.

210. Sir *Lawrence Palk.*] The date is on the back of the petition; is that correct (*handing the Petition to the Witness*)?—Yes, it is the 27th of June. It was the same day that I saw Mr. Ashurst, but it was after I had seen Mr. Ashurst.

211. Mr. Serjeant *Sargood.*] That brings it to your mind, perhaps?—I remembered well that when I showed it to Mr. Ashurst it was not signed, and I thought it must have been signed either on that day or the day following.

212. If you thought you had perfect power to sign that Petition on behalf of the company, why did you trouble Mr. Ashurst at all about it?—Because I knew that the regular way of proceeding was to affix the seal of the company, and I would have done that undoubtedly had I been able to procure the seal.

213. Now we are approaching the point of appreciating your ideas of legality, and so forth; assuming that you had had the seal at your disposal on that day, instead of missing it, do I understand you to say that you would have ventured, with the concurrence of your two friends, to have affixed the seal of the company to that document without any board meeting of directors authorising you so to do?—Undoubtedly I would have done so; I should have been guided by the common sense view of the subject.

214. It would have been as irregular then as it is now?—My answer to that is, that I should have been guided by the common sense view; that is our mode of doing business in the Islands.

215. When you saw Mr. Ashurst, what did you tell him about the seal?—I told Mr. Ashurst what I believe I have repeated here, that I had applied to Mr. Bennett for the seal, and Mr. Bennett had referred me to Mr. Scudamore, and Mr. Ashurst told me that he knew nothing at all about the seal, but, as I tell you

you, he was kind enough to give me that document, which I have produced, and which was the only thing I asked for.

216. You pressed him, and he said (let me remind you of this) that the Post Office had not got the seal, so far as he knew, and that they had heard nothing about it?—He did.

217. You pressed him for an authority from him, ordering somebody to deliver it up to you, did you not?—Yes; I must add that I had not much pressing to use, for Mr. Ashurst was very kind, and did all he could for me.

218. Did not Mr. Ashurst say to you very distinctly, "I cannot authorise any one to give it up to you, because that would look as though I knew he had got it, or, we had got it, but I will give you a general authority, stating that I have no objection to your getting possession of it, if you can find out the man who holds it?—I do not know whether those were the words he used, but it was something like that.

219. The document that he gave you seems to have been carefully drawn?—Yes, Mr. Ashurst told me, "I will give you this document, but I am not prepared to admit that you are the representative of the company."

220. Nor was he prepared to admit that they had got possession of the seal?—No; he told me that he did not know anything at all about it, nor did Mr. Scudamore.

221. And he had no means, nor have we any at this moment, except the means you have told us, of knowing that you are the deputy chairman of the company?—Yes; I am under the impression that Mr. Ashurst, if he had had the seal, would have given it up to me without any difficulty.

222. It is not for me to deal with your impressions, but from what I know of Mr. Ashurst, I rather doubt it. I do not think he would have had much authority for that. As to your being deputy chairman, if the petition is to obtain any authority from that, it will depend upon whether you have been duly appointed deputy chairman at any meeting; that is matter of documentary evidence, I suppose?—I believe I have; I believe you will find my name occurring as deputy chairman, from first to last.

223. If you will show me your appointment, I should be glad to see it?—It would appear in the minutes.

224. Mr. *Webster.*] Take this document into your hand (*handing a document to the Witness*), and tell me whether that has your name attached to it?—Yes.

225. Mr. Serjeant *Sargood.*] What is that document?—These are the accounts of the Channel Islands Telegraph Company.

Mr. Serjeant *Sargood* objected to the document being used for the purpose of proving the appointment of the deputy chairman.

226. Mr. *Webster.*] My learned friend said, will you show me your name as deputy chairman?—My name is on that account as deputy chairman.

227. Mr. Serjeant *Sargood.*] I said, will you show me your name with that appointment; you say you are appointed by some minute; that minute must be produced if you want to prove your appointment as deputy chairman; we may resolve it all into this, may we not, at last: you three gentlemen laid your heads together, and thought it for the advantage of your company to appear against the Bill, and this petition is the result of that?—It is.

228. You ventured to say something about three being a quorum; if that is so, it appears, I suppose, either in the Act of Parliament or in your deed?—I said this, that I acted with the authority of the only acting directors of the Channel Islands Telegraph Company, the other gentlemen having resigned.

229. You told us that three made a quorum; what is your authority for that statement?—I believe the learned counsel stated so.

230. I know my learned friend did, and you swore it?—No, I never did; if you ask me the question my answer is, I believe so.

231. Then you know nothing about it; the deputy chairman ought to be able to tell me that, at any rate, I apprehend: what is your authority for assuming my learned friend Mr. Webster's suggestion to be true, that three make a quorum; I know of no authority?—I believe that on several occasions, under Mr. Grimston's presidency, we have acted as a board with only three directors present.

232. You may have done many things irregularly at many times, but that is not my question; I ask what authority had you for saying that three directors make

Mr. *D. De Quetteville.*

4 July 1870.

make a quorum?—Because at previous periods under Mr. Grimston's chairmanship many meetings were held with only that quorum.

233. *Chairman.*] That is no evidence that three are a quorum?—I believe you will find it on the minute books that three have sat as a meeting of the board.

Re-examined by Mr. *Webster.*

234. I will not put questions to you as a lawyer, but perhaps you know that you are registered under the Act of 1856?—I believe so.

235. Are you aware that under the Act of 1856 the directors can themselves make a quorum, and that there is no Parliamentary quorum fixed?—I believe so.

236. Whether three be the legal quorum by the Joint Stock Companies Act or not, have you in fact repeatedly acted to the best of your belief with three directors sitting as a quorum?—Yes, and I believe not only under my chairmanship but under Mr. Grimston's, our chairman's presidency.

237. Have you right or wrong acted as a director from the first?—Yes.

238. Whether right or wrong have you acted as deputy chairman?—Yes, I have acted as deputy chairman and do act as such to this day.

239. Since the arrangements between the International Company and the Post Office, are there any acting directors or any persons with powers to act as directors except these three?—And Mr. Lefeuvre.

240. You mean Mr. Lefeuvre, the chairman of the rival company?—Yes, and Mr. Robin, also of Jersey, but Mr. Robin, for some reason unknown to me, has refused to act for some months back.

241. Since the secession, so to speak, I do not use it as an offensive term, your board has practically been reduced to five nominally, one of whom is Mr. Lefeuvre, the chairman of the rival company, and another is Mr. Tupper, who declined to act?—Yes; or rather, Mr. Robin, one of the directors of our Channel Islands Telegraph Company, acted up to the latter part of last year; since then, for some reason, I do not know what, he has not acted.

242. Mr. *Neville-Grenville.*] Does he belong to the other company?—No.

243. Mr. *Webster.*] When did the secession of the International directors take place?—I could not say.

244. About what time?—I fancy it must have been last year.

245. In point of fact, after the passing of the Telegraphs Act?—Yes.

246. My learned friend has asked you several questions as to what passed with Mr. Ashurst when Mr. Ashurst gave you that authority to have the seal delivered over to you?——

Mr. Serjeant *Sargood* objected to the question, on the ground that he had not admitted that Mr. Ashurst had given any authority.

247. Mr. *Webster.*] At all events, whether it was in point of form and authority, or not, was it an assent by Mr. Ashurst and Mr. Scudamore that if you could find where the seal was, so far as they were concerned, you should have it?—I understood it to be so, and the proof that it was so was, that with the document I went to Mr. Bennett, who, if he could have found the seal, undoubtedly would have delivered it to me, for he said so.

248. I inadvertently, the other day, used the word "abstracted"; I was wrong in using the word; I did not mean to suggest any intentional abstraction of the seal?—No, certainly there was none.

249. I was told it was not to be found, and I, perhaps rather inadvertently, used the word "abstracted"?—On the contrary, it is only due to the gentlemen of the Post Office to say that they received me with the greatest civility, and were ready to do what they thought they were justified in doing for me.

250. You had been before this in communication with them, had you not?—Not before that; I have never seen them before in my life.

251. They knew the old company by name, did they not?—Mr. Ashurst appeared to know about it.

252. You have been asked several questions about this petition. I observe on this document there is written at the corner, "The Common Seal of the Channel

Channel Islands Telegraph Company was affixed hereto in the presence of;" do you remember that being there?—Yes.

253. Was that struck out at the time when you signed it?—It was.

254. Probably you know that that is the ordinary form of putting a seal, by the attestation of a secretary, or somebody else?—I believe so; and I may add that Mr. Bennett the secretary offered to affix his signature with mine to this document.

255. I think that the secretary offering to affix his signature will satisfy my learned friend; surely he cannot want any further authority than that?—I think it ought to satisfy him.

256. *Chairman.*] Why did the secretary not affix his signature?—Because I did not think it necessary at the moment, as the seal could not be procured. I was told that my signature as deputy chairman would be sufficient, and I thought so.

257. Mr. *Webster.*] The Honourable Mr. Grimstone, I think, was the chairman of the company, was he not?—Yes.

258. And acted as such?—Yes.

259. And another gentleman, Mr. Micklethwaite, was a director?—Yes.

260. They were both directors of the International Company, were they not?—Yes, they were.

261. Since the secession, have they taken any part whatever in the proceedings of your company?—None whatever; at the first board meeting they resigned.

262. I suppose that was a meeting very shortly, if not immediately after, the passing of the Government Act?—I remember it was in the latter part of last year, just at the time when we were about taking steps to procure a new cable.

263. I think you have already said, that since the secession of these gentlemen, you, and the two persons who have been named, have been practically the only acting directors?—Yes, we have.

264. At that time I suppose Mr. Grimstone and Mr. Micklethwaite were in London, were they not?—They were. Mr. Grimstone was at least; I am not certain as to the other gentleman; I think he was, but I am not certain.

265. They usually resided in London, did they not?—They did.

266. I think you had another London director?—There was a Mr. Gordon, but he has ceased attending the board meetings for a very long time.

267. Since these arrangements with the International Company, has any question arisen requiring the interposition of the directors except the landing of this cable?—No.

268. Any important question?—No.

269. During the last year has your business been suspended from the uncertain state in which everything was?—It has.

270. *Chairman.*] Will you just explain that a little; what are we to understand by "the uncertain state in which everything was"?—We made several attempts to get a new cable. At one time the Local Government had voted a sum of 12,000 *l.*, without interest, to assist us, but we were met with difficulties on the part of the Government. The fact is, that ever since 1863, when our cable broke down, we have been in the most uncertain state, sometimes hoping that we should get through our difficulties, and at other times feeling that we had very little chance of doing so, until at last we succeeded; and I believe that the cable would be now laid and in working, but for the illegal interference of the Government.

271. Mr. *Webster.*] When you use that expression, which I will not ask you to repeat, you refer to the question of your having been prevented from landing the cable on that part of the shore?—I do.

272. Was that shore private property?—I believe it was.

273. Mr. Serjeant *Sargood.*] We cannot go into the question of its being private property?—The soldiers were called in without the interference of the civil authority.

The *Chairman* stated that it was unnecessary to go into this point.

Mr. Serjeant *Sargood* submitted that he was entitled to cross-examine upon the new matters which had been introduced in re-examination.

Mr. *D. De Quetteville.*

4 July 1870.

274. Mr. Serjeant *Sargood.*] As to Mr. Robin having ceased to be a director, when do you say that Mr. Robin ceased to be a director?—I meant to say that he ceased to act as a director; I think I did not say that he ceased to be a director.

275. I understood you to say that he had ceased to be a director officially by retirement, and not merely that he had neglected to act?—He neglected to act.

276. From what date?—From the early part of this year. He acted up to the latter part of last year, but he has since been connected with Mr. Lefeuvre in a waterworks company. I do not know whether that is the reason.

277. It appears that he has been busy otherwise. I asked you that question, because on the 11th of September, when you were in the chair at a meeting, duly convened, of the directors of the Channel Islands Telegraph Company, held at the offices of Mr. Hawksford, Mr. Robin appears to have been present, was he not?—That was in the latter part of last year. What date did you mention?

278. I said the 11th of September, at a meeting duly convened at the offices of Mr. Hawksford, of the directors of the Channel Islands Telegraph Company (Limited), being in Jersey; you were in the chair?—Yes, I was.

279. And Mr. Robin acted then as a director?—Yes, I think I told you that he acted up to the end of last year.

280. And Mr. Gassiot, and Mr. Carroll, and Mr. Lefeuvre were all there?—Yes, they were all there.

281. The meeting was duly convened?—It was, as far as I know.

282. Was the Government director there?—He was not in the island.

283. Not at that time?—No; and I may add that he has never been in the island.

284. Of course you summoned him, otherwise your meeting would not have been duly convened?—I have already explained that on all these questions I took the common-sense view of the matter.

285. Mr. *Webster.*] On that day, the 11th of September, the two gentlemen, whose names my learned has read to you from that minute, attended?—I remember the meeting.

286. Mr. Serjeant *Sargood.*] I have not read the minute?—I do not know what you read.

287. Mr. *Webster.*] Do you remember a meeting on the 11th of September?—I do; at least I remember that there was a meeting held in the latter part of last year. The learned counsel stated that the 11th of September was the date; I believe that is correct.

288. Whether the Government representative was there or not, you say that you think Mr. Robin was?—Yes, he was.

289. You told us that you had this secession of the International gentlemen?—Yes.

290. Mr. Serjeant *Sargood.*] Does it appear by the minutes that they seceded?—I believe you will find it on the minutes.

Mr. Serjeant *Sargood* objected to the Witness stating what was on the minutes without further proof being given.

Mr. *Webster* stated that he was not in a position to prove what was on the minutes in any other way, inasmuch as the representatives of the Post Office would not put them in.

Mr. Serjeant *Sargood* stated that he was not withholding the minutes.

Mr. *Johnson* stated that the minutes were in the possession of Mr. Lefeuvre, who had formerly been a director of the company, and that there was no wish to withhold them, but that they would be produced immediately if anyone wished to see them.

The *Chairman* stated that the Committee wished to see the minute books.

The minute books were handed in to the Committee.

Witness.] Your Lordship will find my appointment at the first meeting. There was a general meeting held in Jersey when the company was formed.

291. Mr. *Webster.*] My learned friend objected to my use of the word secession or resignation.

resignation. As a fact, did Mr. Grimstone and the other directors of the International Company cease to act as directors of your company after the autumn of last year?—Yes; and more than that, they positively resigned at a board meeting. I think you will find the minutes of those proceedings in the books.

292. Whether they resigned formally or not, have they ceased to act?—They have.

293. When did Mr. Lefeuvre cease to act as a director, or act in opposition, rather I should say?—In the early part of this year; but from the moment that Mr. Lefeuvre became connected with, or had started, the other company, I considered that he had ceased to act as a director of our company.

294. Then is your explanation of that other gentleman ceased to act, or not having acted, that he has been connected with Mr. Lefeuvre in other matters?—That is my impression.

295. Whatever may be the motive, as a matter of fact he has ceased to act?—Yes.

296. And the direction has been reduced to you three?—Yes.

297. Mr. *Muntz.*] Who appoints the directors under your corporate powers?—We were appointed at a general meeting of the subscribers in Jersey; it was the first meeting held of the company in Jersey.

298. Sir *Lawrence Palk.*] At what date was that?—In 1858.

299. We have no minute of that meeting unless it is in the other book; we have nothing here earlier than 1859?—It was in 1858.

300. Sir *Stafford Northcote.*] It appears that the first half-yearly meeting was held on the 14th of June 1859?—I know that there was a meeting in Jersey before that; in fact, the first meeting of the shareholders took place in Jersey when the board was appointed, and then a subsequent meeting took place in London.

301. Mr. *Muntz.*] Under your corporate powers, in case of a vacancy occurring in the directorate, who appoints the new director?—The remaining directors have done so up to this time; that was the way in which Mr. Lefeuvre was appointed.

302. Mr. Lefeuvre, you say, and other gentlemen resigned or did not attend?—No, they have ceased to act. Mr. Grimstone and Mr. Micklethwaite have both resigned, and so did Mr. Tupper; they all three resigned, but the remaining gentlemen only ceased to act.

303. When Mr. Grimstone and Mr. Micklethwaite resigned, did you fill up their places?—It was then that Mr. Lefeuvre was elected.

304. Then you filled up Mr. Micklethwaite's and Mr. Grimstone's places by electing Mr. Lefeuvre and some other gentleman?—I believe Mr. Lefeuvre was the only director who was then elected; we thought we could proceed with the remaining directorate.

305. Do you consider that Mr. Lefeuvre and Mr. Robin have resigned?—They have ceased to act; there has been no actual resignation, as in the case of Mr. Grimstone and Mr. Micklethwaite.

306. Who summoned the meeting at which you were present when you signed that petition?—There was no meeting; I have already stated that I was travelling on the Continent, and there was no possibility of calling a meeting, but that the two other directors met together, consulted as to what steps should be taken, decided on addressing this petition, and sent it to me, requesting me if it met my approval to sign it and to have the seal of the company affixed to it.

307. So I understood you to say; in fact the directors were not summoned to any meeting at all?—No, not that I know of.

308. According to your corporate powers you have to call general meetings now and then, have you not?—We have.

309. How often?—As long as we were in working order we had a meeting, I believe, twice a year, that is to say, every six months.

310. When was your last general meeting held?—It is some years back; I do not exactly remember.

311. Sir *Stafford Northcote.*] You appear by the minute book to have had several general meetings called, and never to have had a quorum of shareholders, and never to have done anything?—The difficulty was this: there are a great number of shareholders in Guernsey and Jersey, and it is difficult to induce them to be at the expense of travelling up to London simply for the purpose of holding

Mr. *D. De Quetteville.* 4 July 1870.

ing a meeting; I remember on one occasion coming up with powers of attorney or documents duly signed from a great many of the shareholders.

312. Mr. *Muntz.*] Your cable broke in 1863, did it not?—It did.

313. How long was it before you took any steps to lay down a new cable?—We did so, nearly immediately; the great difficulty in getting a new cable was to get money, and one of the first steps that was taken, was that I succeeded in getting a vote of 12,000 *l.* from the local Government without interest; I equally succeeded in finding contractors, Messrs. Glasse and Elliot, to make an offer for the contract.

314. I do not want to know about that; I only want to know when you began to lay down a new cable?—I suppose you refer to this last cable.

315. One cable broke in 1863, when did you begin to lay down the next?—I think it was in April of this year.

316. That was seven years afterwards; during these seven years you were doing nothing?—Yes, we have been several times on the point of proceeding.

317. Mr. *Hurst.*] Was there ever a board meeting of the directors at all between June 1863, and July 1869?—I believe there were other meetings; I know that I have come up to London for the purpose.

318. According to this minute book it appears that there was a meeting in June 1863, and then the next meeting following in the book is in July 1869?—That must be correct; I will explain why I was under the impression that there had been other meetings; I have been up frequently to London for a board meeting, and I could only meet Mr. Grimstone, so that there was no minute of our forming a board meeting.

319. Sir *Lawrence Palk.*] Did those two gentlemen, who you say authorised you to put your name to that petition, see that petition before authorising you to sign it?—Yes; in fact, they had it longer in their hands than I have had it in mine.

320. Mr. *Webster* (by permission of the Committee).] With reference to the question asked by the honourable Member for Birmingham, had not an arrangement been made some years ago with Sir Richard Glasse for making a cable?—Yes.

321. Mr. *Muntz.*] I find in the minutes of a board meeting: "A proposal has been received from Messrs. Glasse, Elliot & Co."; that is in October 1863, and then the next meeting was held in July 1869. Six years appear to have elapsed while you were considering that proposal?—That was the very proposal I was alluding to which would have been carried out, only that the Government, who ought to have helped it, threw difficulties in our way at every step.

322. Mr. *Webster.*] The shares were fully paid up in 1869, I think?—They were.

[The Witness withdrew.

Mr. *Frederick William Lewis*, sworn; Examined by Mr. *Webster.*

Mr. *F. W. Lewis.*

323. Do you attend from the Joint Stock Company's office?—I do.

324. Do you produce a paper relating to the registration of the Channel Islands Telegraph Company?—I do (*producing a book*).

325. What is the last entry there?—The last return was filed on the 10th of July 1869.

326. Have the returns been regularly filed up to that date?—Yes, they seem to have been so.

327. You have these returns from the company?—Yes.

328. By whom are they signed; if you tell me the last, that will do?—Mr. Bennett.

329. Do they purport to have the seal of the company affixed to them?—They do.

Cross-examined by Mr. Serjeant *Sargood.*

330. These accounts are not the only things that are delivered to your office, are they?—Yes, these are everything.

331. Do you not know anything about their articles of association at your place?—They seem to have been registered without articles.

332. They

332. They were registered without articles, were they?—Yes; they were registered without articles, and therefore the table in the Joint Stock Companies Act applies to them.

333. There is a record of that in that book, is there?—Yes.

334. You say that because they are registered without articles they come under the provisions of the Act of Parliament; will you show me the entry of that?—Yes.

The *Witness* pointed out to the learned Counsel an entry in the book he had produced.

335. Then these persons who are returned from time to time are presumed to be the only shareholders?—That is so.

336. You know nothing about the directors, and their change of office, and so forth?—No, the names of the directors are not filed.

337. You do not get that information at your office?—No.

338. We learn nothing here except that they have no articles, and, therefore, come under the Act of Parliament, and that these have been their shareholders from time to time?—Just so.

[The Witness withdrew.

Tuesday, 5th July 1870.

MEMBERS PRESENT:

Marquis of Hartington.	Mr. Muntz.
Mr. Hurst.	Mr. Neville-Grenville.
Mr. J. D. Lewis.	Sir Lawrence Palk.

THE RIGHT HONOURABLE THE MARQUIS OF HARTINGTON, IN THE CHAIR.

Mr. *Nathaniel John Holmes*, called; Examined by Mr. *Bidder*.

Mr. *N. J. Holmes.*

5 July 1870.

339. YOUR office, I believe, is at Great Winchester-street, London?—It is.

340. You are a telegraphic engineer, are you not?—I am.

341. And you have had considerable experience in laying submarine telegraphs?—I have.

342. I may as well ask at once, so as to identify you, whether you are the Mr. Holmes whose letters to various Government departments have been read?—I am.

343. Will you tell me your first connection with the Channel Islands telegraph?—Mr. Stoffel——

Mr. Serjeant *Sargood* objected, that the witness could not give evidence as to the Channel Islands Company, unless Mr. Henley was first connected with it.

344. Mr. *Bidder* (to the *Witness*).] Will you explain to the Committee your first connection with Mr. Henley's cable?—Mr. Stoffel first called at my office, 7, Great Winchester-street.

345. About when was that?—That would be some time in the beginning or middle of December 1869.

346. What took place then?—He brought with him a sample of insulation, I think, under the name of "Mr. Rogers' Patent," to ask my opinion as to whether it would be suitable for laying down a new communication with the Channel Islands.

347. I believe you expressed an adverse opinion to that?—I did.

348. What happened afterwards; will you explain your connection with Mr. Henley?—My connection with Mr. Henley has been since the year 1846——

349. I mean in this particular thing; never mind other matters?—I mentioned to Mr. Henley this subject of the proposed cable which Mr. Stoffel brought me. He agreed with me that Rogers' Patent was not worth very much.

350. What took place further with reference to the Channel Islands cable?—Mr. Stoffel was introduced to Mr. Henry Sharp, of 92, Gresham House.

351. Mr. Serjeant *Sargood.*] At what date was that?—About the 16th December.

352. Mr. *Bidder.*] Did you meet him at Mr. Sharp's?—I did; he brought a letter of introduction from Messrs. Ashurst's and Morris.

353. Those are the gentlemen mentioned, I think, in the resolution of the old company, which was read?—They are.

354. What took place with reference to Mr. Henley's cable?—At that interview Mr. Stoffel was informed by Mr. Sharp and myself that the capital to lay a new

new line of communication to the Channel Islands would be formed by private individuals, he undertaking to raise a guarantee upon that capital in the islands, so that the gentlemen who found the capital should not altogether have it at their own risk. Similar lines had been carried out by myself upon that principle; such as the Orkney and Shetland line, and the West Highland line down to Campbelltown.

355. Let us make it clear, because it has been suggested that you were contractor for the old company; did you propose to act as contractor for the old company?—Certainly not.

356. You have told the Committee that you were not contracting for the old company; what connection had you, and to what extent, with the old company?—It was proposed to repair the land line——

357. Mr. *Hurst.*] Who proposed it?—We, the association of gentlemen who found the capital, proposed it.

358. Who were they?—Mr. Henry Parkinson Sharp, Mr. John Stewart of the Agra Bank, Mr. William Thomas Henley, and myself. Those were the four gentlemen. Other gentlemen were ready to subscribe had they been required, but they were not asked.

359. Mr. *Bidder.*] Before you go further, what was the connection between you and Mr. Henley?—Mr. Henley had been the contractor for a very large number of lines from year to year in which I have been engaged. I, therefore, naturally, as Mr. Henley was one of my contractors, and had previously made submarine cables, applied to Mr. Henley with reference to the making of the Channel Islands new communication.

360. Then, you having applied to Mr. Henley, will you explain what was the nature of the arrangement which was entered into between you and Mr. Henley, and the other gentlemen whom you have mentioned?—The statement to Mr. Henley was to the effect that it was proposed to renew telegraphic communications with the Channel Islands, and to find the funds privately. Mr. Henley was asked at the time that he was asked to contract what amount of capital he would subscribe towards the total amount required in connection with the other three names submitted to him.

361. And what was arranged?—It was arranged that he found his proportion of the money.

362. Mr. *Hurst.*] What was his proportion to be?—Mr. Henley's proportion was two-thirds, and the other three gentlemen found one-third.

363. What was the amount?—£. 22,500.

364. Mr. *Bidder.*] Am I to understand that the four gentlemen named, yourself, Mr. Henley, Mr. Sharp, and Mr. Stewart agreed together to carry on the affair upon those terms?—We did.

365. Mr. *Hurst.*] Is the agreement in writing?—Yes, it is.

366. Can you produce the agreement?—I have not the agreement here.

367. Mr. *Bidder.*] Is that the agreement (*handing a paper to the Witness*)?—Yes, it is.

368. I see across that written "Cancelled by mutual consent"?—It is.

369. When was that written?—After the applications which I had made personally, and in writing from the date of the stoppage of the "Caroline" up to the time that I saw the First Lord of the Treasury with Mr. Seely, and had no applications. Then I spoke to Mr. Sharp and Mr. Henley, and the agreement was mutually cancelled.

370. Will you give us the date, as nearly as you can?—The correspondence will show the date, but without the correspondence I am unable to tell you. It was a date after my last letter to the First Lord of the Treasury.

371. Mr. *Hurst.*] This paper is dated March 17th?—That is dated March the 17th. It was all arranged, and it has not been signed by Mr. Sharp, who went abroad. He went to Germany for his health. Mr. Stewart was also out of town, but as there was a faith between us gentlemen, it was simply put down in pencil to be signed at any time.

372. Mr. *Bidder.*] But that, I understand, is dated March the 17th?—That is dated March the 17th.

373. When was the agreement originally entered into which was reduced to writing in that paper?—The 18th of December 1869.

Mr. *N. J. Holmes.*
5 July 1870.

374. Will you tell me what steps you took, or whether you took any steps to communicate with the Government offices to carry out your undertaking?—I did.

375. When?—About the commencement of March, personally. Previously to that Mr. Stoffel had informed me that he had, in December, communicated with the Post Office, the Board of Trade, and the Woods and Forests.

376. Were those communications of Mr. Stoffel to the Board of Trade and the Woods and Forests made on your behalf?—Not at that time. Mr. Stoffel made the applications on behalf of the new cable about to be laid.

377. Mr. Serjeant *Sargood.*] On behalf of whom?—The foreshores were asked from the several departments for the purpose of laying the new cable. If Mr. Stoffel used the name of the old Channel Islands Telegraph Company it would have been upon his own responsibility, by reason of its having been agreed that we should make use of their existing land lines.

378. Mr. *Bidder.*] You have told me that the arrangement between you and Mr. Henley and the other gentlemen was made in December?—It was.

379. At that time you were in communication with Mr. Stoffel?—I was.

380. And Mr. Stoffel, as the Committee know, was making the applications to the Government departments?—He was.

381. Will you explain how it came to pass that Mr. Stoffel ceased to carry on the correspondence with the Government departments, and that your name appears instead in the correspondence?——

Mr. Serjeant *Sargood* heard in objection to the question.

Mr. *Bidder* heard in support of the question.

382. Mr. *Bidder* (to the *Witness*).] Do I understand you to say that Mr. Stoffel's correspondence was not upon your behalf?—The correspondence was carried on by Mr. Stoffel without having consulted me, and therefore I am not responsible for any terms in which he chose to address his letters to the several departments. It was carried on on behalf of the proposed new cable; but, had he applied to me, it would have been carried on in the name of the parties proposing to lay down the cable, not of parties who had no connection with us.

383. But was Mr. Stoffel's correspondence, or was it not, carried on on behalf of the Telegraph Association?—It was carried on on behalf of the cable proposed to be laid down by them.

384. Mr. Serjeant *Sargood.*] On behalf of whom was it carried on?—The proprietors of the cable, but he gave him a wrong title.

385. Mr. *Bidder.*] You mean to say that he described the parties for whom he was acting wrongly in his application?—His letter would lead to the inference that the Channel Islands Telegraph Company were laying the cable, which was not the fact.

386. Mr. *Bidder* (to the *Witness*).] Were you in communication with Stoffel at the time he was carrying on that correspondence?—I was.

387. Was there any other cable in contemplation at that time but the one which Mr. Henley was preparing to make?—Not to my knowledge.

388. Will you tell me what terminated your connection with Mr. Stoffel?—Mr. Stoffel visited the Islands of Jersey and Guernsey for the purpose of raising this guarantee. He was provided with the necessary documents for signature by the merchants; but he did not succeed in raising the guarantee. We, therefore, determined to subscribe the money without the necessity of a guarantee, and we had no more occasion for Mr. Stoffel.

389. Who paid Mr. Stoffel for the work which he had done?—I can hardly say who paid; I know that money was sent to him; possibly Mr. Sharp sent it; I did not pay him myself, and I do not know who did.

390. From whose funds would it come?—It would come out of the association. We were all liable for it; but I thing that Mr. Sharp advanced it.

391. Subsequently to that your name appears in the correspondence, and you, I think, yourself applied to the various Government departments?—I did.

392. Will you tell the Committee what took place; I think that besides that correspondence you had interviews with officials at several of the departments, had you not?—Yes, I had.

393. With

393. With which of them?—With the Board of Trade, the Woods and Forests, the Home Office, the Treasury, and the Post Office.

394. I believe your delay was principally at the Treasury, was it not, in the first instance?—The delay was at the Treasury by reason of the matter having been referred to the Postmaster General, and no reply was received.

395. *Chairman.*] No reply had been received from the Post Office?—From the Post Office.

396. When did those interviews take place?—Every second or third day.

397. From what time?—From about the day of my application.

398. What day was that?—About the 1st or 2nd of March I think would be the date of the first application that I made. I may state, as it may save perhaps a good many questions, that not receiving any reply from any of the departments, and at my interviews being told that the delay arose from no communication from the Post Office, I called upon Mr Seely, and I laid the matter before Mr. Seely, who had an interview with Mr. Stansfeld at the Treasury. I laid the matter before Mr. Stansfeld, and he would not believe that I had received no reply. I told him that it was five weeks from the date of the letter, and there was no reply. I called his attention to the fact that the Treasury were not to blame, inasmuch as they had received no communication from the Post Office. He said, yes, you bring it to my mind that that is the fact. He simply said, yes, you are correct; we have no reply.

399. Mr. *Bidder.*] I think, in the first instance, you made no application whatever, did you, in respect to landing the cable that actually was stopped on the shores of Jersey and Guernsey?—I did not.

400. For what reason?—That the previous cable of the old company of 1859 had been laid without any application or written consent from any departments of the Government; and I was informed that the same facilities which had been given to the old company would be afforded to us, and that it was not necessary.

401. Sir *Lawrence Palk.*] Who informed you of that?—Mr. Hawksworth, the solicitor to the old company.

402. Mr. *Bidder.*] In consequence of that did you proceed, without the consent of the Government departments, to lay that cable?—It was because the Channel Islands, I was informed, had always been treated as a colony, and the Patent Act had no jurisdiction as to the foreshore.

403. I must ask you this question, because it has been imputed to you; were your proceedings in constructing and preparing for the laying of this cable in any way for the purpose of creating a claim against the Government?—Certainly not; there was no knowledge of any proposed Bill being brought in at that time.

404. At the time that you and Mr. Henley and the other gentlemen embarked in this undertaking——

405. Mr. Serjeant *Sargood.*] What time do you mean?—December 1869.

406. Mr. *Bidder.*] When you and Mr. Henley and the other gentlemen embarked in the undertaking as to the Channel Islands cable, had you any knowledge whatever of any intention on the part of the Government to extend the Telegraph Act to the Channel Islands?—Certainly not.

407. When had you first knowledge of the intention of the Post Office to introduce this Bill?—About eight or nine days after the detention of the "Caroline." I first saw it stated in the newspapers.

408. Mr. Serjeant *Sargood.*] Will you give us the actual date, as near as you can?—Until I see the correspondence I cannot even say the date of the stoppage of the "Caroline," but I think it was in April. I think it was about the 13th of April.

409. Mr. *Bidder.*] You wrote to the Lords of the Treasury, I see, that part of the cable had been laid down, and it is suggested that you were stating an untruth to the Lords of the Treasury in making that statement; will you explain that?—The "Caroline" left for the purpose of laying the cable, and in due course the cable would have been laid before my letter reached the Treasury had no stoppage taken place.

410. At the time you wrote that letter, were you aware of the stoppage?—Certainly not.

Mr. N. J. Holmes.

5 July 1870.

411. I think that will fix sufficiently nearly the date which my learned friend wishes to have?—Yes, of the letter to the Post Office, not to the Treasury. The letter to the Post Office as to the Start Point landing.

412. The letter to the Board of Trade of the 2nd of April says the first section of the cable between Jersey and Guernsey was laid——

413. Mr. Serjeant *Sargood.*] I understand that on the 2nd of April, when you wrote that, you did not know that the cable had been stopped?—No.

414. Mr. *Bidder.*] You say it was eight or nine days after the cable had been stopped that you were first aware of the intention of the Post Office to bring in a Bill?—It was.

415. All that you had done up to the time when the "Caroline" was stopped when you had actually got your cable made and sent out in her, was in perfect ignorance of any intention of the Post Office to bring in any such Bill?—It was.

416. And it was an ordinary trade undertaking?—A purely commercial undertaking.

417. Out of which, I presume, you expected to make a profit?—We did.

418. You have had, I believe, considerable experience, have you not, in the course of your professional work in communicating with Government departments on the subject of landing cables on the foreshores of the United Kingdom?—I have; I have applied for upwards of 27 in England, and Ireland, and Scotland, and I have always obtained them.

419. Has it ever been treated before as a matter in which the Government considered the trade aspects and commercial aspects of the undertaking, in respect to which the application was made?—So long as the rights of navigation have not been interfered with, the foreshore has always been granted.

420. The departments, I think, according to your experience, have always confined themselves hitherto to those Crown rights and public rights which were intrusted to their care?—They have.

421. Have you ever in your experience previously, had a case of a public department reporting for or against a commercial scheme, on the grounds of competition, or any such grounds?—Never.

422. Mr. *Bidder* (to the *Witness*).] Here is one letter to the Treasury of the 25th April 1870; will you read the letter, and say if you received that letter?—This letter is addressed to me, and is dated the 25th of April, from the Treasury Chambers.

423. Is that a letter beginning, "Sir,—With reference to your letter of the 23rd instant, I am directed by the Lords Commissioners of Her Majesty's Treasury"?—It is.

424. Did Mr. Stoffel hand over to you the letters which he received from the different Government departments?—He did.

425. Did he hand over to you this letter from the Board of Trade, on the Board of Trade paper, marked H4, 688, dated the 16th of December (*handing a letter to the Witness*)?—He did.

426. Did he also give you this letter from the office of Woods and Forests, signed "Charles Gore," of the 11th of January (*handing a letter to the Witness*)?—He did.

427. Did he hand you this letter of the 22nd of December, from the Board of Trade Harbour Department, signed "Cecil Trevor" (*handing a letter to the Witness*)?—He did.

428. Did he also hand you this letter, signed "Frank Ives Scudamore," of the General Post Office, dated the 28th of December (*handing a letter to the Witness*)?—He did.

429. Did he hand you also this letter, signed "Cecil Trevor" from the Board of Trade, dated 1st of February (*handing a letter to the Witness*)?—He did.

430. Did he also hand you this letter from the Board of Trade, dated the 5th of February, also from Mr. Trevor (*handing a letter to the Witness*)?—He did.

431. Did he hand you also this letter from Mr. Trevor to himself, dated the 2nd of April (*handing a letter to the Witness*)?—He did.

432. Did you write this letter, dated the 5th of April, to the Board of Trade (*handing a letter to the Witness*)?—I did.

433. Did

433. Did you write a letter, of which this is a copy, on the 5th of April to the Office of Woods and Forests (*handing a letter to the Witness*)?—I did.

434. Did you receive that letter of the 6th of April from the Board of Trade (*handing a letter to the Witness*)?—I did.

435. Did you receive that letter of the 7th of April from the Woods and Forests (*handing a letter to the Witness*)?—I did.

436. Did you receive as an inclosure in a letter from the Board of Trade of the 6th of April, a copy of a letter purporting to be a copy of a letter from Mr. Lefeuvre?—I did.

437. Subsequently, I think this copy was forwarded to you from the Board of Trade, purporting to be a letter, signed by Mr. Stoffel, and sent to the Board of Trade, and dated the 8th of April, the day after that letter which he had written to you, which you had forwarded to the Board of Trade?—It was.

438. "Sir, I have the honour of informing you that a letter was written, and signed by me, to Mr. Nathaniel John Holmes of, and at, No. 7, Great Winchester-street Buildings yesterday, the 7th instant, the object of which was to invest the cable now stored on board the "Caroline," in the harbour of St. Helens, with the benefit of the applications, plans, &c, for license to land, which have hitherto been conducted by me, by virtue of the resolutions passed by the Board of the Channel Islands Telegraph Company (Limited) in September last, but the letter and the accompanying papers have this day been withdrawn, until such time as the Channel Islands Telegraph Association, represented by Mr. Holmes, will have completed the arrangements previously understood, but over which they demur, since possession has been obtained of the aforesaid letter and papers accompanying." Was that forwarded to you by the Board of Trade as being a letter which they had received from Mr. Stoffel?—It was.

439. What did Mr. Stoffel refer to then, when he said that he withdrew the authority for you to act under his applications until you had completed some arrangements with the old company, which were formerly promised, but which were demurred to?—

Mr. Serjeant *Sargood* heard in objection to the question.

440. Mr. *Bidder* (to the *Witness*).] I see this letter says that the letters and papers "have this day been withdrawn" until such time as the association had completed the arrangements previously understood; what arrangements were previously understood between you and Mr. Stoffel or the old company?—The arrangements simply had reference to what had occurred between Mr. Stoffel and ourselves when he proceeded to the Channel Islands to raise the guarantee; if he had been successful he was to receive so much money from the association for his services; he had not been successful in raising the guarantee and had got into difficulties, and that, therefore, that letter contained an imputed threat that the amount of money we offered him was not so much as he required. It was a pecuniary matter.

441. The arrangement previously understood between you and Mr. Stoffel, being at the time that he was applying for the guarantee, that if he was successful he should be remunerated for securing the guarantee for you?—He would.

442. When was it that he went over to Jersey about the guarantee?—I think about the 21st or 22nd of December 1869.

443. Then the association had made that arrangement with him in December?—Yes.

444. On the 9th of May I have a letter signed "Frank Ives Scudamore," to you, simply acknowledging the receipt of a letter, and giving you no reply?—I received that letter.

445. Then here is another, of the 11th of May, from the office of Woods and Forests, acknowledging your letter of the 7th?—I received that letter.

446. Were you in the room when I read certain letters and communications made by you to the different Government departments?—I was.

447. Were those communications really made?—They were. They are all in order; press copies.—(*The letters were handed in*).

Mr. *N. J. Holmes.*

5 July 1870.

Cross-examined by Mr. Serjeant *Sargood.*

448. Now let us see if I can find out the position of Mr. Henley from you. In the first place, allow me to ask you, have you any connection with Mr. Henley at this moment?—No.

449. In the next place let me ask you, whether all that you did in communicating with the public departments was done on behalf of Mr. Henley, conjointly with yourself and the two gentlemen whom you have named?—It was.

450. Now, let me ask you whether all that Mr. Stoffel did in communicating with public departments was done on behalf of yourself and Mr. Henley, and the other two gentlemen you have named?—I am not able to state what passed in Mr. Stoffel's mind, but the object——

451. I did not ask you that; I am alluding to what passed in Mr. Stoffel's letters, and not to what passed in his mind.

Mr. *Bidder* heard in objection to the question.

Witness.] I may at once state that Mr. Stoffel was not aware of the names of the parties who were finding the money, consequently he could not make the application on behalf of Mr. Henley, myself, Mr. Sharp, and Mr. Stuart. He did not know who they were; it was A., B., C., and D. to him.

452. *Chairman.*] Did Mr. Stoffel act on behalf of those gentlemen?—Certainly.

453. He acted on behalf of you and the other gentlemen named?—I was the agent in the matter, and all the communications between Mr. Stoffel and the association were carried on through me.

454. Mr. Serjeant *Sargood.*] On behalf of yourself and the three other undiscovered gentlemen?—They were. That was the intention of Mr. Stoffel's application.

455. Was there any point of time at which you desired to repudiate Mr. Stoffel as your agent in his communications with the public departments?—When Mr. Stoffel received no reply he handed me his letters, and the answers which he had received, informing me that he had made applications to the three departments at certain dates; that no reply had been received, and that in the meantime the cable had been made, and was about to be sent to its destination; I therefore personally took upon myself to try and obtain the foreshore.

456. I repeat my question; having accepted Mr. Stoffel as your agent at the beginning of his correspondence, is there any point of time at which you desire to repudiate him as having been any longer your agent?—After he had been unable to obtain the guarantee, he had not fulfilled that part of his contract which he went to do.

457. I repeat my question, for the third time, is there any point of time at which you desire to repudiate Mr. Stoffel as being your agent in his communications with the public departments?—No, certainly not.

458. How easy it would have been to have said that at first?—I beg your pardon; I misunderstood the question.

459. It was my fault, perhaps, and not yours. Now will you tell me, Mr. Henley having been appointed with you under that written agreement which you put in, the point of time at which you and your two other friends became dissociated from him; in other words, when was it that by an indorsement on this agreement, you cancelled your existing state of relationship?—About three weeks or a month since, I think. I will not speak very accurately, but it is comparatively recently.

460. Sir *Lawrence Palk.*] I have it on my notes that it was the 27th of April?—I will not speak accurately as to the date, but that handwriting across the deed is my handwriting.

461. Mr. Serjeant *Sargood.*] As it is within three or four weeks back, try and tax your memory more accurately, and tell me the exact date when this endorsement was made, and you dissolved your connexion?—It may be longer than three or four weeks, because I find I had been out of town more than that time, and it was previous to my going out of town, but I cannot speak exactly as to date.

462. I must have, as nearly as you can, some notion as to when you dissolved this

this association; you know we are now at the 5th of July?—It might be some time in May, possibly the end of May.

463. It might have been any time; tell me as accurately as you can pledge your word to it, when it was?—I really have no means of giving you the date any more than that it was certainly five weeks since. It may have been earlier.

464. Why do you suggest the end of May rather than the beginning?—I am merely guided now by the period I have been out of town, and I know it was just before that.

465. To the best of your belief, was it the end of May?—I think about that time, but I really could not speak with certainty. Mr. Sharp most likely would know the date; I think it was about the end of May.

466. Sir *Lawrence Palk.*] Then the 27th of April is wrong?—Certainly, the 27th of April is wrong.

467. Mr. Serjeant *Sargood.*] It being about the end of May, was it before or after Mr. Henley lodged a petition in his own name?—It was before.

468. It was done for the purpose of enabling him to lodge the petition perhaps?—Not at all.

469. Whose writing is this, "Cancelled by mutual consent, Nathaniel Holmes"?—My own.

470. Who was present when you did it?—Merely Mr. Sharp and myself; I had previously spoken to Mr. Henley on the subject, that is to say, that as the cable was not able to be laid, there was no fulfilment of the contract. The cable had been stopped by the Government, although the ship had been detained for a great many weeks, it could not be got down, and therefore the thing was cancelled.

471. Then the cable had not been laid, or any part of this thing done, at the time when you cancelled the contract?—No.

472. You are quite clear upon that?—Quite clear upon that. There was no prospect, as far as I could see, of its being laid, and that being the case, Mr. Sharp agreed with myself that the contract had not been fulfilled for which we had subscribed our money.

473. Then your impression being that this was cancelled at the end of May, your notion also is, that whoever laid down the cable, or any part of it, has done it since the end of May?—I was out of town at the time the cable was laid down by the "Caroline," and therefore I cannot say.

474. You believe that it has been done since?—The laying of the cable?

475. Yes?—It might have been done at that time.

476. No doubt, but I am asking your belief?—At the time that was cancelled I certainly had a belief that no part of the cable had been laid.

477. Supposing that you have a belief now that any part of the cable has been laid, your belief is, that it has been done since this contract was cancelled?—Certainly.

478. Now let me see if I can learn what the meaning of this agreement between you all is. In the first place, the agreement itself has no date to it, but the parties who were to sign it were four in number, and had to contribute certain sums; I see they have put their names in a schedule with the respective sums which they had to contribute?—Yes.

479. And against one name, that of Mr. Nathaniel Holmes, yourself, is appended "March 17th"?—It is.

480. Did you put your name to this piece of paper on that 17th day of March?—I did.

481. Who had prepared the document?—I had prepared the document some time previously.

482. This sheet of paper?—That sheet of paper.

483. Sir *Lawrence Palk.*] You stated that no part of the cable was laid after the cancelling of the agreement, did you not?—I think so. It might have been laid prior to it, but I was not aware that the "Caroline" had laid any.

484. Mr. Serjeant *Sargood.*] You had written this thing yourself, had you?—I had.

485. This is your handwriting?—It is.

486. You had had it in your possession for some time before you signed it?—I had.

Mr. *N. J. Holmes.*

5 July 1870.

487. For how long?—I cannot say. Mr. Henley had it for some time before I received it from him.

488. Did you sign it on the 17th of March as soon as you got it back from Mr. Henley?—I did.

489. How long had he had it in his possession?—I am not able to state how long, because it had been waiting for Mr. Sharp's signature for more than a month.

490. Can you not tell me within a week or a month?—I cannot state; it had been lying about, and it has not even yet been signed by Mr. Sharp or Mr. Stewart, because both are out of town.

491. Then Mr. Henley signed it first, and you cannot tell me when; is he here?—He is.

492. After you had written it out did you keep it in your possession until you sent it to Mr. Henley for signature?—I did.

493. How long?—That I am not able to state; it went to Mr. Sharp first.

494. How long did he keep it?—Mr. Sharp, I think, kept it some weeks.

495. Then, adding Mr. Sharp's some weeks to your weeks and Mr. Henley's, how long before the 17th of March had you written this piece of paper?—I am not able to state; a good deal of delay arose from my being out of town myself; the matter was in my hands, and I frequently went out of town in a great hurry, and left all those things unfinished.

496. Did you write it in December?—No, I do not think I wrote it in December.

497. Did you write it in January?—I will not even swear to that; it was understood between us in December with respect to the amount of money which we were to subscribe.

498. Did you write it as early as February?—I will not state that; but I will answer the question by saying that Mr. Henley frequently applied for that document.

499. I am sure you will excuse me, and will not think me captious, but you know, as you signed it in March (and you have already suggested an interval of a great many weeks), I am surprised to hear you say that you cannot tell me whether you prepared it as early as February?—The draft of that agreement was prepared——

500. I do not speak of a draft; I speak of this piece of paper?—The draft of that agreement was prepared and agreed to between Mr. Sharp and myself as early as December; the writing out of that piece of paper was entirely dependant upon my being in London, and my absence from London is so frequent that I really cannot say the exact date at which I wrote it.

501. Mr *Hurst.*] Can you produce the draft?—I cannot; I think it was only a pencil draft.

502. Mr. Serjeant *Sargood.*] Did you use the pencil draft in copying this?—I did.

503. Do you mean to say that you cannot tell whether you wrote it as early as January, or February, or March, you signing it on the 17th of March?—I really cannot state the date at which I wrote it; it might have been lying about for some weeks.

504. I will read it: "It is hereby mutually agreed between the undersigned that they shall respectively contribute towards the contract price of 22,500 *l.* for a cable." Now, I will first ask you to tell me what is meant by "the contract price"?—The contract price is the lowest sum at which the article required can be manufactured in that document.

505. The contract price is specified at 22,500 *l.* Who had made a contract to make a cable for 22,500 *l.*?—Mr. Henley had stated that he would make a cable, and lay it for 22,500 *l.* Upon going over the estimates and specifications I found that that was the net cost of material and labour.

506. Then you thought it a cheap contract?—A cheap contract.

507. Mr. Henley, then, had said that he would make a contract?—He did.

508. To whom had he communicated his intention to undertake the cable at that price?—To Mr. Sharp and myself.

509. When?—In December.

510. Do you know whether there had been any proposal that he should make one

one for the old company, as we call it; the Channel Islands Company?—I do not know.

511. Then, on the date in December, when you and your friend met Mr. Henley, you tell this Committee that you do not know whether or not you had had any communications with the Channel Islands Company?—I knew that he had sent in a tender to Messrs. Ashurst and Morris at some previous date (I think in October or November) upon the same subject of restoring the communications, but then the capital was not forthcoming to pay for it.

512. Then you did know that Mr. Henley had made a proposal of laying a cable at a fixed price, and had made that proposal to Messrs. Ashurst and Morris?—I did.

513. Did you know on whose behalf Messrs. Ashurst and Morris had been treating with him?—No, not then.

514. You say that advisedly?—I do.

515. Then you had no knowledge that Messrs. Ashurst and Morris were acting in any way on behalf of the old company?—No, I had not come into connection with this undertaking at the time of Mr. Henley's offer to them.

516. You did not know it as a fact?—I did not know it.

517. Then you did not know, of course, that 22,500 *l.* was the contract price which Mr. Henley had suggested for the old company?—No, certainly not.

518. And, of course, the words "The contract price of 22,500 *l.*" you intend now to say——

Mr. *Bidder* inquired whether that 22,500 *l.* was the contract price to the old company.

Witness.] The 22,500 *l.* there, has reference to the specification for that particular cable.

519. If this was a specification of a contract, with whom was the contract made?—The contract was to be made with the association.

520. That is, Mr. Henley, you, Mr. Sharp, and another gentleman?—It is.

521. The contract was to be between Mr. Henley on the one side, and himself and you, Mr. Sharp, and another, on the other side?—It was; therefore, the sum of 22,500 *l.* was very narrowly watched as the cost price of making and laying without profit.

522. Now I will go on reading: "For a line of cable to be laid down between Start Point" (that is on the margin of this country), "and the Islands of Jersey and Guernsey, in the respective amounts set opposite their respective signatures ereto, and which contract price of 22,500 *l.* the contractor, Mr. Henley, duly declares is the net price of the manufacture and laying down the cable, without any profit whatever, and that they will respectively pay the several amounts at such times as may be required to complete the contract, and that they will respectively subscribe *pro ratâ* such additional amount as may be necessary for the erection of the several sections of land line to work the said cable." Then that was to be an additional contribution after the 22,500 *l.*?—It was; it was an undefined sum being in the hands of the Post Office on this side, and there being the repairing of the old lines on the other.

523. When did you first hear anything about the old company undertaking, thinking of laying down a fresh cable in the place of the one which they had lost?—Several times during the last three or four years.

524. But, I mean, when did you first hear of it, or was it about the period when you and your friends were making this agreement?—It was about the 16th of December when Mr. Stoffel first called upon me.

525. At present you see we have not Mr. Stoffel on the scene in connection with this Bill; had you seen Mr. Stoffel before you had made your agreement with Mr. Henley, and Mr. Sharp, and Mr. Stewart?—Certainly.

526. You had made this agreement before you ever saw Mr. Stoffel at all?—No, I saw Mr. Stoffel first; that took place after Mr. Stoffel had been to me and the meeting at Mr. Sharp's. Mr. Stoffel was told that the question would be raised.

527. When Mr. Stoffel came to you what did he come for, or did you send for him?—No; he had been endeavouring to raise the capital under the minute

Mr. *N. J. Holmes.*

5 July 1870.

of the board of the old company, authorising Messrs. Ashurst and Morris to take such steps as they thought necessary to restore the communication.

528. Did he tell you that?—He did.

529. In December?—In December.

530. Mr. Stoffel in December told you that he had been trying to raise the capital which Messrs. Ashurst and Morris were authorised to raise on behalf of the old company?—He did; he brought a letter of introduction from Messrs. Ashurst and Morris to Mr. Sharp and myself, as he thought we would be able to provide the capital as we had done for other lines of the same nature.

531. Then it looks very much as though Mr. Stoffel, aiding Messrs. Ashurst and Morris in raising capital for the old company, found his way to you and your friends under the notion that you might be able to help him?—Certainly.

532. You do not now affect that you did not know that Messrs. Ashurst and Morris were acting for the old company?—I certainly answer as I did before, because at that time I had not seen a copy of the minutes.

533. You do not now pretend to say that you did not know that Messrs. Ashurst and Morris were acting for the old company?—Certainly; I simply knew from Mr. Stoffel that attempts were being made to restore a Channel Islands communication; the old company was not mentioned.

534. You have first told me that Mr. Stoffel's mission to you was to tell you that Messrs. Ashurst and Morris were attempting to raise capital for the old company, and that he was helping them, and came to you thinking you would help him?—I think I did not state that I stated that Mr. Stoffel called upon me with the view of restoring the communication with the Channel Islands, and that Messrs. Ashurst and Morris had the matter in hand, or to that effect; but I do not think that I stated that he was acting for the old company.

535. Do you, or do you not, mean to tell this Committee that in December, as the result of your interview with Mr. Stoffel, you did not know that Messrs. Ashurst and Morris were acting on behalf of the old company?—Certainly; because the object of Mr. Stoffel coming to us was to raise money, without reference to the old company.

536. When you say "certainly," do you mean certainly yes or certainly no; do you, or do you not, mean to say now that you did not know then that Messrs. Ashurst and Morris were acting for the old company?—Certainly not.

537. You do not mean to assert it now?—Certainly. I never asserted it, but I stated simply that Mr. Stoffel brought a letter of introduction from Messrs. Ashurst and Morris to Mr. Short and myself, with one object, and that object was to raise money, as an independent investment, to lay down a new line; that they were endeavouring to restore the communication, and they had not succeeded in raising the money.

538. Then did you believe at that time that Messrs. Ashurst and Morris were entering upon a speculation unconnected with the old company?—Nothing was mentioned about their acting for the old company.

539. I am asking you what you believed?—I never thought twice upon the subject as to whether they were acting for the old company or whether they intended to act, as an independent matter, to lay a new cable. They came to us as independent individuals to raise a fresh capital, totally unconnected with the old company, and to lay down a new line of telegraph entirely independent of the interests of the old company, except so far as we might find their existing land lines were in order. It was not known at that time that those land lines were in order, as they had been lying dormant for seven years, and therefore we could not tell.

540. He came to you, and you believed that Messrs. Ashurst and Morris were perfectly independent of the old company?—Certainly.

541. Have you that letter of introduction?—No, it was a letter of introduction signed by Mr. Ridley.

542. Where is it?—Mr. Sharp may have it. It was simply three lines: "Allow me to introduce Mr. Gustavus Stoffel to you on a matter connected with telegraphic communications." That is about the contents of it.

543. Did you ever hear of a gentleman named Bullivant?—I have heard of his name.

544. Is he a manufacturer of cables?—Not to my knowledge.

545. Does he undertake to manufacture them, or to get them manufactured?—I have never heard very much of him, except in the earlier days of the old Atlantic

Atlantic in 1857. I think his name was mentioned then. I have not heard of his having made or laid any cables. Mr. *N. J. Holmes.*

546. In 1869 and 1870, did you ever hear of his undertaking a contract for the old company when they thought of laying their cable again?—No, I never heard of that. 5 July 1870.

547. Just do me the favour to tell me if this is in your handwriting (*handing a paper to the Witness*)?—It is.

548. "Great Northern Telegraphs, 7, Winchester-street, 1st February 1870," addressed by you to Mr. Bullivant, whose name I have just mentioned. He lives at 114, Fenchurch-street, I suppose?—I believe so.

549. "Dear Sir (Jersey Telegraphs), Mr. Lefeuvre has called upon me this morning with reference to some correspondence in the paper regarding the above line, and I mentioned to him that Mr. W. T. Henley, of No. 27, Leadenhall-street, would be very happy to sub-contract with you to make up some portions of the Channel Islands cable, as I knew he had a machine or two idle, which are waiting for some large contracts from us. Mr. Lefeuvre has stated that he would ask you to call upon him, and as Mr. Henley is well known to me, you can use my name to him in the matter. It may facilitate business, as Mr. Henley has made several large cables for us, and has more contracts in hand. I shall be glad to learn that yourself and Mr. Henley have come to terms so as to get the Channel Islands cable promptly and efficiently laid." Then you say that Mr. Bullivant is a gentleman who does not make cables. You never knew him to undertake to do them. Mr. Henley is a man who does make cables, and so you sent Mr. Henley to Mr. Bullivant to help Mr. Henley to get his cable made. What is the meaning of all that?—The meaning is very simple. Mr. Bullivant was not known to me as a cable manufacturer; indeed I was not aware that he possessed any machinery. If my memory serves me rightly, I was asked by Mr. Lefeuvre, I think, whether Mr. Henley would make the cable. I said, "I have no doubt Mr. Henley will make the cable. Mr. Henley is an open contractor in the market, and will make anything as a contractor in the way of business. He has large machinery, and if his machines are idle he will make for anybody and everybody."

550. But it is suggested by this letter that Mr. Henley should be a sub-contractor under Mr. Bullivant?—Certainly; if Mr. Bullivant had the contract from the Jersey Telegraph Company, as appeared from the prospectus, and had no machinery, Mr. Bullivant was very anxious to obtain a sub-contract from a contractor who had machinery, and not only that, Mr. Bullivant appeared to like that arrangement; but he has also applied to Mr. Henley for the use of the "Caroline" to lay down the cable, not possessing a ship. It was a mere business transaction.

551. Then at this moment you have some such idea in your mind as that Mr. Bullivant contracted to make a cable for what I call the new company, the Jersey and Guernsey?—It was announced in the public papers.

552. And you thought your friend, Mr. Henley, might probably be a sub-contractor, and make the cable for him?—I thought it possible; there had been some kind of verbal understanding to that effect.

553. Mr. Lefeuvre, who was at one time, and I believe always has been, connected with the old company, was also a very active gentleman in the new company, was he not?—He was.

554. Is it within your knowledge whether Mr. Henley sent in a tender to the new company, as also Mr. Bullivant had done?—That I am not aware of.

555. Has not your intimacy with Mr. Henley enabled you to know that?—Mr. Henley does not inform me of his business, except upon business which brings him in connection with me.

556. Did you see Mr. Henley after writing this letter, introducing him to Mr. Bullivant?—I am not certain; I do not think I did. I do not know that I saw Mr. Henley upon that subject, neither am I aware whether Mr. Bullivant called upon Mr. Henley.

557. Whether Mr. Henley called upon Mr. Bullivant you mean?—I do not think Mr. Henley called upon Mr. Bullivant; Mr. Bullivant would call upon Mr. Henley.

558. Then whether or not Mr. Henley's was a competitive tender with Mr. Bullivant's to the new company, you do not know?—I do not know at all.

559. But you thought that Mr. Henley might be useful to Mr. Bullivant in making

Mr. N. J. Holmes.

5 July 1870.

making the cable?—As a sub-contractor having machinery at his disposal, I may state in reference to that letter, that in my applications both to the Board of Trade and the Treasury, I have always stated that the company had no objection to the cable being laid.

560. Then let me askyou this; when you four gentlemen had made a cable that was to cost 22,500 *l.*, what were you going to do with it?—Retain it on the revenue of the lines; upon the working of the lines.

561. What lines are you talking about?—The cable when laid down; of course when that cable was laid down a traffic would have ensued. In order to guard ourselves against the contingency of loss, we sent Mr. Stoffel over to raise a guarantee upon the capital of 5 or 6 per cent. Mr. Stoffel failed to do that, and we risked the money without the guarantee. The cable being laid, we should then have only the traffic to reimburse us.

562. This document not showing what was to be done with the joint cable when it was made, did any bargain exist between you four gentlemen as to what you should do with your cable when you had manufactured it at this cost? —Work it on our own account.

563. There is nothing about that here; was that a verbal agreement between you?—It was understood, because an application had been made to the Post Office by the Government with regard to the working of the cable on the English side.

564. Was there a verbal agreement between you four that you should lay down a cable as telegraph owners, and work it as a telegraph between the two countries?—Certainly.

565. At your own risk and on your own responsibility, quite independently of any other company?—Certainly; we had engaged the clerks for the island for that purpose, but that the Post Office, we presume, would have worked it on the English side.

566. You probably, as you are not a maker of cables, cannot tell me when this cable, if it does exist at this moment, was manufactured?—The manufacture of the cable was not commenced in December, so far as I can remember, because Mr. Henley was very busy with some large contracts for the Maintenance Company; but the moment any of his machines were idle he took it up. A cable has been lying for some time at North Woolwich, a portion is now laid between Jersey and Guernsey, and another portion is on the "Caroline."

567. But can you tell me when the telegraph cable was made; this identical cable which is to cost so much money?—No, I cannot tell you at what date Mr. Henley commenced it.

568. Can you tell me the date at which it was finished, supposing it ever has been finished?—Nor the date at which it was finished.

569. Can you tell me the date on which it was put on board ship?—I cannot, because I was out of town.

570. Nor when any part of it was taken out of the ship and laid down between the two islands?—I cannot tell you when it was laid.

571. Have you no idea?—A portion of it was taken out recently. I do not know when Mr. Henley finished the cable or his machines, or when he packed it on board the "Caroline"; I only know that in my correspondence with the Board of Trade, I stated that the "Caroline" had sailed.

572. Do you know that of your own knowledge, or because Mr. Henley told you?—Because he told me.

573. Then you do not know of your own knowledge when any part of it was laid down?—Certainly not.

574. Do you know of your own knowledge whether any portion of the cable came back again?—Certainly; I have seen part of it on board the "Caroline" with the Scilly Islands cable.

575. As you know nothing about the cable, I will not follow that out. When you sent Mr. Stoffel to help you to raise this capital, was he employed by you to raise it as a new capital, independent of all companies, for a private speculation of you four gentlemen?—Mr. Stoffel was never employed to raise capital; he was only employed to raise a guarantee upon the capital which was promised to be raised.

576. What was Mr. Stoffel's connection with your association?—Merely to get the guarantee, for which he would receive a certain sum if he succeeded.

577. Merely

577. Merely to get the guarantee to aid you in the formation of the capital, and to correspond with the public departments for the necessary consents?—Not to aid us in raising the capital, because the capital was promised before we left.

578. To try and get an indemnity?—To try and get an indemnity to cover us in case the traffic should be less than we thought.

579. Then let me be quite clear; Mr. Stoffel's connection with your association was to try and raise a guarantee in the islands, and to communicate with the public departments for the necessary consents?—Certainly.

580. And that was all?—Yes, to my knowledge.

581. And for nobody else?—For nobody else.

582. I will ask you to explain a letter which you wrote to the Board of Trade, dated the 6th of May 1870: "I have to acknowledge your letter of the 5th instant; in reply I beg to state that Mr. Stoffel is not in any way connected with either the Channel Islands Telegraph Company (Limited) or the above association"; the words above being "the Channel Islands Telegraph Association." Was that statement to the Board of Trade true?—It was.

583. That he was in no way connected with the Channel Islands Telegraph Association?—It was. Mr. Stoffel had left the island, because he had not been successful in obtaining the guarantee, and we had closed with him.

584. Then did you intend the Board of Trade to understand that Mr. Stoffel at that particular hour was not connected with you, or that in his previous correspondence he never had been connected with you?—At that particular time.

585. Did you intend the Board of Trade to understand that he was not connected with you at this particular moment, or that he had not been connected with you in his previous correspondence?—At that particular moment.

586. And not to repudiate his connection in his previous correspondence?—Certainly not.

587. This is a letter that you received from Mr. Trevor, in which he says, "Referring to previous correspondence on the subject of landing a cable at Start Point, I am directed by the Board of Trade to transmit to you copy of a letter which has been received from Mr. Stoffel"; then this is the copy of the letter from Mr. Stoffel withdrawing his authority to you to represent the old company?—That is quite correct.

588. Now, you say, that in writing your answer, and saying that Mr. Stoffel was neither connected with the old company nor the association which you represent, you intended them to understand it as applying to that particular hour, and not to the question of the previous correspondence, about which the Board of Trade wrote to you?—Certainly.

589. Then did you intend to mislead them?—Certainly not; I went and personally saw Mr. Cecil Trevor on the subject myself.

590. I am talking of your letter, not of the personal interview; how do you reconcile that with the very next paragraph in this letter: "Any letter addressed to the Board of Trade, under date the 8th of April, is therefore a personal communication, and has not been written by any authority, either written or implied, from the Channel Islands Telegraph Company (Limited) or the above association"; how do you harmonise that with your idea?—In a very simple manner; Mr. Stoffel wrote the letter on the previous day; I think you will find the date is the 7th of April, where he alleged the correspondence that he had written for the landing places to be handed over to him on my application. At that time it was undecided what amount of recompense Mr. Stoffel should have, for, although he had not succeeded in getting the guarantee, there is no doubt that he had spent a great deal of time, and a certain amount was proposed; I think it was 250 *l.* When he found that he was to get only 250 *l.*, he thought that was insufficient. He had got into difficulties, and he has since become bankrupt. Mr. Sharpe considered it quite sufficient; but in a fit of indignation Mr. Stoffel went away without a word to anybody, and sent that letter to the Board of Trade. He had no authority from me to cancel his letter.

591. How do you reconcile your statement in this letter that his previous communication is the unauthorised one, you having just told the Committee that you intended the Board of Trade to believe that it was all authorised, except up to that hour when you repudiated it?—I think you are decidedly under an error there; I did not repudiate the letter of the 7th; I repudiated the letter which Mr. Stoffel had written to the Board of Trade cancelling the previous letter on the 8th. That

Mr. *N. J. Holmes.*
5 July 1870.

8th. That letter was not written by any knowledge of the association or myself; it was written by Mr. Stoffel from his office.

592. Then do you acknowledge Mr. Stoffel up to the 7th of April, and repudiate him from and after the 8th of April?—On the 7th of April Mr. Stoffel came to a final arrangement with ourselves, and he withdrew on the 7th.

593. Do you acknowledge him up to the 7th, and repudiate him from and after the 8th?—I do. Up to the date at which Mr. Stoffel wrote the letter to the Board of Trade, alleging that his previous applications were part and parcel of mine, I acknowledge him.

594. Then any letter addressed to the Board of Trade, under date of the 8th, is therefore a personal communication, and not written by authority; do you repudiate him from and after the 8th of April?—I repudiate him on the face of the letter, dated the 8th. At the present moment I am not able to state whether the letter written to the Board of Trade was dated the 8th or not. My impression is that it was dated the 7th; but had it been dated the 8th, I do not repudiate the first communication. I repudiate Mr. Stoffel's authority to cancel that communication.

595. Let me invite your attention to this thing which Mr. Stoffel had given you. You write on the 7th of April to the Board of Trade, in a letter dated from your association in Winchester-street, and you say, "I enclose the official papers from Mr. Stoffel, who was duly authorised to act for the company;" what company did you mean by that?—Our own association. The official papers, you will observe, are the minutes which were passed authorising Messrs. Ashurst and Morris to raise the independent capital.

596. Do not let me take you at a disadvantage. I will give you time to think. "I enclose the official papers from Mr. Stoffel, who was duly authorised to act for the company." What company do you mean?—It may have two meanings.

597. I know it may. What company do you mean?—It may be taken that he was——

598. I will not take that answer. What company do you mean?—I cannot say what company I mean there, because the minute——

599. Did you not mean the old company, the Channel Islands Telegraph Company?—I can hardly mean the old company, seeing that the capital was not found for the old company.

600. Then, did you mean the new one, the Jersey and Guernsey Company?—It certainly did not mean the new one, as he had no connection with it.

601. Did you mean your association?—I might have meant the association, and I might have meant that he was authorised to act in the interests of the old company, which were so far connected with us, inasmuch as our new cable would restore their communication.

Mr. *Bidder* applied that the letter on which the witness was being cross-examined should be put into his (the witness's) hands.

Mr. Serjeant *Sargood* declined to comply with Mr. Bidder's request.

The Committee ruled that it was unnecessary that the letter should be put into the witness's hands.

Witness.] I perfectly recollect the letter; and the difficulty of answering the question is apparent, because the minutes authorise Messrs. Ashurst and Morris.

602. Mr. Serjeant *Sargood.*] Now, I will read the words again, "Mr. Stoffel, who was duly authorised to act for the company by a minute of the board;" to what company did you refer then?—My impression is that I referred to the interests of the old company, under the minute of which I enclosed a copy.

603. Then you referred to the old company?—The old company did not connect themselves with the minute.

604. I did not ask you that; did you refer to the old company?—I referred to the minutes of the old company.

605. Did you refer to the old company?—The old company passed a minute.

606. Mr. *Hurst.*] Surely it is a very simple question. You used the words "The company;" what company did you mean?—When I wrote the word "company," I certainly had no conception that it would be construed in that way;

way; I certainly referred to the minutes. I enclosed the minute which explained the circumstances.

607. You meant the minutes of the old company?—Of the old company.

608. *Chairman.*] The company, for which Mr. Stoffel was duly authorised to act, was the old company?—No; he was authorised to act by Messrs. Ashurst and Morris.

609. Mr. Serjeant *Sargood.*] You say he was authorised to act for the company by the minutes of the board; did you mean the minutes of the board of directors of the old company?—Certainly; which I enclosed; but those minutes did not authorise Mr. Stoffel to act for the company.

610. I want to know what you wished to convey to the minds of the Board of Trade?—I sent the minutes for their own construction. They had the copy of the minutes.

611. I am talking of your letter, and not of the copy of the minutes?—I refer to the minutes. I enclosed the minutes.

612. "I enclose the official papers from Mr. Stoffel" (and then you give him a character), "who was duly authorised to act for the company by a minute of the board to that effect." Did you, with this letter, send a copy of that minute of the board?—Not with that letter, but afterwards; because at that time I had not received it.

613. Did you send it a month afterwards?—When I was able to procure it. I knew the purport of the minutes.

614. You have not seen it up to this hour, of course?—I have not seen it, but I have heard of it.

615. You sent them this paper, signed by Mr. Stoffel, dated April 7th, and addressed to "N. J. Holmes, Esq." "Dear Sir,—(Channel Islands Telegraphic communication)" (that is the new name for the company or the association), "being duly authorised by minutes of the board of the Channel Islands Telegraph Company (Limited), of the 11th of September 1869, duly entered into their minute-book, to undertake such negotiations, and perform such acts as I might deem necessary for the renewal of telegraphic communication between the Channel Islands and Great Britain, and under which authority I have made the necessary application to the Board of Trade and Post Office for the foreshore rights under the Crown's prerogative and the transit service. I hereby authorise you (Mr. Holmes) to apply for and receive, in the name of the Channel Islands Telegraph Association, such foreshore, and transit permission, and way leaves, as had been applied for by me in the name of the Channel Islands Telegraph Company (Limited), by virtue of the minutes above referred to." Now, you accepted that from Mr. Stoffel, did you not?—Certainly.

616. Did you think you wanted it or needed it?—Mr. Stoffel——

617. Answer my question, "Yes" or "No," and then explain what you like?—Yes, certainly, Mr. Stoffel had made the applications in December to the Government departments without, as I have stated already, referring the matter to me. If Mr. Stoffel made them in the name of the Channel Islands Telegraph Company, that was his own mistake. He never communicated with me; they had not found the capital.

618. I am not talking about capital, but I am talking of facts?—That is a fact, that the Channel Islands Company had not established a capital to lay the new line. The parties who owned the cable, and who found the money, were the right parties to whom the foreshore should have been granted. If Mr. Stoffel misinterpreted the tenor of the minutes which authorised Messrs. Ashurst and Morris to appoint any party they chose, and they appointed Mr. Stoffel to act for them, and to do whatever was right in the interests of the old company, without involving the old company, I was not responsible, but when I came to deal with the Board of Trade, and had a personal interview with Mr. Cecil Trevor, he stated to me that Mr. Stoffel had made the applications in the name of the old Channel Islands Telegraph Company, and I must, therefore, identify myself with that application, as Mr. Stoffel had done it; therefore, I required that letter. Mr. Stoffel had made an error, and I wished it to be put in a proper way correctly.

619. That means that you wanted two strings to your bow?—Certainly not; we never had two strings. The old company were never mentioned

620. Mr. Stoffel's first communication with the Board of Trade, on the 13th of December, runs thus: "Having contracted with the Channel Islands Tele-

Mr. N. J. Holmes.

5 July 1870.

graph Company (Limited) for laying a new submarine telegraph cable between the Channel Islands and the United Kingdom, I beg to make application to you for the consent required." Did you think it all a blunder?—Mr. Stoffel might be a very sanguine man, but he had not raised his capital; he had contracted for the cable.

621. There is not a word about capital; he says he is acting on behalf of the Channel Islands Company, the old company, in asking for leave to lay a cable?—Then he must have raised his money, because the minutes which authorised him, stated that the capital must be raised; under the minutes under which Mr. Stoffel was authorised to act as agent, he must have raised his capital. No doubt, he was of a sanguine turn of mind. He had not raised his capital.

622. He writes and asks for leave on behalf of the old company, and not of the association; do you mean now to say that your agent made a gross blunder, and did not know for whom he was acting?—He interpreted the minutes, which were the only authority upon which he could apply to the Board of Trade, in his own way.

623. You mean to say that he made a gross blunder, and that he did not know whether he was acting for the association or for the old company?—Certainly I do; for the parties who found the money, and who ought to have been the parties to receive the foreshore.

624. Then Mr. Stoffel being your authorised agent to act on your behalf, began in December and ended in April, always acting for the old company, and forgetting that he was working for you?—I can explain to you why these mistakes have arisen; the mistake is very simple. At that time our Peterhead communications from Norway was broken, and I was away the whole of December mending our Northern cable. Mr. Stoffel had undertaken to communicate with the Government Departments, and he did it in his own way; I was not in London at the time to be consulted.

625. I think we have sifted out where the blunder is; how it arose other people must judge?—I should wish the Committee to understand that during nearly the whole of December, except two or three days, I was at Peterhead restoring the broken cable, and I therefore was not in London at that time, and that accounts for the delay in the agreement, and also this matter of Mr. Stoffel's misinterpretation of the minutes.

Re-examined by Mr. *Bidder*.

626. You say that at the end of the year, when the correspondence was going on, you had to be absent upon other business?—Very important business, because we had nearly 100,000 *l.* at stake in the North Sea.

627. And I understand you to say that the communication forwarded by you, and written by Mr. Stoffel, authorising you to take advantage of his former applications was in consequence of your interview with Mr. Trevor, and his informing you that it was necessary that you should identify yourself with Mr. Stoffel?—He said the application had been made in the name of the Channel Islands Telegraph Company; I explained to Mr. Trevor the nature of Mr. Stoffel's connection with us, and he said I must identify myself, as I was now making application personally with the former application.

628. You have been asked a good many questions about that agreement; are you quite clear, as you stated in your cross-examination, that the original pencil draft was made in December?—Yes; I am quite clear as to that, because it was always intended to have had it signed immediately, and Mr. Henley or Mr. Rogers was frequently asking me for the document, and I excused the delay on account of my absence.

629. The substantial agreement took place between you in December, did it not?—It did; at the time that the question of laying the cable was settled.

630. And whatever the form of Mr. Stoffel's applications was, you were trusting to Mr. Stoffel's applications to the Government Departments for the sanction for your cable being laid on the English foreshores?—I was.

631. Were you in December *bonâ fide* embarked in this enterprise?—We were.

632. When did you first become acquainted with the fact that the new company were in the field?—We became acquainted with it by a letter I think from Mr.

Mr. Hawksford. During the time that Mr. Stoffel was in the Islands he applied to the chief merchants to guarantee, and amongst other parties he applied to the South Western Railway Company at Southampton, who ran the steamers between Southampton and the Islands, with a view of getting some guarantee from the railway company, or the dock company, who owned the boats, and, I believe, that shortly after that application had been made I first became aware of the formation of the new company.

633. *Chairman.*] At what time was that?—It would be either the beginning of January or the end of December that the application was made to the Southampton Dock Company for their subscription to the guarantee.

634. Sir *Lawrence Palk.*] The learned counsel yesterday, in stating this case, gave me reason to believe that you had received consents to land the cable at Start Point, and I said, not being sure of that, "Then you did not get those consents"; upon which the learned counsel said, "I beg the honourable Baronet's pardon." I gathered from that that you had the consents to land the cable at Start Point. Then I see, in Mr. Henley's petition, that he states that the cable was manufactured, and then he says, "Since the refusal of the new company to purchase the cable of the association, leave to lay the cable which was constructed by the association has been persistently refused by the Government; so much so that troops were called out on the 4th of April," &c. Have you at any time during any portion of your negotiations, or the formation of your association, or the manufacture of the cable, received any consents from any authority to land the cable either at Start Point or in the Channel Islands?—Not a direct consent in writing, because the Board of Trade and the Office of Woods and Forests referred the matter to the Postmaster General, and no reply had been received; but, under the rules of navigation, it had been approved of, and the Board of Trade had intimated that they had no objection to granting the consent.

635. Then the learned counsel was not correct when he contradicted me in saying that you had this consent?—No, that is not correct; in the letters to the Woods and Forests and Board of Trade they have since then stated that they would be ready to grant their consents.

636. But you did not get them?—No.

Mr. *Bidder* stated that he had afterwards endeavoured to explain what was the real state of the case, and that he had no intention of misleading the Committee.

Witness.] The formal business had been completed, so far as approving of the plans for landing the cable went, and nothing more was wanting than the assent of the Postmaster General, when the consent would have been executed.

637. Sir *Lawrence Palk.*] But you never had that consent?—No.

638. Mr. Serjeant *Sargood* (through the Committee).] In a letter addressed by you to the Treasury on the 5th of April, before Mr. Stoffel is repudiated, you say this: "It is necessary that I inform your Lordships that there has been some apparent mistake on the part of the cable proprietors who had started to submerge the cable before the official landing foreshore permission had been obtained." This is the phrase which I am going to ask you to explain; "This has arisen in error, as it was considered that the previous consents of the old cable landings covered the present renewal." How do you explain or make consistent that statement to the Treasury, if you now repudiate the old company, and say that you were an independent speculation?—The explanation of that is, that the foreshores on the English side are vested in the Crown, and applications had been made; but no applications had been made in the case of the old company to lay the cables in Jersey and Guernsey. Although the Treasury granted them a subsidy, still no permissions or rights were asked from any department of the Crown. We were promised the same facilities, and therefore no application had been made.

639. *Chairman.*] Did you not in that letter lead the Treasury to believe that the consents which had been given to the old cable covered your undertaking?—They had no consents; they had no interference. I meant that no consents had ever been given or applied for. They were suffered to lay their cable by landing

Mr. *N. J. Holmes.*

5 July 1870.

it, and we were informed, through Mr. Hawksford, that we should have the same facilities.

640. You said, "This has arisen in error, as it was considered that the previous consents of the old cable landings covered the present renewal;" what consents did you mean?—I meant the landings upon the foreshore of the Channel Islands. I had applied for Start Point under the Crown prerogative, and when I went to the Treasury and personally saw Mr. Welby (who was very kind) to make some explanation as to the foreshore rights, he stated that the matter had since become vested in the Treasury, and that this had become a very good precedent.

641. You said that these consents that you have referred to were consents to land the cable in Guernsey and Jersey?—Certainly; the Treasury now claim it.

642. By whom had these consents been given?—They had been given, or promised to us, by Mr. Hawksford; the same facilities as the old company enjoyed. The old company had no written consents.

643. When you talked about consents, you talked about what did not exist?—I meant that the proprietors of the private foreshore would have no objection.

644. When you spoke of the consents to the landing of the old cable, you had not any consents at all?—No; I meant that we should have the same facilities. I do not think the Submarine Company had any consents.

645. Why did you not put it to the Treasury in that way; why did you use the word "consents" if there were no consents?—There is a consent of the owner of the private property beyond high-water mark, and the owner of the private property had no objection to the cable being landed on his property.

646. What cable?—The new cable which the "Caroline" had carried out.

647. Did you ask him?—Mr. Hawksford had undertaken to do that, and he had stated that there were no difficulties, and that it would be given to us; the Treasury afterwards claimed a right to the foreshore, and hence the application. At the time we started with the "Caroline" we never dreamt that the Treasury claimed a right to the Channel Islands foreshores, and they had not previously done so.

648. Then no previous consents having been obtained, you said that you considered that the previous consents covered the present renewal?—That the private proprietor had no objection to the present renewal.

649. But in this letter you are apologising to the Treasury for having acted without their consent?—The Treasury told me that I had applied to every department under Government but the right one and that was the Treasury; I therefore apologised to the Treasury, because I was not aware that they claimed the foreshore; I had applied to all the other departments.

650. Mr. *Hurst.*] Do you imagine that any reasonable person receiving that letter would not suppose you were in connection with the old company, and acting with the old company?—I think not, because I had sent an explanation to the Woods and Forests.

651. This was not to the Woods and Forests?—I understood that as he was communicating with the Treasury and the Home Office, that communication would be made public to the different departments; I did not send a copy of it to each of the departments, but I was always referred to the Treasury from the Office of Woods and Forests, and I sent them full details of the whole association.

652. *Chairman.*] It appears that in December you entered into an association to re-establish telegraphic communication with the Islands?—We did.

653. And in February it appears that you wrote to Mr. Bullivant to introduce Mr. Henley as a sub-contractor to him?—I did; they called upon me in my office; I did not of course run after him.

654. Who?—I think it was Mr. Bullivant or Mr. Lefeuvre; I am not sure whether I did not see both in the ordinary course of business, Mr. Henley having made large contracts for me at different times; and knowing that Mr. Bullivant had no machinery, I said that Mr. Henley had three or four machines idle, and that no doubt he would be very glad to undertake it.

655. Was it your intention that he should make another cable?—That he should make a distinct cable; because I stated to the Treasury and the Board of Trade, that I had no objection whatever to their granting the right to land on the

the foreshores to the Jersey Company; I said that I was not at all for a monopoly. Mr. *N. J. Holmes.*

656. Were you rather anxious that a second cable should be laid?—No; but as they had their money, it was no business of mine to assist them. 5 July 1870.

657. But you appear to have assisted them?—In the shape of having assisted them to get the cable laid, and they could not get any ship that had any paying-out machinery to lay it.

658. I did not understand why you, who had entered into an association to lay a cable between the Channel Islands and this country, were to encourage a new and a rival company to lay another cable?—I had two objects; in the first place Mr. Henley was simply contractor to the association; he was in the association so far as profit and finding capital went, but he was a contractor to the association, and as a contractor without profit; therefore he had a double capacity; but I had a great interest, and every person connected with submarine cables has a great interest in having good cables. We have just suffered and lost a good many thousand pounds from a bad cable having been manufactured for the Scilly Island, by an incompetent manufacturer. I did know Messrs. Bullivant and Allen in the telegraph world, and any bad or improperly laid cable would have damaged the value of the security, of which myself and friends were large holders, and therefore I was anxious if they did lay the cable, that they should go to some substantial contractor who should know his business.

659. You did not intend to dispose to Mr. Bullivant of the cable which you had been constructing for yourselves?—Certainly not.

660. In fact, you did all you could to assist a competing company to lay another cable?—Certainly, I offered no objection to their making a cable, or laying it. I offerred to put them in the way of getting a good contract.

661. You preferred that your competitors should have a good cable rather than a bad one?—Certainly, I should not like to have seen the money lost, as it was in the Scilly cable. That was one reason why Messrs. Ashurst and Morris referred the matter to Mr. Sharpe and myself, because the Scilly cable had not turned out very satisfactorily, and they felt that they did not know so much about cables as we did, and that it was, therefore, better to hand it over to us.

662. Mr. *Muntz.*] I think you stated that you, Mr. Henley, Mr. Stewart, and Mr. Sharpe, engaged to supply 22,500 *l.*, and Mr. Henley to supply 15,000 *l.*?—He was to supply two-thirds.

663. Mr. Sharpe supplied 5,000 *l.*, Mr. Stewart 1,500 *l.*, and yourself 1,500 *l.*; was this money paid —No, it was not paid.

664. When was this money to be paid?—At any time Mr. Henley liked to call for it, on my giving the certificate of the cable.

665. When the difficulties arose, the foreshore difficulty, so that you could not lay the cable, then you withdrew?—The money would have been paid——

666. Did you withdraw?—We withdrew when the cable could not be laid. Mr. Henley would not be entitled to draw the money from us until the cable had been laid.

667. Then, in fact, Mr. Henley being unable to lay the cable, agreed to your withdrawing, and cancelled the deed?—That is so; he could not fulfil the contract.

668. Mr. *J. D. Lewis.*] You say that Mr. Stoffel visited the Channel Islands about the month of December in order to raise a guarantee fund, as far as I stand?—Exactly.

669. Then he was acting as agent for the association; there is no writtten instrument constituting the association as we understand?—There was merely a verbal agreement.

670. Did Mr. Stoffel carry out any written authority or instructions?—Mr. Stoffel had a written letter of introduction to Mr. Hawksford, and he was supplied with the necessary legal documents to get the guarantee signed.

671. Still there was nothing but a verbal agreement, was there?—There was nothing but a verbal agreement.

672. *Chairman.*] To whom did he take a written letter of introduction?—To Mr. Sharpe and Mr. Hawksford.

673. Mr. *J. D. Lewis.*] But he was introduced to Mr. Sharpe at your office on the 17th, was he not?—Exactly. Mr. Stoffel did not start for the Islands until the 21st, I think, and the documents were sent and furnished to Mr. Stoffel for signature

Mr. *N. J. Holmes.*
5 July 1870.

nature when he went over. I may also state that from time to time in the local papers, Mr. Stoffel's meetings connected with the guarantee, were printed.

674. Mr. *Muntz.*] I think you stated that you ascertained that this contract for the 22,500 *l.* would leave no profit?—No; it is a very heavy cable, and a very large cable. I have samples of it in the room.

675. We do not want to see the samples. You stated that you had ascertained that it would give no profit, did you not?—Yes.

676. Then are the Committee to understand that Mr. Henley was to take the risk of this 22,500 *l.* to supply the cable, making no profit upon it?—Certainly.

677. Mr. *Hurst.*] There is a paragraph in your petition, stating that the new company applied to the association, and requested to purchase their cable, but that no purchase was completed; when was that application made?—I am not aware; I know in conversation it was found that the price which we asked for our cable was more than the capital of the company, and when Mr. Henley put on his trade profit, it exceeded their capital. The 22,500 *l.* was the nett cost.

678. When was the application made?—That I am not able to say. Mr. Henley might know.

[The Witness withdrew.

Mr. *David De Quetteville*, re-called; further Examined by Mr. *Bidder*.

Mr. *D. De Quetteville.*

679. Are you a member of the Royal Court of Jersey?—I am. I am a Jurat of the Royal Court, and as such a member of the States of Jersey.

680. Will you tell the Committee whether it is necessary for a person desiring to lay a cable between Jersey and Guernsey to apply to any officer of the Crown for assent, in respect of the foreshore?—It was not, so far as Jersey and Guernsey were concerned. I know that as a fact, because as deputy chairman of the old Channel Islands Company, I had the entire management, or rather had the direction of the laying down of the land lines in Jersey in connection with the cable; and I did so without applying to any authority whatever.

681. Then no Government office was ever applied to in reference to the landing of the cable of the old company on the Channel Islands shores?—None.

682. Mr. Serjeant *Sargood.*] Do you represent all the Government offices in Jersey?—As a Jurat of the Royal Court for the last 20 years, and as a member of the States, I can speak rather positively on all those questions. It is rather more than a common sense view; it is a legal point. I should not like to travel into the general question of law, but with regard to this particular question I speak positively.

683. Mr. *Bidder.*] Then I understood you to say, also, that it was not necessary as a matter of law?—It was not.

684. You are acquainted with the law of the Channel Islands?—I am. As far as the experience of 20 years as a member of that Court can make me so.

685. Have the Crown any office in this country acting of its own motion with any authority to suspend or prohibit, or interfere with, the landing of a cable on the shores of the Channel Islands?—None whatever; and I believe that their own law officers in both Islands will bear me out in the assertion; and I believe that if the gentlemen of the Post Office would produce the correspondence which has taken place——

686. Mr. Serjeant *Sargood.*] That is all irregular; there are some facts.

Witness.] So far I am giving you facts, rather beyond your own satisfaction, I think.

687. Mr. *Bidder.*] Let us confine ourselves to questions of law. You say that, as a matter of law, no Government office in this country has any right whatever to interfere with the landing of the cables in the Channel Islands?—None whatever.

688. Therefore it is not necessary for any personages intending to land a cable between Jersey and Guernsey to apply to any Government office?—Not any Government office in this country, certainly.

689. Any person who did interfere is committing a breach of the law?—They did so, I have no doubt.

Cross-examined

Cross-examined by Mr. Serjeant *Sargood.*

690. You have been asked one question very much to the purpose, and that is, that the old company, with which you were connected, did not need permission for anybody to lay down their cable anywhere?—They did it without anybody's permission being asked for.

691. Had not your old company the special advantage of a private agreement with the heads of departments in this country, by which they put what I will call a Government director, for the want of a better idea, on your board of directors?—They had.

692. And did not that Government director himself settle the route which your cable was to take?—I could not give you an answer to that question. This I know, that the route was selected by the Government in opposition to our wishes.

693. The route was selected by the Government in opposition to your wishes. The Government put a director on your board to take care that you did not escape from it; was that so?—They put a director on our board, but he generally agreed; in fact he always agreed with whatever we did.

694. That is because you did what was right, I suppose?—I hope so; and I hope I am doing what is right now.

695. The Government director being put there to take care that the Government interests were not disregarded, your company probably paid a certain sum for getting your lines on the foreshore?—With regard to the islands, not a penny; nor would I have consented to the payment of a single penny.

696. But you had to pay something for getting your lines on the foreshore of the islands?—Not in Jersey and Guernsey; I believe that after the land lines were laid down we were called upon by the Woods and Forests to pay something like 1 *l.* a year, if I remember rightly.

697. For what?—For going through their grounds.

698. Where?—In England. As far as Jersey and Guernsey are concerned we never paid one farthing, and never asked any one's permission.

699. Nobody has ever said you did?—I was asked the question, or it looked very much like it, if I understood you rightly. Not only did we not, but I never would have consented, nor would the company, to have paid one farthing.

700. You know everything which goes on in Jersey, and are a great authority?—Not quite everything.

701. You have a railway company there, I believe?—We have.

702. I have never been at your pretty place?—It is a pity; you should come.

703. Have you any connection with the railway?—Not in any way.

704. Do you happen to know as a matter of knowledge, and interest in the island, that the railway runs down on the foreshore?—It does.

705. Do you happen to know that they had to pay something to get permission from somebody in order to do it?—I believe they paid the Treasury some money, but I told Mr. Pickering at the time that so far as we were concerned we would treat that as waste paper, and that the Treasury had got money out of them under false pretences.

706. That is not the first time that you have abused the Treasury?—No, nor the last either.

707. You set up the war-cry, did you not?—It is not a war-cry. If it is of any interest to these gentlemen, I have no objeceion to state what it is, though I do not see what it has to do with this case.

708. It was a remonstrance against what you call imposition?—Not of the Treasury. I was at war then with the railway. I am at war with everybody now and then, I suppose.

709. You are, I will not say a litigious man, but a courageous man?—I have some Norman blood in me.

710. It so happened that the Treasury, on some pretence (you call it false, but I call it true), did make the railway company pay for coming on to the foreshore?—They made them pay in this way; they did it in an indirect way; they managed to prevent the assent of the Crown being given to the railway until they got this money.

711. That is a very direct way of doing it, is it not?—I do not know.

Mr. *D. De Quetteville.*

Re-examined by Mr. *Bidder.*

5 July 1870.

712. That is to say, the Treasury claimed, and they recognised some alleged right over the foreshore, and they happened to have another screw upon the railway, and they would not assent to the railway being made at all, unless they would give way there?—Yes, that is it. I may add, in proof of what I have been asserting, that lately, on a question of the foreshore, they managed to get an Order in Council, and to send it down to the Islands, giving——

713. *Chairman.*] Who managed?—The Treasury; giving a portion of the foreshore to a private individual. The court refused to register it. Perhaps I may as well add, that no Orders in Council are law in the Islands until they are registered, and that the question is now pending between the Treasury and ourselves.

714. Mr. *Bidder.*] My learned friend suggests that in the other case Government did practically superintend the affair, because he says they had a director upon your board, and arranged the line which the cable was to take; is it not the fact that in that case the Government were guaranteeing themselves, and taking the risk of the profits which might arise from that cable so long as it was worked?—I believe so.

715. And therefore, being guarantors, they claimed a right to be represented upon the board?—Just so, as the shareholders were represented by their own directors.

716. Mr. *Hurst.*] To whom do the foreshores, in your opinion, belong in Jersey?—There is no doubt in Jersey, with regard to that question, that the foreshores are under the guardianship of the States and the Crown jointly; but that, as in this country, the Crown could not do an act without the assent of Parliament, neither could the Crown do so without the assent of the States in Jersey.

717. Does it not come to this, that in Jersey there would be two consents required, that of the Crown and that of the States?—In fact, I have already told you that we laid our cable without asking any authority, and I would have done so again. With respect to Mr. Henley's cable, I may add that had I been the chief municipal authority of the parish where the cable was about to be landed, notwithstanding the orders of the Treasury and the Home Secretary, I would have gone on board and had the cable landed, and anybody who had interfered with me I would have presented in court.

718. The foreshores, you say, belong jointly to the Crown and the States?—They are under the protection of the Crown and the States.

719. Supposing that the question was urged hostilely, would it not be necessary to have the consent of the Crown and of the States to have anything done with the foreshore?—But the States, considering the advantage of laying a cable between England and the Islands, would never have thrown impediments in the way.

720. *Chairman.*] But the Crown might do so?—The Crown could not legally without the States.

721. But surely, if the foreshores are under the joint protection of the States and the Crown, the consent of each would be necessary?—The strict way would be to apply to the States, and the act of the States would probably be sanctioned by the Crown.

722. But supposing it is not sanctioned, what then?—The first interference must come from the local authorities.

723. Then what has the Crown to do with it?—Only as an appeal; they in all cases give their assent.

724. Sir *Lawrence Palk.*] If they refuse to give that assent what happens?—No acts of the States are valid without the assent of the Crown.

725. *Chairman.*] So that the cable could not be laid over the foreshore without the consent of the Crown?—It could be laid, and has been laid, without the consent of the Crown.

726. But supposing that the question is legally raised?—If the question were legally raised undoubtedly the permission of the States would have to be asked. The States would then either give or refuse their permission. If they refused there would be an end to it; if they gave their permission it would require then the assent of the Crown, and all our acts do.

727. Sir

Mr. *D. De Quetteville.*

5 July 1870.

727. Sir *Lawrence Palk.*] If the assent of the Crown was not obtained, the cable could not be legally laid?—No.

728. Mr. *Hurst.*] Then the consent of the Crown must be had before the cable can be legally laid?—The States must always come in first. The fact is that the Crown can never be appealed to without the concurrence of the States.

729. And the consent of the States having been given, that would be of no value unless it was concurred in by the Crown?—No.

730. Mr. *J. D. Lewis.*] Then when you say that you would have taken the telegraph line if you yourself had been the chief municipal officer of the parish, you admit that it would have been an wholly unauthorised act on your part?—No, because I could only have been prevented by legal interference.

731. Mr *Bidder* (through the *Committee*).] Has the Crown any right whatever, or any power, to interfere without the previous consent of the States?—It has not.

732. Mr. *Muntz.*] Has the Crown no prerogative in the States?—They have; but with regard to the foreshore, not to the extent which the Treasury is now claiming; and the proof of that is the view that both the courts and the States took, that upon an order being sent down giving a portion of the foreshore to a private individual, both the court and the States have refused to register it.

733. Mr. *Hurst.*] In your opinion in whom is the soil of the foreshore vested, quite independently of the right of protection of which you speak?—In my opinion, in the proprietors of the land bordering; for instance, I have property bordering on the foreshore where the railway passes, and I claim a right to the foreshore.

734. I do not know whether you are a lawyer?—Not exactly; I have been 20 years a jurat and a member of the court.

735. Do you claim that by prescription or by grant, or under the Crown in some way?—I need not tell you that in former times the Crown exercised rights which would not be recognised now-a-days.

736. You say the soil is vested in the owner of the adjoining land?—Yes.

737. Mr. Serjeant *Sargood.*] You do not say that as a lawyer, but that is your private opinion?—Yes.

738. Mr. *Bidder.*] The Crown assent is like the Crown assent to an Act of Parliament?—I have stated that.

[The Witness withdrew.

Mr. *William Thomas Henley*, called; Examined by Mr. *Bidder.*

Mr. *W. T. Henley.*

739. What are you?—A Telegraphic Engineer.

740. You have works at North Woolwich, which are very extensive, where you are making a great number of cables?—I am.

741. Will you tell the Committee your first connection with the idea of laying down a cable between England and the Channel Islands?—The first I heard of it was that in last winter something was said to me about tendering for a cable to Messrs. Ashurst and Morris; I was told by my clerk that Messrs. Ashurst and Morris required a tender for a cable to lay between the Channel Islands and England.

742. Then did you tender?—I did.

743. Did that come to anything?—No.

744. The tender is dated, is it not, the 22nd October 1869?—It would be about that time.

745. It is addressed to Messrs. Ashurst and Morris, and it is as follows: "In reply to yours of the 6th, requesting an estimate for laying and manufacturing a cable between Bury Head to Guernsey, and then to Jersey." Then you specify the description of cable, and you say the price of the cable would be 25,858 *l.*, including 30 days' guarantee after laying?—Just so.

746. Then you say, as to maintenance, "I should have replied to your letter before had it not been for this point. I have considered it very carefully, and, except at a very high figure, I would not undertake it;" and so on. Then, I think, you also wrote afterwards and offered to maintain it?—I did.

747. To whom is that addressed?—To Messrs. Ashurst and Morris.

748. I have a letter to you from Messrs. Ashurst and Morris: "We are instructed by the Channel Islands Telegraph Company, Limited, to make arrange-

Mr. *W. T. Henley.*

5 July 1870.

ments for renewing telegraphic communication between the Islands and England. It is proposed to lay a new cable from Bury Head, on the Devonshire coast, to Guernsey, 66 miles, a land line across Guernsey, thence to Jersey a cable, a distance of 17 miles. We shall be glad if you will let us have an estimate for the construction and laying of such a cable as you consider suitable, and for the completion of the work, furnishing us at the same time with a specification of the cable you would propose to lay, and stating, also, for what sum per annum you would undertake its maintenance. We observe that you have been doing some work for our friend Mr. Tietgen, of Copenhagen, or rather for a company in which he is largely interested, hence the present application." It was in answer to that that you tendered?—It was in answer to that I tendered.

749. Did that come to anything?—It did not; I heard very little more of it.

750. Mr. *Hurst.*] Have you had no answer?—I do not recollect receiving any answer.

751. Mr. *Bidder.*] What was the next thing, so far as you were concerned?—Next I heard from Mr. Sharp that he contemplated making a proposal to me and other gentlemen to find money to lay a cable across there, and he had a Mr. Stoffel out in the Island endeavouring to get a guarantee.

752. When was this?—That would be at the end of last year.

753. What happened at that time?—Mr. Stoffel did not succeed in obtaining the guarantee, and no money could be raised.

754. What happened next?—Then I agreed to find the greater part if Mr. Sharp and his friends would obtain the rest, and would take it at their own risk, without the guarantee.

755. Was that arrangement entered into?—Yes.

756. When did that take place?—That would be at the end of December or the beginning of January.

757. I do not think that you yourself took any part in the application to the Government departments, did you?—No, I did not; I left that to others. I was too much engaged at the works.

758. And you did not interfere from the beginning to the end in the correspondence with the departments?—Not the least. I read some of the correspondence, but I had nothing to do with answering it.

759. You left that to the other gentlemen?—Yes.

760. Did you proceed to take steps for preparing to make the cable, and did you make the cable?—I made the cable, 92 miles.

761. When was it completed?—It was completed in March I think.

762. I think you embarked a portion in the "Caroline," did you not?—Yes; the "Caroline" could not take the whole of the cable, so I sent a part.

763. When was that?—That was towards the end of March; to my surprise they were prevented landing.

764. Can you give me more accurately the date?—I do not recollect the date; it was towards the end of March. I knew the ship would not be more than two days getting to her destination, and it was fine weather, and she would have commenced laying it at once unless she had been prevented.

765. Can you fix more accurately the date when the cable was embarked on the "Caroline," or when she left?—I should think about the 27th or 28th of March, as near as I can say; but it is easy to obtain the exact date.

766. The Committee have heard already about the landing being stopped; had you in embarking in this transaction any knowledge of any proposed application on the part of the Post Office, or of any contemplated extension of the Post Office monopoly to the Channel Islands?—None whatever.

767. Did it enter into your mind when you entered into this undertaking, that your cable, when it was made and laid, would be a thing to sell to the Post Office?—I had intended to work it, and had sent clerks out.

768. Had you any idea at the time when you entered into that arrangement, of doing so in order to sell it to the Post Office?—Not to the Post Office. Mr. Sharp said that he probably could sell the cable after a few months' working.

769. To whom?—He did not say to whom.

770. Did he mention to you the negotiations which had been going on with the old company?—No; I scarcely saw Mr. Sharp above once or twice in my life.

771. A letter

771. A letter has been read of Mr. Holmes's, in which he suggests to Mr. Bullivant that you would be prepared to make his cable for him?—I do not recollect authorising Mr. Holmes to make such a statement, but, at the same time, I would not object to make a cable for anybody. Mr. Holmes would get a commission upon all work brought to me through him, so that probably he would like to get a cable made for Mr. Bullivant, as well as anybody else. For instance, if he got an order for a cable I would give him a certain commission, and he would just as soon get a commission upon Mr. Bullivant's and Mr. Allen's cable, as anyone else. In the way of trade any gentleman obtaining an order is entitled to a commission.

772. Would you have had any objection to contract with Mr. Bullivant to make a cable?—I cannot say that I should, when it was known that the cable was going to be made, because if I did not make it, somebody else would, probably.

773. I will not go into the history of the stoppages with you, but except for the impediments thrown in your way, would the cables between this country and the Islands, and amongst the Islands, have been completed and worked by your association?—It would have been completed early in April, and would have been working ever since.

774. It has been mentioned that subsequently you agreed to cancel the agreement between you and the other gentlemen; will you explain why you did that?—I knew Mr. Sharp only; it was all through him. He was to find the money for the other gentlemen; and when I first was going to commence the cable he said, "You can have a cheque for 5,000 *l.* now if you like." I said that I did not usually take money until I had done part of the work, that he should pay me 5,000 *l.* then, and the rest when the cable was laid; I could have had the money at the time, however, when the cable was laid and a part sent out, but this obstruction came, and they became frightened, and said, "We want to see our way clear to getting our money back before we pay it," and I was so disgusted that I said, "Well if you do not like to take the risk I will, and you may cancel the agreement." I had a legal claim upon them.

775. *Chairman.*] Do you remember the date when it was cancelled?—Just after the stoppage in laying the cable.

776. Just after you heard of it?—Yes.

Cross-examined by Mr. Serjeant *Sargood.*

777. You are the petitioner who are coming here for sympathy and success?—Yes.

778. We have heard very little from you in comparison with what I expected?—I have answered the questions.

779. Let me see if I can get any story from you; first of all, let me look at your petition; you start in your petition by informing Parliament that there was an old company incorporated in 1858?—Yes.

780. And that they left off business?—Yes.

781. I suppose you knew of the existence of that old company?—Yes; I put down the land lines for them.

782. Then is that abandoned cable of theirs at the bottom of the sea a thing that you made?—No, I do not make such cables as that.

783. Then yours were the land lines only?—Mine were the land lines only.

784. Were you a shareholder in the old company?—Not the slightest.

785. With whom had you been in communication for those works?—Mr. Newall.

786. He is a large manufacturer. The Telegraph Association was formed, of which you say you are the sole representative?—I am now.

787. The association (now pay attention to this, please, because we may get some information out of you) had entered into arrangements with the old company to lay their cable in connection with their undertaking, and had given the old company an interest in the enterprise?—Yes.

788. First of all, will you give me the date when your association made some arrangement with the old company?—I cannot tell you anything about the dates; I had nothing to do with it.

789. Who drew this petition for you?—Whether it was Mr. Holmes, or Mr, Rogers,

Mr. *W. T. Henley*, 5 July, 1870.

Rogers, my managing clerk, I cannot say, or Mr. Sharp; that petition I did in conjunction with the Parliamentary agent and my solicitor.

790. Somebody made it for you, and you signed it?—I read it before it was signed.

791. Who did it?—My solicitor.

792. But who gave him the facts?—I gave him the facts,

793. I will assume that you told him this: "Tell the House of Commons that the association entered into arrangements with the old company"; I want your authority for making those statements?—I only had it from my clerk, Mr. Rogers, and Mr. Sharp, that they used whatever rights they had.

794. But you were a part of the association always?—I was; I was one member of it.

795. And you are the association now?—Yes.

796. When did your association make an arrangement with the old company?—As far as I can recollect, it was somewhere about the end of last year.

797. But you do not know?—I do not know the exact date.

798. Then who does know?—Mr. Sharp, no doubt.

799. Not Mr. Holmes?—I dare say not.

800. Nor Mr. Stuart?—No.

801. Is Mr. Sharp here?—He is not.

802. Are you in friendly relation with him?—Middling; but as he would not pay me my money, we are not so friendly as we might be.

Mr. *Bidder* stated that Mr. Sharp had declined to appear before the Committee as a Witness without a summons.

803. Mr. Serjeant *Sargood* (to the *Witness*).] Is this one of the firm of W. and H. P. Sharp, of Gresham House, Old Broad-street?—It is.

804. I think I may say of my own knowledge that Mr. Sharp is far too respectable a man to say that he stopped away from here if he was wanted, and, therefore, do not affect that I am wanting Mr. Sharp?—I know of my own knowledge that he was asked to come the other day, and he refused.

805. Of course he would not come if he was not obliged. You say this: "And have given the old company an interest in their enterprise;" first of all, tell me what was your enterprise?—It was making a cable and laying it.

806. What was the interest you had arranged to give the old company in it?—Using their land lines, and paying them for them, supposing they were fit for use.

807. Is that the subject of any written arrangement, or is it only talk?—I believe something has been written of the kind.

808. Have you got it here?—No.

809. You have come here to prove the allegations of your petition?—I have come here to speak the truth and tell all that I know.

810. If the thing is in writing, where is it?—If I cannot prove it other people can who wrote the letters.

811. Where is this arrangement between your association and the old company?—I do not know where it is now.

812. Do you agree with your friend Mr. Holmes, that you are a different affair; that you are not the old company, and have nothing to do with them?—Yes, I do.

813. Then what is the meaning of there being a written contract between you and the old company, which you did not notice?—We can produce it; I have no objection to produce anything which was written. I did not say that it was written; I said, probably it might be. I will appeal to the shorthand writer whether I said there was a written contract or not.

814. Then you do not repudiate all connection with the old company?—I know they found no money towards it.

815. What you tell me is, that though there is a connection and an arrangement in writing, you cannot explain it to me?—I did not say it was in writing.

816. Whether it is or not, can you explain it?—No further than that, that I am aware of; that we were to use their land lines, and that they were to give us all the facilities they could.

817. Do you mean to say that a bargain was ever made between your association and the old company?—Very likely it was.

818. Do

818. Do you mean to state that it was?—I did not state that it was; verbally it was.

819. Who were the people who talked it?—Mr. Sharp.

820. He represented you?—Yes.

821. To whom did he talk to represent the company?—He talked to the directors, no doubt. The negotiations and communications, I believe, passed through Mr. Hawksford.

822. The initiation of it then is this: that you, through Mr. Sharp, as one of your association, made arrangement of some sort or other with the old company, by which you were to land the cable and connect the cable with their land lines?—We were to lay the cable at our own risk, and it was to be our own property, and to be connected with their land lines, if their land lines were capable of being worked.

823. When did you first know Mr. Stoffel?—The first I heard of him was from Mr. Sharp, that he was out in the Islands endeavouring to obtain a guarantee.

824. Had you never heard of him before?—Never.

825. When did you first see him?—I have only seen him twice in my life.

826. When did you first see him?—Two or three months since, or more.

827. Was it this year or last?—This year.

828. Where did you see him?—I saw him at my office.

829. Did he bring an introduction to you?—No; my managing clerk had seen him before.

830. What is his name?—Mr. Rogers.

831. Is Mr. Rogers here?—Yes.

832. Do you know how early he had seen Mr. Stoffel?—I do not; I am so much engaged down at the works, that I do not come to my London office above once a week. He spoke to me of Mr. Stoffel; I believe when Mr. Stoffel came in, he said, "This is Mr. Stoffel, the gentleman whom Mr. Sharp sent out to the Islands."

833. Had you been previously told that he had seen Mr. Stoffel, and that Mr. Stoffel was coming?—No, I had not, that I am aware of.

834. When Mr. Stoffel came to you, what did he say?—He said very little to me, because his business was with Mr. Rogers.

835. But Mr. Rogers is your managing man?—Exactly; I left him with Mr. Rogers.

836. Did you never know or hear what he said?—No, I did not; it was not worth my while to ask.

837. Mr Stoffel came to see you; you left him with the managing clerk, and you never thought it worth your while to ask why he came, and you have never been told?—I knew why he came; his business was with Mr. Rogers; Mr. Rogers is my managing clerk at the London office.

838. Has he a separate business from yours?—None whatever.

839. Was the business with Mr. Stoffel something of a private character?—It was in connection with my office. When I explain to you that I am at the works, and doing business at the rate of 60,000 *l.* to 70,000 *l.* a month, I have not much time to pass at the office, and I leave all that business to Mr. Rogers.

840. Do I understand you to say that, Mr. Stoffel having paid his visit, you never learned from Mr. Rogers what he had come about?—I knew he had come about this business of the guarantee.

841. I asked you what he came for, and you said you did not know?—I knew what he came for, but I did not hear what he said, because I did not wait.

842. What did Mr. Rogers say?—I did not see him until the next day, and then it passed my memory.

843. Did not Mr. Rogers tell you what had passed?—I dare say he did; but I am not certain whether he did or not.

844. Do you mean to tell us that?—I mean to tell you that.

845. Then I will not probe you further than that. That is one of the only two visits of Mr. Stoffel; when was the next visit?—The next visit was three or four weeks afterwards.

846. Can you give me that date?—No; I should think it would be in March.

847. Did you see him, or did Mr. Rogers see him?—I saw him; I knew what his business then was.

Mr. *W. T. Henley.*

5 July 1870.

848. You knew it beforehand; who had told you?—I heard he was coming about this commission.

849. Who had told you?—Mr. Rogers or Mr. Holmes, I cannot say which.

850. Coming about what commission?—The commission for trying to get a guarantee.

851. Then he had been, and Mr. Rogers told you he was coming?—Yes.

852. What did he say?—I recollect his saying he wanted more than was promised him. I told him he must see Mr. Rogers about it.

853. And that was all?—Yes.

854. Then on the first occasion you did not know why he came, and on the second it was to talk about the commission?—Yes.

855. And on neither of the two occasions was the cable talked about, which is the subject matter of your application to the House at this moment?—It was spoken of to Mr. Rogers.

856. How do you know?—I certainly knew what passed, although I cannot say that he told me the precise words.

857. Then on neither occasion did anything pass about the laying of this cable, which is the subject matter of your application?—It was about the cable, but nothing about the laying.

858. What about the cable. Hitherto you have told me that it was about the guarantee and not about the cable?—It was the guarantee about the cable.

859. Had it anything to do with the cable, or the contract, or with the guarantees only?—It had nothing whatever to do with the contract.

860. The new company, which you say was formed in January, applied to the association, and requested to purchase their cable. Now, tell me when was it that the new company applied to you and asked to buy your cable?—They applied after the cable was out there

861. When was it?—In March.

862. At what date?—At the end of March.

863. At the end of March was the new company applied to?—To buy the cable then on board the "Caroline."

864. Just as anybody else might have done?—Anybody who wanted it.

865. Anybody might have made you an offer for it, and the new company made you an offer; is that it?—That is it.

866. Who made you the offer?—It was made by Mr. Meade, who came deputed by Messrs. Bullivant and Allen, or by the company; I cannot be sure which.

867. What is he?—A shipbroker, I believe.

868. What was the offer?—To buy it; but no price was mentioned.

869. To whom was the offer made?—To the association; to Mr. Rogers or to Mr. Holmes.

870. To you?—Not to me, because I was not there.

871. Was it made to Mr. Rogers?—It was made to Mr. Rogers on behalf of the association. Of course Messrs. Bullivant and Allen or the company did not know.

872. Sir *Lawrence Palk.*] At what date was the offer made?—It was at the end of March.

873. If it was at the end of March, and I am correct, the agreement was cancelled on the 17th of March, and you were then the sole proprietor.

Mr. *Bidder* stated that the 17th of March was the date on which Mr. Holmes signed his subscription, and that the agreement was said to have been cancelled in May.

874. Mr. Serjeant *Sargood* (to the *Witness*).] The offer to buy the cable was made by Mr. Meade, representing the new company, to Mr. Rogers, who is your managing clerk?—It was.

875. And that offer was made about the end of March?—Yes.

876. That is so, is it?—Yes; about the end of March or the beginning of April.

877. Where was the cable at the time that offer was made?—On board the "Caroline."

878. Do you adopt what Mr. Holmes has stated for you, that from December 1869 up to the month of April 1870, Mr. Stoffel was communicating with the public

public offices on behalf of yourself and your friends who are called an association?—I heard that he was doing so.

879. You heard of it at the time?—Yes.

880. You do not desire to repudiate Mr. Stoffel, of course?—Oh no; until a certain time, when he wanted more commission.

881. That is a separate subject; I will not go into that. Then you were aware that Mr. Stoffel had been communicating with three or four public departments, endeavouring to obtain leave to lay down the cable?—I heard so through Mr. Holmes.

882. Did you hear that he had not yet succeeded?—Yes.

883. What is the meaning of this allegation in your petition: "Since the refusal of the new company to purchase the cable, leave to lay down the cable which was constructed by the association has been persistently refused by the Government"?—So it had.

884. Then, so far as abstinence from giving you the permission is concerned, the public departments had taken the same tone; from the month of December they had abstained from giving you permission?—They had abstained from giving us answer.

885. Then they did not grant you any permission?—They have not refused to grant it, nor have they granted it.

886. They have not refused to grant it, nor have they granted it, but they have abstained from giving an answer?—Yes.

887. Now let me call your attention to this: "Correspondence was carried on by the association with the Government from between the 13th of December 1869 and the 1st of May last;" is that true?—Yes, so I heard.

888. You are alluding, then, to the correspondence of Mr. Stoffel which began on the 13th of December?—And Mr. Holmes.

889. Which began on the 12th day of April by a letter to the Board of Trade; that is what you are alluding to, I suppose?—It is.

890. Then it seems to me that Mr. Stoffel, after all Mr. Holmes' differences with him, was about right on the 13th of December, when he said that he was making application on behalf of the old company for leave to lay down a cable; you are now telling me that you were speaking about the making of a cable to be associated with the wires of the old company?—Yes; but not to lay it for the old company. I was going to lay it; and simply instead of putting up new land lines, to use theirs if they were in a proper state.

891. Were you to use their cable, or were you to pay for the use of their land lines?—I was to pay for the use of their land lines.

892. That, you say, is in writing?—I did not say that it is in writing, but I thought probably it might be.

893. Is there any bargain of this sort between you and the company at all?—Yes, there was a bargain to that effect.

894. But you will not say that it is in writing?—I cannot say that it is in writing.

895. Then nobody is bound by it?—Yes; when I make a bargain by word of mouth I consider myself bound by it as a man of honour.

896. Is it a thing which nobody is bound by at this moment; is anybody else bound by it at this moment, or is it a matter which is abandoned, nobody being liable?—If we were allowed to lay the cable I should, of course, use their land lines and pay them for it.

897. Then you would lay it now if you got permission, in pursuance of some arrangement which you had made with the old company?—Not at all; I should lay it without any arrangement with them.

898. How can you do that if the arrangement is still binding upon them as men of honour?—If I laid the cable, and their land lines were capable of being used, they would allow me to use them.

899. Are they capable of being used?—I cannot say; I have not examined them. I have made a bargain to use them if they are capable of being used.

900. We do not want men of honour brought into the question; then it depends entirely upon whether their land lines are fit for use?—We are bound to use them if they are fit for use.

901. And they are bound to attach your cable on the same conditions?—Yes.

Mr. *W. T. Henley.*

5 July 1870.

902. Supposing that you got permission to-morrow to lay your cable, you would attach it to their lines if they were fit for use?—Yes.

903. And you would consider that that would be carrying out your contract if there be one with the old company?—Yes, paying them a proper sum.

904. *Chairman.*] What are you to pay them?—I do not think any sum was named.

905. Mr. Serjeant *Sargood.*] Perhaps men of honour would do it for nothing?—No.

906. *Chairman.*] No sum was named?—No sum was named that I am aware of.

907. How was it to be settled?—We knew what sort of mileage the land line was either to sell or lease; that is easily settled.

908. Who gave you any authority to use the land lines?—I believe the directors of the Channel Islands Telegraph Company; but the correspondence passed through Mr. Holmes and Mr. Hawksford, and of course I saw but very little of it.

909. Mr. Serjeant *Sargood* (to the *Witness*).] You say that there is a correspondence between Mr. Holmes and the old company, by which the old company agreed with Mr. Holmes that the land lines should be used?—I never said anything of the kind; I said that correspondence was carried on between Mr. Hawksford and Mr. Holmes.

910. That is exactly what I have said; Mr. Hawksford is the solicitor of the company, and Mr. Holmes represented you; nobody has ever told us that there was such a correspondence; have you ever seen it?—No.

911. So I thought; will you undertake to say that any such thing exists?—I have heard that it exists.

912. Who told you?—I cannot say who told me; Mr. Holmes, probably.

913. Now look at this letter (*handing a letter to the Witness*), and tell me if you ever saw that before; that is the letter of Mr. Holmes purporting to introduce you to Mr. Bullivant?—I never saw it.

914. Then of course you never made any use of it?—I did not.

915. Have you ever heard of it in your life?—The first time I heard of it was just now.

916. That is a very funny thing, because Mr. Holmes said he wrote this letter and gave it to you as an introduction?—I never had that.

917. Have we been going through all the force of this letter of introduction being produced to learn now that Mr. Holmes wrote it, and that you never used it?—

Mr. *Bidder* stated that the letter had been produced by the Promoters.

918. Mr. Serjeant *Sargood* (to the *Witness*).] I have been mistaken in supposing that you produced the letter to Mr. Bullivant with your own hands; it probably preceded you, and you availed yourself of it afterwards?—I did not avail myself of it at all, for I never heard of it until this morning.

919. Then, of course, you had never been in communication with Mr. Bullivant in consequence of the letter?—No.

920. Perhaps you have never seen Mr. Bullivant on the subject of the subcontract for the cable?—I saw him at the office one day after I had commenced making the cable, to see if some arrangement could be brought about, I suppose, for him to buy the cable, but it was not in those words. Mr. Bullivant called at my office one day after I had made part of the cable, saying, he thought it a great pity that two cables should be made, and could we not arrange something between us, I suppose to take my cable.

921. You guess that that was what he meant?—Yes.

922. What did you say?—I said I should make my cable and he might make his.

923. That was your answer, was it?—Yes, that was my answer.

924. That was all that ever took place between you?—That was all that ever took place.

925. You had sent in a tender to Messrs. Ashurst and Company on behalf of the Channel Island Company, in competition with Mr. Bullivant, had you not?—That was before the Mr. Bullivant's Company was heard of; it was last October.

926. But

926. But you had sent a tender in competition with Mr. Bullivant?—No, it was not in competition.

927. When you sent in the tender you had nobody to compete with, had you?—Yes.

928. Who were they?—There was Messrs. Silverton and Company, the Telegraph Construction Company, and Messrs. Seaman; I know of no others.

929. That was a contract for the old company, was it not?—It was to Messrs. Ashurst and Morris to restore the communication.

930. Was it for the old company?—I did not know whether it was for the old company or not.

931. You do not know?—I know it had nothing to do with the company since advertised.

932. Then it must have been for the old company, then?—It turns out that it was.

933. Did you not know that Messrs. Ashurst and Morris were acting on behalf of the Channel Island Company?—My tender was to restore the communication; of course, I know that the cable had been laid before by the old company.

934. Did you not know that Messrs. Ashurst and Morris were acting on behalf of the Channel Island Company?—I cannot say that I did.

935. Will you say that you did not?—No, I will not.

936. The very letter which you read from Messrs. Ashurst and Morris, writing you to send a tender, begins with, "We are instructed by the Channel Island Company, Limited, to make arrangements," and so on?—Yes; but very likely I never saw that letter in my life before; my managing clerk would receive the letter.

937. Do you mean by that that you never did see the letter before?—I knew the substance of it generally.

938. Do you mean to say that you did not see the letter?—I cannot recollect.

939. Do you mean to state unhesitatingly that you did not know?—No, I do not mean to state anything of the kind.

940. You answer my question before I put it; did you not know that Messrs. Ashurst and Morris were acting on behalf of the old company in their first communication with you about that telegraph?—I do not mean to say so; I did know it, probably.

941. Was not your tender to them knowing that that cable was to be made on behalf of the old company?—Very likely, but the old company were not going to find the money.

942. They could not find the money, could they?—No.

943. But Messrs. Sharpe and the other gentlemen of the association could, I suppose?—Yes.

944. They intended to do it, of which you took a large share?—Yes, and did the largest work.

945. I am very anxious to know when you put your name to that four part contract. Will you tell us when you wrote your name; we have never been able to find that out, when was it?—It was at least three months after the verbal arrangement was made, I think.

946. Can you tell me when you did it?—I cannot say for certain, but I think it was some time in February.

947. You sent it back to Mr. Holmes, who says that he received that from you, I suppose?—Yes.

948. Where did you sign that?—At North Woolwich.

949. Was it sent to you by post?—No, I believe Mr. Rogers brought it down to me.

950. You mean your managing clerk?—Yes.

951. You did not take long to read it, I suppose?—I had known the substance of it for months.

952. But you read and signed it then and there, and sent it back again?—Yes.

953. Is there any reason for saying that you took several weeks to study it before you signed it?—I did not get it to sign.

Mr. *W. T. Henley.*

5 July 1870.

954. It is a mistake to say that you kept it for several weeks?—I did not keep it.

955. Mr. Holmes fancied that you did. You were to be in this joint speculation at a risk of 15,000 *l.*?—I was.

956. Will you tell me the meaning of a little incident that rather struck me; when you were being examined by my learned friend Mr. Bidder, you said that Mr. Sharpe tried to induce you to go on in the matter by saying that you might have 5,000 *l.* on account if you wanted it?—He did not try to induce me to go on, we arranged to go on long before that, but when I was going to commence the cable, he said, if you want a cheque for 5,000 *l.* on account you can have it.

957. But you were not very likely to be haggling for an advance if you were to contribute 15,000 *l.*?—No; and that is the very reason I did not want it, and not wanting it, I did not receive it.

958. Does not it strike you as rather funny, that if this arrangement really existed between you, by which you were to advance 15,000 *l.*, Mr. Sharpe should almost insult you by asking whether he should advance you 5,000 *l.*?—No, not at all.

959. It would have been very consistent if you were going to make this thing at the expense of some one who represented the company, but as you were going to do that 15,000 *l.*, it seems to me a little inconsistent?—Not at all.

960. I thought you said that you were not to have the money at all until the thing was completely laid down?—I was to have 7,500 *l.* from Mr. Sharpe when the cable was completed, but he offered me 5,000 *l.* in this manner.

961. £. 7,500 is the exact sum that the other people were to contribute together, is it not?—Yes; that offer came from Mr. Sharpe.

962. You were to have that sum when the cable was completed?—Yes.

963. Do you mean to tell me that under that state of things Mr. Sharpe offered to advance you 5,000 *l.*, to make it for the company?—To make it for which company?

964. The old company, which Messrs. Ashurst and Morris represent?—I was not making it for the company at all.

965. Mr. Stoffel did not say that, then?—I say that now.

966. Now, with regard to the cancelling; have you ever seen this until to-day, with that word "cancelled" on it?—No; but I know that it was put on.

967. Who told you?—My clerk.

968. Mr. Rogers, again?—Yes.

969. He told you that somebody had written something on it?—I gave him permission to have it cancelled. I said that I would take the entire risk myself if they were frightened of losing their money.

970. I want to know the exact date when you took the whole risk on your shoulders?—It was after the Government prevented the cable being landed.

971. Sir *Lawrence Palk.*] What date was that?—It was early in April. The 3rd or 4th of April was when it stopped; it was after that a few days, perhaps, that I authorised him to allow it to be cancelled.

972. Mr. Serjeant *Sargood.*] One point I may put, was this: after the cable was stopped, you relieved those three gentlemen from the obligation to pay you the 7,500 *l.*, did you not?—Yes.

973. And you are now here to ask the Government to pay you instead?—I am asking to be paid for my cable which was stopped being laid.

974. You relieved those gentlemen from the contract to pay you, and you expect the Government to pay you instead?—Yes, if they are going to take the work, and if they take it all, I suppose they will pay me my part as well.

975. If I were to ask you about all this correspondence between Mr, Stoffel and the Public Department, and then between Mr. Holmes and the Public Department, you would know nothing about it, I suppose?—Very little, I am afraid.

Re-examined by Mr. *Bidder.*

976. With regard to Mr. Bullivant, was he, prior to this, a telegraphic contractor?—No, never.

977. He never had anything to do with it, had he?—No.

978. He is a ropemaker, is he not?—Yes, in a tolerably large way of business.

979. Now,

Mr. *W. T. Henley*

5 July 1870.

979. Now, with regard to the 5,000 *l.* This 5,000 *l.* is the amount that Mr. Sharpe himself was going to find, is it not?—Yes.

980. And he told you, if you wished it, that you should have that 5,000 *l.* at once?—Yes.

981. I am tempted to ask you this question: have you behaved throughout this matter with honest intention?—I have entirely.

982-3. Mr. *Bidder.*] Have you acted with integerity and *bona fides* in this matter?—Yes, entirely.

984. Did you do what you did in agreeing with those other gentlemen in preparing to make the cable with any intention of foisting your claim on the Government?—Not in the least.

985. And at the present time you ask for no more than to be recouped the expense that you have been put to?—That is all.

986. Sir *Lawrence Palk.*] At the time that you took the risk of the cable upon yourself, which was sometime in April, had you the consent of any of the authorities for laying down your cable?—No, the consent was refused.

987. You did it entirely at your own risk?—Yes.

988. Mr. *Muntz.*] I think the sum that you were to receive was 22,500 *l.*?—Yes.

989 Of which you subscribed 15,000 *l.* yourself?—Yes.

990. That deed was not signed at the time you agreed to that, was it?—No, it was a verbal arrangement.

991. You undertook the contract for 22,500 *l.* without any signature or agreement?—I did.

992. Mr. Holmes' statement was that you took it without any profit, was it not?—I took it without any profit except on the manufacture of the wire; other people were to buy the wire.

993. You expected that your profit was to come out of the wire?—I expected some profit, but it was nearly the cost price.

994. Are you aware that the old company was suspended in the year 1863?—That is about the time.

995. Are you aware what profit they ever made?—I am not.

996. Do you know that there is a submarine telegraph company to the Islands by which communications can be passed?—From France to Jersey there is.

997. But the company that was suspended in 1863 appears to have made no profit (of which there is little doubt); did you risk the 22,500 *l.* in the hope of making a profit where they could not make it?—I believe that a considerable profit would be made with a cable between the Channel Islands and this country.

[The Witness withdrew.

Mr. *Nathaniel Holmes,* called in; Examined by Mr. *Bidder.*

Mr. *N. Holmes.*

998. Now with regard to this one matter as to the arrangement with the old company, with reference to the land lines; can you tell me what arrangements had been entered into; first, whether, so far as you know, there was any legal document or not?

999. Mr. Serjeant *Sargood.*] Was there a correspondence between the witness and the solicitor?

1000. Mr. *Bidder.*] Was there any legal agreement, so far as you know on this matter, between the old company and the association?—Not to my knowledge.

1001. Mr. *Hurst.*] Was there any correspondence?—It was chiefly verbal, between Mr. Hawksworth and myself, who came from the island, and in my office made arrangements. He had, I believe, communicated with the directors in the island, but between the association and the company there was no writing. The arrangements had chiefly reference to repairing the land lines, and paying them so much per cent. per annum on the cost of the lines.

1002. Mr. *Bidder.*] The whole of that arrangement between you and them was, that unless you availed yourselves of their land lines you must make fresh lines?—Yes; if we had not used their lines, we must put up new lines.

Mr. *N. Holmes*

5 July 1870.

Cross-examined by Mr. Serjeant *Sargood*.

1003. Now, as the chief part of your correspondence was verbal, I will trouble you for that which was in writing?—There were some letters which passed between Mr. Hawksworth and Mr. Sharpe. Those letters are at my office.

1004. If Mr. Henley said that you told him there was a correspondence between you and the solicitor, is that a mistake?—There was a conversation, not a correspondence.

1005. No letters?—No; there have been letters between Mr. Hawksworth and myself, but not on the land lines; they were chiefly on the guarantee.

1006. You are not entitled to tell us that; I want the letters between you and the solicitor to the old company?——

1007. Mr. *Bidder*.] Have you got those letters here?—No.

[The Witness withdrew.

Mr. *Bidder* stated that though it was not part of his case, he would now, in justice to Mr. Preece, put him into the box.

Mr. Serjeant *Sargood* submitted that it was not competent to Mr. Bidder to call Mr. Preece to contradict an allegation contained in the petition of his own clients.

Mr. *William Henry Preece*, called in; Examined by Mr. *Bidder*.

Mr. *W. H. Preece.*

1008. You are Engineer to the Jersey and Guernsey Telegraph Company, are you not?—I am.

1009. You are a large shareholder in it?—I am.

1010. Are you an officer in the Public Telegraph Department of the Post Office?—I am.

1011. What office do you hold in the Telegraph Department of the Post Office?—I am engineer of the southern division of the postal Telegraph Department.

1012. With regard to this new cable to Guernsey and Jersey, will it be within that department?—Yes; it will.

1013. Are you the professional adviser of the heads of the Post Office in matters connected with your department?—In some matters, I am.

1014. In what matters is it your duty to advise them?—In some matters.

1015. Has your advice been asked, or have you been communicated with by the heads of the department about this matter, in connection with the Guernsey and Jersey telegraph cable?—No.

1016. By no one whatever?—No.

1017. You have had no communication with the heads of the department about that matter?—None whatever.

[The Witness withdrew.

Mr. *Bidder* stated that he now in the fullest and frankest manner withdrew the imputation on Mr. Preece, and apologised for it.

The *Chairman* stated that the Committee were still of opinion that Mr. Bidder had pursued a wrong course in not withdrawing the imputation before Mr. Preece had been called, and that the statement ought not to have been inserted in the petition unless his clients were fully prepared with evidence to prove it.

Mr. *Frank Ives Scudamore*, re-called; and cross-examined by Mr. *Bidder*.

Mr. *F. I. Scudamore.*

1018. You have told us before, when I cross-examined you on the first occasion, that you had those communications with Mr. Stoffel?—Yes.

1019. You wrote to Mr. Stoffel, asking him whom he represented, did you not?—Yes.

1020. And

Mr. *F. I. Scudamore.*

5 July 1870.

1020. And you obtained the answer from him which has been put in and read by him on a previous occasion?—Yes.

1021. After that answer from Mr. Stoffel, what did you do further in the matter?—I waited for further communications.

1022. You waited for further communications, and you got another letter from him, asking for an answer, did you not?—I got a letter from him on the 30th of January, I think.

1023. Did you answer that letter?—No, I did not.

1024. Why not?—Because I found that Mr. Stoffel had represented to me that which was not true; I thought I would wait until I had received some further communication.

1025. What had he said which was not true?—He had said, "I have, you are doubtless aware, received the necessary letters from the authorities for landing the cable from the Board of Trade, and the Office of Woods and Forests."

1026. How was it that you found that that was not true; that is the letter that had the marginal note to it, is it not?—Yes; I had seen a letter from Mr. Stansfeld of the Treasury, stating that no such authority had been given to Mr. Stoffel.

1027. A letter from Mr. Stansfeld, to whom?—I have a copy of the letter (*handing it to the learned Counsel*).

1028. This letter is dated the 14th of February, and is as follows: "Dear Sir,—We are in receipt of your letter of the 10th instant. With reference to the second paragraph of your letter, we annex a copy of a letter from Mr. James Stansfeld, the Secretary of the Treasury, which has been already published, in reply to the statement made in the newspapers on behalf of the parties calling themselves the Globe Telegraph Works Company. We think you will find that Mr. Stansfeld's letter answers the notice you have received; but if we should be mistaken in supposing that you allude to the parties mentioned in Mr. Stansfeld's letter, we shall be obliged by your informing us what other notice has been received. With reference to the third paragraph of your letter, we have already given you a copy of Mr. Charles T. Simpson's opinion upon the possible claim of the Submarine Company, which we hope, on further consideration, will be found to meet this part of the case. The board of the Jersey Company will meet to-morrow afternoon, and we are requested to inquire whether the proposed arrangement can be carried out with any, and if any, what modification. We shall be obliged if you give us a further letter by to-morrow.—We remain, dear Sir, yours faithfully, Bristows and Carpmael.—W. H. Ashurst, Esq., General Post Office." Then comes a copy of the letter from Mr. Stansfeld: "Treasury Chambers, 2nd February 1870. Sir,—In reply to your letter of this date, I am directed by the Lords Commissioners of Her Majesty's Treasury to acquaint you that my Lords are not aware of any authority to land cables between the Channel Islands and England having been granted to the Globe Telegraph Works Company, Mr. Louis Marie Stoffel, or Mr. Woulfe Brennan, civil engineer;" that is to say, their Lordships of the Treasury were not aware of it?—Just so.

1029. Now, you say that was your authority for saying that the statement of Mr. Stoffel, that he had obtained the Woods and Forests, and the Board of Trade authority, was utterly untrue?—That was part of my authority.

1030. What was the rest of your authority?—This: ever since the passing of the Telegraph Act of 1868, whenever an application has been made to the Board of Trade for permission to land cables on foreshores, the Board of Trade have requested the Postmaster General's opinion before they have granted it, and they have always told him when they have granted it.

1031. Had you not had a communication from the Board of Trade, with regard to Mr. Stoffel's application being laid before you?—We had received no communication from the Board of Trade with regard to Mr. Stoffel.

1032. Then is this incorrect, in the letter from the Board of Trade to him, when they say, "the application;" but stop: first, what is the date of that?—Do you mean their letter to Mr. Stoffel?

1033. I mean the letter from the Board of Trade to Mr. Stoffel, saying that the application had been laid before the Post Office?—The 2nd of December.

1034. On the 2nd of December the Board of Trade wrote as follows: "I am to inform you that no application with regard to telegraphic communication can be sanctioned by the Board of Trade, without the consent of the Postmaster General; your application has been transmitted for his consideration," and on

Mr. *F. I. Scudamore.*

5 July 1870.

hearing from him a fresh communication would be made to you?—That is not strictly correct; his application was not forwarded to the Post Office; you have the letter from the Board of Trade to the Post Office, and there is a gentleman from the Board of Trade here.

1035. What is the date of that letter?—The 22nd of December.

1036. "I am to acquaint you, for the information of the Marquis of Hartington, that an application has been made on behalf of the Channel Islands Telegraph Company (Limited), for permission to lay the English end of a new submarine telegraph cable, from the Channel Islands to the United Kingdom, at or near Start Point, in the county of Devon, in lieu of the Bill of Portland where the old cable was laid, and I am to request that this board may be favoured as soon as possible with any observations on this proposal that the Board of Trade may have to offer." What reply did the Post Office make to that?—I have my reply here.

1037. What is the date of it?—It is dated the 28th of December: "I am directed by the Postmaster General to acknowledge the receipt of your letter of the 22nd instant, and to inform you that, so far as this department is concerned, his Lordship has no objection to offer to the application which has been addressed to the Board of Trade by the Channel Islands Telegraph Company (Limited) for permission to land a submarine cable at Start Point. His Lordship, however, directs me to point out, for the information of the Board of Trade, that a concession under special conditions was made to this company some years ago by the Lords of the Treasury, whom the President of the Board of Trade might possibly think it well to consult before giving, unconditionally, the permission sought for."

1038. Then there had been a communication between you and the Board of Trade, and you had advised those gentlemen that they might consent?—The Board of Trade told us that they had had application from the old Channel Islands Telegraph Company, and we said——

1039. On behalf, you mean?—On behalf.

1040. Did that give you the right to say that the statement of Mr. Stoffel, that he had the consent of the Board of Trade, must be utterly untrue?—I think we put in evidence to that point the other day. When he applied to the Postmaster General, I asked him if he appeared as the representative of the old Channel Islands Telegraph Company, and he wrote back to say that he did not.

1041. He wrote back "I am not the agent"?—He said "I am not the representative;" as far as the letter could go he ignored it.

1042. What passed through your mind was, that the Board of Trade wrote and said, "This is an application on behalf of the old company——"

Mr. Serjeant *Sargood* objected to Mr. Bidder's paraphrasing the letter.

1043. Mr. *Bidder.*] I understand you to say, that the Board of Trade having written to you to say that an application had been made on behalf of the old company, and Mr. Stoffel having written to say that he was not the agent of the old company, you felt they were different applications?—Yes; in fact the reason of my asking Mr. Stoffel whether he represented the old Channel Islands Telegraph Company was that I might know whether I was dealing with the case which I had already attended to, or with another case.

1044. Now, going to the other part of your authority, namely, the letter from Mr. Stansfeld, that is a letter to Mr. Lefeuvre; how did that letter come under your notice?—The solicitor to the Jersey and Guernsey Company gave it to Mr. Ashurst, I think, so far as I can tell, but I am not prepared to say at this moment.

1045. Then who did he communicate with on behalf of the new company?—Mr. Lefeuvre, as he had on behalf of the old company.

1046. You kindly promised to tell me on the last occasion, at what date his first communication, on behalf of the new company, came to you personally or otherwise?—I am afraid I cannot fix the first personal application; at what time he ceased to be the old company and became the new, I cannot be quite sure, but I have got a date here that I can give you.

1047. Will you give me about the date, if you please?—To the best of my belief, he wrote to me on the 2nd of February, saying, "We have formed a new company."

1048. On the 2nd of February was the first communication that you had?—

Mr. *F. I. Scudamore.*

5 July 1870.

The first written communication. I saw him very nearly every day during those months; but when he ceased to be the old company and became the new, I cannot tell you; it was so gradual a transition.

1049. During what months do you mean?—I should say between July 1869 and the end of February; I saw him very frequently.

1050. In January and February of this present year, you saw Mr. Lefeuvre pretty nearly every day?—Yes, I did; we constantly met; as I came to the office in the morning, I passed along Wallbrook and met him coming.

1051. Is he a personal friend of yours?—Not the least; I never saw him except on this business.

1052. I referred to your letter of the 30th of April, which is set out at page 13 of the Minutes; this is a report to the Lords of the Treasury in answer to their letter of the 6th of April: "My Lords, in replying to your Lordships' letter of the 6th instant, and returning the papers connected therewith, I beg first to state that I should be glad, if circumstances would have permitted me, to reply at an earlier date; this however has not been possible. It has been necessary to institute a careful inquiry as to the accuracy of some of the statements which have been made to your Lordships;" what inquiry did you institute with regard to the accuracy of those statements?—I endeavoured, as far as I possibly could, to ascertain who the contracting parties with the Treasury were, and what their relations one with the other were.

1053. Whom did you apply to?—I examined the correspondence with the departments, and I made such personal inquiries as I could.

1054. Personal inquiries of whom?—I made personal inquiries at the Treasury, and partly, but not in my own person, at the Board of Trade.

1055. Personal inquiries at the Board of Trade could tell you nothing about the parties; of whom did you make personal inquiries as to the condition and status of the parties?—I did not say that I made inquiries with regard to the condition and status of the parties.

1056. You said that you endeavoured to ascertain who the parties were?—No, I said in order to try and unravel the conflicting relations of the parties with each other.

1057. Of whom did you make those personal inquiries; did you not make personal inquiries?—Possibly I have used an incorrect term; I will go back to the words "careful inquiry."

1058. Did you not make personal inquiries?—Will you tell me what you mean by that?

1059. I mean inquiry by word of mouth from another person; did you not inquire by word of mouth from another person with regard to this matter?—Yes, I did at the Treasury.

1060. But besides the Treasury?—I do not think that I made a verbal inquiry of anyone else.

1061. No other person except the Treasury officials?—No.

1062. "In July last year the Channel Islands Telegraph Company, which was originally established under guarantee from your Lordships, but which had for some time failed to maintain telegraphic communication with the Channel Islands, proposed to re-establish that communication, and applied to your Lordships for a renewal of the guarantee; your Lordships having called upon me for my observations on the subject, I replied on the 9th August, describing the arrangements which the company proposed to make with respect to the transmission of their messages over the land lines of the United Kingdom, and giving an estimate of the number of messages which, if these arrangements were carried out, was likely to pass between the Channel Islands and the United Kingdom. I am led to believe, though I have no official information on the subject, that your Lordships declined to renew the guarantee to the company."——

1063. How were you led to believe that, if you had no official information on the subject?—

1064. Mr. *Bidder* (to the *Witness*].) "I am led to believe, though I have no official information on the subject, that your Lordships declined to renew the guarantee to the company"; having no official information on the subject, who led you to believe that?—The gentlemen at the Treasury who had charge of the case.

1065. That would have been official information, would it not?—No; it was not communicated to me officially, but in conversations as we came to town in

Mr. *F. I. Scudamore.*

5 July 1870.

the morning; the letter which you cross-examined me upon is not my letter; it is the letter of the Postmaster General.

1066. In the name of the Postmaster General you mean?—No; it was signed by him, and therefore the words are his words; and when he says he has not had official information, he means that they have not written officially.

1067. The letter being officially the letter of the Postmaster General, you are the officer of the Post Office who prepared the draft of it, I suppose?—Yes; I had not had official information of that guarantee having been refused.

1068. "In spite of your Lordships' refusal, the company appear for some time to have contemplated the renewal of telegraphic communication, but after a time they appeared to have abandoned their design; they were brought to this conclusion, I am informed, by the fear that the debts which they had incurred up to, and since, the breaking of their cable, would prove too heavy a burden upon them if they were to resume business as the Channel Islands Telegraph Company"; who informed you of that?—The Solicitor to the Post Office.

1069. That is to say, Mr. Ashurst?—Yes.

1070. Had he any connection with the old company?—I have not the remotest knowledge.

1071. "With a view, however, to establish telegraphic communication with the Channel Islands, by means of an undertaking uncrippled by debt, some of the directors and shareholders of the Channel Islands Telegraph Company projected and formed a fresh company, to be called the Jersey and Guernsey Telegraph Company;" who told you that those same directors were shareholders in the old company?—With regard to the directors, I saw it on the prospectus, and Mr. Lefeuvre told me that some of the shareholders were.

1072. The report then goes on to say, "Mr. Holmes, in his letter to your Lordships of the 5th of April, states, the matter has been officially brought under the notice of Her Majesty's Postmaster General, both with reference to the erection of the necessary land lines and the subsequent working of the circuit, and your Lordships ask me to state whether it is true that the proprietors of Mr Holmes' cable had been in communication with me; in reply, I beg to enclose a copy of the first communication received from Mr. Holmes, or from anyone else on the subject of this cable; it is dated the 1st of April;" what was the reason for your using that expression, "the first communication received from Mr. Holmes or from anyone else;" in the face of the communication that you had received from Mr. Stoffel in the earlier part of the year?—Because there was nothing whatever in those communications from Mr. Stoffel to show any connection to me at that time with Mr. Holmes or Mr. Henley, or anyone else.

1073. Will you be kind enough to give me Mr. Holmes' first letter to you?—Certainly (*handing the same to the learned Counsel*).

1074. I have now got Mr. Holmes' letter on the 1st of April, which was the first communication from you, and which is referred to in that report?—Yes.

1075. Now I believe that that letter is headed, "The Channel Islands Telegraph Company"?—Yes.

1076. Does not it say, "The Channel cable to connect Guernsey and Jersey with England is now being laid down"?—Yes, it does.

1077. Seeing the letter commencing in that way, did it not enter your mind to suppose that it had reference to a cable as to which there had been previous communications?—When I received that letter, I thought it was intended to convey to the department the idea that the cable referred to had been the subject of previous communications, and therefore I looked back for previous communications, but I failed to connect them together.

1078. You knew that there had been previous communications with Mr. Stoffel?—Yes; I looked at those communications, and I saw that he dated them from the Globe Telegraph Works; I knew that Mr. Henley's works are at North Woolwich, and I failed to connect the two things together.

1079. Thinking, as you did, that that letter was written with the intention of leading you to believe there had been previous correspondence with regard to the cable, and failing to connect the two things, did it never occur to you to write to Mr. Holmes and ask him to explain himself?—No, it did not.

1080. Did you return any answer whatever to that letter?—No.

1081. Why did you not do so?—Because at the time it came into my hand I knew that the laying of the cable had been stopped by orders directly conveyed from

Mr. *F. I. Scudamore.*

5 July 1870.

from the Treasury, and I thought I would wait the result of further communications.

1082. You thought that you would wait the result of further communications?—Yes.

1083. From whom?—From the Treasury.

1084. And you had further communications from Mr. Holmes shortly afterwards, did you not?—I believe I had; yes, there were several further communications.

1085. Did you answer them?—I think that one or two of them were acknowledged.

1086. There was one upon the 12th of April, from Mr. Holmes to you, to the following effect: "Sir,—Upon the 1st instant I addressed a communication to you with reference to the erection of about 1½ miles of land wire, required to connect the landing of the cable shore end with the nearest postal telegraph office, Tor Cross. I shall be obliged by receiving from you an early reply to that communication"?—Yes.

1087. Did you return any reply to that letter?—I believe that most of those letters from Mr. Holmes were brought by him to the Post Office, with a request to see me, but I was engaged. He saw a gentleman who acted on my behalf, and I told him to state that it was not in my power to give him any reply until the matter had been settled by the Treasury.

1088. The Treasury giving Mr. Holmes to understand that it was not in their power to tell him anything until the matter had been reported upon by you?—Yes.

1089. You could not give him any reply until the matter had been settled by the Treasury, and the Treasury gave him to understand that it was not in their power to tell him anything until you had reported?—Yes.

1090. While you were making those careful inquiries to ascertain the exact position of the parties, did you ever apply to Mr. Holmes, or to anybody on his behalf, or on behalf of the gentlemen whom he represented, to obtain their views and their statements; who they were, and what they represented?—No, I never applied to him. We had had several statements of their views, and what they represented.

1091. From other people you mean?—No, I mean from themselves.

1092. But you made no application to obtain their statement?—No, they appeared to pour in perfect torrents of statements.

1093. To you?—To me and the Treasury; there was, perhaps, a communication three times a week.

1094. You were in communication with the other company, were you not; with individuals?—I had been in communication with the other company from the beginning of February.

1095. Up to that time?—Yes.

1096. You were receiving from them their view of what their position was?—Yes, we received their view.

1097. I see you go on, a little further down in the report, to state, "In his letter of the 1st instant to this department, he states that the Channel Islands cable is now being laid down, as if he were calling attention to the completion of an undertaking with the particulars of which the department was perfectly acquainted. In his letter to your Lordships of the 6th instant, he states that the proprietors of the cable had not obtained the necessary consents, as it was considered that the previous consents of the old cable landings covered the present renewal?"—Yes.

1098. "Your Lordship will, no doubt, be at a loss to understand how the laying down of a new cable between two fresh points could be regarded as a renewal of the old cable." How did you know it was "between two fresh points;" from whose information?—Almost the first application that we had from Mr. Holmes was to lay down a cable to Start Point. The original cable had not been laid down to Start Point.

1099. You are speaking here of a cable between Guernsey and Jersey?—I was not aware of that.

1100. "In his letter of the 1st instant, to this department, he states that the Channel Islands cable is now being laid down, as if he were calling attention to the completion of an undertaking, with the particulars of which the department was perfectly acquainted. In his letter to your Lordships, of the 5th instant, he states

Mr. *F. I. Scudamore.*

5 July 1870.

states that the proprietors of the cable had not obtained the necessary consents, as it was considered that the previous consents of the old cable landings covered the present renewal"?—I only saw that expression of opinion from him, and I could not forestall the explanation which he has given to-day.

1101. But look again; "In his letter, of the 1st instant, to this department, he states the Channel Islands cable is now being laid down." And you refer to the fact that you knew their Lordships had stopped it between Guernsey and Jersey?—No, I beg your pardon; I understood the stop to be between Jersey and the mainland, on the 2nd of April.

1102. You say, in a former part of the report, "But as it was then known in the department that Mr. Holmes' proceedings had been stopped (the telegrams from the Home Office to the Governor of Jersey having been seen by Mr. Scudamore)"?—Undoubtedly; I thought that stop referred to laying down the cable between Jersey and the mainland. If I was wrong, it was simply because the whole of the information put before us was so defective that it was impossible to get at the truth.

1103. A little lower down in the report, you state, "Mr. Holmes has also forwarded to your Lordships, and to this department, memorials from some of the directors of the Channel Islands Telegraph Company, praying, on behalf of themselves and the shareholders of that company, that the necessary authority may be given to Mr. Holmes to lay down the cable; even these gentlemen, however, do not describe Mr. Holmes, and those who act with him, as the representatives of the Channel Islands Telegraph Company, but declare them to have formed themselves into the Channel Islands Telegraph Association." Just tell me, where had Mr. Holmes been so desirous; I see you said, previously, "Mr. Holmes has evidently been desirous to lead both this department and your Lordship, to believe that he and his friends are the representatives of the Channel Islands Telegraph Company." Where had Mr. Holmes endeavoured to lead you to believe that he was the representative of the Channel Islands Telegraph Company?—I have no doubt all that has reference to the statement that he considered the old consent applicable.

1104. *Chairman.*] That was on the 5th of April, was it not?—I am inclined to think that there was something else, but I cannot lay my hands upon it; but you must take that for the moment.

1105. Mr. *Bidder.*] You say that he was "evidently desirous;" I suppose he had established that desire in some way or other "to lead both this department and your Lordship to believe that he and his friends are the representatives of the Channel Islands Telegraph Company, without committing himself to a positive statement to that effect"?—I adhere to that.

1106. Then if it appears that he was desirous to lead the department and his Lordship to believe that he was the representative of the Channel Islands Telegraph Company, when had he expressed that desire?—He had endeavoured to do it in the various memorials which he had produced from the Channel Islands Telegraph Company.

1107. Will you point out one in which he led you to believe that he was the representative of the Channel Islands Telegraph Company?—I do not say that; but I referred to his statement, in which he said that he thought the old consents which were given to the Channel Islands Cable Company, if given at all, covered the renewal. What did that mean if it did not mean that he was going to renew the cables of the old company.

1108. That is what you referred to in this passage?—Yes.

1109. You go on to say, "I have not been able to ascertain that this association has been registered; I am informed that the memorialists have no right to do more in this matter than to express their opinion as individuals;" who informed you of that?—The solicitor to the department.

1110. "That no board meeting of the Channel Islands Telegraph Company has been convened to consider the subject;" who informed you of that?—The solicitor to the department.

1111. Do you think that he knew anything about it?—I do not know; he informed me of it.

1112. Had not Mr. Lefeuvre informed you of that?—No, he had not.

1113. Were you in communication with Mr. Lefeuvre at this time?—I received an enormous number of letters from him, and he tried to see me very frequently; but as my time was much occupied I saw as little as possible of him.

1114. But

1114. But in March and April you did see him from time to time, did you not?—Occasionally I did.

1115. Did he at those times discuss with you the matters of the new company?—The new company? Yes. He made certain applications to me on behalf of the new company, which I systematically resisted.

1116. Did Mr. Lefeuvre advocate the interests of the new company?—Yes.

1117. And did he deprecate the position taken by Mr. Holmes and his friends?—Certainly, he protested against it.

1118. Did Mr. Lefeuvre represent to you that Mr. Holmes and his friends were persons not worthy of your support?—No.

1119. And that they were in a false position?—No.

1120. Did he say nothing to their disadvantage with regard to this undertaking?—I cannot say that he did.

1121. Then you go on to say in the report: "The question then resolves itself into this: there are two applicants for permission to lay a cable between Jersey and the United Kingdom. Is that permission to be given to both, or to one only?—I think it is open to doubt whether the traffic will pay a commercial company for laying one cable, but I am confident there is no probability that the traffic will pay for two cables. To permit the laying of two cables will be to permit a ruinous and unnecessary competition." What caused you to put that into the report, and to take upon yourself to put it into the Postmaster General's mouth to consider the question of trade between the two parties; did you conceive it to be the duty of the Post Office to restrict competition?—I conceived it to be the duty of the Post Office, when it is making a report to another public department charged with an important case, to express its opinion as fully as possible.

1122. You did consider that competition between two private companies or undertakings was a matter in which the Post Office had jurisdiction to express its opinion?—Certainly.

1123. And you conceived that you were justified in advising the Lords of the Treasury to use their power over the Crown lands in creating a monopoly in favour of one of those parties?—I thought it right on the part of the department to point out that competition in this case would be wasteful.

1124. *Chairman.*] And inconvenient to the public interest?—And inconvenient to the public interest.

1125. Mr. *Bidder.*] You go on to say, "I have heard that your Lordships have expressed your willingness to grant the necessary consent to the Guernsey and Jersey Telegraph Company, and I am of opinion that in giving this consent your Lordships will have done enough for the public interest." You meant to intimate that you thought they should not go further?—I did.

1126. You did advise their Lordships to create a monopoly in favour of the new company, did you not?—No. Finding that their Lordships had determined to permit one company to work, I told them that it would be inconvenient to permit another company to work.

1127. That is very much like creating a monopoly in favour of one company, is it not?—You may put it so if you like.

1128. Then you go on to say, "It is not, in my opinion, desirable that the cases for pressure should be multiplied; and they certainly will be multiplied if facilities be given to Mr. Holmes and those who work with him, to manufacture an undertaking for sales to the Government." Now, am I to understand that you represented that, in your opinion, Mr. Holmes and those who were with him, were manufacturing and undertaking for the purpose of selling it to the Government?—Yes, you may.

1129. What grounds had you for making that very serious imputation against Mr. Holmes and his friends?—That was the opinion I formed after going into the whole of the correspondence.

1130. That is to say, after being in communication with Mr. Lefeuvre, and having made no communication whatever to Mr. Holmes?—Yes.

1131. You never asked for the slightest explanation from Mr. Holmes and his friends, but having heard only the representations of one side, you took it upon yourself to make a report to the Treasury, in which you directly imputed to Mr. Holmes and his friends, that they were manufacturing an undertaking for the purpose of sale to the Government?—Yes. I will give you an additional opinion which I formed at an earlier period. When I supposed that applications were coming in to us on the one side, from the old company, and on the other side,

Mr. *F. I. Scudamore.*

5 July 1870.

from the new company, and when I saw that there was a split in the old company, and that it was broken up into two halves, I came to the conclusion that each half was trying to sell its undertaking, as a whole, to the Government.

1132. Then how was it that you came to support the undertaking of the new company?—I have not supported it.

1133. You thought that each half was trying to sell its undertaking to the Government as the whole; have you not advised and supported the granting of the necessary permissions to the new company, and have you not assented to their being conceded in this Bill?—I have not advised it.

1134. Have you not assented to the clause under which they are to obtain compensation?—Yes; what other course could I take, the Treasury having assented to it.

1135. Are you still of opinion that the new company was got up for the purpose of sale to the Government?—I have not said that.

1136. You said that you were of opinion that the new company was got up for the purpose of sale to the Government; are you still of that opinion?—I did not say that the new company got up the undertaking with a view to a sale to the Government; I said my opinion was that the two halves of the old undertaking were each trying to sell their half as a whole, but I did not say that the new company was got up for that purpose.

1137. Did you believe that the new company was got up for the purpose of selling their undertaking as a whole to the Government?—No, I believe undoubtedly that the new company was got up primarily with the object of working, but I thought it extremely probable that after they had worked it a little while, they would try to sell to the Government.

1138. What did you mean by saying that the two halves of the old undertaking were trying to sell each their half, as a whole, to the Government?—If you will have the whole thing, it is this: my impression is, that whatever company had been allowed to work between the Channel Islands and the main land, would, in a very short time, in some way have caused pressure to be put on the Government to buy its undertaking. That I said the other day, and I stick to it.

1139. What you said just now amounted to a good deal more than that. You represented, I think, that you had an opinion that both undertakings at one time were got up for the purpose of sale to the Government?—No, I did not say that; I said that I thought both companies were trying to sell the half as a whole. I did not say that they were got up for the purpose of selling to the Government.

1140. But you did not approve of that?—No.

1141. And you believe that still?—I believe that if you let both halves do the work, each will have to be bought as a whole.

1142. Do you still believe that they were got up for that purpose?—I do not say that they were got up for that purpose; but I do not want to evade the point in any way.

1143. We may take it that you did not approve of the action of the new company?—Certainly not.

1144. Are you still of the same opinion as you were then?—I should strongly disapprove of our buying the two halves as two wholes.

1145. But do you approve of buying one-half as a whole?—Not if I can avoid it; and I do not think we are going to do it.

1146. Did you believe that the new company was got up with the view to ultimate sale to the Government?—I have not said so.

1147. But did you believe it; was that what you meant?—No, that was not what I meant.

1148. Did it not occur to you that before making this imputation against Mr. Holmes and his friends to the Treasury, it would have been only fair to have had some communication with him?—I thought that we had all the communications that were necessary for making that report.

1149. But had you known at that time that Mr. Holmes and his friends had been engaged in preparing to lay down this cable, would you have been of the same opinion?—If at that time I had had the pleasure of sitting in this room for three days, and hearing all I have heard, I should have written the same letter.

1150. If you had known that Mr. Holmes and his friends had been preparing to lay down this cable, would you have made that representation to the Treasury.

Mr. Serjeant *Sargood* submitted that Mr. Bidder was not entitled to ask that question.

Mr. *F. I. Scudamore.*

5 July 1870.

The *Chairman* stated that the Committee were of opinion that the question ought not to be put.

1151. Mr. *Bidder.*] Does not the fact now disclosed to you by the evidence that they were engaged in this business in December, change your opinion?—Not in the least.

Mr. Serjeant *Sargood* stated that he did not admit that that fact appeared on the evidence.

1152. Mr. *Bidder.*] With regard to Mr. Stoffel's statement, that he had obtained the consent of the Woods and Forests, and your statement, believing that it was utterly untrue, I beg to draw your attention to the letters written by the Woods and Forests, and by the Board of Trade, to Mr. Stoffel, and I ask you if you still consider that you were justified in making that statement?—I do.

1153. Just listen for one moment while I read you the letter from the Woods and Forests: "So far as regards the shore between high and low water-marks immediately adjacent to the coast of Devon, upon which a portion of the proposed cable is to be laid, I shall be prepared to grant a license to the Channel Island Telegraph Company (Limited), to lay down and maintain that portion of the cable, upon payment of a rent of 1 *l.* per annum, subject to the following conditions:" was not that substantially a promise of assent on the part of the Woods and Forests?—No. In the first place it was a promise of assent on certain conditions to the Channel Islands Telegraph Company (Limited), which company was not represented by Mr. Stoffel.

1154. On that point, Mr. Stoffel having obtained that letter, you charge him with saying that it was utterly untrue, because you take the point, that although they wrote it to him, they used the expression, "Channel Islands Telegraph Company (Limited)"?—Yes; I say he led the department to believe that he was representing some one whom he did not represent, and if he obtained the consent, he obtained it by false representations; and any consent that he did obtain was incomplete and worth nothing at all.

1155. But Mr. Stoffel had obtained that consent, and substantially it is true. This is the letter of the Board of Trade: "I am directed by the Board of Trade to acknowledge the receipt of your letter of the 31st ultimo, transmitting a duplicate plan of the landing-place of the proposed new cable at Start Point, and in reply, I am to acquaint you that on comparing that plan with the Ordnance sheet forwarded by you on the 21st December last, the track of the cable does not appear to be identical, and I am to request that you will cause the position of the cable to be laid down on the enclosed plan." "I am to add, that when the terms of the licenses have been settled, the assent of the Board of Trade will be given to the plans"?—Yes.

1156. Now, I ask you were not those two letters substantially, and without making technical points with regard to whether it was the Channel Islands Telegraph Company, or not, sufficient to warrant a man in telling you that he had obtained the consent of the Woods and Forests, and the Board of Trade?—Taking all the facts together, they were not.

1157. Will you now explain to me how the "Monarch" came to be lent to the new company for the purpose of their cable?——

Mr. Serjeant *Sargood* suggested that the "Monarch" was not so lent.

1158. Was it?—No, it was not.

1159. Was it promised?—It was conditional on the Treasury giving permission to the Jersey and Guernsey Telegraph Company to lay down a cable.

1160. Who was that promised to?—By Mr. Culley, the engineer in chief; whether he promised it to Mr. Bullivant, I cannot say. Mr. Preece is named in your petition for a post that he does not occupy.

1161. Mr. *Bidder.*] On whose application was the "Monarch" promised to him?—I believe it was on Mr. Lefeuvre's application.

1162. To whom?—To Mr. Culley. Mr. Culley came to me and said, "We have the 'Monarch' at rest, eating her head off, and I believe they are willing

Mr. *E. J. Scudamore.*

5 July 1870.

to hire her;" and I said, "I see no objection when the Treasury have allowed the company to lay the cable; until then they cannot have her."

1163. Mr. Serjeant *Sargood.*] Was that to the contractor?—Yes, to the contractor.

1164. Mr. *Bidder.*] You have seen the clause which I handed in this morning, have you not?—Yes.

1165. Is there anything in that clause endeavouring to make an unfair sale of this matter to the Government?

Mr. Serjeant *Sargood* was heard, objected to the question as being a legal one.

1166. Mr. *Bidder.*] Assuming the *bona fides* of the undertaking, is that a fair clause?—I can only say that I object to the clause on behalf of the Post Office.

1167. I will ask you the grounds on which you object?—

Mr. Serjeant *Sargood* heard on objection to the question.

The *Chairman* stated that the Witness could hardly be called upon to answer the question.

1168. Sir *Lawrence Palk.*] You object on public grounds, I suppose?—Yes, I do.

1169. Do you happen to know whether the foreshore at Start Point is in the Duchy of Cornwall or in the Crown?—I do not know.

1170. *Chairman.*] Have you read the paragraph in Mr. Henley's petition, in which it is stated that "Your petitioner humbly submits that the new company which has been registered and formed, as he is informed and believes, since the Government came to the determination of extending the Telegraphs Act to the Channel Islands, has been formed for the purpose of disposing of the same to the Government, and he submits also that an official employed in Her Majesty's public service, and under whose immediate care, and to whose control the public telegraphy department is entrusted, was (if he is not now) a large shareholder in that company, which your petitioner submits is wholly contrary to the practice and policy of Parliament"?—Yes, I have read that.

1171. Who is the "official employed in Her Majesty's public service, and under whose immediate care, and to whose control, the public telegraphy department is entrusted;" whom would you understand by that?—If not your Lordship, it must be myself, I think

1172. Did you understand that that was an imputation against you?—I understood it was intended to appear to the Committee as an imputation upon me.

Mr. Serjeant *Sargood.*] We all thought so.

Mr. *Bidder.*] Nobody ever thought of raising an imputation of that kind against Mr. Scudamore.

1173. *Chairman.*] We have been told that the "official" who was alluded to was Mr. Preece. Can it be said that the telegraph department is under the immediate care and control of Mr. Preece?—Certainly not.

1174. Mr. *Muntz.*] Were you a large shareholder in the company at that time?—No.

[The Witness withdrew.

Mr. *William Henry Lefeuvre*, called in; Examined by Mr. *Freeman.*

Mr. *W. H. Lefeuvre.*

1175. You are an Engineer, are you not?—I am.

1176. You are a native of the Island of Jersey?—I am.

1177. And you are interested in public works both there and at Guernsey, are you not?—Yes.

1178. You are also Chairman of the Jersey Railway Company, are you not?—I am.

1179. I believe that your family are landowners in Jersey, and largely interested in the island?—They are.

1180. The Jersey railway, I believe, has been recently constructed?—It will be

be completed within the next fortnight, and ready for opening; it is only waiting for locomotives to get over there.

1181. Will you be kind enough to point out the railway on the map to the Committee?—I will do so (*pointing it out on the Map*). This is a plan of the Island of Jersey. This is the principal town, St. Heliers, and there is another town, with a population of about 2,000, St. Aubyns. The cable coming from Guernsey comes in at this point; the wires are erected and carried through St. Heliers; I mean the Jersey land lines. We are sending messages for 3 *d.* all the way; they go through this way (*pointing to the Map*). With regard to the arrangements entered into before I was aware of this Bill, we had entered into an arrangement with the Post Office to pay a rent of 1 *s.* a week, and a commission on the receipts, of 15 per cent., so that we reduced the cost of our stations to a minimum taking the same scale as is adopted in France; they charge a rate of 5 *d.* for a message from one department to another; in this case we charge 3 *d.*, but we make a small charge for porterage. A message comes from England to here (*pointing to the Map*), where I reside; it goes to St. Heliers. I pay 5 *s.* for porterage, and 6 *s.* 8 *d.* for a message through France; that is 11 *s.* 8 *d.* The practical result is, that though we might have a uniform 1 *s.* rate from England to the island, that would be practically inoperative to all except people residing in the immediate vicinity of the station. It is a very small island, and it is very thickly populated. We are scattered all over the island; we have no villages. We have equal divisions of property there, and the consequence is that we have very small holdings there; people have a farm of two or three acres; in fact, the whole island is covered with people, and, except for the people residing within the immediate vicinity of the station, as I have already stated, though we might have a uniform rate of 1 *s.* from England to France, it would be practically inoperative. We have only one money-order office there, and the 1 *s.* tariff would be practically inoperative.

1182. That is to say, in the island?—Yes.

1183. You mean on account of the porterage?—Yes, on account of the porterage. I am just over four miles, and I pay 5 *s.* for every message that comes to me, and I have got the wires running within a quarter of a mile of my residence.

1184. Mr. *Neville-Grenville.*] What you want is a cheaper rate for inland messages, is it not?—Yes; but Mr. Scudamore is bound to make a uniform rate.

1185. *Chairman.*] Your complaint appears to be that the telegraph is so far from your house?—Yes; Mr. Scudamore would only be bound to give us one telegraph office here, and it is not, in fact, obligatory on him to give a telegraph office at all. There is nothing in the Act of Parliament to compel it.

1186. But there is nothing to prevent him, is there?—But your Lordship will see that this land line goes right through the island. The wires are laid down, and arrangements are entered into with those postal stations, and it is a very hard case if the landowners allow those wires to go through their land with the distinct understanding that they are to have a cheap rate, if they are not to have it. The practical result is, that the 1 *s.* rate would be prohibitory. If Mr. Scudamore were over there, he would agree with me that this is an exceptional case. The houses are scattered all over the island. If Mr. Scudamore will say so, and will agree that so many stations shall be placed in the island, that might get rid of my difficulty.

1187. Your desire appears to be rather to have more stations than a cheaper rate?—That would be the same thing. Some of those stations are open.

1188. Mr. *Scudamore.*] Who works this station now (*referring to the Map*)?—The Jersey and Guernsey Telegraph Company. We work this one station (*pointing it out on the Map*).

1189. Mr. *Scudamore.*] I shall not shut that station?—There is nothing in the Bill to prevent your shutting it.

1190. Mr. *Neville-Grenville.*] You do not complain of your 1 *s.* rate, but what you complain of is the porterage of 1 *s.* a mile, is it not?—

1191. *Chairman.*] But are you not mixing up two things together?—No, I am only looking at the matter in a public point of view; I believe it is to Mr. Scudamore's own interest that he should have the option of having a lower rate.

Mr. *Scudamore.*] I am sure that it is not; we have some equally exceptional cases.

Mr. *W. H. Lefeuvre.*

5 July 1870.

Witness.] This is tantamount to shutting out local telegraph communication from the island. The wires are already laid, and we take them into use, and we pay 1 *s.* a week rent; besides that we give the person that takes the messages an interest in 15 per cent. of the receipts in addition.

1192. How long has that station (*pointing to the Map*) been opened?—I suppose that station has been opened something like three or four years.

1193. Mr. *Freeman.*] What is the arrangement between the railway company and the telegraph company with respect to telegraphing over the railway?—The arrangement between them is on the same basis, as you have just explained in your address to the Committee.

1194. But I mean with regard to telegraphing?—It is the same arrangement.

1195. What is the total rate that they charge?—From St. Heliers to St. Aubyns, 3 *d.*; we give the postmaster the option of charging 3 *d.*; we have everything in miniature in this island.

1196. Will you be kind enough shortly to state to the Committee what are the arrangements between the railway company and the telegraph company with reference to the telegraph wires?—The telegraph wires are laid along the railway; they are between the rails and the fence of the railway company; so that, assuming Mr. Scudamore takes over the Jersey and Guernsey Telegraph Company, he cannot have any communication at St. Heliers except by means of the railway company. This railway company is incorporated by an Act of our own Parliament, which is a very peculiar Act. My sole object in coming here was to empower the railway company and the Post Office to enter into an arrangement. I question very much whether the railway company could do it unless some clause is inserted in the Bill.

Cross-examined by Mr. Serjeant *Sargood.*

1197. If you merely want an enabling clause, and there are legal difficulties in the way, we shall be very happy to do it?—Of course, if the Post Office take the wires over from the railway company, they will have to compensate them.

1198. If you think that we cannot make a contract with you, we will have an enabling clause to enable the Postmaster General to make a contract with your company?—I think that would satisfy us.

1199. I believe that we can do it already?—It is very doubtful, I think. All those Acts apply to Jersey and Guernsey; the Acts are not passed by the Legislature here; they are passed by the local Parliament, and are referred to the Queen in Council. It has been said that Parliament has no right to legislate for the Channel Islands. With the exception of the Post Office Act, I do not believe that Parliament has hitherto legislated for us.

1200. *Chairman.*] But still there is nothing to prevent the Post Office making a contract with the railway company, or anything else, is there?—I do not know.

1201. Mr. Serjeant *Sargood.*] By the present Act, we make Jersey and Guernsey part of the United Kingdom for telegraphic purposes, and therefore there can be no difficulty?—I think——

1202. Mr. *Freeman.*] But the Jersey Railway is not incorporated under the General Statutes, is it?—No.

1203. Mr. Serjeant *Sargood.*] What difficulty is there in the Post Office making a contract with anybody it chooses in the island?—I question whether they would have the power to take land compulsorily.

1204. We do not want it; is there anything in the Jersey law which would prevent our making a voluntary contract with the railway company, or anybody else?—I do not know.

1205. Mr. *Hurst.*] There can be no doubt about the power of the Post Office to make a contract with the railway company if they are willing?—I merely suggest that; I know the Jersey law is very peculiar. If the Post Office say that they have no objection to give us power to enter into a contract with them, that would get over a great deal of the difficulty. With regard to the question of land, this railway has been constructed on the foreshore, and there are very intricate questions arising there. It would be very much safer for the Post Office

Office and the railway company to have actual powers to enter into an agreement. If they did not agree, that might involve the Post Office in laying down lines under the road at a cost of seven times what they could do it for otherwise.

1206. Mr. Serjeant *Sargood.*] At present you have a contract, as I understand you, in words with the telegraph company?—Yes; I am chairman of the railway company, and I am also chairman of the telegraph company.

1207. Do I understand you to say that the railway company grant wayleaves to the telegraph company, and that, in return, the telegraph company undertake to keep the posts and wires alive, and to give the railway company the use of those wires for their private service?—Yes, that is the honourable understanding.

1208. Is it your belief that if we buy up that telegraph company you are still bound in law to grant us a wayleave?—It is a question that might arise in law, because it is merely an honourable understanding.

1209. Is it your opinion that you would be bound in law to continue the grant of wayleaves to us?—The posts are there, and there is an understanding existing; in equity, no doubt, it would stand, but with regard to the law I can scarcely say.

1210. In equity you think that you are bound to continue the grant of wayleaves?—Yes.

1211. Do you not think that we are bound to keep up the posts, and give you the use of the wires, on the same principle?—I question very much whether the railway company——

1212. Jersey equity is a one-sided thing, I suppose?—We have no court of equity there.

1213. Well, then, there would be nothing binding on either of us; is that what you mean?—There is merely this honourable understanding.

1214. There would be nothing binding on the Postmaster General, or upon you, you think?—I will not express an opinion whether it is binding or not.

Re-examined by Mr. *Freeman.*

1215. Your desire is that it should be made binding by this Bill, is it not?—Yes.

1216. What would be the effect, in your opinion, on the telegraph traffic if the Post Office charge 1 *s.* for each message?—The increase would be something enormous; it would be tantamount very nearly to being prohibitory.

Re-examined by Mr. Serjeant *Sargood.*

1217. If the Postmaster General makes you a present of 5 *s.* for every message outside the island, that will be a very good set-off, will it not?—That is outside the island; but I only speak now with regard to local messages.

[The Witness withdrew.

REPORT

FROM THE

SELECT COMMITTEE

ON THE

TELEGRAPH ACTS EXTENSION BILL;

TOGETHER WITH THE

PROCEEDINGS OF THE COMMITTEE

AND

MINUTES OF EVIDENCE.

Ordered, by The House of Commons, *to be Printed,*

REPORT

FROM THE

SELECT COMMITTEE

ON

TRAMWAYS BILL;

TOGETHER WITH THE

PROCEEDINGS OF THE COMMITTEE

AND

MINUTES OF EVIDENCE.

Ordered, by The House of Commons, *to be Printed*,
2 *May* 1870.

Monday, 7th March 1870.

Ordered, THAT the Tramways Bill be read a second time, and committed to a Select Committee.

Monday, 14*th March* 1870.

Ordered, THAT the Select Committee do consist of Nine Members, viz. :—

Mr. Shaw Lefevre.	Mr. Cawley.
Colonel Wilson Patten.	Mr. Hibbert.
Mr. Ayrton.	Lord George Hamilton.
Mr. Sclater-Booth.	Mr. Loch.
Mr. Dent.	

Oraered, THAT the Committee have power to send for Persons, Papers, and Records.

Ordered, THAT Five be the Quorum of the Committee.

Wednesday, 23*rd March* 1870.

Ordered, THAT all Petitions presented during the present Session against the Bill be referred to the Committee, and such of the Petitioners as pray to be heard by themselves, their Counsel, or Agents, be heard upon their Petitions if they think fit; that Counsel be heard in favour of the Bill against the said Petitions; and that the Minutes of Evidence taken before the Committee on the Metropolitan Tramways Bills in Session 1869, be referred to the said Committee.

Monday, 28*th March* 1870.

Ordered, THAT it be an instruction to the Committee on the Tramways Bill, that they have power to extend the Bill to Scotland.

Ordered, THAT all Petitions from Scotland relating to the Tramways Bill be referred to the Committee.

Ordered, THAT the Select Committee do consist of Nine Members, read, and discharged.—Committee to consist of Ten Members.—Mr. Dalglish added to the Committee.

Friday, 29*th April* 1870.

Ordered, THAT the Committee have power to report the Minutes of Evidence taken before them to The House.

REPORT - - - - - - - - - - - - - p. iii
PROCEEDINGS OF THE COMMITTEE - - - - - p. iv
MINUTES OF EVIDENCE - - - - - - - - - p. 1

REPORT.

THE SELECT COMMITTEE on the TRAMWAYS BILL have considered the said Bill, and taken Evidence thereon, which they have agreed to report to The House; and have gone through the Bill, and made Amendments thereunto.

2 *May* 1870.

PROCEEDINGS OF THE COMMITTEE.

Thursday, 17*th March* 1870.

MEMBERS PRESENT:

Mr. Shaw Lefevre.	Mr. Dent.
Colonel Wilson Patten.	Mr. Cawley.
Mr. Ayrton.	Lord George Hamilton.
Mr. Sclater-Booth.	Mr. Loch.

Mr. *Shaw Lefevre* was called to the Chair.

The Committee deliberated.

[Adjourned till Thursday next, at Twelve o'clock.

Thursday, 24*th March* 1870.

MEMBERS ALL PRESENT.

TRAMWAYS BILL.

Agents:—Messrs. *Wyatt & Hoskins.*

The following Petitions were read, and appeared upon:

1. Corporation of Liverpool.
   Agent:—Mr. *Joseph Raynor.*
2. Corporation of Leeds.
   Counsel:—Mr. *Aspinall.*
   Agents:—Messrs. *Simson & Wakeford.*
3. Metropolitan Board of Works.
   Counsel:—Mr. *Evelyn Ashley.*
   Agents:—Messrs. *Dyson & Co.*
4. Corporation of Salford.
   Agents:—Messrs. *Wyatt & Hoskins.*
5. Lambeth Waterworks Company.
   Agents:—Messrs. *Bell & Steward.*
6. Manchester Carriage Company.
   Agent:—Mr. *J. Newall.*
7. Corporation of Manchester.
   Agents:—Messrs. *Wyatt & Hoskins.*
8. Manchester, Hyde, and Mottram Road Trustees.
   Agents:—Messrs. *Dyson & Co.*
9. Corporation and Board of Police of Glasgow.
   Counsel:—Mr. *J. Clerk.*
   Agents:—Messrs. *Simson & Wakeford.*
10. Promoters

10. Promoters of Birmingham and Staffordshire Tramways Bill.
Agents:—Messrs. *Martin & Leslie.*

11. Whitechapel District Board of Works.
Agents:—Messrs. *Dyson & Co.*

12. Glasgow and Yoker Turnpike Road Trustees.
Counsel:—Mr. *Davidson.*
Agents:—Messrs. *Grahames & Co.*

13. Great Western Turnpike Road Trustees.
Counsel:—Mr. *Davidson.*
Agents:—Messrs. *Grahames & Co.*

14. Glasgow and Shotts Turnpike Road Trustees.
Counsel:—Mr. *Davidson.*
Agents:—Messrs. *Grahames & Co.*

15. Glasgow and Three-mile House and Renfrew Bridge Turnpike Road Trustees.
Counsel:—Mr. *Davidson.*
Agents:—Messrs. *Grahames & Co.*

16. Local Board of Health of West Derby.
Agent:—Mr. *S. Price.*

17. Promoters of Birmingham Tramways Bill.
Agents:—Messrs. *Dorington & Co.*

18. Renfrewshire Road Trustees.
Agents:—Messrs. *Grahames & Co.*

19. Promoters of Liverpool Street Tramways Bill.
Agents:—Messrs. *Dorington & Co.*

20. Messrs. *Dorington & Co.*, Agents for the Promoters of the Portsmouth Tramways Bill.
Agents:—Messrs. *Dorington & Co.*

21. East London Waterworks Company.
Agents:—Messrs. *Bircham & Co.*

22. Trustees of Glasgow Bridges.
Agents:—Messrs. *Connell & Hope.*

23. North Metropolitan Tramways Company.
Agents:—Messrs. *Sherwood & Co.*

24. Owners, &c. of Collieries, &c.
Counsel:—Mr. *Edwards.*
Agents:—Messrs. *Dyson & Co.*

25. Promoters of Street Tramways Bills in Glasgow, Leeds, Manchester and Plymouth, Stonehouse and Devonport.
Agents:—Messrs. *Dorington & Co.*

26. Metropolitan Street Tramways Company and Pimlico, Peckham, and Greenwich Street Tramways Company.
Counsel:—Mr. *Pope* and Mr. *C. E. Thomas.*
Agents:—Messrs. *Dorington & Co.*

27. New River Company.
Agents:—Messrs. *Baxter, Rose & Norton.*

28. Liverpool and Prescott Road Trustees.
Agents:—Messrs. *Dyson & Co.*

29. Hay Salesmen in Whitechapel.
Counsel:—
Agents:—Messrs. *Dyson & Co.*

30. Staffordshire Potteries Street Railway Company.
Agents:—Messrs *Dorington & Co.*

 31. Corporation

31. Corporation of Birmingham.
Agents:—Messrs. *Sharpe & Co.*

32. London General Omnibus Company.
Agents:—Messrs. *Dyson & Co.*

33. Great Western Railway Company.
Agents:—Messrs *Dyson & Co.*

34. Messrs. Shoolbred & Company.
Agents:—Messrs. *Dyson & Co.*

35. Liverpool Tramways Company.
Agents:—Messrs. *Sherwood & Co.*

36. Imperial Gaslight and Coke Company.
Agents:—Messrs. *Sherwood & Co.*

37. Prestwich, Bury, and Ratcliffe Road Trustees.
Agents:—Messrs. *Dyson & Co.*

38. Lancashire and Yorkshire Railway Company.
Agents:—Messrs. *Dyson & Co.*

39. Metropolitan Railway Company.
Agents:—Messrs. *Burchall & Co.*

40. London and North Western Railway Company.
Counsel:—Mr. *Merewether* and Mr. *Round.*
Agents:—Messrs. *Blenkinsop & Co.*

41. North London Railway.
Counsel:—Mr. *Merewether* and Mr. *Round.*
Agents:—Messrs. *Blenkinsop & Co.*

42. Cumberstang and Muirkirk, &c. Road Trustees.
Agents:—Messrs. *Grahames & Co.*

The Committee deliberated.

[Adjourned till Tuesday next, at Twelve o'clock.

Tuesday, 29th March 1870.

MEMBERS PRESENT:

Mr. Shaw Lefevre, in the Chair.

Colonel Wilson Patten	Mr. Cawley.
Mr. Ayrton.	Lord George Hamilton.
Mr. Sclater-Booth.	Mr. Loch.
Mr. Dent.	Mr. Dalglish.
Mr. Hibbert.	

The following Petitions were read, and appeared upon:

1. Justices of Lancashire.
Counsel:—Mr. *Gorst.*
Agent:—Mr. *Sudlow.*

2. Inhabitants of Oxford-street.
Agents:—Messrs. *Dyson & Co.*

3. South Eastern Railway.
Agents:—Messrs. *Dyson & Co.*

4. Corporation of London.
Counsel:—Mr. Serjeant *Sargood.*
Agent:—Mr. *Corrie.*

5. Commissioners of Sewers of the City of London.
Agent:—Mr. *Corrie.*

6. Southwark and Vauxhall Waterworks Company.
Agents:—Messrs. *Hargrove & Co.*

7. Grand

7. Grand Junction Waterworks Company.
Agents:—Messrs. *Hargrove & Co.*

8. Midland Railway Company.
Counsel:—Mr. *Round.*
Agents:—Messrs. *Dyson & Co.*

Mr. *Round* was heard on behalf of the Railway Companies, and called Mr. *Thomas Coates,* who was examined.

Mr. *Rodwell* was heard on behalf of the Metropolitan Board of Works.

Mr. *Newall* was heard on behalf of the Manchester Omnibus Company.

Mr. *Edwards,* on behalf of the Owners of Collieries and other persons interested in Canals in Lancashire, called Mr. *Thomas Part,* who was examined.

[Adjourned till To-morrow, at Twelve o'clock.

Wednesday, 30th March 1870.

MEMBERS PRESENT:

Mr. Shaw Lefevre, in the Chair.

Colonel Wilson Patten.	Mr. Cawley.
Mr. Ayrton.	Lord George Hamilton.
Mr. Sclater-Booth.	Mr. Loch.
Mr. Dent.	Mr. Dalglish.
Mr. Hibbert.	

Mr. *Denison* was heard on behalf of the Owners of Collieries and other persons interested in Canals in Lancashire.

Mr. *Round* was heard on behalf of the Water Companies and other persons interested in matters under the roads.

Mr. *Gorst* was heard in support of the Petition of the Justices of Lancashire.

Mr. *Shrubsole* was heard on behalf of the Trustees of the Turnpike Roads, and called Mr. *John Lingard Vaughan,* who was examined.

On behalf of the Corporations and Local Authorities the following witnesses were examined:—Sir *Joseph Heron,* Mr. *E. T. Hayes,* and Mr. *Joseph Raynor.*

[Adjourned till To-morrow, at Twelve o'clock.

Thursday, 31st March 1870.

MEMBERS PRESENT:

Mr. Shaw Lefevre, in the Chair.

Colonel Wilson Patten.	Mr. Cawley.
Mr. Ayrton.	Lord George Hamilton.
Mr. Sclater-Booth.	Mr. Loch.
Mr. Dent.	Mr. Dalglish.
Mr. Hibbert.	

The following Petition was appeared upon.

1. Promoters of the Leeds Tramways Bill—(Mr. *F. Smith* and others).
Counsel:—Mr. *Pope* and Mr. *Thomas.*
Agents:—Messrs *Sherwood & Co.*

2. Vestry of St. Marylebone.
Counsel:—Mr. *Granville Somerset.*
Agent:—Mr. *Greenwell.*

Mr. *Serjeant Sargood* was heard on behalf of the Corporation of London.

Mr. *Clerk* was heard on behalf of the Corporation and Board of Police of the City of Glasgow, and called Mr. *Alexander Monro,* who was examined.

Mr. *Davidson*, on behalf of the Turnpike Road Trustees in the neighbourhood of Glasgow, addressed the Committee, and called Mr. *Andrew Hoggan*, who was examined.

In support of the petitions of the inhabitants of Oxford-street and Messrs. Shoolbred, Mr. *Thomas Coates* was examined.

Mr. *Granville Somerset* was heard on behalf of the Vestry of St. Marylebone, and called Mr. *Walpole Eyre Greenwell*, who was examined.

Mr. *Newall* was heard in support of the petition of the Manchester Carriage Company, and called Mr. *C. S. Grundy*, who was examined.

[Adjourned till Monday next, at Twelve o'clock.

Monday, 4th April 1870.

MEMBERS PRESENT:

Mr. SHAW LEFEVRE, in the Chair.

Colonel Wilson Patten.	Mr. Dent.
Mr. Loch.	Mr. Cawley.
Mr. Sclater-Booth.	Mr. Hibbert.
Mr. Dalglish.	Mr. Ayrton.

Mr. *Joseph Raynor* re-called.

Mr. *John Layton* examined.

Mr. *C. E. Thomas*, on behalf of the owners of existing Tramways, called Mr. *John Morris*, Mr. *George Hopkins*, C.E., Mr. *Benjamin Boothroyd*, and Mr. *Barron Emmanuel*, who were severally examined.

Room cleared.—The Committee deliberated.

[Adjourned till Thursday next, at Two o'clock.

Thursday, 7th April 1870.

MEMBERS PRESENT:

Mr. SHAW LEFEVRE, in the Chair.

Lord G. Hamilton.	Mr. Dent.
Mr. Loch.	Mr. Hibbert.
Mr. Sclater-Booth.	Mr. Cawley.
Mr. Dalglish.	Colonel Wilson Patten.

RESOLUTIONS to be proposed by the Chairman, read as follows:—

"1. That Provisional Orders be substituted for certificates.

"2. That the consent of ratepayers be not required.

"3. That inquiries by Referee of the Board of Trade be permissive, and at the discretion of the Board of Trade.

"4. That the Board of Trade have power to proceed with a Provisional Order, notwithstanding that certain of the local or road authorities refuse their consent, and to report to Parliament their reasons for the same.

"5. That the powers of sale conferred upon Promoters by Clause 5 be limited to local authorities.

"6. That the Provisional Order specify the nature of traffic for which the Tramway is sanctioned: where the Tramway is sanctioned for other than passenger traffic, Promoters to allow all carts or trucks with flange wheels to use the same on payment of tolls.

"7. That the maximum tolls be inserted in the Schedule, with power to the Board of Trade to reduce the same in Provisional Orders.

"8. That

"8. That the Bill be extended to Scotland.

"9. That the Metropolitan Board be the local authority for London (except the City), but the consent of the vestries be necessary in the case of road authority."

RESOLUTIONS to be proposed by Mr. *Sclater-Booth*, read, as follows:—

"1. That Provisional Orders be substituted for Board of Trade certificates.

"1*a*. That the preliminary inquiry be permissive.

"2. That the metropolis be excluded from the operation of the Act.

"3. That Clause 5 be omitted.

"4. That local authorities constructing Tramways be prohibited from giving any monopoly or exclusive privilege to private parties.

"5. That a *locus standi* be reserved for the owners and occupiers of property, fronting a street or road through which it is proposed to construct a Tramway, to appear both before referee, and afterwards before Parliament."

RESOLUTIONS to be proposed by Mr. *Dent*, read, as follows:—

"1. That the form of proceeding by Provisional Order be substituted for the certificate in the Bill.

"2. That any consent of the ratepayers in boroughs governed by a municipal council, beyond the decision of the council, is unnecessary.

"3. When local authority has obtained power to make Tramways, they should not be allowed to make an absolute sale of the concession.

"4. Parties who have neglected to appear before the referee appointed to make local inquiry under this Act, shall not have the right of appearing before Select Committee.

"5. That the local authority should have control over the whole road, including the Tramway, and that they should be liable for the repair at the expense of the Company.

"6. That power should be given to local authorities to make bye-laws for regulation of traffic, and for licensing drivers and conductors of vehicles.

"7. That clauses are necessary to give ready powers of removal of Tramways found injurious or disused.

"8. Clauses should be introduced to enable Board of Trade, or some other authority, to settle differences of local authorities who may not concur in making Tramways through their districts.

"9. Provision should be made for residents in streets being heard against lines proposed to run through their streets."

RESOLUTIONS to be proposed by Mr. *Cawley*, read as follows:—

"1. That Provisional Orders be adopted, to be confirmed by Act of Parliament, as under Local Government Acts, with similar provisions as to reference to Select Committee, in case any order be petitioned against.

"2. That local authorities may be Promoters.

"3. That where intended Tramway will pass into the districts of two local authorities, either of such local authorities may apply for Provisional Order.

"4. That where such Tramway will pass into or through more than two districts, Promoters may apply, with consent of district in which termini are situated.

> "*Note.*—It is doubtful whether consent of road authorities, where other than local authority, should be necessary, as it must be borne in mind that in the case of turnpike roads the inhabitants of the parish or township alone are indictable for non-repair, and not the trustees.

"5. That ample public notice be given of intended application to Board of Trade, and time stated within which objections must be lodged.

"6. That Board of Trade may hear objections, or receive objections in writing, and may, if they think fit, direct local inquiry, and on receipt of their officers' report, may make Provisional Order.

"7. That previous order shall prescribe the position of Tramway as to line and level, either by road or reference to plan and section.

"The kind of rail or tram to be used.

"The gauge at which they are to be laid.

"The tolls to be paid for the use of the Tramway.

"The carriages to be used thereon.

"8. That the Promoters shall be responsible to maintain in good order, to satisfaction of local or road authority, the space occupied by Tramway, and 18 inches outside each rail; this not to relieve local or road authority from the responsibility of maintaining road, but they to have power to enforce performance of obligation against Promoters.

"9. That when Promoters are others than local authority, security for execution of works to be given by a deposit, to be retained until completion.

"10. That there be no power of sale except to local authority, and then only of Tramway at the then value, with per cent. added.

"11. That if Tramway made by, or be the property of local authority, they may lease tolls, but not the exclusive use of the Tramway.

"If property of parties other than local authority, such parties not to have exclusive use, but others may use it in paying tolls, and conforming to bye-laws.

"12. That power be given to local authority to raise money for undertaking.

"Tolls to go to paying interest on borrowed money, and providing sinking fund for repayment of capital.

"13. That local authority have power to make bye-laws for regulating the working of Tramways, and the ordinary traffic of all roads or streets along which Tramways are laid.

"Drivers and conductors of omnibuses on Tramways to be licensed by local authorities as cab-drivers, &c.

"Bye laws to be approved by (Secretary of State) or (Board of Trade).

"*Note.*—In Municipal Acts and Metropolitan Tramways Act, the Secretary of State is named."

Motion made, and Question, That the Resolutions to be proposed by the Chairman be now considered—put, and *agreed to.*

Resolved, That Provisional Orders be substituted for certificates—(*The Chairman*).

Resolved, That the consent of ratepayers be not required in boroughs governed by a municipal council; that such decision should be given at a special meeting at which two-thirds of the Members shall be present—(*Mr. Dent*).

Resolved, That local inquiries by the Referee of the Board of Trade be at the discretion of the Board—(*The Chairman*).

Resolved, That the Board of Trade after considering objections, shall have power to proceed with a Provisional Order, notwithstanding that certain of the local or road authorities refuse their consent, and shall report to Parliament their reasons for the same—(*The Chairman*).

Motion made, and Question proposed, That the powers of sale conferred upon promoters by Clause 5, be limited to local authorities—(*The Chairman*).

[Adjourned till Monday next, at One o'clock.

Monday, 11*th April* 1870.

MEMBERS PRESENT:

Mr. Shaw Lefevre, in the Chair.

Colonel Wilson Patten.	Mr. Sclater-Booth.
Mr. Loch.	Mr. Dent.
Mr. Dalglish.	Lord George Hamilton.

Question again proposed, That the powers of sale conferred upon Promoters by Clause 5 be limited to local authorities—(*The Chairman*).—Motion, by leave, *withdrawn.*

Resolved, That Clause 5 of the Bill conferring powers of sale upon Promoters, be omitted—(*The Chairman*).

Resolved, That the Provisional Orders shall specify the nature of traffic for which the Tramways are sanctioned—(*The Chairman*).

Resolved, That the maximum tolls to be inserted in the Provisional Orders—(*The Chairman*).

Motion made, and Question proposed, That the Metropolitan Board be the local authority for the Metropolis (except the City), but the consent of the Vestries be necessary as road authorities, subject to Resolution 4—(*The Chairman*).—Amendment proposed, to leave out from the word "That" to the end of the Question, in order to add the words "the Metropolis be excluded from the operation of the Act"—(Mr. *Sclater-Booth*),—instead thereof.—Question put, That the words proposed to be left out stand part of the Question.—The Committee divided:

Ayes, 3.	Noes, 3.
Colonel Wilson Patten.	Mr. Sclater-Booth.
Mr. Loch.	Mr. Dent.
Mr. Dalglish.	Lord George Hamilton.

Whereupon the Chairman declared himself with the Ayes.—Main Question put, and *agreed to.*

Motion made, and Question put, That in the case of the Metropolis the power of the local authority be limited to the second alternative in Clause 4 of the Bill—(Mr. *Sclater-Booth*).—The Committee divided:

Ayes, 3.	Noes, 3.
Mr. Sclater-Booth.	Colonel Wilson Patten.
Mr. Dent.	Lord George Hamilton.
Mr. Loch.	Mr. Dalglish.

Whereupon the Chairman declared himself with the Noes.

Resolved, That a *locus standi* be reserved for the owners and occupiers of property fronting a street or road through which it is proposed to construct a Tramway, to appear both before referee and afterwards before Parliament—(Mr. *Sclater-Booth*).

Resolved, That power be given to local authorities to make bye-laws for regulation of traffic, and for licensing drivers and conductors of vehicles—(Mr. *Dent*).

Resolved, That power be given to local authorities to remove Tramways found injurious or disused—(Mr. *Dent*).

Motion made, and Question, That the rules for carrying the Act into effect be inserted in the Schedule to the Act—(Mr. *Dent*)—put, and *negatived.*

Resolved, That the Bill be extended to Scotland—(*The Chairman*).

[Adjourned till Monday, 25th April, at Two o'clock.

Monday, 25*th April* 1870.

MEMBERS PRESENT:

Mr. Shaw Lefevre, in the Chair.

Mr. Loch.	Mr. Dent.
Mr. Sclater-Booth.	Lord George Hamilton.
Mr. Dalglish.	

Preamble postponed.

The Committee proceeded to consider the Clauses.

Several Clauses amended, and *agreed to.*

[Adjourned till Thursday next, at Twelve o'clock.

Thursday, 28*th April* 1870.

MEMBERS PRESENT:

Mr. Shaw Lefevre, in the Chair.

Mr. Dalglish.	Lord George Hamilton.
Mr. Dent.	Mr. Hibbert.
Mr. Cawley.	

Clauses considered, amended, and *agreed to.*

[Adjourned till To-morrow, at Twelve o'clock.

Friday, 29*th April* 1870.

MEMBERS PRESENT:

Mr. Shaw Lefevre, in the Chair.

Mr. Dalglish.	Lord George Hamilton.
Mr. Dent.	Mr. Hibbert.
Mr. Loch.	Mr. Cawley.
Mr. Sclater-Booth.	

Clauses further considered, amended, and *agreed to.*

New Clauses *added.*

Schedules considered, amended, and *agreed to.*

Preamble *agreed to.*

Ordered, to report the Bill, as amended, together with the Minutes of Evidence, to The House.

MINUTES OF EVIDENCE.

LIST OF WITNESSES.

MINUTES OF EVIDENCE.

Tuesday, 29th March 1870.

MEMBERS PRESENT:

Mr. Ayrton.	Mr. Hibbert.
Mr. Cawley.	Mr. Shaw Lefevre.
Mr. Dalglish.	Mr. Loch.
Mr. Dent.	Mr. Sclater-Booth.
Lord George Hamilton.	Colonel Wilson Patten.

G. J. S. LEFEVRE, Esq., IN THE CHAIR.

Mr. *Thomas Coates*, called in; and Examined by Mr. *Round*.

Mr. *T. Coates.*

29 March 1870.

1. I BELIEVE this Bill, as brought in in the House, was placed in your hands by certain clients, amongst them the Railway Companies whom I represent, for the purpose of going through it, and seeing whether it was a workable Bill in the first instance?—It was.

2. The Bill as drawn involves a very large and important principle, does it not?—Yes, it does.

3. To which principle, I believe, you do not accede?—Those who instruct me do not accede to that principle.

4. It is with a view of laying down in this Bill a principle, which you believe will commend itself to this Committee, that you have gone through it carefully and altered it?—Yes.

5. May I ask you whether the alterations which you propose in the Bill range themselves principally under four marked and distinct heads?—They do.

6. Is the guiding principle throughout the substitution of the principle which is recognised in the Piers and Harbours Act of 1861, for that of a certificate as proposed by the Bill?—That is one.

7. Is another of the principles which you propose, that the proceedings under the Bill should be defined and settled beforehand, and not left to be decided upon afterwards?—That is one of the objects that I have in view.

8. Is a third object that of giving every possible publicity to the proceedings so as to bring them to the knowledge of every party affected by it?—Yes; I thought that the arrangement proposed by the Bill did not give an opportunity to parties to be heard, and I have amended the Bill to the best of my ability in that respect.

9. Then, may I add a fourth power which will comprise them, which is, whereas the Bill gives the certificate an absolute statutory effect, you by the Bill, as you propose to amend it, give an appeal to Parliament?—In short, that is involved in the substitution of a provisional order for a certificate.

10. Those are four points to which you have principally had your attention drawn, and they have guided you throughout the alterations you have made in this Bill?—Just so.

11. Now, I will take you through it, and you shall explain your alterations to the Committee; what is the first alteration that you propose?—In the first clause I propose no alteration nor in the second clause. In the third clause, at

Mr. *T. Coates.*
29 March 1870.

the end of the page in the original Bill, it runs thus: "The terms prescribed shall mean prescribed by any rules made in pursuance of this Act." I have altered that: "The term prescribed shall mean prescribed by the regulations contained in the second schedule to this Act." Then, in the subsequent part of the Act rules are to be made by the Board of Trade, which they may from time to time vary or annul as they think fit, and those are the rules which are implied by the word "prescribed."

12. Mr. *Loch.*] Where are you now referring to?—If you will be kind enough to look at page 21, Clause 53, you will see these words: "The Board of Trade may from time to time make, and when made, may rescind, annul, or add to rules with respect to the following matters" (perhaps it is worth while to read this clause): "The proceedings to be had before the Board under this Act. 2. The forms of certificates under this Act, and directions as to the mode in which this Act is to be carried into execution. 3. The mode of holding meetings for the purpose of obtaining the consent of owners and ratepayers to applications for a certificate under this Act. 4. The payment of money or lodgment of securities by way of deposits; the repayment and forfeiture of the same, the investment of the same, the amount and payment of interest or dividends from time to time accruing due on such deposits. 5. The services of notices, the lodgment of documents, and any other matter by this Act directed to be prescribed. 6. As to any other matter or thing, whether similar or not to those above mentioned, in respect of which it may be expedient to make rules for the purpose of carrying this Act into execution. Any rules made in pursuance of this section shall be deemed to be within the powers conferred by this Act, and shall be of the same force as if enacted in this Act, and shall be judicially noticed. Any rules made in pursuance of this section shall be laid before Parliament within three weeks after they are made, if Parliament be then sitting, and if Parliament be not then sitting, within three weeks after the beginning of the then next Session of Parliament." Practically I know that this is a very inconvenient process. The practitioner seeking to get one of these provisional orders or certificates does not know by what rules he is to abide, but must go to the Board of Trade to know what the rules are at that moment applicable to this purpose; whereas, supposing these rules are, which they may perfectly well be, now prepared under the direction of the Board of Trade, they may form part of the Act or be scheduled to the Act, as in certain analogous cases they do form part of the Acts. Therefore the correction that I make here is this: "The term 'prescribed' shall mean prescribed by the regulations contained in the second schedule to this Act."

13. In what analogous cases is that course followed?—In the Railways Construction Facilities Act; I am pretty nearly sure that the regulations are all prescribed in a schedule to that Act.

14. Mr. *Sclater-Booth.*] I do not see a schedule proposed to this Act?—No; I do not presume to create the regulations which the Board of Trade should prescribe; all I desire is that the Board of Trade before they proceed with the Bill shall make those regulations.

15. Mr. *Round.*] So that they shall be made beforehand in order that those interested may know what they are?—In order that the persons interested may know what the Bill consists of.

16. Mr. *Dent.*] You do not provide for any variation of circumstances which may arise?—They are not likely to arise within 12 months; at all events there will be the experience of 12 months. If a variation of circumstances does arise, nothing can be more easy than in one comprehensive Act or Provisional Order, to do as has been done in previous Acts, make some alteration to the regulations by the Board of Trade; at all events, then the persons interested (and I need scarcely say that they represent very large interests) will have statutory notice of the laws by which they are bound.

17. But cannot a comprehensive Act be passed which would contain clauses affecting the regulations?—I do not mean to say that it is perfectly right that it should be done, but boards of health over and over again have got powers confirmed by Provisional Orders. I do not think that is a good process, but it has been done over and over again.

18. Mr. *Cawley.*] I understand you to mean that all regulations which will be general in their effect, should be prescribed by the Act?—Just so.

19. And if there are any others which are special, they should be excepted, but

but all which have general application should be in the Act itself?—That is a very vague word; I mean all that is fundamental, and which will apply to every case, ought to form part of the Statute.

20. Mr. *Round.*] Having prescribed so far as you can with certainty, would there be any objection to give the Board of Trade a discretionary power to make from time to time such additional regulations as they may think proper?—Anything which goes to the rights of parties (and amongst those rights is the right to be heard), I think the Board of Trade ought to have no discretionary power at all.

21. That should be one of the fixed rules from which there should be no departure?—Yes.

22. Will you now proceed to your next alteration?—In the next clause is involved a considerable principle. I strike out the word "certificate," and put in the words "provisional order," and, of course, all the subsequent clauses will be amended in that respect. I do not know whether the Committee desire to hear me upon the expediency of that alteration; but the Bill is founded on this hypothesis, that there shall be an inquiry before a referee, which I take to be always a local inquiry; that the referee shall hear, according to the Bill, such parties (which is somewhat indefinite) whom he shall hear, but he may call before him such parties as he thinks fit, and then he is to report to the Board of Trade; and, according to the Bill as it is now drawn, the Board of Trade has absolute authority of hearing, or not hearing the parties, and to issue a certificate that the tramway may be made; that certificate is to lay upon the Table of both Houses of Parliament, and, if neither House objects to the certificate, then the certificate has the force of law. The result is this (and when I talk about the result, I hope the Committee will understand that, according to my experience, neither House of Parliament ever objects to such a certificate; it does not move in the matter at all), that the certificate has the force of law. That seems to me unfair to all parties interested, and the alterations that I have taken the liberty of making in this Bill go first to this: that the inquiry shall be made under closer restrictions than the Bill has provided; next, the referree having made his report to the Board of Trade, the Board of Trade shall make what is called a Provisional Order, a thing known in all the Public Health Acts, and known likewise in certain of the proceedings of the Board of Trade; shall come to Parliament for a confirmation of those Provisional Orders according to the Harbours and Piers Act, and according to the Public Health Acts. Likewise any person aggrieved by those Provisional Orders should have a right to petition against them as they would against a Private Bill. I may go on to say that the practical result is this: a Provisional Order is very seldom objected to, although sometimes it is; and, according to my experience, although objections to a Provisional Order are rare, yet when they have been made they have usually been successful. It seems to me that in these great interests Parliament ought to have a voice, and persons ought to have a right to appeal to Parliament against any grievance that they may have by the proposed Provisional Orders. The Bill is amended throughout upon this hypothesis, namely, that the ultimate appeal should be to Parliament. If any persons think fit to appeal against a Provisional Order, they should be at liberty to appeal to Parliament.

23. The section seems to be this, that under a Provisional Order one has no statutory effect until after the other practically may be said to have a statutory effect?—Just so; that is the distinction. The 5th clause is this: "The Promoters empowered by any certificate under this Act to make a tramway in any district may, where they are the local authority, and where they are not any such authority, they may, with the consent of the local authority, within two years from the date of the certificate, unless a shorter period is prescribed therein, sell, transfer, and assign to any corporation, company, persons or person, the right to make such tramway, and all other rights, powers, and authorities given by the certificate; and thereupon all such rights, powers, and authorities shall be transferred to, vested in, and may be exercised by such corporation, company, persons or person, as if they had been the Promoters specified in such certificate; and they shall for the purposes of this Act be deemed to be the Promoters: Provided always, that such sale shall not be made without the consent, in writing, of the Board of Trade." The railway companies object to that (and, since I happen to be here,

Mr. *T. Coates.*

29 March 1870.

I may as well state that this is objected to in other quarters), because, in principle, it is an utterly mischievous provision. It will necessarily almost have this effect, or, if it has not, it will be what is equally bad, suspected of having this effect: A. gets a Provisional Order, and what is in this Act called a certificate, from the Board of Trade to make a tramway, which becomes in his hand a marketable commodity; he may go, within two years, and sell it. Fortunately, in this country such a thing is not known, but abroad it is perfectly well known, that persons who are suspected of having influence with the department in question get a concession, as it is there called; whether you call it a concession or a certificate is a matter of perfect indifference; having that influence, and having obtained that concession, they sell the concession to somebody else at a profit. What justification there is for the clause I cannot very easily conceive. I do not know why this clause was put in; that it is mischievous I am perfectly satisfied of; that it may lead to abuse is manifest; that it will always be suspected of abuse is still more manifest. Therefore, in the interest of the Railway Companies who have petitioned against the Bill, and in the interests of certain other clients, who have also petitioned against it, I have taken the liberty of suggesting that this 5th clause should be struck out.

23*. Is it not also at variance with the principle that is laid down in the 157th Order of this House, which says that no power of purchase, sale, lease, or amalgamation shall be contained in any Bill for the construction of a railway?—Quite so.

24. Prior to this Standing Order it was not unusual to introduce into a Bill authorising the construction of a railway power to lease it?—Quite so, and to sell it.

25. That was not found to work well?—It was found rife with mischief.

26. And it was to prevent that mischief that this Standing Order was specially passed?—It was.

27. Is not the provision in the Bill to which you are referring precisely analagous to such cases as are provided for by this Standing Order?—Yes, it is; the purchaser is unknown, his competence is unknown, and whereas the power, if vested in the hands to whom it was originally granted, might have been relied on with security. I do not mean pecuniary security, but the safety of all parties concerned; yet during two years it may not be known to whom it may be given, and if it be given it is highly objectionable to all those who are affected by the tramway.

28. To whom *non constat* it would not have been granted if they had been the first Promoters?—No, that is, I think, by the two last lines of the clause somewhat secured. I now proceed to touch upon a very delicate matter. The last two lines of the clause say, "Provided always that such sale shall not be made without the consent in writing of the Board of Trade." I hope nothing I may say will be deemed to be disrespectful, because I have no other desire than to make the Bill as good as possible; those two last lines rather aggravate the matter. Supposing it to be suspected, which will ultimately be suspected, that the Board of Trade, which has originally granted the certificate or granted the concession, for so I call it, is to have a voice likewise in the transfer of the concession, it seems to me so far from mitigating the evil to aggravate the evil, in one point of view, at all events.

29. Colonel *Wilson Patten.*] You are aware, I presume, that the object of the Standing Order which you have referred to, was to prevent a monopoly of railways, was it not?—So far as I recollect that was so. I recollect the passing of that Standing Order, and what I understood by that Standing Order was this, at any rate it had this effect, adventurers got Acts of Parliament which were mischievous, perhaps, to existing companies; they forthwith carried them to the company and said, "Here are these powers; we will execute them unless you give us so many thousand pounds." That was one of the evils intended to be prevented.

30. Was not the main object to obviate the evil that was found to exist before the passing of that Standing Order, that companies having the power of sale were selling themselves to railway companies, and thereby creating a monopoly against the public interests?—No, I think not; this Standing Order relates only to the inception of the Bill incorporating the company. The Act incorporating the company prevents the sales, under the power of that Act, to any other company; but that would not have had the effect which, I think, you are touching upon.

upon. In short, the parties representing the company would have come themselves for such powers.

31. Did not Parliament, in passing that Standing Order, determine to reserve to itself the power of saying whether a company should be amalgamated with another company or not?—Certainly.

32. Mr. *Round.*] Apart from the evil which you have pointed out, is there any advantage in giving the Board of Trade these powers?—I cannot understand the advantage of granting them these powers at all. I can see how largely they may be abused; but I cannot understand that persons obtaining these concessions should, within two years, desire to divest themselves of them, excepting for a profit, and that, to my mind, is an illegitimate source of profit.

33. You see no advantage to counterbalance the actual evil which you anticipate will follow upon it?—None.

34. Now I think we may turn to page 3. In Clause 7 you strike out from line 15 to line 21?—Yes. The first part of Clause 7 is as follows: "When a tramway has been completed under the authority of a certificate under this Act by any local authority, such authority may, with the consent of the Board of Trade, and subject to the provisions of this Act, by lease, demise to any person, persons, corporation, or company the right of user by such person, persons, corporation, or company of the tramway, and of demanding and taking in respect of the same the tolls and charges authorised." Now, what is felt concerning this clause is this: the local authority abstractedly, supposing they had the money, would, I take it, undoubtedly be the proper persons to lay down these tramways themselves, the custody of the streets being in them, indeed what is termed the property in the streets being in them; therefore, unless for the sake of obtaining capital, that is to say, saving the money of the ratepayers, there can be no apology for their divesting themselves of any authority, or any property in the streets, but it is their duty, consistently with the state of their funds, to make the streets as convenient as possible to the public using them; if, therefore, they undertake to make a tramway, there seems to be no apology for their letting that tramway to somebody else to work, that is to say, to spend the money of the ratepayers, to spend capital in laying down the tramway, and then to get a rent out of the use of the streets which the ratepayers have already formed for themselves. If they are the promoters, as it is technically called here, and sell the property, then they should make the tramway for the benefit of the public, whom they represent, they having the streets themselves. As it appears to those who instruct me, they would be violating their duty if unnecessarily they part with their control over the streets; they may necessarily do it, if they have not got the funds to make the tramway, then they may hand the streets over to some one else, who has the funds for a limited time, but to abandon the making of the tramway, or leaving the absolute use of the streets to somebody else, seems to me to be a violation of principle.

35. The power of leasing is not to arise until the Board of Health have completed the tramway, but the ratepayers would, after all, I presume, be mainly interested in the work of it?—Undoubtedly.

36. If it is worked, the Board of Health would have no other interest to represent but that of the ratepayers?—No.

37. Then I understand you to say, that if the ratepayers have a certain guarantee, that it will be properly worked, it will not be an inconvenience to them?—Just so.

38. But whereas if it were handed over to A., B., and C., as a commercial speculation, there would not be the same principle applied to them in the working of it, as there would be to the local board of health?—No; it has this disadvantage likewise, that it makes the local authority speculators in these tramways, that is to say, by investing capital raised out of rates, or borrowed on the security of rates, in the construction of tramways. That is a speculation in tramways which, it appears to me, a local authority ought never to be permitted to embark in.

39. That is going into a speculation as distinct from providing tramways for their legitimate purpose?—Yes.

40. Mr. *Dent.*] Surely if the local authority have made a line, and have laid it down, supposing they have not capital enough, or do not think it right to raise capital for carriages and rolling stock, you do not see any objection to their granting a lease to a company to work it; could they not keep the company in

Mr. *T. Coates.*

29 March 1870.

better order, and have the traffic better regulated by so doing, than they could by leaving it open to the public to use it with the power of charging and taking tolls?—I admit that leaving it open to be used is a separate question; but the capital required for working cannot be very considerable; it must be nothing in comparison with the original capital required for the construction. The capital required for the construction will, according to the supposition, be found by the local authority, and after having spent their money upon the construction, then they enter into the speculation of letting the tramway upon lease, and part with the control of the streets, not because they have not capital enough to make the tramway, but simply because they have not capital enough to provide horses and carriages.

41. It seems to me, that it might be perfectly legitimate for the public authority to make a tramway in the direction that they thought for the benefit of the public, and still keep the control of the streets, but it may be quite another question, whether they should be carriers of passengers, and compete with the omnibus traffic, or whether that would not be much better done by a public company?—Yes, I admit that is an important question. The question does, to my mind, consist mainly in this, whether they should be allowed to be speculators by having omnibuses, carriages, and so on.

42. Mr. *Hibbert.*] Would not your objection, to some extent, cease, if it were done with the consent of the ratepayers?—It might.

43. Mr. *Cawley.*] There are two points to be considered: one is, whether only special carriages can go upon the tramway, and the other is, with reference to leaving the tramway open to only a certain portion of the public, who may choose to use a particular kind of carriage; I wish to know whether you mean, that it really should be worked entirely by the local authority who are to provide carriages, or whether you mean that it should not be a simple and exclusive use by one particular party, but that anybody providing the carriages, whether under lease or not, should be at liberty to work it?—Quite so; I am of opinion that the local authority should grant licenses under some such control as the Bill may provide, or the local authorities may themselves provide, for the use of their own local conveyances.

44. You do not wish the Committee to understand, that, in your opinion, the preferable course would be that the local authorities should become the sole owners of the carriages to be worked upon it?—No, not the sole owners of the carriages, undoubtedly, but that they should be the sole owners of the tramways, if they have capital enough to construct a tramway; but, with respect to the carriages, that the tramways should be open to everybody, in conformity with the regulations.

45. Lord *George Hamilton.*] Do you object to the principle contained in this clause, of giving the local authority the power of leasing?—Just so.

46. In objecting to that principle do you consider that in this clause the interests of the ratepayers are not sufficiently protected to prevent the local authority, whoever they may be, from speculating?—I think to. I think that the one is in some sort a result of the other. I think that the local authority having, with the consent of the ratepayers, which is provided for, constructed the tramway, that then the leasing of it to an individual, which is giving the benefit of it to an individual, is, first of all, in principle inexpedient, and, next, that there is not a sufficient security, nor is there, in this clause, any security to the ratepayers themselves.

47. Mr. *Loch.*] Then you do not object to the construction originally by the local authority of the tramway, but that having constructed it, they should lease it to some particular company or individual?—That is my objection.

48. If they were to be thrown open to public use, you think that might be a very legitimate operation?—Yes, that is to say, whereas paving is the best thing we have got at yet for streets, if tramways are a better thing for streets, then let the local authority construct tramways, and open them for the use of the public.

49. Mr. *Sclater-Booth.*] Do you think it is practically inconvenient with a flange-wheel to be made use by the whole of the public?—Even the Bill contemplates that there shall be licenses in certain cases of misfeasance of the proprietors or lessees to any body, under certain circumstances, to use the tramways.

50. That would be in lieu of the promoters, I presume?—In place of the promoters. Then there may be any number of them. It is not that there is to be only

only one license, but, according to the arrangement of the Bill, there may be as many licenses as the Board of Trade think fit to grant.

51. Anybody working it except by license implies that the party granting the license will secure what is practically a monopoly?—I very much doubt whether, supposing these things prevail, that will be so. For instance, at Manchester, which is represented here, my belief is that there will be numbers of persons, unless there be a statutory monopoly, who will use these tramways upon paying tolls for them.

52. Do you consider it consistent with public safety that there should be a power in the ratepayers to make use of tramways, irrespective of any system of licensing, which should secure due order and regularity in the passage of the cars?—It should be worked by horse power. Whether they can be worked at all in crowded towns is a question to which I am not in anywise pledged; my own private conviction is, that they cannot be made to work; but I go upon the hypothesis that there will be tramways even, for instance, in Manchester and in London. My belief is, that if there are such tramways they will be worked, and must be worked, in certain places, especially for heavy traffic, and not for passenger traffic.

53. Are you not aware that the Tramway Bills which have already passed through Parliament have contemplated the substitution of trams for omnibuses, but have not contemplated making use of the rails for the passage of coals or heavy traffic?—I am perfectly aware of that.

54. Your intention in making this suggestion, with regard to the local authorities allowing a tramway to be for the use of the public, is merely to imply that the tramway is to be used for the carriage of coals, goods, and so on?—Yes.

55. That is a different sort of tramway from that which any parties have yet been found to promote in Parliament?—You will observe that I have adopted this from the Bill; it is not my suggestion, it is in the Bill. I have only struck out the power of leasing; the rest is in the Bill.

56. That is a very proper answer for you to make, but might it not be said that it will be a new kind of proposal?—Perfectly; but it is a thing which the Bill suggests, and not I.

57. It does not seem to me how you can complete your plan for a re-casting of the Bill before the Committee, unless you provide a schedule which you would suggest in lieu of Clause 53, which you propose to strike out?—I would rather leave it to the learned Counsel who drew the Bill to prepare it, but I could do it.

58. You have made no difficulty in striking out Clause 53?—I have had no difficulty in striking out that which says that regulations shall, at some future time, be made, they being now unknown. All I have done in striking it out is to say that they shall be prescribed.

59. Supposing, after you have left the box, the learned Counsel who has prepared this Bill should propose a schedule which in your opinion is unworkable and unsatisfactory, are the Committee to go through the whole of this inquiry again?—For my own sake, as well as for the sake of the Committee, I trust that this will be a closing examination on my part.

60. *Chairman.*] I understand you do not object to the local authorities making tramways?—It is a thing beyond my sphere.

61. You have not struck out that portion of the Bill in your proposals?—No; I have dealt with the Bill on this hypothesis, that there ought to be tramways; that I have done in deference to the will of the Committee. Then, with a view to the security of my clients, I have made certain amendments founded on that hypothesis.

62. Accepting as a basis that the local authorities will make tramways in certain cases?—That the local authorities, or the promoters, or somebody or other shall make them, but that is a matter beyond my sphere.

63. Having made them, that they shall have the right of charging toll to the persons using them?—Until a certain time; until they they have paid off their money.

64. Until they have paid off their money they are to be at liberty to charge toll to the persons using them?—Yes; in short, I find that in the Bill. The companies who n I have the honour to represent, deal with that as a thing concluded; they do not deal with the propriety of the tramway; with what is

Mr. *T. Coates.*

29 March 1870.

vaguely and loosely called the principle of the tramway, they do not deal with that at all; that I understand they assume.

65. What you object to is this, that a local authority having made a tramway, that it should then be handed over by lease or otherwise to any private company to use exclusively?—Yes.

66. Have you taken into consideration Clause 25, which gives power to the Board of Trade, even when a lease or concession is made to any private company, still under certain circumstances to provide that third parties shall use the tramway?—Clause 25 is the clause with respect to leasing, that I have not even touched.

67. Does not proposing that clause somewhat mitigate your objection to the local authority making leases of tramways when once they have made them?—No. As I read the 25th clause, it provides for some misfeasance on the part of the promoters or the lessees; that is the object of the 25th clause. I think there ought to be a remedy, and that somebody or other ought equally to be able to make use of this undertaking which, according to the 25th clause, will have been leased.

68. I only want to get at your objection to the Bill as it stands; do you object to the local authority having made the tramway themselves, parting with the control of it?—Yes.

69. Mr. *Hibbert.*] Is not the real ground of your objection, that the local authority have made a tramway with the consent of the ratepayers for one purpose, should under this clause have power to lease it without the consent of the ratepayers for another purpose?—That is one of our objections to the Bill.

70. Mr. *Round.*] We are indifferent as to whether the local board may do it or not?—Yes.

71. Then we will proceed to the next; I think, in Clause 8, the alterations are merely of a formal character?—Yes.

72. But for Clause 9 you propose to substitute 8A, and 8B?—The alterations in Clause 8 all go to having regulations prescribed by the Act.

73. Mr. *Loch.*] You strike out these words in Clause 8, line 10, "and to such extent as shall seem to them sufficient"?—Yes; there is an important alteration in this clause. They may apply to the Board of Trade for a Provisional Order, and then they shall within the prescribed time in the prescribed manner, that is, in the manner prescribed by the Bill, deposit at the prescribed place maps, plans, sections, and so forth. And then they shall publish a notice of the application in the prescribed manner. That, I presume, will be in the schedule of the Bill. "And thereupon the Board of Trade shall" (this is an important alteration); in the text it stood thus: "in such manner and to such extent as shall seem to them sufficient to inquire whether the promoters have duly complied with the requirements of the Act." That, I beg leave humbly to say, seems certainly a loose method of dealing with very great interests, and what I propose to insert in substitution there is this: "And thereupon the Board of Trade shall, in the prescribed manner, inquire whether the promoters have duly complied with the requirements of this Act," and so on. The Board of Trade shall state in a schedule to the Act what the conditions they require are.

74. Mr. *Round.*] Let me ask you, with reference to that, whether that is one of the main objections you make with regard to the rules and regulations, that there is a large discretion proposed by the Bill to be conferred upon the Board of Trade; that they are to be the judges as to the manner and extent to which the inquiry shall extend?—Yes.

75. You omit them altogether?—Yes.

76. When we come to consider Clause 52, you will explain to the Committee what you propose instead, by which their discretion is limited and their sphere of inquiry enlarged; is not that so?—Yes

77. What is the next alteration to which you propose to refer?—By Clause 9, the Board of Trade are to settle the certificates which are to be laid before both Houses of Parliament.

78. You propose that the whole of the clause shall come out?—Yes. This is Clause 9: "The Board of Trade shall lay any draft certificate settled by them before both Houses of Parliament within seven days after the same is settled, if Parliament is then sitting, and, if not, then within seven days after the next meeting of Parliament, but not later in any year than the 1st of June. If either House of Parliament, within six weeks after such draft certificate is laid before

that

that House, resolves that such certificate ought not to be made, the same shall not be further proceeded with. If neither House of Parliament, within the period aforesaid, thinks fit to resolve that the certificate ought not to be made, then the Board of Trade may make and issue a certificate in conformity with such draft." That I propose to show you is a clause which is contained in the Harbours, Docks, and Piers Act.

79. *Chairman.*] With the view of substituting the Provisional Order system for the Certificate system?—Yes; the Committee may take it for granted that I have copied the clauses right.

80. I think we need not labour those points; what we understand is, that what you propose to substitute for the Certificate system is the Provisional Order system, and that you have inserted all the amendments which you have considered necessary for that purpose?—Yes. In Clause 10 that is the only alteration; in Clause 11 there is no alteration; in Clause 12 what I have struck out will be dependent upon other things. Then, in Clause 13 there is the same thing, namely, that the Certificate is amended by substituting the words, "Provisional Order." Then the power to correct error in the 14th clause is left untouched. Not in the interests of those whom I represent, but in the interests of the promoters of the Bill, may I point out a deficiency in the 15th clause? It says, "Where the local authority in any district are the Promoters of any tramway authorised by Certificate under this Act they shall pay all expenses incurred by them in carrying the purposes of this Provisional Order" (as I have altered it) "out of the local rate." It ought to go a little further; it ought to say, "in applying for and carrying into effect."

81. Mr. *Round.*] I see you prescribe a uniform gauge of 4 feet 8½ inches?—I believe that the Railway Company are very desirous that this amendment should be made. I am perfectly well aware, and indeed I know an instance where it is about to happen, that carriages may be so constructed for a railway as that they shall carry on passengers to particular tramways without getting out of the railway carriages; there is a Bill for that purpose before Parliament. Anybody knowing the Isle of Wight is aware that the railway is about a mile from the southern end of Ryde Pier. The proposal is to have a tramway working between those two points by horse power, for the security of the streets of Ryde, but that the carriages of the Isle of Wight Railway shall go along the tramway right from the end of the pier.

82. *Chairman.*] You think the interests of the railway companies is involved in having an identity of gauge?—Yes.

83. Mr. *Sclater-Booth.*] How many feet wide were the tramways which were sanctioned last year?—I am told that the width of them is the railway narrow gauge.

84. Mr. *Cawley.*] Would not that be met by a Provisional Order that the tramway may be worked in connection with the railway?—It might be.

85. Mr. *Round.*] Is not the very object of the amendment, which you propose to supersede, the necessity for special legislation by a general Act?—Yes.

86. Mr. *Cawley.*] That raises another question as to whether or not the Bill should make it imperative to use a particular class of trams?—I believe there is scarcely anything in Part 2 which relates to the construction of the tramways from beginning to end. All those matters were carefully considered.

87. Mr. *Round.*] I think you may pass on to Clause 22, to which you have added Clause 22 A, with reference to railway bridges, in order to give railway companies additional protection; see what Clause 22 does provide for, and that will lead up to what 22 A provides?—The whole of this is with respect to the construction of railways. First of all it protects the street authorities; in short, these clauses are copied, I believe, precisely from other Acts. In Clause 20, there is a provision as to gas and water companies. Clause 21 is with reference to the protection of sewers. I need not trouble the Committee with all that; we think that there ought to be some such provision as this: "The Promoters shall not execute any works affecting any railway, or the bridges or works connected therewith, excepting under the superintendence and to the reasonable satisfaction of the engineer of such railway, and according to plans and specifications previously approved by him." Then there is a general Arbitration Clause.

88. *Chairman.*] That does not make their consent absolutely necessary, but merely that reasonable satisfaction shall be given?—Yes.

Mr. *T. Coates.*

29 March 1870.

89. Mr. *Round.*] Is it not precisely the clause which is inserted in a Bill where one railway company makes a junction with another, namely, that the junction is always made to the satisfaction of the engineer of the company with whose line the junction is proposed to be made?—Precisely so; then, as to the carriages, we have not presumed to touch those at all, nor the license to use carriages for the reasonable use of the tramways. There is a proviso to Clause 31, which, perhaps, I had better read: "The Promoters on the one hand, and any company or any corporation or person on the other hand, from time to time may, subject to the provisions of this Act, enter into and carry into effect contracts, agreements, and arrangements for or with reference to the use by such company, or by such corporation, or person, of their tramway" (this is a very important matter), "or any part thereof, and the tolls, rates, and charges to be paid by such company, corporation, or person to the Promoters for such use, and the terms and conditions of such user, and all incidental matters." The result of the clause, as it now stands, will be that a preference may be given to some particular body, or company, or person; for instance, there may be three railway companies in any particular part of a town, one of whom may enter into an agreement with the promoters to the exclusion of the other two, which would be a manifest abuse. For the purpose of preventing that it is proposed to insert this proviso, which I will take the liberty of reading, "Provided that the Promoters shall not by any such contract, agreement, or arrangement, give to the other contracting party any exclusive use of the tramway, but they shall make similar contracts and arrangements with any other company, corporations, or person in like circumstance requiring the same; and if any question arises between the Promoters and the party demanding that such similar contract should be made as to the duty of the Promoters to enter into the same, or as to the terms, pecuniary and otherwise, of such contract, such question shall be settled by an arbitrator to be agreed on between them, or in default of agreement to be nominated on the application of either party to the Board of Trade." I take it that there can be no objection to that.

90. That is providing, in fact, for equality of treatment?—Yes.

91. Will you allow me to go back for a moment to Clause 25, where, I think, in order to make the Bill in conformity with what you stated before, the words "or their lessees" should be struck out?—No; I would rather leave them in.

92. Very well, then, I suppose there is some object for them which I do not at present see; to this last substantive clause which you propose you attach considerable importance?—The clause, as to equality of treatment, I have no doubt, is a clause of the highest importance. Take Manchester, for instance. The promoters may come up to the stations of two or three separate and rival railway companies, and may give the priority of the use of their tramway, and may make a contract with one of those railway companies to the exclusion of the other two. That would be manifestly an abuse. All that the clause goes to is, that all parties similarly circumstanced shall have the same right to contract. For instance, if the North Western, the Midland, or the Lancashire and Yorkshire, all of whom are here represented, are in the same town, the promoters shall not be able to make an agreement with the Lancashire and Yorkshire to the exclusion of the London and North Western, for the use of their tramway; but that, if they make an agreement with the one, they shall make an agreement precisely, or as nearly as possible, of the same sort with the others, it being left to an arbitrator to determine what the particular terms shall be.

93. Mr. *Loch.*] Might not this difficulty naturally arise out of your suggestion; supposing you make the gauge of your tramway 4 feet 8½ inches to correspond with the gauge of the railway, so as to admit of the railway carriages running on the tramway if they communicate with a railway station, and you are bound to make an agreement with every railway company, you might convert that which was intended to be a tramway into a continuation of a railway system, to the exclusion of the omnibus traffic which was designed to be run upon the tramway?—According to my notion these tramways are not to interfere with the movement of the omnibuses.

94. But they are intended to promote that sort of omnibus traffic in the shape of omnibuses upon wheels calculated to be drawn by horses?—Yes.

95. Upon the basis of their carrying traffic along the streets?—Yes.

96. But supposing your suggestion should be carried into effect, and these tramway companies were bound to make arrangements with other railway companies

companies who choose to enter into an arrangement with them, they might, in fact, become a continuation of railways for the conveyance of railway traffic to the exclusion of the intended omnibus traffic?—I have supposed that they make one agreement.

97. Mr. *Sclater-Booth.*] It is to be adapted for the use of all traffic?—Yes.

98. Mr. *Round.*] There is no obligation upon them to make an agreement with everybody; it only says that, "where the power has been agreed to be exercised, it may be exercised, but not exclusively"?—Yes.

99. Mr. *Sclater-Booth.*] Would not your object be fairly obtained by a clause prohibiting the company from making any agreement of the kind in cases where a conflict would be likely to arise?—I have made as little alteration in the principle of the Bill as I can. I must leave that for the Committee to determine.

100. Mr. *Loch.*] Your amendment is to this effect, provided the promoters shall not, by any such contract, agreement, or arrangement, give to the other contracting party any exclusive use of the tramway; but they shall make similar agreements with any other company requiring the same, therefore it is obligatory?—I am supposing that they have made one contract.

101. *Chairman.*] The contracting parties being of the same kind and character?—Yes, there being an identity, or at all events a sufficient similarity.

102. Mr. *Round.*] In Clause 32 you strike out in line 34 the words, "with the approval of the Board of Trade," that is with reference to the future purchase of the undertaking?—Yes; I cannot tell why the Board of Trade should have a voice in the matter. If the city of Manchester, for instance, thinks fit to buy the tramways within the city with the consent of the citizens of Manchester, I do not exactly understand why a department of the Government should interfere in the matter.

103. *Chairman.*] That is a matter which does not affect the railway companies particularly?—It does not. Then there is no alteration until Clause 35, which is to this effect: "The Board of Trade may nevertheless by the certificate vary the tolls, and charges, and regulations, specified in the schedule to this Act or any of them, if in any case it seems to them necessary or proper under the circumstances to do so." That I have struck out altogether, the remark which one of the honourable Members made just now bears upon this; there is this advantage in a Provisional Order, that a Provisional Order coming before Parliament to be ratified is a great deal more plastic than the certificates: by this Act coming before Parliament they may vary their tolls and charges which need not be absolutely peremptory. I do not know whether honourable Members have observed that the intention is that Schedule B. shall contain a schedule of clauses; this does not affect railway companies, but it affects other clients whom I represent. Clause 41 enacts that, "if any person without lawful excuse (the proof whereof shall lie on him) wilfully does any of the following things (namely) interferes with, removes, or alters any part of a tramway, or of the works connected therewith, places or throws any stones, dirt, wood, refuse, or other material on any part of a tramway; does or causes to be done anything in such manner as to obstruct any carriage using a tramway, or to endanger the lives of persons therein or thereon." On the part of the omnibus companies I shall have hereafter to call your attention to the clause; then comes Clause 52, which is a very important clause.

104. Mr. *Round.*] Clause 52 refers to a very large question, does it not?—In point of fact everything depends upon Clause 52.

105. I believe you have a clause printed which you propose to substitute for that?—Yes. I am afraid I must trouble the Committee by reading this clause: "Every inquiry which by this Act the Board of Trade are empowered to make or direct shall be made in accordance with the following provisions: 1. The inquiry shall be held before an officer, to be appointed in that behalf by the Board, hereinafter called the referee, and whose appointment shall be by writing, which shall specify all the matters referred to him. 2. Ten days' notice at the least shall be given by the referee to the parties upon whose representation the Board of Trade shall have directed the inquiry of the time and place at which the inquiry is to be commenced." I propose to add this, and I may as well state that all these amendments which I have made have been founded on preceding Acts, with reference to an inquiry before an Inclosure Commissioner. "Notice of the inquiry shall likewise be advertised, for two consecutive weeks, of some

Mr. *T. Coates.*

29 March 1870.

newspaper circulating in the district or place to which the application relates; and it shall also be outside on the door, or other part of the town hall, vestry hall, or other place on which public notices relating to the said district or place are usually affixed"; in the Inclosure Acts it is upon the church doors, but I think there is always an objection to that; "and that the inquiries shall not be held earlier than seven days after the last advertisement of the notice, and after the same shall be so affixed." Then the clause as proposed proceeds, "The inquiry shall be commenced at the time and place so appointed, and the referee may adjourn the inquiry from time to time as may be necessary, to such time and place as he may think fit." There is absolutely nothing in this clause which gives anybody whatever a right to be heard from beginning to end. You will find afterwards that there are expressed parties, but those parties are never defined. Before I read the next alteration, perhaps I may be permitted to read Clause 4, which is printed in the Bill, "The referee by summons shall, on the application of any party to the inquiry," none being defined, "require the attendance before himself, at a time and place to be mentioned in the summons, of any person to be examined as a witness before him," and so on. And then it proceeds to say that he may administer oaths, and so on, and inflict a penalty if a witness does not attend. It no doubt is an accidental omission in the Bill, and I have taken the liberty of amending it thus: "The following parties (that is taking the expression in the Bill) shall have a right to be heard before the referee."

106. *Chairman.*] Is this on the supposition that the Provisional Order is substituted for a certificate?—Yes; at all events there being a Provisional Order, there is a preliminary inquiry, as there is in the case of all Provisional Orders under the Public Health Act, not only the Piers and Harbours Act, unless the Board of Trade think fit. The Board of Trade may send a referee to the spot if they think fit.

107. The Board of Trade is not obliged to hold a public inquiry?—No, but it usually does. I know of no instance in which a Provisional Order has been made for a pier or dock without a preliminary inquiry. Of course there may have been such instances, but I do not know of them. There is this difference, that it is something made by the desire of the landowner on his own land. Certainly, under the Public Health Acts, there is always a preliminary inquiry. What I propose is: "The following parties shall, among others, have a right to to be heard before the referee, namely, all the railway companies on the ground their access to their stations may be interrupted by the proposed tramway, or that the proposed tramway establishes an unfair competition with them, that it will interfere physically with their railway or works, or on any other ground of injury." If the Committee will bear with me I will state what the justification for that is. There are tramways, for instance, at Manchester, proposed by Bills now before the House. The London and North Western, and the Lancashire and Yorkshire Companies say that the construction of those tramways is incompatible (I do not say that they are right at all, I merely give it as an instance) with the access to their stations. That is a subject upon which, at all events, they ought to be heard, it being a matter of extreme importance to them. Then, again, they say that one of these tramways establishes a competition between them, for instance, between the Lancashire and Yorkshire, which has one of its termini at Manchester, and another at Bury, which is about seven or eight miles from Manchester. They say that they have constructed, at an expense of some millions of money, a line of railway between Bury and Manchester, and that a tramway will be established upon a public road, to the maintenance of which they, through the rates, are large contributors, and which will compete with them. Again, the North London Railway Company, whom I represent before this Committee, have gone to an expense of about two and a-half millions of money in the construction of a railway round the north of London; tramways may be established in competion with them, which will be of the deepest possible injury to them; at all events, they say they have a right to be heard as to the propriety of that construction, and also upon the ground of competition.

108. Mr. *Sclater-Booth.*] Does the Metropolitan Railway Company also take that view?—That is another instance, but I think the strongest instance, in fact, I know of no stronger, is the line between Bury and Manchester.

109. Can anything be stronger than the case of the Metropolitan Railway?—Certainly not

110. Mr. *Round.*] Take the North London. The object of the North London was to compete with what was essentially omnibus traffic?—Quite so.

111. They have got a large amount of capital which they have got to repay themselves before they can compete with others?—Yes.

112. Is it within your knowledge that the rates which the railway companies pay towards the repair of the roads are in some cases a very large proportion of the whole?—Yes, it is not within my own knowledge, because I have never had to pay those rates, but I have heard over and over again from railway companies that within certain districts the proportion of the rates which they pay is very large indeed.

113. As much as one-fourth of the whole, is it not?—I have heard that.

114. Then the position is this: that, whilst contributing a very large proportion towards the repair of the roads, they are by the Bill to see the roads appropriated to purposes in direct antagonism to their interests?—Quite so.

115. And a weapon put into the hands of opponents by means of the roads to which the railway companies have contributed such a large proportion of the rates?—Yes; what they ask by that amendment is, not that there shall be any prohibition or protection, but that they shall be heard before any injury shall be inflicted upon them.

116. It practically amounts to this, that at all events they shall be heard?—Yes; then I propose to add this likewise: "Owners or occupiers of property" (I mention this now because if I do not I shall have to mention it hereafter for the sake of Mr. Shoolbred and others) "who complain that the construction or use of tramways will interfere with the access to their shops or warehouses." There is a very large body represented by the owners of shop property who are affected by this Bill.

117. Then you propose a proviso to the effect that, having been heard before the referee, shall not deprive a party of his right to be heard against confirming the Provisional Order?—Clearly; I very much doubt whether there ought not to be a correlative proposition. I say, provided that the having been heard before the referee shall not deprive any party of the right to be heard on petition against the Bill for confirming the Provisional Order.

118. *Chairman.*] Do you think that after having been heard before the referee, that the parties should be allowed to be heard against the Provisional Order?—Well, candidly I ought to say, before they are heard before Parliament they ought to give notice of their objection by being heard before the referee. I think, if due notice is given of the inquiry (and this is essential), if, in short, there is no excuse for those interested saying that they did not know that anything of the sort was going on, then I do think they ought to be heard before the referee, and that they ought to be asked to be heard before the referee before they trouble Parliament with their complaint.

119. And if they have not asked to be heard before the referee that then they should be shut out from objecting to the Provisional Order afterwards?—Yes, I am sorry to make that remark on my own clients, but I think it is fitting that it should be so.

120. You do not think their interests will be sufficiently preserved by being allowed to be heard before the referee, and not heard before Parliament afterwards?—I look upon the application to Parliament for a Provisional Order as, in point of fact, asking for a registration of the referee's report.

121. Mr. *Round.*] The provision would be this, would it not, that if they do not think their interests sufficiently important to induce them to go before the referee there could be no great hardship in saying, "As you have not taken that step you shall not take the other"?—I think the promoters should have notice before the referee that they may be opposed in order that they may make their arrangements accordingly.

122. Let me ask you whether this may not apply also to it, that Parliament would be better able, in the event of an opposition to the Provisional Order being made, to decide if they know that the whole question had been ventilated before a referee, who had heard all the parties who were before Parliament?—Yes, I think from all points of view that ought to be made reciprocal.

123. Mr. *Sclater-Booth.*] But it is one thing for private parties to have the advantage of the provision which is suggested of going before a Committee of the House of Commons, and it is quite another thing for Parliament to part with its

Mr. *T. Coates.*

29 March 1870.

its powers of throwing out the Bill altogether as a public Bill?—That has been done over and over again.

124. But the Provisional Order may be thrown out on petition?—Yes.

125. You cannot exclude the possibility of the Bill being thrown out on account of any shortcomings on the part of the promoters?—It is quite true that it does seem to restrict the power of Parliament with respect to petitions.

126. But you can meet that by restricting the penalty, as it were, in the way, that you will not allow the petitioners to have the advantage of going before a Private Bill Committee unless they have been before the referee?—Quite so.

127. Supposing parties having the right of presenting a petition in one House omit to do so, and then they petition the other House praying to be heard, it is always a matter of prejudice against them that they have not gone before the other House, is it not?—That is a matter always of prejudice; both Houses have always said, "We will not be ousted of our jurisdiction because the parties have not appeared in the other House."

128. *Chairman.*] I understand from your evidence that you do not think it right that parties should be allowed to lie by and not appear before the referee, and then appear against the Provisional Order before Parliament?—That is my own private opinion, and I am instructed to express that opinion on behalf of my clients.

129. Your proposal would give them three parties before whom to be heard; first, before the referee; a second time before the House of Commons, if the Provisional Order were brought in in the House of Commons; and then, again, before the House of Lords?—Clearly.

130. You propose a preliminary inquiry before a referee?—That is the case with all Provisional Orders of the Board of Health.

131. Mr. *Round.*] You are not proposing to enlarge the scope of the inquiry which the Bill itself provides for?—I am not.

132. Mr. *Loch.*] The local inquiry is not a new principle, because in former years the same sort of thing was carried out under the Preliminary Inquries Act?—Precisely the same sort of thing.

133. *Chairman.*] Have you considered whether in the case of parties who appear before a referee, and have had their cases decided, and who then appeal to Parliament against Provisional Orders, there should be any provision as to costs?—The law now enables Committees to give costs.

134. It enables them to do so, but does not make it compulsory?—No.

135. Mr. *Round.*] They can deal with the question of costs, but they must be unanimous?—Yes; in point of fact, I can assure you that it is not such an agreeable thing to be a petitioner against a Private Bill; it has various incumbrances in the shape of expenses and otherwise attached to it. People do not come here for fun.

136. *Chairman.*] Will you now proceed with your next alteration?—I have struck out a most important matter in paragraph 8, page 21, line 6, which is, "The referee shall have power to direct by, and to whom, the costs or any part of the costs of the inquiry shall be paid." I have struck that out, because I think that is a monstrous power. The promoters come to the spot and ask for a great privilege, namely, the privilege of using the streets; I will admit for the public benefit, but, at all events, immediately for their own private emolument; and if anybody comes before the referee to object to their having this privilege, he may, for ought he knows, be mulcted in costs. That seems to me a great and very gross and manifest injustice. It is clear that people, whether right or wrong, when their property is to be affected, or when they believe their property is to be affected, ought to be able to go before the referee and mention their grievance, and that they should not do it under the dread of a threat which would be undoubtedly exaggerated by the promoters, and, for ought they know, they may have to pay the whole of the costs of the inquiry. The thing is manifestly to my mind unjust.

137. Mr. *Round.*] Suppose the case of a landowner; you are aware that under the power which Committees have to impose costs, a landowner, acting *bonâ fide*, is exempted from the operation of that power?—Quite so.

138. Might there not be many cases arising directly out of the Bill, in which landowners would be opposing parties?—Yes. Then let me come to a humbler sphere. Let me take the case of a great shopkeeper, a man who pays 300 *l.* a day in wages; he believes that the business of his shop will be suspended during the construction of the tramway, and greatly impeded, and afterwards he desires

desires to be heard before the referee. The solicitor for the promoters says to him, "You will have to pay costs, Mr. Shoolbred, if you do this." That is a threat held out over and over again to men not to maintain their rights. I say he ought not to be subjected to costs in that case: rightly or wrongly, he ought to be heard without paying his adversary's costs; it is quite enough that he should have to pay his own.

139. In any case he is subjected to great losses in his business during the time that the tramway is being constructed?—Undoubtedly. Therefore the 8th paragraph of the 52nd clause is entirely unjustifiable. Then comes the 9th paragraph, which I confess I do not understand: "The referee shall for all purposes be deemed to be an arbitrator" (I do not know what it means), "and his appointment shall be deemed to be a submission to arbitration." Between whom? "Between the parties in the inquiry in respect of the matters thereby referred to them"; I assure you I do not know what it means; "and his report shall be deemed to be and shall have the effect of, and be dealt with, as an award made upon the submission, and each such submission be made upon the application of any party interested in the inquiry and right of any of Her Majesty's Superior Courts of Law at Westminster." If anyone will tell me that that clause is here by accident, and means nothing, it will save the Committee itself a great deal of trouble.

140. Mr. *Sclater-Booth.*] You think it may mean something very mischievous?—It may probably be thought that I am disrespectful, but it is nonsense.

141. There is no definition of the word "parties" at all?—First of all there is no definition of the word "parties." Then observe this: A., B., and C. are parties to the inquiry, because they all object; but it is made a submission between them all, and amongst them it operates against A., B., and C.; in short, if you trace it out it has no meaning in it; you cannot get to the end of it.

142. The parties in the earlier part of the clause are the parties who promote the inquiry?—Quite so; the word "party," which is an important word, is by some accident not defined. If it is as between the promoters and the Board of Trade, supposing them to be parties, that is an absurd proposition. I may mean as between Her Majesty's Government and the promoters, but it can have no meaning; at least, I cannot find out any meaning.

143. The next clause is 53?—That I strike out.

144. There is an important manuscript clause printed at page 22, which will come in at line 55?—That is this: if you observe, the expenses are to be paid out of the rates, and this schedule defines what rates they are. There must be a consolidated rate for the City of London; there is the general rate, leviable under the Metropolis Local Management Act for the metropolis; then in boroughs there is the borough fund, or other property applicable to the purpose of borough rates; then any rate leviable by the Commissioners of Sewers; then the general district rate, and then there is to be the borough rate. What I propose on behalf of the railway companies is to put them, and arable land and garden ground, under the same exemption under which they are put by the Board of Health Acts, namely, that they shall only pay one-fourth of the rate for the purposes of these tramways.

145. It is generally introduced into all Board of Health Acts?—Yes.

146. You may call it stereotyped legislation, may you not?—It is stereotyped legislation for all local Acts whatever.

147. Wherever the Board of Health Act applies, this clause applies also?—Yes; it is the Local Management Act.

148. Mr. *Cawley.*] With regard to that exemption, you are aware that it only applies to certain rates; that being so, if the money is to be chargeable on the borough rate, are the companies only to have credit for the same proportion of the tolls and receipts as they now have, namely, one fourth?—I quite admit that as to the borough rate they have not an exemption, and as to the highway rate they have not an exemption; how that would be strictly, when it came out of the borough rate, is more than I at the present moment see. All I want to do is, as the French say, to consecrate the principle in the Bill.

149. If they are to be exempted from the rate they must be exempted also from the receipts and tolls as would appear to be a question of account?—By the Act there is to be a separate account kept, and that certainly facilitates the exemption.

150. Mr. *Sclater-Booth.*] I still do not know on what grounds, as you have

Mr. *T. Coates.*

29 March 1870.

suggested such extensive amendments to this Bill; in fact, you have proposed to re-cast it entirely, you have refrained from completing it by putting in the schedule, which you think would be in harmony with your views?—First, because I have not had time for it; and next, because I seriously think it would be no part of my business to interfere with the very framework and essence of the Bill in such a way as to prescribe regulations for a department of the Government to obey. If it were the wish of the Committee that I should do so, I certainly will do so, but it seems to me far better in the hands of the learned person who has drawn the Bill than in mine.

151. Mr. *Round.*] You have no desire to shirk the question in any way?—The task of making these regulations, I think, ought to be in the hands of the gentleman who has drawn the Bill. I think it would have been presumptuous in me if I had drawn these regulations.

152. Mr. *Loch.*] Do you conceive that your consideration of the case is complete until you know what the contents of that schedule will be as regards the regulations which shall be made?—Yes; all I have done hitherto has been to secure, to the best of my ability, publicity to the inquiry, so that parties interested in that inquiry may know of it, and the ultimate appeal to Parliament, supposing the Provisional Order is made.

153. *Chairman.*] You object to a certificate, such as proposed by the Bill, upon the ground that it does not give sufficient opportunity to the parties of being heard?—Certainly.

154. Supposing the Certificate system to be altered, so as to give the parties a full opportunity of being heard, do you think there would be any objection to it as compared with a Provisional Order?—Then it becomes a mere name; I am perfectly content with the name "Certificate," provided those two clauses are put in which are in the Piers and Harbours Act and in the Public Health Act, that persons petitioning Parliament against a Certificate or Provisional Order, no matter by what name it is called, should be heard as though against a private Bill.

155. I presume it rests with Parliament to lay down what rules it thinks fit, with reference to certificates, whether they shall go as a matter of course to a Committee, or whether parties should be heard or not in the same manner as in the case of Provisional Orders?—Of course I do not presume to dictate at all to Parliament; but the principle I do insist upon is, that these mighty interests which I represent shall not be dealt with by some gentleman who, from necessity, cannot be a person of eminence. You cannot get eminent men to be referees.

156. I think the only Act under which the certificate system has yet been adopted is the Railways Facilities Act, and I think that Act provides for parties being heard before Committees of the House of Commons?—I believe that is so.

157. I am referring to the existing Railway Act, under which certificates for that purpose can be given?—It seems to me that the distinction is that those Acts are with universal consent.

158. *Chairman.*] Supposing there are conflicting parties, would they not in the ordinary course be heard directly before Parliament or before a Committee?—Permit me to show you the difficulty. First of all, the case does not arise upon these two Acts, because the consent of all the landowners is at the basis of your proceedings; all the landowners must consent. But the difference between a certificate which has validity, unless objected to, and a Provisional Order which must be confirmed, and may be petitioned against, is this (I speak now of my own individual and personal experience), you cannot get a Member to deal with these certificates. Some Member who has a local interest may perhaps listen to you against the certificate, but all he will say to you is, "Well, the thing has been determined already; it is to have validity if not objected to; I cannot get the House to object to the certificate." It is a totally different thing if he who is injured has a right to petition Parliament and has a right to be heard. The one thing arises from the act of the party himself, the other thing arises from the willingness of some Member of the House to wait for the chance of the House listening to the case when he does take it up; but the hope of finding a Member to run the chance of the House listening to it, is most remote indeed.

159. Then, providing the Bill contained a clause to the effect that the parties objecting before Parliament should have a right to be heard before a Committee, and that that certificate itself should be referred to a Committee, you would not object?—No.

160. You then say that, practically, there is very little difference between the two systems, namely, a certificate and a Provisional Order?—To my mind (provided I am following you), it is a mere difference of name.

161. With this exception, that the one would go through all the forms of a Bill in both Houses, and the other would go directly to the House, unless petitioned against, and would become law within six weeks; is there not on the whole a certain convenience in that?—There is that very great difference, I quite agree.

162. It is a difference of form, involving certain conveniences under which the principal parties would still have an opportunity of being heard?—Yes.

163. Mr. *Sclater-Booth.*] But would the public have the same opportunity of interfering?—No.

164. *Chairman.*] The certificate would be laid before Parliament, and would be in the hands of every Member; and if there were any public interests concerned, I presume any Member might move that it should be referred to a Committee; is not that so?—Yes.

165. Mr. *Sclater-Booth.*] A Provisional Order passes into the hands of every Member, who can procure the papers relating to it from day to day?—Yes.

166. Mr. *Round.*] Supposing a certificate is objected to by certain parties, and there is no other machinery by means of which it can be objected to, it must be objected to in the House by some independent Member?—I think the hypothesis of the honourable Member in the Chair is that there should be a certificate, and that against that certificate the parties affected may petition, and that they may be heard against it. What is desired seems to be that the whole process of the first and second reading, report and third reading should be avoided, but that a certificate should of itself have the incidents of a Statute.

167. Then I understand that if it is a Provisional Certificate with a right to be heard, it would meet your case as well as if it were entitled a Provisional Order; that is what it comes to, is it not?—Yes; I would let it depend, in short, upon a Petition, and not upon a Motion in the House.

168. Mr. *Sclater-Booth.*] Then you would give persons, as far as you are concerned, the advantage, such as it is, of having public attention called to a Provisional Order in the way that it is now?—I am not here on behalf of the public. All I care about is that my clients shall have an ultimate appeal to Parliament.

169. *Chairman.*] I think under the Provisional Order system there are a considerable number of Provisional Orders generally included in one Bill?—Yes.

170. Then if there is an objection to any one of those Provisional Orders, the whole Bill goes as a matter of course to a Committee?—No, that simply drops out.

171. Mr. *Ayrton.*] It is committed so far as regards the Petition?—Yes.

172. *Chairman.*] All the other cases are delayed until the hearing of that case?—That is so.

173. All the other cases are delayed pending the hearing of the Petition against that one?—In point of fact the delay is nothing; it is a delay of only a fortnight or three weeks. It is a Bill which ought to be introduced early in the Session, but very often is not introduced until very late.

174. Mr. *Cawley.*] Do you know whether any railways have been constructed or any certificates issued under the Railways Facilities Act?—I do not.

175. Mr. *Round.*] Are we in any way trespassing in this discussion upon the province of the other House of Parliament when the Bill comes up there? No; the certificate, as I take it is to be heard before both Houses of Parliament, and certainly, if men are rash enough, after being beaten before the referee, and beaten before a Committee of the House of Commons, to go before the other House, it is clear that the other House ought not to be ousted of its jurisdiction.

176. *Chairman.*] You think it reasonable that they should have an appeal which should be made the subject of a preliminary investigation?—I think so.

177. Making two appeals therefore from the referee?—I may be excused if I do not feel an absolute reverence towards the referees. They are persons no doubt of great respectability and great property, but they cannot be eminent persons; eminent persons have their own professional occupations, and they are

Mr. *T. Coates.*

29 March 1870.

never eminent persons; and therefore that their judgment should be erroneous is a thing at all events within the region of possibility.

178. Therefore do you think that the Board of Trade should be competent to hold a local inquiry in every one of those cases?—Indeed, I think so.

179. Would it not be sufficient that they should have power to direct an inquiry?—No, I am sure you will forgive me for saying that the inquiries before the Board of Trade are really unsatisfactory; in point of fact one does not know what is going on. A landlord, for instance, may have something or other affecting his property going on in the Board of Trade; he knows nothing about it, and he does not see the correspondence; he does not hear the parties. He himself may go to whoever has the management of the department of the Board of Trade and converse with him about it, but he is conscious that the other side may do so, too; there is no confronting his opponent; there is no rule that what comes from one side shall be communicated to the other side. I am sorry to be obliged to make the statement but I must do so in point of truth, and I say it not from my own personal feeling, because I entertain nothing but gratitude towards all the officers of the Board of Trade; but there is a mistrust, and a feeling that things may be going on, and influence may be used which should not be going on and which should not be used. The mere suggestion of there being a possibility of that evil, and therefore that these things should be done otherwise, is attended with inconvenience.

180. Mr. *Ayrton.*] You mean that the Board of Trade has none of the attributes of a judicial body?—Absolutely none.

181. Either in its procedure or decision?—No.

182. That it is not an administrative body?—No.

183. *Chairman.*] You would propose to give them these powers?—No, all I propose is that they may negative if they think fit the referees inquiry.

184. You would vest in the referee judicial functions of this kind?—They nominate certain persons to collect facts; it comes really to that. If the referee is so injudicious as to state essays, as many public officers unfortunately do write essays, then they go beyond their functions. I suppose if they go to the spot and collect facts, and report those facts to the Board of Trade, and the Board of Trade, upon its own responsibility, investigated those facts and issues, either a Provisional Order or a Certificate, anything in the shape of a judicial inquiry, anything which, as far as the contentious parties, as the French say, are concerned, should be done by the Board of Trade, that is, to my mind, an unmitigated evil.

185. Have you the same objection to the local authority having power to sell a certificate, as in the case of companies?—I think so. We will assume any particular town. Take Manchester, Bristol, or any particular town. The corporation there may be persons to be trusted, and who may be confided in by their citizens or constituents, but the persons to whom they sell may not be at all trusted, and there may be a great abuse by the companies which the town council would never either desire or venture to permit. I say again that railways have not a very peculiar interest in that matter, but it is a matter which, amongst other things, they have considered.

Mr. *Rodwell* handed in the following Resolutions:—

"United Metropolitan Vestry Committee,
"Saint Pancras Vestry Hall,
"King's-road, Pancras-road,
"25 March 1870.

"Sir,

"I AM instructed by the representatives of the several vestries and district boards forming the United Metropolitan Vestry Committee, to forward herewith the accompanying copy of their resolutions with reference to the Tramways Bill, and am to request that you will bring the same under the consideration of your board at their next meeting.

"I am Sir,
"Your obedient servant,
"*Thos. Eccleston Gibb,*
"Clerk."

"Jno. Pollard, Esq.,
"Clerk, Metropolitan Board of Works."

"United Metropolitan Vestry Committee. Mr. *T. Coates.*

"At a Meeting held on the 17th day of March 1870, 29 March 1870.

Mr. CLEMENT GEORGE in the Chair.

"The Committee having considered the Tramways Bill,

"It was resolved,—

"1. That in the opinion of this Committee, tramways can be laid and worked upon roadways of great traffic in the metropolis, so as not to interfere with the ordinary uses of the roadways by any kind of vehicle.

"2. That tramways ought to be laid according to an uniform gauge, and upon some comprehensive scheme applicable to the whole metropolis.

"3. That in the event of such a scheme being adopted, the construction and management ought to be in the hands of some central authority.

"4. That it is advisable to confer upon some central representative authority the duty of devising, constructing, and managing such scheme, and that such authority should have power to let by tender the privilege of running cars upon the tramways, and that after defraying the cost of construction and maintenance, the surplus of the revenue arising should be applied in aid of the rates.

"5. That is not expedient to permit companies of private individuals to lay tramways upon public thoroughfares.

"Extracted from the Minutes."

Mr. *John Part*, called in; and Examined by Mr. *Edwards*, on behalf of the owners of collieries and other persons interested in canals in Lancashire.

186. You are well acquainted with the interests of the occupiers of collieries, and the owners of canals and navigations in the counties of Lancashire and Cheshire, and that part of England?—In the county of Lancashire particularly. Mr. *J. Part.*

187. Mr. *Ayrton.*] What are you?—I am a Solicitor, and also extensively interested in large collieries and iron works.

188. Mr. *Edwards.*] You have gone through the Bill for the purpose of suggesting such amendments as you think would be for the interests of the petitioners, and of the public?—I have suggested such alterations as I think desirable to be inserted in the interests of the public.

189. There are some amendments which you propose in the Interpretation Clause, but I will go at once to Clause 5, which vests the power of sale in the promoters; you have suggested that which you think would be a proper alteration of that clause; will you state what that alteration is, and what your reasons are for suggesting the alteration?—The alteration in Clause 5 is by Rider A.: "And upon such sale all the powers and privileges granted to, and which might otherwise be exercised and enjoyed by, the Promoters, by virtue of this Act, or the certificate granted thereunder, with regard to the making of such tramway, and the use, repair, and management thereof, and the tolls to be taken thereon, shall, for such limited term, be exercised and enjoyed by the purchaser, under the same regulations and restrictions as are by this Act, or the certificate imposed upon the Promoters; and such purchaser shall, with respect to the tramway comprised in such sale, be subject to all the obligations by this Act, or the certificate imposed on the Promoters."

190. Will you state to the Committee upon what ground you propose that a limited time should be stated in the Bill?—Upon reading the Bill I take for granted that it was in the contemplation of the framer of the Bill that when parties who were promoters of an undertaking of this description were reimbursed their principal money and the proper amount of interest, that then they should be as far as possible open to the use of the public, without any further payment, except such as would be necessary for the maintenance and repair of it, because they were interfering with a public highway.

191. That is with respect to the power of leasing for a limited term?—Yes; then

Mr. *J. Part.*

29 March 1870.

then again, in the same clause I propose an amendment after the word "certificate," in line 27, giving power to the Board of Trade to extend the time to any term, in case the parties shall not be reimbursed their capital and interest.

192. Mr. *Ayrton.*] Do you think there is anything in the Bill which authorises a person to sell what he has not got?—This gives the power to sell the tramways without any limit,

193. *Chairman.*] Subject to the other clause in the Bill?—It is not so stated in the clause itself.

194. Mr. *Dent.*] You do not raise any objection to the public authorities; your opposition rather relates to private companies?—I think where they can be kept in the hands of local authorities, it would be greatly to the advantage of the public that they should be so retained.

195. Would it not be rather preferable to strike out the clause which reserves the power of sale, and leave in the clause giving the power to lease?—Certainly.

196. So that power over the traffic might be kept in the hands of the local authorities?—If this clause is to stand, I think it should be with this amendment.

197. Would you not rather prefer striking out this Clause 5, which gives the power of sale, and keeping in Clause 7, which gives the power of leasing?—Quite so.

198. We may take it, then, that you would agree with the railway companies who have appeared before us, and strike out Clause 5 altogether?—Yes.

199. Supposing that the local authority had got power to make a line, that is, a concession, and they sold the line, in the one case it being a constructed line, and in the other a line to be constructed, do you think it would be unjust that they should have the power to sell a concession of that kind?—I think it would be a very dangerous power, and one contrary to the principle of prior legislation.

200. As I said before, you really agree with the railway companies that that clause shall be struck out altogether?—Yes.

201. Therefore, on what ground do you think it dangerous that local authorities should have the power; you are now assuming that it should be made by the local authority and not a company; but supposing the concession is given to a local authority?—I think it much to be preferred that an undertaking of this description should be kept in the hands of the local authority, for this reason: the local authority are interested in the convenient user of the public highway, and have solely the interests of the public and the district to consider. That is not the case with a private company which takes up the matter as a private speculation. I think works of this description would be much more beneficial to the public at large if in the hands of the local authorities than in the hands of third parties who are merely speculators.

202. It may have been the case, perhaps, that the certificate was obtained without opposition, because the local authority was the party who constructed the road?—Precisely.

203. *Chairman.*] If afterwards they were to have any power to sell, that might quite alter the relations of the parties who were not benefited?—Undoubtedly so, and the rights of parties would be affected by it.

204. Mr. *Dent.*] Supposing a concession is obtained in the first instance by private parties, you would not object to a sale of it to the local authority?—Certainly not.

205. Mr. *Ayrton.*] Do you see any objection, when a certificate has been granted to private persons, to their selling it with the consent of the local authority; what does it matter whether A. or B. holds the concession?—Much of the objection to its being sold would be that the sale was not to take place until the tramway was completed. I think it would be very objectionable to allow them to sell the concession itself, without the power of making the tramway, to any third parties, because men of straw might obtain a concession and then make a merchandise of it, to the prejudice of the public.

206. However, your object is to prevent any underhand dealing, so to speak, with the certificate?—Yes.

207. That is the only motive that you think ought to be considered?—Yes.

208. Mr. *Edwards.*] I understood you also to say that you think a tramway should

should be managed by a public body, having no particular private interest?—I think it desirable it should, if that could be effected.

209. *Chairman.*] You would prefer to see the tramway in the hands of local authorities to being in the hands of companies?—Undoubtedly.

210. Mr. *Edwards.*] The local authorities, knowing the interests of the district, being the persons to repair and maintain the roads formed out of the money of the ratepayers of the district?—Yes.

211. Mr. *Ayrton.*] You do not go the length of suggesting that no concession should be made to individuals who wish to make tramways?—No, I do not say that at all.

212. Mr. *Edwards.*] The ground of the general opposition of those whom you are speaking of at present is, that the Bill provides for an exclusive use of the tramway when made?—Yes.

213. Will you state to the Committee on what ground you think it not desirable that exclusive use should be given to promoters or lessees, but that the tramway should be open to every description of traffic under proper regulations for the whole of the country; take, for instance, the coal trade in Lancashire, the amendments proposed in 7 and 24 really go to the question of exclusive user?—I think it would be extremely objectionable that a monopoly in undertakings of this description should be vested in any single body, and more especially if there is to be a power of lease or sale. The traffic in Lancashire is principally of a very heavy character, and one can well imagine that if an individual or any powerful body were enabled to obtain a lease, and by such lease a monopoly of an undertaking, they might very considerably interfere with and embarrass the trade of the country. I will suppose, for instance, that a large company, having a canal or railway, were to obtain possession of one of these undertakings, and that, when in connection with their own undertaking, they might prescribe to parties, who might wish to use the tramway, terms and conditions which would compel them to have recourse to the system of the company which had the monopoly, and so interfere with the competition of all other companies. For instance, in an extensive colliery district there are works which may be at a distance of some three, four, or five miles from a canal or a railway system; the parties having the monopoly of the tramway might say, "Unless you choose to forward your goods by our system, we will not facilitate you in the use of these tramways." If at the terminus of a railway or a canal, or any portion of it, parties might wish to forward their goods or minerals, they might say to those parties, unless you choose to send your goods by our system we will not render you the facilities of the tramways, or only on conditions which would be tantamount to prohibition.

214. *Chairman.*] When you speak of the exclusive user of a tramway, do you mean exclusive user by a particular class of traffic?—For any class of traffic. Suppose, for instance, they were constructed for the transport of coal or merchandise, no one body should be enabled to say, "You must use our system if you wish to have the privilege of using this tramway."

215. Suppose a tramway laid down simply for the use of omnibuses, do you think that heavy traffic, carrying coal, for instance, should be allowed to use that tramway?—I see no objection to it.

216. Would it be possible, in your opinion, that two different kinds of traffic should be carried on?—It is done extensively on the dock railways of Liverpool, which are used indiscriminately for passenger, omnibus, and all the heavy dock traffic.

217. Mr. *Hibbert.*] If such traffic were allowed on tramways, for instance on the road entering Salford, would it be possible for omnibuses to use the tramways; is not the traffic there so great that it would be quite impossible for an omnibus to get on to the tramway?—There are many cases in which it would be inexpedient that traffic of a heavy character should use the tramway, but I think that might be met by vesting in the Board of Trade, or the local authority, a power to regulate what classes of traffic should use a tramway in certain localities.

218. *Chairman.*] You are of opinion that the tramways, under the authority of the Board of Trade, should be restricted to a particular class of traffic?—*Primâ facie* they should be open to all classes of traffic, subject to restrictions by the Board of Trade where the circumstances of the population or the amount of traffic rendered such restrictions necessary for public convenience.

Mr. *J. Part.*

29 March 1870.

219. Mr. *Cawley.*] Would it be possible for any tramways or railways yet laid down, to be used for carriages which go upon roads and convey coals to their destination?—I understand, although I have not seen it, that in Lancashire the drivers of the omnibuses have the means of raising the flange so as to release them from the tramway and enable them to pass along the road.

220. Mr. *Edwards.*] That is done, I believe, for six miles along the docks?—I think the dock tramways are six miles in length.

221. Mr. *Cawley.*] Supposing such a tramway to be laid down as you are speaking of now, could any conveyance which is used for carrying coals from the collieries distribute those coals at the different manufactories, and in the course of their transit use the tram?—I have no doubt that mechanical ingenuity will discover means to accomplish that.

222. But that has not yet been done?—It has not yet been done.

223. Mr. *Edwards.*] Waggons might be specially provided for the coal traffic, might they not?—Yes.

224. You are speaking of traffic which comes from collieries and passes along the streets, which you say ought to be able to use the trams, but which when they get to the trams must go off it?—Yes.

225. Can the present omnibuses, which are used in Manchester and Salford, go on and off the tram as they please?—I am not acquainted with the practical working of it. It is a question of degree and strength. The principle is the same.

226. Assume that a tram is made through the coal district, say, from Manchester to Bolton, do you see any objection to that being used right up to a certain part of the town by waggons or carriages properly adapted to run on the rail along with passenger traffic?—I should be inclined to think that the construction and use of a tramway by the heavy coal traffic between Manchester and Liverpool would be a great saving to the local authority; because it would greatly diminish the wear and tear of the roads by taking the heavy traffic upon the tramways, which will clearly transport at a much less expenditure in repairs than the common roads.

227. Mr. *Loch.*] Taking the neighbourhood of Manchester as an example, do you think that a tramway for heavy traffic, such as coals, could be used consistently with the greater speed which would be required in the case of omnibuses?—I think they might be made to work together. I think the coal traffic might be taken at a speed almost as great as the speed of the omnibuses.

228. Then, without retarding the passengers, you would accelerate the coals?—Yes.

229. *Chairman.*] Would the heavy traffic, in your opinion, be prepared to pay tolls for the use of the tramway?—Undoubtedly.

230. Mr. *Sclater-Booth.*] And you think the width of the gauge would be no objection?—The width of the gauge would depend on their being worked in connection with existing railways.

231. For ordinary classes of heavy goods?—There need not be much difference between the gauge on the tramway and the ordinary railway gauge of the country.

232. Mr. *Edwards.*] Up to a certain point, may not the tramway run through what may be called the rural district, and then the heavy traffic be diverted along another tramway, and the passenger traffic afterwards enter upon another line?—I think the arrangements, as to what traffic should pass along certain lines in certain districts, might be left much better in the hands of some public department to make regulations, according to existing circumstances, when those circumstances are changeable in their character.

233. Mr. *Ayrton.*] Is it your opinion, that when fast and slow traffic (for that seems to be the only distinction) is to be provided for by tramways, that the slow traffic ought to be carried in carriages so constructed that they can be turned off so as to allow the fast traffic to pass?—Yes.

234. Mr. *Sclater-Booth.*] Your proposal implies that there should always be two lines of tramways?—Undoubtedly.

235. Mr. *Dent.*] Each of these cases must rather rest upon its own merits?—As to whether heavy traffic should or should not be permitted.

236. Will not these cases be rather met by the proposition that has been made, that there should be a Provisional Order in lieu of a certificate, and a local inquiry where the parties interested could be heard, and such a system adopted by

by a separate Provisional Order?—That, I think, would meet my view, to a great extent, but the present scope of the Bill is, that the use of a tramway for passenger traffic is the exception and not the rule.

237. Particular cases like these to which you have referred are exceptional, and will have to be dealt with by an exceptional and particular Act of Parliament?—By a particular certificate or Provisional Order.

238. But the Board of Trade would scarcely be as well adapted to deal with that from a central office, as an inquiry in the locality, where all parties could be heard, and the Act of Parliament adapted to that?—I can well imagine that questions would arise in certain circumstances.

239. Lord *George Hamilton.*] Do you think that any company would apply for a certificate to lay down a line if they knew that they could not have the benefit of the line, but that it would be used for heavy traffic?—I think they would; I have reason to know that parties would be willing to contract under the terms of a lease, where the traffic was likely to yield an adequate sum by the construction of a tramway; I am not in a position to say positively that they would do so, but I believe that to be their present feeling. With reference to the question just put, I would say that where parties are not in a position to construct a tramway, it is, I think, contrary to the principle of legislation hitherto in all matters, and contrary to good feeling that they should have power to construct a tramway and sell it to others, when it is necessary for them to have recourse to other parties to borrow the money.

240. You think that corporations would apply to lay tramways where they could, and that amongst the conditions of sale they should be liable to be used for heavy traffic?—Yes, in payment of tolls.

241. Mr. *Edwards.*] What I understand you to say generally is, that with regard to the requirements of the district upon a particular application, the question has to be decided what kind of traffic should be permitted or not permitted upon the tramways to be laid down in it?—Quite so; I could imagine many districts having tramways of this description, in order to make them remunerative, which would depend almost exclusively upon heavy traffic.

242. Mr. *Ayrton.*] In your view, the greatest use of the tramways would be for heavy traffic, and not for passengers?—No doubt, the greatest saving would be in the heavy traffic.

243. Mr. *Edwards.*] The circumstances of one large manufacturing town might be different from another, and heavy traffic might be permitted in one and not in another?—Yes; I can illustrate that by what has been done, to a great extent, in some of the large towns, namely, providing that heavy traffic, such as the cartage of coals, shall only take place in certain streets on certain days. The same restriction might be adopted, under Provisional Orders, with respect to certain towns where there were tramways, which might be used for general traffic at certain times, and during a portion of the week only used for passenger traffic.

244. Mr. *Ayrton.*] What you seem to aim at is, that tramways should be in the position of ordinary turnpike roads?—Precisely so; they are taking it from the public, and should give as much back to the public as they can.

245. Unless a case is made for some modification in the ordinary condition of a turnpike road it should be subject to that?—Precisely so.

246. Mr. *Edwards.*] You have suggested some alterations in Clause 7; will you explain what they are?—The object of the alterations in Clause 7 is with regard to the power of leasing the undertaking; that the lease shall be confined to the power to let the collection of tolls, and if they are let subject to a lease, being liable to the maintenance of the road and the necessary repairs, that the tolls might be let either with or without a tramway.

247. You distinguish between a leasing of the tolls and a leasing of the exclusive use of the tramway?—Yes; to strike out which might imply an exclusive use of the tramway.

248. In turnpike trusts the tolls are let to be collected by the trustees at so much per annum; it is that kind of lease which you propose by the alteration you suggest in that clause?—Yes, it follows almost upon tramways being open for the use of the public, such as I have before suggested.

249. Take the case of a canal; canals even now, with few exceptions, are simply for the purpose of collecting tolls; all persons who use them, paying the tolls required by the particular Act of Parliament?—I believe in every instance

Mr. *J. Part.*

29 March 1870.

the lease of what may be termed the canal, is confined to a lease to collect tolls; the companies retain to themselves the canal, and the liability to repair.

250. Canal navigations admit all kinds of traffic upon them, and as a rule they do not have their own plant?—They do, practically.

251. At all events they have not until recently, the exclusive right to carry upon canals?—None whatever.

252. You would apply that principle then to tramways?—Yes.

253. Mr. *Sclater-Booth.*] You do not apply this to the railways?—In theory I believe it is applied to railways, but practically it is a monopoly.

254. Some tramways might approximate more nearly to a railway in respect to their construction and the kind of use they would be put to, and other tramways might approximate more nearly to the case of a common turnpike road?—One might be more adapted for heavy traffic than another, but so long as tramways are to be used only by animal power, what renders railways a monopoly would not apply to them.

255. Mr. *Ayrton.*] Every landed proprietor has the right, has he not, of making sidings to a railway under certain conditions?—Which conditions almost amount to a prohibition. There is a further amendment which I have suggested in Clause 7, which is this, "There shall be inserted in every lease of a tramway a condition of re-entry if at any time the lessees shall fail or neglect to keep the tramway and every part thereof in good repair and condition." I think, for the benefit of the public, that that should be inserted.

256. Mr. *Edwards.*] Then there is an alteration in Clause 24 which goes to the question of exclusive user; will you point that out to the Committee?—Clause 24 is to secure to the public the enjoyment of a tramway. The alteration for that purpose is this, "Subject to the payment of the prescribed tolls, and the observance of the bye-laws, any person shall be entitled to use a tramway or any part of a tramway made under the provisions of this Act for all classes of traffic with wheels especially adapted to run on a grooved rail. All carriages used on any tramway shall be moved by animal power only." I propose that that clause shall stand with that power; that is, to secure the tramway for the use of the public.

257. Subject to the payment of tolls that may be prescribed?—By the bye-laws.

258. *Chairman.*] The effect of this clause will be rather to disconnect the tramways from any particular omnibus company?—Yes.

259. It would be to compel any tramway companies to lay tramways down, open to all the world upon the payment of tolls?—Precisely, as a canal is at the present moment.

260. Your reasons for that are grounded on the peculiar character of the traffic of Lancashire?—I think the principle is applicable to every part of England; it is certainly adapted to large heavy traffic.

261. Mr. *Edwards.*] In addition to the proposed alteration of Clause 24 you have suggested an additional clause which is printed as 24 A?—Yes.

262. What is the object of Clause 24A?—Clause 24A is a clause corresponding in a great measure with the power to lay down branch railways which is contained in the Railway Clause Act. Then 24 A is as follows: "This Act or any certificate thereunder shall not prevent the owners or occupiers of lands adjoining or near any road along or across which any tramway shall be laid from laying down, with the consent of the road authority, either over the said lands and road or the lands of any other person, with the consent of such person, any collateral branches of tramway to communicate with the tramway for the purposes of bringing carriages to or from or upon the tramway; and the promoters shall, if required, at the expense of such owners and occupiers, make openings in the rails and such additional line of rail as may be necessary for effecting such communications in places where the communication can be made with safety to the public and without injury to the tramway, and without inconvenience to the traffic thereon, and the promoters shall not take any toll for the passing of any passengers, goods, or other things along any such branch: but this enactment shall be subject to the following conditions: The promoters shall not be bound to make any such openings in any place which they shall have set apart for any specific purpose with which such communication would prejudicially interfere. The persons making or using such branch tramways shall be subject to all bye-laws and regulations of the Company from time to time made, with

with respect to using the tramway and otherwise, and the person making or using such branch tramway shall be bound to construct, and from time to time as need may require, to renew the offset plates and switches, according to the most approved plan adopted by the promoters and under the direction of their engineer."

263. Mr. *Ayrton.*] That is the clause in the General Railway Act, is it not?—The general Railway Act gives power to the local authority; we only propose here to give a power with the consent of the local authority.

264. *Chairman.*] That is carrying out more completely your views, that tramways should be open to everybody?—Yes.

265. And that they should have sidings where it is advisable?—Precisely so.

266. Mr. *Edwards.*] The alterations in the succeeding Clauses 27 and 28, are for the purpose of carrying out the views which you have expressed?—Clauses 27 and 28 are, and Clauses 27A and 28A are, for the purpose of carrying out more effectually what is expressed in Clauses 27 and 28 of the Bill. 27A is for the purpose of making it obligatory upon the parties using the tramways to render an account, that is also taken from the Railway Acts.

267. That is the case also with Clause 28A?—It is; that is merely imposing a penalty for not giving an account.

268. Now will you turn to Clause 33?—There is an amendment to Clause 33, which, as originally framed, enabled the local authorities, in case the parties ceased from working the railway, by sending a single cart or carriage over the tramway, to remove the tramway, which took it out of the operation of this clause. What struck me was, that it was important to the public that the tramway and the road connected with it should be kept in good order; therefore, I have made an alteration to this effect: "If at any time after the opening of any tramway for traffic, shall fail or neglect to keep the tramway or any part thereof, in good working order and condition, and a certificate of the Board of Trade of such failure or neglect shall be obtained, such tramway shall thereupon vest in the local authority, with all the powers and subject to all the obligations vested in, and imposed upon, the promoters by virtue of this Act, or any certificate thereunder, or it shall be lawful for the local authority at any time after such certificate of failure or neglect shall have been obtained, with the consent of the Board of Trade, to remove the tramway." Then follows the language of the clause as originally drawn. It strikes me that it would be undesirable, under certain circumstances, that if the promoters failed to keep the road in order, and it is vested in the local authority not to remove it, and that it might well pay the local authority to continue to keep the road in repair, where it would not pay a private company to do so, and that it should be for the convenience of the public that the road should be continued and not removed.

269. In Clause 36 attention has been called to the making of the bye-laws; what is the object of the alteration which you suggest?—That there should be a publication and notice of the bye-laws. It is in line 14.

270. That is the case also with the alteration at the bottom of page 17?—Yes.

271. You propose an addition to Clause 17, with respect to bridges; will you explain why you suggest the insertion of that clause?—There are bridges over navigable rivers, and also over canals, some of which are not the property of the owners of the navigation, and, therefore, they would not come within the definition of the owners of bridges in the Interpretation Clause, but it might so happen that in constructing a tramway it might become necessary to interfere with the crown of the arch of a bridge, and the object of this amendment is to prevent the promoters of tramways having power, without the express authority of Parliament, to lower the headway of a bridge over a navigation, or to diminish the waterway. That is a limitation which they propose under the power to cross bridges.

272. I think Clause 49 also affects the same interest; there is a rider to Clause 49 which you propose?—This is to preserve certain existing rights which the owners of navigations have to alter their works. The clause as it originally stood was confined to altering the roads over bridges. The navigation is so connected with public roads that I venture to suggest this alteration: "Nothing in this Act, or in any certificate obtained in pursuance thereof, shall limit or interfere with the rights of any owner, lessee, or occupier of any mines, or minerals,

Mr. *J. Part.*

29 March 1870.

lying under, or adjacent to, any road, along, or across which any tramway is laid to work such mines and minerals; nor shall any such owner, lessee, or occupier be liable to make good, or pay compensation, for any damage which may be occasioned to the tramway by the working in the usual and ordinary course of their mines or minerals."

273. This clause has reference to the protection given to the owners of mines lying under roads?—Yes.

274. Will you explain why you think a clause protecting the owners of mines from making compensation to the owners of tramways should be inserted in this Bill; your clause is, "Nothing in this Act, or in any certificate obtained in pursuance thereof, shall limit or interfere with the rights of any owner, lessee, or occupier of any mines, or minerals, lying under or adjacent to any road along, or across, which any tramway is laid to work such mines and minerals, nor shall any such owner, lessee, or occupier, be liable to make good, or pay compensation for any damage which may be occasioned to the tramway by the working in the usual and ordinary course of their mines or minerals"?—A clause providing for this has generally been inserted in Railway Acts, and in Waterworks Acts, to enable the owners of mines to work mines as they have heretofore done under any undertaking. This is merely to protect the owners of mines if they get no compensation on account of those tramways from having imposed on them an additional responsibility to working those mines in the ordinary course, greater than that to which they are now subject.

275. *Chairman.*] In what respect is it greater?—The present system of working the mines is entirely to remove the whole of the stratum, and a certain subsidence takes place. It would be easily removed in repairing a turnpike road, but not so in repairing a tramway; unless some provision of that kind is inserted, the owners of mines would be liable to a greater risk and obligation.

276. Mr. *Edwards.*] You do not want persons who have got rights under a road to be subject to an injunction being awarded against them in Chancery, or to an action for damages?—No.

277. *Chairman.*] I suppose a level road is of more importance to tramways than roads which turn?—No doubt.

278. You think if the subsidence takes place in consequence of the working of the tramways that you would be put to greater expense?—Yes, and for which we get no compensation by the Bill.

279. Mr. *Cawley.*] No property would be vested in them by the Bill?—There is an easement.

280. Would that easement affect the rights of the parties underneath?—Yes, you give them an easement, and from the time they use that easement they would be entitled to compensation for any interference with that easement.

281. Mr. *Sclater-Booth.*] Supposing you cause a subsidence in an ordinary turnpike road, what happens?—They can compel you to make it good.

282. Mr. *Edwards.*] You do not want to deal with strangers having a right over the road for the purpose of making tramways; is that what your view is?—Yes.

283. Mr. *Cawley.*] The railway companies purchased land, the mines being specially reserved by their Act of Parliament?—Yes, the landowners get compensation. The Legislature has provided for the protection of the landowner in the enjoyment of his mines, and also for the protection of railway proprietors, the same as waterworks companies.

284. Is not there this difference, that in that case the landowner only parts with a portion of his rights, it being then optional with the company whether they pay for the remainder?—Here you interfere with the soil and freehold of the landowner, and you give him no compensation.

285. *Chairman.*] Then, is the right taken away from the landowner by the Tramways Bill?—You impose an additional risk in the enjoyment of his property.

286. Mr. *Ayrton.*] All you want to take care of is, that no right shall be taken away from him?—That no additional obligation shall be imposed upon him.

287. Mr. *Cawley.*] The landowner is to restore the road, is he not, if he lets it down?—Yes; I do not propose to interfere with the obligation, but I propose that we shall not have a third party put upon the land with rights.

288. Mr. *Edwards.*] In the last alteration which you propose in Clause 51 A, which

which is, "Nothing in this Act shall prevent the maintenance, construction, and user, of railways and tramways already made, or hereafter, with the sanction of the road authority, to be made across any road along which any tramway shall, under the authority of this Act, or any certificate thereunder, be made or constructed"?—Those roads are made with the sanction of the road trustees, and the construction of tramways might break them up.

Mr. *J. Part.*

29 March 1870.

289. Tramways do cross many roads in the neighbourhoods of Manchester?—Yes, and in many instances in Lancashire.

[Adjourned till To-morrow at Twelve o'clock

Wednesday, 30th March 1870.

MEMBERS PRESENT:

Mr. Ayrton.	Mr. Hibbert.
Mr. Cawley.	Mr. Shaw Lefevre.
Mr. Dalglish.	Mr. Loch.
Mr. Dent.	Colonel Wilson Patten.
Lord George Hamilton.	Mr. Sclater-Booth.

GEORGE JOHN SHAW LEFEVRE, Esq., IN THE CHAIR.

Mr. *John Lingard Vaughan,* called in; Examined by Mr. *Shrubsole.*

Mr. *J. L. Vaughan.*

30 March 1870.

290. You are Clerk to the Trustees of the Manchester and Buxton turnpike roads?—Yes.

291. Have you had any experience in the existing tramways which have been laid down at Liverpool?—I have merely inspected the tramways there, in company with the road surveyor.

292. By Clause 19 of this Bill, it provides that the promoters are, besides repairing so much of the road as the tramway will occupy, likewise to repair 18 inches beyond the rails on each side of the tramway, why is that insufficient in your view?—On inspecting the tramway in Liverpool we measured the sides of the outer rail, and in many instances we found that the injury to the road exceeded considerably 18 inches; in one instance a subsidence had taken place considerably beyond 18 inches; and there was one instance where it was actually four feet.

293. Mr. *Sclater-Booth.*] Is the rail at Liverpool set in solid granite?—Yes, it is.

294. *Chairman.*] And they have paved for a distance of 18 inches?—Yes; it is paved altogether; the whole of the street is paved, and not macadamised at all.

295. Mr. *Dent.*] Is it an iron tram?—Yes, it is an iron tram, with a groove and flanged wheels.

296. And the subsidence, you say, has taken place four feet beyond the rail?—Yes, the outer side of the rail.

297. Mr. *Hibbert*] Did that extend for some distance?—There were several patches.

298. Mr. *Ayrton.*] Why was there a subsidence to the extent of four feet?—I cannot tell from what cause it was, but there was a great hole just at the side, and there appeared to be a subsidence of the roadway.

299. Mr. *Dent.*] Did you find the average distance from the roadway more than 18 inches?—Yes, the average would be considerably more than that; I should think it would be nearer three feet than anything else.

300. Mr. *Sclater-Booth.*] What do you mean exactly by subsidence?—The under part of the road giving way; and I apprehend it was from the imperfect construction of the tramway itself.

301. Can you trace it in any way to the construction and action of the tramway, or is it from the traffic of the rest of the street flowing in a certain line?—There is no doubt that it is in a great measure attributable to the traffic being all confined to one side of the street in consequence of the tramway.

302. A sort of rut is made there?—Yes.

303. Is

303. Is the subsidence a rut, or is it due in any way to the action of the tramway?—I take it that it is in one sense a rut; it is not from the carriages themselves. Mr. *J. L. Vaughan.*

304. Mr. *Ayrton.*] Do you mean that the part of the road which contains the tramway itself has subsided some three feet on each side, or that there is a rut or sinking at each side of the tramway, the tramway rising up above the ordinary level?—No, it is on the outer side of the rail. 30 March 1870.

305. Mr. *Hibbert.*] Has not this subsidence taken place since the tramway was laid; it has not been completed very long, has it?—It was in a part of Manchester-street.

306. Do you know when the tramway was laid, for what width the pavement was broken up outside the rail?—I do not know; I was not present, and I cannot tell.

307. You cannot tell whether this subsidence has taken place in the old pavement, or in the pavement which was replaced when the rail was put down?—It would be the new pavement, because they made an open space to lay the rail, without taking from the outer part of the pavement.

308. What width of pavement did they break up when the rail was put down? I am not able to answer that question.

309. You cannot say whether this four feet was new pavement, or old pavement?—It appeared to be new pavement; I should judge it to be new pavement from the other style of pavement in the street. It was in Dale-street where the measurement took place. We measured it in Dale-street, and also in Manchester-street.

310. Mr. *Dent.*] Is there goods traffic on that tramway?—No, it is all passenger traffic.

311. *Chairman.*] Is any part of the Liverpool tramway laid in a macadamised road?—No, it is all upon a paved road.

312. Have you any experience of laying down tramways on macadamised roads?—No.

313. The effect of your proposition would be to entail upon the tramway companies, when tramways were laid down upon a macadamised road, the expense of paving another foot and a-half on each side of the tramway?—Yes.

314. Mr. *Hibbert.*] Do you consider that the damage which was caused to the road was from the action of the carriages moving on the tramway, or from the excess of traffic upon the diminished part of the road, the road of course being diminished by this part which is monopolised by the tramways?—It would be from the excess of traffic on the outer side; not arising from the tramway itself.

Sir *Joseph Heron,* called in; and Examined.

315. *Chairman.*] What have you to state to the Committee with regard to the amendments proposed on behalf of local authorities?—Perhaps I may explain to the honourable Chairman that the Committee have, I believe, the alterations I am going to refer to copied into the Bill, and also separately; but I will refer to them as they occur in the Bill. I may say that I am speaking on behalf of the Corporations of Liverpool, Birmingham, Leeds, Salford, and Manchester, and also the Hundred of West Derby who were represented at our meeting when we went together very carefully over the Bill, and, except what I shall explain, the amendments which I propose are proposed on behalf of all the corporations; and I think I may say that they are amendments which will be generally adopted by other corporations who have not been actively interfering. The first amendment which I will read is on page 2 in Clause 4, which reads: "The local authority with the consent of the ratepayers in such district." The amendment which I propose on behalf of the corporations is, after the word "authority," "in boroughs or districts of local boards, in pursuance of a resolution adopted at a meeting specially convened to consider the question, and in other districts the local authority," and in line 8, after the word "district," insert the words "In pursuance of such resolution and with such consent as hereinbefore provided." It will be seen at once why we propose this. We consider that if we do not represent the other inhabitants for such a purpose we do not represent them at all, and that in corporations or local Sir *Joseph Heron.*

Sir *Joseph Heron.*

30 March 1870.

board districts, where there is a council or a local board, it may very well be left to the council or the local board to determine whether they will apply themselves for a certificate, or give consent to the certificate being applied for by any other party. It has been proposed by some of my friends in Liverpool, and others, that these words should be introduced with reference to the meeting "at which two-thirds of the members shall be present."

316. *Chairman.*] You propose to leave in the words "with consent of the ratepayers," in the case of boroughs or corporations, or you would then assume that they had the consent of the ratepayers?—Yes, if there is the vote of the council or the local board. The words which I have just read the town clerk of Liverpool, I believe, would like to say something with regard to their being introduced on behalf of Liverpool, Leeds, and West Derby, that is to say, "at which two-thirds of the members shall be present." I have no doubt the honourable Chairman will recollect that that is the case sometimes with reference to making bye-laws. It is required that at any meeting of the council where bye-laws are made two-thirds of the members of the board shall be present, and then of course at that meeting the vote of the majority is conclusive. The next amendment is in Clause 5. It will be seen that we propose to strike out the words "and where they are not any such authority they may with the consent of the local authority," we think it very undesirable that promoters, other than the local authority, should have the opportunity of disposing of the certificate. It really is a temptation to parties to try to get the certificate for the mere purpose of selling it and speculating with it; as far as the local authority is concerned they really would have in some way or other to dispose of it, for they are authorised to do it by the very principle of the Bill.

317. Mr. *Hibbert.*] But that would not prevent them selling it to the local authority, supposing they had obtained it?—Certainly not; not under the provisions which follow; but, supposing the tramway had been laid, and the promoters were willing to dispose of it to the local authority, the provisions that follow in the Bill enable that to be done.

318. *Chairman.*] You think that where the promoters are the local authorities they should have the power, after getting the consent of Parliament or the Board of Trade, to make those tramways, to make a concession of their authority to companies?—To any company with whom they were perfectly satisfied that the work would, under their immediate direction, be satisfactorily performed.

319. So that they delegate to a company the right of making the tramway?—Yes, exactly so, as well as the use of it.

320. Mr. *Sclater-Booth.*] And of selling it?—No, not of selling it; we assume that if the authority grant to a company the right to make it, it will be to a company that would give them satisfactory security that they were going properly and in accordance with the Act to utilise it. We should simply obtain the certificate in the mode in which they might have obtained it as promoters; and we should only put them in the same position, by transferring the certificate to the company, as they would have been in if they had originally applied for it.

321. *Chairman.*] The scheme would originate with you?—Yes.

322. As I understand, you would then get the consent of the Board of Trade and of Parliament under an Act, and having done so, you would offer the concession to anybody who chose to make an offer?—Yes, we should have power to do that; or we might make the line and then let it, which is the only way in which we could deal with it.

323. That is the second process under the Bill?—Yes, we must let it, because we cannot work it by the very nature of the Bill and the provisions of the Bill.

324. Mr. *Ayrton.*] What you propose is, to get the sanction to make it yourselves, the inhabitants having concurred in it; what do you propose to do, to protect the inhabitants from your shifting the ground and altering the character of the undertaking?—We should have no power to shift it; whether we made it ourselves under the authority which it is supposed would be obtained, or whether we assigned that authority to a company who had made satisfactory arrangements with the local authority; they would be tied down to the plan which had been approved by the Board of Trade, and confirmed by Parliament.

325. It is one thing for the inhabitants of a town to allow the local authority to make the road, and it is another thing for the inhabitants to acquiesce in speculators taking that road into their own hands and doing anything with it?—As

—As far as that alteration is concerned, there is no variation whatever from the whole principle involved in the Bill; because the very principle involved in the Bill is, in the first instance, that the local authority may obtain the power to make the tramway; and in the second instance, that the company or the speculator may obtain the power, with the consent of the local authority.

326. The inhabitants are aware of the application of the company or speculator to make the road, and they have an opportunity of objecting to it, and everybody has notice of what the thing is; but you propose that the public notification shall be for an entirely different purpose, namely, for the local authority to make it; then I want to know what security you propose to give to the inhabitants and the public, to give them an opportunity of objecting to the change?—It does not appear to me that they require any additional security than they would necessarily have, because they may fairly expect and believe that the local authority will take care that the work is executed in a manner just as satisfactory to them as if they executed it themselves; and at any rate, so far as the inhabitants are concerned, they would be in no worse position than they would have been if the certificate had been applied for in the first instance by the company, with the consent of the local authority and the works executed by them.

327. They would be in an entirely different position, because in the one case the certificate cannot be granted unless the inhabitants acquiesce in the speculators taking possession of the road, but in the other case the speculators would get possession without the inhabitants having any opportunity whatever of objecting?—No; assuming that the alterations which we suggest are adopted, it is the consent of the local authority which alone would enable the speculators to get possession and get the certificate.

328. That would not enable them to get it; that would only be one act towards getting it; of course the inhabitants could object to it?—I confess that I do not quite see the difference which is being pointed out. It appears to me that there is really very little difference so far as the inhabitants are concerned, whether the certificate is obtained upon the application of the local authority and then handed over to the company to execute and carry out, or whether it is to be obtained on the application of the company itself with the consent of the local authority and then carried out by them.

329. Every occupier of a house in the street in which a tramway is to be made might claim to object to that tramway being laid down in his street in front of his door?—Of course he could, but it could not make any difference to the occupier whether the rail was laid down by a speculator or by the authorities, provided it is laid down properly; whether the works are executed by one or the other, assuming the works are executed satisfactorily; and it is quite clear that the time for such parties to object would be when the scheme was placed before them; they could object in the first instance before the Referee of the Board of Trade; and if they thought that their objections were not fairly attended to there they could object in Parliament.

330. How could they object to what is not proposed; their objection might be to the tramway being in the hands of speculators, whereas the proposition before the referee would be that it should be in the hands of the local authority; how could they object to any proposition which is not before the referee?—I do not say that the Bill provides for that; they should object here if they meant to object to it.

331. *Chairman.*] As the clause now stands the consent of the Board of Trade is necessary to any such transfer?—Certainly, and that is not proposed to be omitted.

332. If the ratepayers think themselves aggrieved by the substitution of a company for the local authority, they could appeal to the Board of Trade upon the subject?—Certainly.

333. Mr. *Hibbert.*] Would not it be the case that if you carry out that alteration you would be able to obtain a certificate, and to transfer that certificate without ever getting the consent of the ratepayers of the district at all?—Certainly; we are only limiting the proposal made in the Bill, because we do see a very great objection to mere speculators getting the certificate without intending or having power to carry it out, and then trying to sell it.

334. Mr. *Sclater-Booth.*] You wish to retain the power of sale for yourselves?—Yes, certainly, with the consent of the Board of Trade.

Sir *Joseph Heron.*

30 March 1870.

335. *Chairman.*] As I understand you otherwise, the local authority would not be able to devise a scheme and get consent to that scheme without they intended to carry it out themselves?—Yes, certainly, they could not make it at all, unless they had quite made up their mind that, whatever might be the consequence, they were to carry out the works and make the line; and we are very glad to see a provision in the Bill which seems so obviously necessary, but after this certificate has been obtained we may, instead of waiting till the line is made, transfer the certificate to a company to make the line as well as work it.

336. Mr. *Loch.*] Were you in the room when Mr. Denison spoke?—Yes.

337. Did you hear the objections that he urged on behalf of his clients, the owners of coal, and so on, to those lines being placed in the hands of persons who might probably have adverse interests to the coal owners, and use them adversely to those owners?—I did hear that; but I thought the learned counsel had not been quite informed of the contents of the Bill, because his observations were clearly so entirely inconsistent with the whole scope and object of this Bill. The Bill authorises the local authorities to make the line, but positively forbids them to work it. Then there must be a mode of getting the tramways into the hands of other parties to work; I should rather suggest, that they should continue in the hands of the local authorities, but you forbid the local authorities by the Bill to work them, and, therefore, they would become useless to anybody.

338. Mr. *Sclater-Booth.*] It does not follow that the local authorities might not give the preference to one class of carriers over another?—That will arise in connection with the clauses. Our understanding of the Bill has been that this Bill is really for omnibus traffic. I thought that very question, which was put by an honourable Member of the Committee to Mr. Denison, how they were to get on and off the rail, and his stating that he was not prepared to suggest any mode in which that could be accomplished, was almost an answer to the suggestion that really you should run coal waggons upon the rails.

339. Mr. *Ayrton.*] What leads you to suppose that the Bill was merely introduced for omnibus traffic?—Merely as an opinion that I had formed; it may be a very erroneous one; but I think I shall be able to show that our amendments are upon that assumption, and are based upon the clauses that we find in the Bill.

340. Mr. *Loch.*] Shall we hear any opinion of yours as regards the liability of these lines to be used by one trading interest adversely to another?—Yes, certainly; I am quite prepared to go into that; but our assumption is this, I may be quite wrong, but that is our assumption, that the Bill contemplates tramways for omnibus traffic rather than for anything else, and, therefore, there could be no competition except between those that were competing for that kind of traffic.

341. Mr. *Sclater-Booth*] There is a clause in the Bill limiting the amount of luggage that anybody may take?—Yes; and we had added to that clause, believing that that was the intention and object of the Bill, as pointed out by that clause.

342. Mr. *Hibbert.*] Would you see any objection, supposing that your words in the 5th Clause were permitted to require the consent of the ratepayers before any sale took place; that having in the first instance, supposing the amendment in the 4th Clause is carried, obtained the certificate without the consent of the ratepayers, you should require the consent of the ratepayers before any power of sale is put into execution?—It would be quite inconsistent to say that we were prepared to adopt that suggestion, for this reason: if we were right in saying, in the first instance, that the consent of the Council, who are the representatives of the ratepayers, ought to be sufficient, we are right to say that the decision of the Council in the other instance ought to be quite sufficient. The decision of the ratepayers, at any rate in a public meeting, would be an utter farce; but I have no doubt that that will be altered by the Committee, and that if they are of opinion that the consent of the ratepayers is to be obtained in any district, they will prescribe, in some way or other, in what mode that opinion is to be ascertained, probably adopting the plan which is adopted chiefly with reference to the introduction of the Libraries Act. It is very easily arranged; but no doubt the words would refer it to the Board of Trade to determine in what manner that meeting should take place, for that is almost contemplated by the Bill as it stands; but to have a public meeting, where it is to be decided by the majority or by a show of hands, is simply a farce, because there would be no

difficulty

difficulty in getting a meeting, either by those who were promoting the tramway or by those who were opposing it; but it would certainly not represent the deliberate opinion of the inhabitants of the district. I think that every ratepayer ought to have an opportunity of giving his vote, if they are to be asked, even saying aye or no, in such manner and at such time as shall be determined.

343. Mr. *Loch.*] In the event of an application to Parliament would the corporation of Manchester feel bound to consult the ratepayers' views upon the matter?—Certainly not.

344. They cannot petition against any decision come to by the corporation with regard to an application to Parliament?—Certainly not, but under this Bill they would have an opportunity of being heard fully before the Board of Trade as individuals.

345. *Chairman.*] I think the corporation of Birmingham have already the power of laying down tramways, under a local Act?—Yes, they have.

346. Mr. *Dent.*] But they have not power to sell?—No, nor have they power to take tolls, which makes it comparatively of little value, therefore they would avail themselves, to a certain extent (of course wishing their rights to be preserved) of the provisions of this Bill.

347. Mr. *Hibbert.*] Supposing you carried out the power of sale, say after 10 years, you might do that contrary to the wishes of the ratepayers of the town, they would have no influence directly over the corporation, and therefore you might sell the concession for a number of years, against the wishes of the ratepayers of the town?—As far as Manchester is concerned, speaking merely of what the result there would be, we should be perfectly indifferent about a clause being put in, that it should only be with the consent of the ratepayers, if that was the opinion of the Committee, because I am satisfied that it would be really altogether nugatory, and would amount to nothing; but in principle I do not think there is any necessity at all, looking at the general scope and object of the Bill, and at the other clauses, for giving or making the consent of the ratepayers in such a case necessary, any more than there would be to make the consent of the ratepayers necessary to taking any steps whatever under the Bill.

348. Mr. *Cawley.*] Is it not the fact, that you have already power to let tolls and rates to a very much larger amount than you have contemplated here, without ever asking the ratepayers at all?—Yes, certainly. It is opposed to the very principle of a Municipal Corporation to be making the consent of the ratepayers necessary for any act which is authorised to be done by the council. They are supposed to be the representatives of the inhabitants for all purposes, and for all matters which it might be thought proper by Parliament to entrust to them. They ought not to have the power unless they can be trusted, and if they have the power, there ought to be no further appeal to the ratepayers.

349. Mr. *Dent.*] You are decidedly in favour, as I understand, of the power of sale being left in the hands of the local authorities?—Yes, I think it might be exceedingly important to have it, and I cannot myself see what objection there is to it. I think it might be exceedingly convenient to hand over to a responsible company the making of the line, as it would be made entirely under the direction of the local authority, instead of imposing upon the council the duty of making the tramway, which certainly is not exactly one of the objects for which corporations have been constituted.

350. Mr. *Sclater-Booth.*] You observe that the clause does not require that there should be a power of sale, but only the power of assignment or transfer?—I have not looked at it with that view; of course it says that all rights given by a certificate. As I understand, under this clause it would simply be transferring to the company, probably, the duty or the power of making a tramway.

351. Do not you see that the word "sale" involves that the authorities might put up the thing for auction, and they may get thousands of pounds bid which, of course, must be taken out of the ratepayers' pockets afterwards, or out of the travellers' pockets in increased tolls?—It is as if they had been the promoters; by this clause you might hand it over to some other body, and they would be just in the same position "as if they had been specified in such certificate, and they shall for the purposes of this Act be deemed to be the promoters." There is no doubt that it is open to the suggestion of the honourable Member, that it might be put up to auction, and I think that is the very mode in which it is contemplated to let those lines by auction, because, of course, the higher the rent obtained the more goes into the pockets of the ratepayers, and certainly there

Sir *Joseph Heron.*

30 March 1870.

would be no objection to their getting even a considerable sum of money for the concession, for after all, if you look at what the promoters are seeking to obtain, it is a somewhat strong measure to obtain the power at all without making very large compensation to those who have made the streets which they propose without any expense to occupy.

352. *Chairman.*] As the consent of the Board of Trade is necessary, it would be for the Board of Trade to say whether it would not be better, in the interest of the public, that the tolls should be reduced, rather than that a large sum should be handed over to the local authorities?—It would be entirely in the hands of the Board of Trade to say whether the arrangement proposed was satisfactory, and to determine what toll should be taken; this transaction refers to the transfer of the authority to make the line which should arise before the tramway was made, but we could not enter into arrangements with the company without putting all the terms before the Board of Trade, and obtaining their consent.

353. The Board of Trade would represent the more general interests of the public?—Yes, of everybody.

354. And if they thought that a larger sum of money was being handed over to the local authority for this concession, and that it would on the whole be better that the tolls should be reduced, they would refuse their consent?—Certainly not; you see that the tolls are proposed to be fixed by this Act.

355. That is the maximum, but, of course, each individual scheme may contain a lower maximum than that indicated in the Act?—No doubt.

356. Mr. *Dent.*] The object of the local authority getting power to make tramways of this kind is to keep the control in their own hands, I imagine?—One advantage that would result to them, if they were disposed and anxious to make the line, is that they would have the right to determine absolutely through what streets and in what direction those tramways shall be carried with reference to the interests of the public generally.

357. *Chairman.*] This clause, in fact, gives the initiation to the local authority of the whole system of tramways within their district?—Yes, the fourth clause does, and then the fifth is simply additional power given to them if they have been the parties to take the first step.

358. Mr. *Ayrton.*] Do I understand that your amendments have been made with the idea that those tramways are only to be used by omnibuses?—Chiefly so; that has been the understanding, arising from the clauses in the Bill; the Committee will see, when I come to those clauses, how it is that we have been induced, and by what clauses, to come to that conclusion, and why we do not believe that the other scheme is possible.

359. Is it your impression that a tramway constructed under this Bill can only be used by one omnibus company, if I may use the phrase?—I think there would be extreme difficulty in arranging for its being used by any others, because of the difficulty as to whether they can get on or off the line; and even if they could, as some of the schemes propose that they should be able to go off the line in case there was a breakdown, and so on, I really see a difficulty in imagining by what arrangements you can have a line being worked by a number of competing omnibus companies.

360. We may take it that, in your view, there would be but one carrying company for the conveyance of passengers?—I think, practically, that it must be partially, although I will not say to what extent, a monopoly in the hands of one company; I believe that that would be almost necessary, but, of course, I am speaking now rather with reference to the experience that we have had in Manchester, where we certainly have no competing omnibus companies, except that there are different companies occupying different routes, but I do not think that we have many. There are gentlemen in the room that can correct me if I speak wrong, but I do not think that we have any companies that are competing for traffic upon the same routes; they have divided the routes to a certain extent, but the greatest portion of our traffic in Manchester is performed by the City Carriage Company, which is a very wealthy and a very large company, and does the service exceedingly well. I do not think that we shall have much improvement if ever we see those tramways which are being now so much talked of laid down.

361. Mr. *Loch.*] Your proposal, under Clause 5, is that the local authorities shall have the power of selling the concession?—Yes, or rather, we only propose to substitute certain words; it is not our proposal.

Sir *Joseph Heron.*

30 March 1870.

362. The proposal of the Bill is that a certificate having been once obtained should be saleable by the local authority?—Yes.

363. Referring to an answer which you gave a little while ago, do you propose that the local authority shall put them up to auction, and obtain a premium, as it were, for the concession?—No, we have not proposed anything of the kind; it was only a suggestion by the honourable Member that the tramway might be put up to auction to see how much could be obtained for the concession. I do not think it is a very likely case to arise with a local authority. It is quite certain that we should never dream of handing over a concession that we had previously obtained, unless we were handing it over to a company that we thought would do the work as satisfactorily as we could do it ourselves.

364. Mr. *Sclater-Booth.*] Great objection was taken by a witness who appeared the other day, to this power of sale by the local authority, because it was said to open the door to speculation and jobbery?—I thought that the objection was rather an objection to tramways generally, and, like many other suggestions that were made which we should not at all agree in, it went rather to show the difficulties that beset the laying down of tramways at all.

365. *Chairman.*] That is to say, they were rather with the view of limiting the extension of tramways?—Yes, because I cannot see anything whatever in the objection, myself.

366. The Corporation of Manchester, in fact, is interested in works of greater magnitude than this; gas, for instance?—Yes, certainly, we are in the fortunate position in Manchester of having only one local authority for corporation business generally, and everything connected with sanitary matters, highways, gas, water and sewers, we have only one authority to deal with, so that we are in a very advantageous position as far as that goes; much better than many other districts.

367. Mr. *Dent.*] I do not, of course, think that the Corporation of Manchester would be liable to such imputations, but do not you think that the power of sale might lead to a good deal of jobbery?—I do not see how it possibly could, seeing that all those transactions have to be approved by the Board of Trade, and the Board of Trade would not sanction without making due inquiry, any such proposed transfer, especially if there were any suspicious circumstances about it. There is nothing to prevent the Board of Trade sending down an officer into a district to hold an inquiry to see whether there was any objection urged by anybody to the whole transaction. I think that is quite sufficient protection to the public, for I do not think people would be able to get large prices for those concessions, hemmed in as they are by the clauses of this Bill. There has not been much experience; we know nothing at all about tramways yet.

368. Mr. *Ayrton.*] Do your omnibuses have moveable flanges?—No, certainly not, except that on the tramway, which the Committee have heard of in Salford; occasionally they work upon the principle of having a groove in the centre between the two lines, and what they call a guiding wheel which can be lifted up by the driver of the omnibus; when he is on the tramway, which only runs a certain distance, that wheel is dropped down, and it runs in the centre groove and keeps the omnibus in the line, and when he gets to the end of the line he lifts up the wheel, and runs along the streets into the town.

369. That is a tramway proper, is it?—Yes, it is the tramway. We have no tramway except this in Salford at all; we have ordinary railways, of course, but we have not a single tramway of any kind, except this which is in Salford, and which was put down as a sort of experiment, and there is no doubt has not been kept very carefully as far as the roadway is concerned, and is the cause of considerable complaint; in fact, there are gentlemen in this room who can speak from personal experience, as well as myself, that if your carriage gets on to the line, it is very difficult to know when you will get off it, and whether you will get off without your wheel or not. In Clause 7, we propose to strike out the words "or themselves to use the same for public traffic;" that does not alter the effect of the clause, but those words seem to be unnecessary; it is in the clause that "nothing in this Act contained shall authorise any local authority to place or run carriages upon such tramway, or themselves to use the same for public traffic, and to demand and take tolls and charges in respect of the same." The words "or themselves to use the same for public traffic," do not seem to be necessary, and they caused a little ambiguity in the clause.

Sir *Joseph Heron.*

30 March 1870.

370. Mr. *Dent.*] What does "demand and take tolls, and charges in respect of the same," mean; does it mean for their particular carriages?—No, it means, as we understand the clause, simply this, that we are not to be working the tramway, or putting on carriages for which we should take tolls of any kind; I suppose an individual member might ride upon a tramway in his own carriage, if he did not take tolls, and those words seem to lead to a little ambiguity.

371. *Chairman.*] It seems to me that they are not to run carriages upon them, and to charge tolls for the use of those carriages; it may be that the words do not quite carry that out; of course there can be no objection to the local authority putting carriages upon them if they are not to be used for hire or toll?—No.

372. Mr. *Rodwell.*] In Section 7 we put in two words which settle the whole of it; after carriages we put "for profit"?—That would prevent the necessity of the words that follow the word "traffic;" "any local authority to place or run carriages upon such tramway."

373. *Chairman.*] The object was entirely to prevent the local authorities turning themselves into an omnibus company?—Exactly; that was what we understood the clause to be for. After the 35th line we propose to strike out the words "such discontinuance not being occasioned by circumstances beyond the control of such lessees." It appeared to us that that was quite unnecessary, and that if a tramway is practically not used for six months, the clause should take place. Insolvency might be said not to be within their control. With regard to Clause 8, the amendment is merely formal as to the name. We propose to make it, instead of "settle a draft of a certificate," "issue a provisional certificate." Sometimes it has been altered into "order."

374. Mr. *Ayrton.*] With regard to the 7th Section, supposing a bridge over which a tramway was made had to be taken down, and that stopped the use of the tramway, the bridge say between Salford and Manchester, what then?—I consider that that is provided for by a clause which is contained in the Bill, because we can alter a road, or do anything that we have power to do, under our Acts of Parliament; any local authority can, and if it does stop the tramway and stop their traffic, they are to be entitled to neither compensation nor anything else. It is just one of the difficulties that will be constantly arising. I do not know a case where a tramway could exist in a street without being stopped very frequently for the purpose of getting at the pipes in the centre.

375. If you do not leave this proviso in, the whole thing would be frustrated?—No; if there was a bridge built, of course "every such lease shall imply a condition of re-entry if at any time after the making of the same the lessees discontinue the working of the tramway." You see they must discontinue the working of the tramway; they would not discontinue the working of the tramway although there might be an interruption of a few weeks by means of a bridge; therefore, nobody could put that construction upon it; it must be a discontinuance when it was within their own power to have continued. However, that we will leave to the Members of the Committee; they can settle the clause much better than we can. You will determine upon that. We need not say any more. Then I would refer to the clause which we propose to strike out, Clause 9. Our clause is an exact copy, merely altering two or three words, of the clause in the Local Government Act of 1858, which is simply making the provisional certificate necessary to be confirmed by Parliament.

376. *Chairman.*] Do you concur with the other petitioners?—We entirely concur with them that it is protection enough, and a most desirable change in the Bill, because it really shuts everybody's mouth; if they are not satisfied with the decision of the local authority, even if it is approved by the Board of Trade, they have still an opportunity, which is all they could expect without this Bill of being heard by Parliament; but I think that there ought to be something said about costs in the case. I am not instructed in any way by the other authorities; but I do think that the fear of costs, in case a certificate, is without sufficient ground, opposed in Parliament, ought to be before the eyes of those who may choose to do so.

377. You think that parties who have already been heard before the referee, supposing there is a local inquiry, if they appeal to Parliament upon the subject, should be mulcted in costs if the decision is against them?—Yes; that they should have the fear of costs before them if they do not succeed. On Clauses

Sir *Joseph Heron.*

30 March 1870.

12 and 14 we simply propose that they should be struck out, because they are no longer necessary if the alteration is made in the other clause. Then we come to Clause 16, and it is proposed to introduce after the words, "level with the surface of the road," the words, "the rails to be laid down for any tramway shall be of such form and dimensions, and the carriages to be used on the tramways shall be of such width and construction, and the wheels of the carriages shall be of such form and dimensions as shall from time to time be approved by the local authority; and in case of any difference in relation thereto, the same shall be determined by the Board of Trade." I would merely say with regard to that clause that we are anxious that there should be nothing in the Bill to prescribe actually what sort of tramway, or what sort of wheels should be adopted, as nobody seems to agree which is best.

378. Would not you leave that to be determined in the particular case by the local authority with the consent of the Board of Trade?—That is exactly the alteration which I was just reading at the moment; but we do think it very important that the Bill should not say that it should be a grooved line, or a grooved wheel; but leave it open for any improvement that may be made to be adopted if there should be any.

379. Would you adopt the same principle as to the gauge?—Exactly; I do not think that anybody can say what the gauge ought to be.

380. Mr. *Dent.*] Are you against a uniform gauge being defined by the Bill?—Yes.

381. You do not think that there would be an advantage in having the same gauge as a railway?—I do not see any, but it might be so, and if it should turn out to be the case, there would be no difficulty in making it so; but I think there would be an objection to fixing by the Bill a uniformity of gauge; I think everybody must agree that what was said, that we have not yet had much experience about tramways, is perfectly true, and I am sure that the less rigid the Bill may be made in the interests of the public, and the more opportunity there is for discretion being exercised, the better it will be for all parties having the Board of Trade to appeal to in case of difference.

382. But supposing this Act to become operative, and tramways to become very general in rural districts, and that they are to take the place of railways to supply rural districts, do not you think that it would be a great advantage that they should be the same gauge as railways, and that there should be facility to run railway carriages or railway trucks on to those tramways?—I can easily imagine that in such a case it would be so obviously convenient, that there would scarcely be a difference of opinion. On the other hand, if you were to fix the railway gauge by the Bill, that would involve that width in all the streets of Manchester, or any other town through which it might be proposed to take a tramway. The great difficulty and inconvenience which the proposed tramways will have to encounter, will be in towns to find streets of sufficient width to enable them, even with the narrowest gauge which is practicable, to be laid down at all.

383. You think that that might be safely left to to the Board of Trade to determine?—I think it is most desirable that it should not be fixed by the Bill.

384. Mr. *Dalglish.*] You would leave the fixing of the gauge, I suppose, very much to the local authority?—No doubt; and whether it was the local authority or other parties with the consent of the local authority, no doubt they would in the first instance fix the width of the gauge with reference to the particular circumstances of the district through which they were proposing to form the tramway.

385. Mr. *Hibbert.*] You would not object to leave it to the Board of Trade?—No; it is proposed in all cases, so that it all gets back to the Board of Trade. Originally, those arrangements probably would be made in the country, but practically it all comes back to the Board of Trade to settle those knotty questions in case there is a dispute.

386. *Chairman.*] It would be possible, would it not, for the Board of Trade to lay down two gauges, one the ordinary one, and another an exceptional gauge for particular cases?—No doubt in country districts there would be no difficulty if it were in connection with a railway, and I think as a feeder for the railway, it might be very desirable to have the same gauge, but in a town district the question will be how narrow they could make it. But as regards carriages, and

Sir *Joseph Heron.*

30 March 1870.

as regards the gauge, I know that now the very question has arisen even in Liverpool, and now they are to lessen the width of their carriages, but not the gauge, as soon as they can, because they find the difficulty of working the traffic.

387. What is your next amendment?—The next amendment is in Clause 18. We leave out the word "generally," and insert the words "to the satisfaction of the road authority." I do not think that is objected to. Then, in paragraph 3, at line 33, after the word "shall," we insert the words "bear all"; and the paragraph of the clause as we propose it to read is, "they shall pay or bear all reasonable expenses of the repair of the road." Then we put in, "to the satisfaction of the road authority," "for six months after the same is restored," and then we strike out the words "as far as those expenses are increased by the opening or breaking up." We suggest that alteration, because there would be maintenance and repair, and we would even be able to decide how much of the expenses are due to breaking up and opening. Six months would be a short time for them to repair the portion of the road that they interfered with. The Corporation have been bound to keep in repair roads on which there are tramways, more or less, for a year after we have laid them down, and in some places for two years and three years.

388. That is over roads which are not under your control?—It would be a reasonable compromise with the promoters, and a liberal compromise to us, that they shall pay all reasonable expenses of keeping the whole road in repair for six months along which they have laid down their tram, and then after six months' time to keep in repair that portion of the road which belongs to them.

389. Mr. *Dent.*] We had 18 suggested by the road authority?—They did not propose to make them responsible for the whole road; we proposed to make them responsible for six months for the whole road, because it is well known, that after a road has been broken up for any purpose, considerable expense arises in keeping the whole road generally in a satisfactory state; let them keep the whole of the new road in repair for six months, and then they come under the next clause which makes them liable. The only words we propose to add to that clause are in line 36, after the word "direct," to insert the words "And to their satisfaction," and so on.

390. That is a clause proposed in the interest of the road authority?—It occurred to me, whilst the proposition was being made, that the most satisfactory proposition would be, that they should keep the whole of the road in repair in which they laid down their tramways in part, and, practically, it would come very nearly to that. If they were to go three feet on each side it would really become a question of inches, in fact, as to how much is left for the public; there would be so little left to be repaired by the road authority, that it would be better to say that they should keep the whole road in repair along which a tramway went. We have not thought that we could propose to increase the extent that was proposed by the Bill, that being already sanctioned by other Acts of Parliament which have been granted.

391. Is it not desirable that the road authority should be the authority responsible for the whole of the road?—That really is a very difficult question, because in the first place there is great difficulty in leaving one portion of the road to be repaired by the company, and the other portion to be repaired by the road authority; there would be always questions arising, whether the want of repair was really caused by the promoters, or whether it was caused by the road authority, whoever they might be; there is extreme difficulty about it. We do not feel quite disposed to suggest that the road authority should, at the expense of the promoters, keep the whole of the road in repair, because if we were to propose that, and Parliament were to say carry it out, we should then become responsible ourselves, for all those inconveniences and annoyances which many people think are necessarily connected with, and cannot be got rid of, when tramways are laid down in towns; we should then have all that responsibility upon our shoulders. I heard the engineer of the Corporation of London say the other day, when he was speaking very strongly on the subject of tramways, that he believed it to be an utter impossibility to keep a road in a satisfactory state with a tramway, and that it would inevitably be a nuisance to the other traffic. All the responsibility would devolve upon the road authority, if we were, by the Act, made liable to keep the road in repair. I have no doubt that, practically, the working of it would be this, for I do not believe it would be possible for two

bodies

bodies to keep the road in a satisfactory state; and that the working of the Act would probably be that the road authority would agree with the company, or the promoters, to keep the road in repair only as their agents, leaving them responsible for anything which might arise, for a certain specified amount. That, I believe, probably would be the operation of it. Sir *Joseph Heron.* 30 March 1870.

392. The road authority, even if the tramway were made, would be responsible for the part of the road where the tramway was?—The persons who would be the first to bear the blame in case there was any want of repair would be the promoters, who are bound to repair after the tramway is made. This Bill would relieve the road authority from all responsibility, except that of summoning the promoters, and taking steps against them, if they fail to do what the Act of Parliament imposes upon them; but it is quite clear that the legal responsibility would be removed from the road authority.

393. The inconvenience to the general public would be very great, if the road authority are not responsible for that part of the road being kept in good repair, as well as the other part?—This Bill does not make it so.

394. But would it not be better that it should be made so?—I am not at all prepared to say so, for I think it is making us responsible for things over which we have no control, and also making us responsible for contingencies which we believe are inevitable.

395. We have had road authorities before us who rather desired to keep that responsibility; they say that it will be a very inconvenient thing to make a set of rules to repair one side of the road in one way, and to make another set of rules for the other side of the road, and therefore they wished to have the responsibility of the repair, charging the tramway companies with the expense?—If the Bill carries out the suggestion which the honourable Member makes, we could not object, only they would have to take care that there were such clauses put into the Bill as would not indirectly make the road authority responsible for that over which they might not really have any control, although they would be responsible for keeping one part of the road in repair.

396. Mr. *Ayrton.*] Who is to be responsible to the inhabitants for having their roads kept in repair; you have told us that you consider that the corporate bodies, as the representatives of the inhabitants, are bound to look after their interests, but yet you propose to absolve the corporate bodies now from that duty, do you not?—Not in the slightest degree; I propose simply to take the Bill as it is laid before the Committee by other and better authority a great deal than my own. That Bill places the responsibility of repairing the portion of the road which is interfered with by the tramway on the promoters who work the tramway.

397. Mr. *Cawley.*] Is not this the practical working of it; under the Board of Works Act and Gas Acts the responsibility of maintaining the roads for a certain time is thrown upon the parties laying down the pipes, but I do not apprehend that that removes the primary responsibility from the road trustees; the practical working, so far as I know, is, that a charge is generally made to the parties who are responsible, namely the road trustees, but the work is actually done by those who have charge of the roads; is not that so?—That is generally the case; you make an agreement with the road trustees; you make an arrangement to pay or receive a certain sum for the work which is done by others; that is the way we have done for miles of road. We agree with the road trustees to pay so much per annum whilst our responsibility lasts.

398. *Chairman.*] By this Bill, if a tramway is made, the tramway company would be responsible for the portion of the road occupied by the tramway?—As the Bill now stands, clearly.

399. I think that is the effect of the private Acts which have already been passed, is it not?—Certainly, no doubt subject to the suggestion which has been stated.

400. The effect of the existing private Tramway Acts is, that that portion of the road which is occupied by the tramway companies is under the control of the tramway companies, and that they alone are responsible for it, and the road trustees are absolved from responsibility?—No doubt. Of course, as representing the inhabitants, all that we should have to do would be to exercise the power under this Act; to summon, for penalties or otherwise, the promoters, in case they should not do what under the Act they are bound to do.

Sir *Joseph Heron.*

30 March 1870.

401. In the interests of the public you would be able to take proceedings against a private company who has charge of that portion of the road occupied by the tramway?—Certainly.

402. Mr. *Dent.*] But proceedings must first be taken against the road authority?—I am speaking of what would be the duty of the corporation with respect to the inhabitants. This Act imposes a certain responsibility upon the promoters of the tramway which, if they neglect, they are liable to penalties, and the duty of the corporation would be to summon the promoters for the penalties for not keeping the road in a proper state of repair.

403. Mr. *Ayrton.*] Under Clause 19 it is the duty of the road authority, if a tramway company fail to repair a road, to enter and repair the road at its own cost, and then recover the expenses, if they think fit, from the promoters?—That is a power given.

404. If they think fit they may do so?—Clause 19 is this: "The promoters shall, at their own expense, at all times pave and keep paved in good condition and repair, with such materials and in such manner as the road authority shall direct." Here we propose to put in the words, "and to their satisfaction." The clause then proceeds, "so much of any road whereon any tramway belonging to them is laid as lies between the rails of the tramway and (where two tramways are laid by the same promoters in any road, at a distance of not more than four feet from each other) the portion of the road between the tramways, and in every case so much of the road as extends 18 inches beyond the rails of and on each side of any such tramway; provided always that if they fail to comply with the provisions of this section, the road authority, if they think fit, may themselves at any time after seven days' notice to the promoters, open and break up the road, and do the works necessary for the paving, repair, and maintenance of the road, to the extent in this section above mentioned, and the expense incurred by the road authority in so doing shall be repaid to them by the promoters."

405. Having that power, do you not think that the road authority can be indicted for allowing a road to get out of repair?—No, they say "if they think fit," and Parliament would be obliged to say that the discretion is put into their hands, and that they are not bound to do it, unless they do think fit.

406. Mr. *Hibbert.*] Is not your objection to this clause that it leaves two different parties to keep the road in repair at once, namely, the promoter as to one part of the road, and the road authority as to the other part of the road; would it not be better either to make the whole of the road repairable by the promoters, or the whole of the road repairable by the road authority?—I have already stated what appeared to me to be a *primâ facie* objection to that responsibility being cast on the road authority, because, I believe the duty of keeping the road in a satisfactory state on which a tramway exists will be extreme. I believe you will be obliged to have paviors engaged almost from day to day, and from morning till night, in one part of the road or another, and it will be extremely difficult to accomplish the object even with all the care and attention which might be exercised. Then, if the road authority were made to act, although the expense was to fall upon the promoters, they would really be responsible for any possible defect that might arise, and which it was possible, or might happen, that they could not really escape from.

407. Would it not be a very great inconvenience that the promoters of the tramway should repair the road to a certain extent, and the road authority repair it for the remainder?—I have no doubt that practically there would be great difficulty, and, as I have already said, in most places, I think, the arrangement would be just what has been suggested by the honourable Member, namely, the sort of arrangement we make under waterworks and other Bills, where the parties are responsible for keeping the road in repair a certain time, and on arranging to pay a certain sum the road authority do the work, and take the responsibility, as it were, from them. I think that would be the arrangement in places like Manchester; they would agree with those who had to do the paving of the other portion of the street to pay them a certain sum annually for keeping their share of the street in repair, but the difference is this: that the legal responsibility, if any, in an action for damages, or anything of that kind, would still rest upon the promoters of the tramway, and would not be transferred even by that arrangement, to the surveyors or repairers of the road.

408. It might become a question of measurement; as to how many inches it was from the tramway?—That is just where I see the extreme difficulty. I have

no

no hesitation in saying that if any plan could be suggested by which the repair of the whole of the road would be in the hands of one party, it would be a very great improvement, and a very great advantage.

409. *Chairman.*] Will you now go to your next amendment?—In Clause 20 the alteration is merely verbal; it is only making it 7 days instead of 14. I do not think anyone would think that that was wrong. Then in line 28, after the word "water," we propose to insert the words "or gas." Then in Clause 21 we think there ought to be a map. After the word "with," in line 43, we propose to insert the words, "A plan and section of the proposed work, and" so on. That I am sure nobody will object to. We also propose that the 14 days should be made 21. I do not think anybody would object to that, for it seems only a reasonable time to give. The next alteration we propose is in Clause 24, which is the clause that made us imagine that the Bill was only contemplating omnibus or such like traffic. We propose that these words should be added after the word "only," in line 11. Perhaps I had better read the clause as it stands, in the first instance: "The promoters of tramways and their lessees may use on their tramways, carriages with flange wheels, or wheels specially adapted to run on a grooved rail; and, subject to the provisions of this Act, the promoters and their lessees shall have the exclusive use of their tramways for carriages with flange wheels, or other wheels specially adapted to run on a grooved rail. All carriages used on any tramway shall be moved by animal power only." The addition we propose is after the word "only:" "And shall be constructed for the conveyance of passengers, and no goods, articles, or things, other than passengers' personal luggage and parcels, not exceeding 28lbs. in weight, shall be carried in or upon such carriages."

410. In your opinion the Bill ought to be confined exclusively to omnibus traffic?—Yes, it appears to me that this would confine it to omnibuses; that is our opinion, too. We do not think it possible to work goods traffic and omnibus traffic on the same line.

411. But supposing a line were devoted to heavy traffic?—There could be no objection at all, if the heavy traffic were limited to such hours as omnibuses were not running. Omnibuses are running every three minutes in any densely-populated district, where a tramway would be really made to pay, or it would not be worth while to lay it down. The omnibus has to be continually in motion. We should not expect omnibuses to go eight miles an hour, which is quicker than ever we can find them travelling with us; but they go with passengers very quickly. Of course, having coal carts and luggage conveyances going at that rate is impracticable, and then there is this additional difficulty, that the omnibuses do not require to get off the line; it is their business to be on it, and to work on it in some way.

412. The effect of your amendment is rather, that when a line is laid down for omnibus traffic it should be kept for omnibus traffic and no other traffic?—Exactly.

413. Mr. *Dent.*] The effect of your addition is, to limit the operation of the Act of Parliament entirely to the construction of passenger tramways altogether?—Yes, that is the effect of the last amendment which I have suggested.

414. *Chairman.*] But I do not understand that that is your wish?—Not in the slightest degree. We do not want to prevent parties applying for, and obtaining a tramway for goods alone, if they can show any sufficient case for it.

415. Mr. *Dalglish.*] Supposing a line was laid out sufficient for goods traffic as well as passenger traffic, this clause would altogether prevent omnibuses running upon it?—Yes; this amendment, no doubt, does suggest that no line shall be laid down except for omnibuses which should run for the conveyance of passengers. That is what we contemplate.

416. The addition of those words to this clause would prevent the use of a line calculated to run heavy traffic for *omnibi*?—You mean heavy goods, I presume?

417. It would prevent omnibuses running on a line for heavy traffic, supposing a line laid down suitable for heavy traffic?—No, I do not think it would; it would not affect at all the addition of a line laid down for goods expressly. But, probably, it is quite sufficient for me to say, that our feeling is, that these lines are practically for the conveyance of omnibus traffic, and that it is inconsistent to unite heavy goods, such as coal traffic, and other such traffic, with omnibus traffic, because it could not be so worked.

Sir *Joseph Heron.*

30 March 1870.

418. Mr. *Ayrton.*] All you mean to suggest, so far as I understand you, is, that it should be lawful for the President of the Board of Trade to grant a certificate for a line to be used exclusively by omnibuses, and when such certificate shall be so granted, then that nothing but omnibuses shall run upon it?—That is, practically, all that we desire. Of course we do not object in the slightest degree to people asking for and obtaining a certificate for a tramway for the conveyance of goods.

419. Or anything else?—Or anything else.

420. Mr. *Dent.*] But your amendment goes far beyond that?—I am reminded that this is an amendment proposed by Liverpool, Manchester, Birmingham and Leeds. I ought to have said not by Salford and West Derby.

421. Mr. *Dalglish.*] Suppose two railway companies found themselves able, on any of the streets, to make a communication to be worked by horses alone, which would connect their two railways, and they wish to use it for the purpose of moving their passengers with their luggage or other traffic, your clause would prevent them from constructing it?—I have already explained the only object we have in this clause, and if it would prevent carrying out what has been suggested, of course it would require alteration and modification. All we wish is, that if it is an omnibus line, it shall be an omnibus line. If it be granted for goods also, then, of course, there will be liberty to run goods on it.

422. *Chairman.*] Your amendment is framed on the supposition that the Bill contemplated omnibus traffic only?—Certainly.

423. If it deals with other traffic you have no objection?—There would only have to be special provisions with reference to that other traffic. We do not want in the slightest degree to keep off other traffic.

424. What is your next alteration?—The next alteration is in page 14. It is with reference to the licenses. The clause says, "the licenses shall specify the tolls to be paid to the promoters, or to their lessees, by the licensee or licensees, for the use of the tramways." We propose to strike out the words which follow, namely: "Such tolls to be not less than one farthing, nor more than one halfpenny per mile for each passenger carried by the licensee or licensees on the tramway." It is quite clear that those tolls will be absolutely prohibitory. We think that there has been no experience yet or knowledge which would enable a Committee on a Bill to fix the tolls. It is impossible to say what those tolls ought to be. We suggest that they shall be left to be fixed by the Board of Trade, in fact, under this clause.

425. That clause, I think, is taken from the Acts of last year?—I am not aware; but, however, that is a matter which does not so much interest or concern corporations.

426. You think it should be left to the Board of Trade to determine what should be the tolls?—It is quite certain that that clause will prevent the possibility of anybody asking for a license; it is to give licenses to parties where the promoters are not doing their duty. The clause is altogether nugatory; no licensee could ever earn anything; he could not live,

427. What is your next alteration?—The next alteration which we propose is in Clause 31. It is proposed to insert after the word "Act," in line 18, the words "and to the approval of the Board of Trade." It seems to us desirable that these agreements should be submitted to the Board of Trade. Then, in Clause 32, the alteration which is proposed is only to carry out, to a certain extent, the alteration we have suggested with reference to the assent in the first instance. It is using words which will make the consent which is required to apply for a certificate sufficient for this purpose. We propose after the word "authority," in line 27, to leave out the words, "with the consent of the ratepayers in each district (such assent being testified in like manner as consents to the making of tramways under this Act) may," and to insert these words, "in the like manner and with the like consent as is required in relation to the application for a Provisional Certificate." Then, in line 33, after the word "years," we propose to insert these words, "or within such shorter periods in either case as may be agreed upon, the promoters and the local authority may;" and in line 37, after the words "paying the," to strike out the words "value of," and insert "their present actual value of the tramway, and." We also propose to leave out in lines 39 and 40, the words, "and the value of the tramway estimated as a constructed work." Then we propose to have these words added, which would show clearly the principle of valuation, namely, in line 41, after the words

words "to be," to insert the words "fixed without any allowance or compensation being made for goodwill, prospective value, compulsory sale or other consideration whatever."

428. Do you think that the words of the clause, as they now stand, do not sufficiently exclude the goodwill?— We know how high items of compensation in valuations are put, but unless you exclude the use of very positive and express terms we do not believe we could ever carry out valuations without their being edged in in some way or other.

429. You doubt whether the words have the effect of excluding goodwill?—Exactly; we are only anxious to prevent it being a matter of controversy. We are also anxious to have these words in the clause proposing to fix 21 years and then seven years. After the words "21 years" we should wish to insert these words: "or within such shorter periods in either case as may be agreed upon between the promoters and the local authority, may with the Board of Trade," and so on. That is simply in the cases of parties owning property were prepared to say that at the expiration of 14 years they would sell; such an arrangement might be practicable.

430. It is always open to them to enter into a contract, is it not?—I do not know whether it would be when there is an express provision in the Act. We want to take advantage of this clause.

431. Mr. *Ayrton.*] Do you think, in the sale of an undertaking, that the distinction should be kept in view between the parties as owners of tramways and the parties as carriers, and that they should only be able to sell the tramways as owners of the tramways, and not to sell their business as carriers?—I do not think this clause contemplates anything to be done with the traffic.

432. Does it not say, "shall sell their undertaking"?—That is the tramways under this Act.

433. If they are carriers their undertaking is the business of carriers, is it not?—No; the undertaking is the tramway, as we understand the meaning of this provision of the Act.

434. You will find these words in the clause, "all lands, buildings, works, materials, and plant of the promoters"; what do you understand by those words?—That is for the purpose of the tramway; that is the way we understand it. There might be many trades connected with the working of the line. I am only expressing what our understanding of the clause is; that it really is a tramway only. We do not think it would include in any way, directly or indirectly, business of any kind.

435. Or any business carried on by the use of the tramways?—No.

436. You do not understand that the words, "lands, buildings, works, materials, and plant," apply to collateral land, such as houses where horses are kept, and so forth?—It would apply to houses where horses are kept, probably, because they are necessary to the working of tramways. The word "plant" would imply carriages, and might include horses. They might fairly say, "If you buy our tramways you must buy our omnibuses and horses, for they are of no use to us without the tramways." I do not think it would carry anything beyond that.

437. *Chairman.*] It includes the rolling stock which is necessary for the working of tramways?—Yes.

437*. Mr. *Ayrton.*] Then you do contemplate buying all property incidental to the business of a carrier on tramways?—Yes.

438. *Chairman.*] By a previous clause of the Act the local authority are forbidden to work the tramway themselves, therefore if they purchase all the rolling stock and horses and carriages it would become a very expensive affair?—They could only buy them to sell again. I am not very hopeful about it. There is no inconsistency in it. There is a piece of property which they cannot use for the same purpose as those who preceded them, but they can sell it again. They would only be buying for the purpose of taking up the line, if they found it was undesirable to sell it to somebody else who was to carry on the business.

439. They might buy it for the purpose of enabling them to reduce the fares?—Exactly.

440. Mr. *Dent.*] How are they to reduce the fares unless they work the line themselves?—They might sell it to somebody else on certain conditions, one of which might be that they will only charge such and such fares.

440*. *Chairman.*] Or having the power of purchase, they would be able to sell

Sir *Joseph Heron.*

30 March 1870.

it to a company and be able to provide for a reduction of the fares?—If they were to purchase it against their wish.

441. Mr. *Ayrton.*] Have the corporate bodies for whom you speak considered this question; are you able to speak on behalf of the councils of the corporate bodies on this point, whether they think it desirable that they should have the right of purchasing the tramways alone, or whether that purchase must necessarily be encumbered with the purchase of the business of the company as carriers on the tramways?—I am speaking, I believe, the opinion of the corporations whom I profess to represent; they are represented by their town clerks, and they are represented by members; they have been in London when all these points have been considered and discussed. Of course my answers to many of the questions which I have been asked must only be taken as my own opinion, but as far as the amendments show the wish and desire of those corporations, those amendments may be taken as the opinion of all.

442. *Chairman.*] Have you examined the Private Acts of last year by which tramway companies were established?—Not very carefully.

443. Are you aware that this clause is the same as clauses in those Acts, with the exception that goodwill is excluded?—Exactly; I believe the same clause has been introduced into all the Private Bills that have been adopted as affecting Manchester and other places.

444. They have all included goodwill in plant and rolling stock?—They have.

445. Mr. *Dent.*] Suppose the case of a company having constructed a tramway, does this clause enable the local authority, at the determination of 21 years, to compel the promoters to sell not only their tramway but their rolling stock?—I take it that it does, but I think it would be very unreasonable if it did not. If you take power to compel them to sell the tramway, I think as a matter of justice you should buy everything of them which is required for using and working the tramway.

446. I am supposing the company do not want to sell their plant; does this clause give them power to buy compulsorily, whether the promoters wish it or not, not merely their tramway, but to buy the horses and carriages which they may have, in order to run on their tramway?—I look upon it rather as an obligation which must follow upon that, but if it is thought desirable to exclude anything of that kind, if the promoters or corporation wish it, I do not suppose the local authorities would have the slightest objection; but it appears to me, that if you want to have powers compulsorily to buy tramways, you ought to be compellable to take, with the tramways, the omnibuses, horses, stables, and everything which they have erected for the purpose of working the tramways.

447. Mr. *Ayrton.*] That assumes always, that the promoters are to have the exclusive use of the tramways on the theory which you have previously mentioned?—Yes.

448. *Chairman.*] On the supposition that the concession has been given to them on that principle?—Yes.

449. You think it would be reasonable to frame the clause in that way, if required by the promoters?—I have assumed that that would be so obviously; they would say, if you take the tramway, you must take everything that we have provided for working it.

450. Mr. *Ayrton.*] You consent to that view, provided your theory is adopted?—Exactly.

451. *Chairman.*] What is your next amendment?—We propose in Clause 33 striking out the words beginning in line 12. "Such discontinuance not being occasioned by circumstances beyond the control of the promoters." After Clause 35, we propose to add Clause 35A, which is that "Every passenger travelling upon the tramways may take with him ordinary luggage, not exceeding 28 lbs. in weight without any charge being made for the carriage thereof." That is a clause which is taken from the Liverpool Tramways Act; then we propose to add Clause 35B, "A list of all the tolls and charges authorised by this Act to be taken, shall be exhibited in some conspicuous place inside each of the carriages used upon the tramways." Those are two new clauses, which you will find at the bottom of page 16, taken from the Liverpool Tramway Act.

452. Mr. *Dent.*] Would not 35A rather be for each separate Act, than for a general Act?—These provisions must be in the Act; you are making all similar provisions. As I understand, it is only proposing that parties shall not be charged

charged for a moderate quantity of luggage. They might say, we will not take it until you pay an extra charge. With reference to Clause 36, I may be allowed just to state, that as far as Manchester and Salford are concerned, all we propose to add to Clause 36 are these words, "And a copy of all such bye-laws shall, within seven days after the same have been sent to the Board of Trade, be delivered to the local and road authorities." My learned friend, the Town Clerk of Liverpool, wishes to suggest a clause in addition, which, with the Committee's permission, I willl eave him to explain the object of. What is proposed in lieu of Clause 36 is this: "It shall be lawful for the road authorities, from time to time, to make such regulations as to the rates of speed of, and the distance to be observed in travelling between, and the stopping of carriages using the tramways, and for regulating the travelling upon or using and working of the tramways and carriages running thereon, and the street traffic in the streets in which the tramways are laid, and for better enforcing the observance of all or any of such regulations, it shall be lawful for the road authority to make bye-laws for all or any of the aforesaid purposes, and from time to time to repeal or alter such bye-laws and make others, provided that such bye-laws be not repugnant to the laws of that part of the United Kingdom where the same are to have effect, or to the provisions of the Act." 36A is a very important power, which I hope it will be thought desirable to give. "The local authority shall have the like power of making and enforcing rules and regulations, and of granting licenses with respect to all carriages using the tramway, and to all drivers, conductors, and other persons having charge of or using the same, and to the standings for the same, as they are for the time being entitled to make, enforce, and grant with respect to hackney carriages, and the drivers and other persons having the charge thereof, and to the standings for the same in the streets and district of or under the control of the local authority." The fact is, that unless we can license the drivers and conductors of omnibuses it is a great inconvenience. In Manchester we have not the power to license the drivers and conductors of omnibuses; in other towns they have the power, and we have found a difficulty arising from the want of that power. It is not so much for the assistance of the managers in keeping order with their drivers, as the public, who are so much interested. We think we should have power to license them.

453. *Chairman.*] And that no other persons should be employed on the carriages?—Yes; so that we should have some control over them.

454. What is your next amendment?—In Clause 44, after the word "any," we propose to insert the word "petroleum." Clause 45, it is suggested, should run thus: "If any person (except under a lease from or by agreement with the promoters or under license from the Board of Trade, as by this Act authorised) uses the tramway, or any part thereof, with carriages for the conveyance of passengers for hire having flange wheels or other wheels specially adapted to run on a grooved rail, such person shall for every such offence be liable to a penalty not exceeding 20 *l.*, leaving out the words 'over and beyond any tolls which may be payable by him or them under this Act.'" We propose to strike out the words "an edge rail," which, it is thought, is very objectionable.

455. Supposing an omnibus without a flange wheel using one of these tramways habitually for the purposes of traffic, what is there to prevent them doing so?—You cannot prevent them; that of course would depend somewhat on the form in which the Bill leaves the Committee; but the understanding is that whether they are public or private carriages having an ordinary wheel not specially adapted for running on tramways, they should be allowed to use the tramway if possible.

456. And supposing they are specially adapted and in the form that the omnibus company has tried, with wheels for the expressed purpose of using the tramways, although not flange wheels, do you think there is anything to prevent them?—I do not think this will affect it. I think that very question is now being raised before the Vice Chancellor in the case of Liverpool.

457. Mr. *Sclater-Booth.*] Was that the case of an omnibus specially adapted to running on a tramway?—In Liverpool they have altered the gauge of their carriages; they put an omnibus on the line in front of the omnibuses belonging to the promoters of the tramway, and they ran before them, and probably will run at lower fares.

458. *Chairman.*] The horses have learnt to hug the rail, so that they use it very much?—They have as complete a use of the tramway as if they were specially

Sir *Joseph Heron.*

30 March 1870.

cially constructed for running on it subject to the liability of occasionally getting off the line.

459. Mr. *Sclater-Booth.*] They have no guide wheels?—They have got no guide wheels, but they can run on the tramway, and are doing so. That is the question which has arisen. The town clerk of Liverpool will be able to give you information upon that. I believe that is the question which has been raised before the Vice Chancellor.

460. Mr. *Ayrton.*] All this will depend on whether they use the tramway, properly so called, or a sunk or case railway?—Yes; it will depend on what is in the Bill. The Bill proposes to exclude carriages with wheels prepared specially for running on tramways.

461. Any private carriage or cart could run upon any ordinary tramway?—Yes, that is the question that is now to be determined, because in those cases the rights of the public are not to be in any way interfered with, so that the public may have the same use of the tramways as those who have gone to the expense of making them.

462. On a case rail any person could not run?—No.

463. *Chairman.*] What is your next alteration?—In Clause 49, there is rather an important amendment; I do not think it is one which can possibly be objected to. The clause as it stands is, "Nothing in this Act shall take away or affect any power which any road authority has by law to widen, alter, or improve any road." We propose that it shall read in this way, "Nothing in this Act shall take away or affect any power which any road authority may have by law to widen, alter, or improve any road, and in any case where any street shall be widened, the road authority may, at the cost of the promoters, remove any existing tramway, and lay down the same in such altered position in the street as shall, in the opinion of the road authority, be desirable." A road might sometimes be doubled in width, and it might be very necessary or desirable to go to it.

464. Mr. *Dent.*] Should not that be done at the cost of the promoters?—No, because according to the principle of this Bill, they are subject to the liability of their tramway being interfered with at their own cost and expense, in case it is necessary for the purposes of the public, because they get enormous advantages by being allowed to use the streets, and certainly the public ought not to have cast upon them extra and additional expense in consequence of tramways being there in carrying out necessary works. We should like to see the words in Clause 51, "save as in this Act provided," struck out. It should read, "Nothing in this Act shall take away or abrogate the right of the public to pass along or across every or any part of any road along or across which any tramway is laid, whether on or off the tramway with carriages having ordinary wheels." We think the words "save as in this Act provided" seem to assume that the right of the public is interfered with. I fancy that is not intended, and we are desirous that there should be no possible controversy on that question.

465. Mr. *Ayrton.*] Whether it is a tramway, or whether it is a railway, it must be so laid down that an ordinary carriage can drive on the road without injury, and that horses can go along without being tripped up?—Certainly: that is our wish and our desire, but I can say that we have no very strong expectation of its being realised. That is certainly our opinion that the rail, whatever it may be, shall be level and flush with the rest of the road.

466. Your view is that that should be the right of the public, to be enforced against the company, and if they do not perform it, that it shall be at their own peril, because that might lead to mischievous results?—There are two or three clauses that I hope will in some way be put in. There are no powers by this Bill to get rid, under any circumstances, of a tramway which has been once laid down. We think it really extremely important that a similar clause to one contained in a Metropolitan Act, as to the removal of tramways, if after three years, or within three years, they are found to be an absolute nuisance, shall be inserted in this Bill, and that there shall be the power of getting rid of them, and that we should not be obliged to endure that nuisance for at least 21 years, if they once get possession of our streets.

467. If they fail to fulfil what you have described?—Exactly; the clause to which I refer is the 37th Clause of 32 & 33 Vict. c. 101, which is the North Metropolitan Tramway Act, 1869, the title of which is, "An Act to authorise the Construction of Street Tramways in certain Parts of the Metropolis North of the River Thames, and for other Purposes." The clause is a very lengthy

lengthy one; but all we desire is, that there shall be the means under the Act of getting rid of a tramway in case circumstances should arise to warrant it.

468. *Chairman.*] Perhaps you will hand the clause in?—Yes. (*The Witness handed in the same.*)

469. Mr. *Sclater-Booth.*] You think those clauses are sufficient for the purpose?—I think they are; we think the fact is one that should be recognised. Then there is another point which is rather important, although the clause is very short. Something has been said about not paying the full rates, and the introduction of a clause from the Local Government Act was suggested; we should be very sorry to see that clause introduced. We do not think that it is in any way necessary to be connected with the Bill, that is to say, making them liable to a quarter of the rates, or something of that kind. I did not exactly hear what was the object of the clause, but we think "the promoters or lessees having such exclusive user of tramways" (and it is so considered by this Act) "ought to be assessed as occupiers thereof to all parochial and municipal rates." We are liable to rates for going under the streets, and we certainly do think that if ever there was a case for making the occupiers of these tramways, or making anybody liable for rates, it is the occupiers of a portion of our streets for the purposes contemplated by this Bill.

470. *Chairman.*] Would not that be so without any provision?—I do not think it would.

471. Mr. *Ayrton.*] Would it not be so if they were exclusive of the occupiers?—That would be a question.

Mr. *Rayner* (the town clerk of Liverpool) stated that the question had already arisen whether they were assessable or not to any rate whatever.

The *Witness.*] We think it ought to be clearly stated in the Bill that they shall be liable to all rates.

472. Mr. *Dalglish.*] How would you value the property?—There would be no difficulty at all in that; it is only what it is worth to let. Supposing the local authority had made the line, the very terms would to a certain extent determine the value of the property as far as regards stables, and everything of that kind, there would be no difficulty.

473. Mr. *Sclater-Booth.*] If you make them pay, we will say one-third of the cost of repairing the street through which they go, by the terms of the agreement do you think it would be fair afterwards that they shall be rated generally?—I think so decidedly, because it would reduce their liability; they would be able to show that under the Act they were subject to certain annual expenses in repairing the streets, and that the traffic was only worth so much per annum to let, and therefore their liability would be reduced *pro tanto.*

474. *Chairman.*] The traffic would be taken into consideration with this property?—With all the legal liability imposed on it by the Act in fixing the rateable value.

475. Mr. *Cawley.*] If it belonged to the local authority it would be a matter of indifference whether they were rated or not?—Certainly.

476. *Chairman.*] But if in the hands of a company for beneficial purposes, then there would be very little doubt that it would, without any clause to that effect, be liable to rates?—I am not quite sure whether questions might not arise as to the nature of the occupation of the company of a tramway; but, assuming that it is clearly agreed that they are and ought to be liable, we should much prefer that it should be distinctly stated in the Act, so as to prevent any litigation arising, because certainly there would be litigation as to their liability if it were not so expressed.

477. Mr. *Hibbert.*] I see you propose to strike out these words at the end of the schedule, "which is not assessed to the county rate of any county by the justices of such county." To make that definite that ought to apply to all cases?—To all places like Salford. It is evidently an oversight to put those words in; in fact, it would exclude a large proportion of the corporations, for it is only where there is a court of quarter sessions existing that the borough would be included. It is obviously a mere clerical error, and those words, "which is not assessed to the county rate by the justices of such county," should go out. I will now read a clause which we think ought clearly to form part of this Bill: "Provided always, that the Board of Trade may, if they think fit, dispense with any such consent

Sir *Joseph Heron.*

30 March 1870.

consent as aforesaid in any case in which, upon inquiry, it shall appear to them that the consent of the local or road authority is unreasonably and without sufficient ground upheld or refused."

478. *Chairman.*] I suppose that is with a view to getting rid of the opposition of a particular bridge or road authority which intervenes in the middle of a scheme?—Yes. Then there is a clause which is suggested by the town clerk of Liverpool and others; it is called Clause 4 A: "Where it is proposed to lay down a tramway through three or more districts of local authorities in which the termini are situate consent to the granting of a Provisional Certificate, and one or more of the intervening local authorities object thereto, the Board of Trade may, if they are satisfied, after inquiry, that such consent is unreasonably and without sufficient ground withheld or refused, grant a Provisional Certificate, notwithstanding such objection."

479. This clause has a more limited operation than the one you have already proposed on behalf of Manchester?—Certainly.

480. Will you explain to the Committee your reasons for proposing this clause?—My reason is simply this: it appears to me that unless that power exists the Bill will be practically inoperative. There is scarcely an instance where a tramway would not go through the district of several local authorities of one kind or another, and it would be quite open for any one of those to negative the tramway, and there would be no remedy; and, in fact, instead of the Bill doing what everybody hopes it will, putting an end to a good deal of private legislation, except that it would go through the House as a matter of form, it would involve the necessity of a private Act of Parliament for every Bill that was proposed. So far as the corporations are concerned, we feel strongly, and we cannot state it too strongly, that if an authority which represents the inhabitants is against a tramway, that that tramway ought not to be authorised for them by anybody. We believe that that view would be taken, if the circumstance arise, by the Board of Trade. We hope so, at any rate. The difficulty we have is simply this, that if the Board of Trade are to have the power to grant a certificate if any local authority refuse, we do not see upon what principle it could be proposed to give them power to override one without giving them the power to override all, in case of need; because we feel this, that if we object we should be able to satisfy the inspector of the Board of Trade when he came down that we had good ground for our objection, and that he would confirm that objection. On the other hand, if we were unreasonable, and without sufficient ground refused to grant a certificate, of course we ought to be open to revision; but I do not see why we should expect the Board of Trade should say, without rhyme or reason, that there should be no tramway, without allowing anybody else to say that there should.

481. Mr. *Loch.*] The result would be that persons who were objecting, and whose objection was overridden, might appeal to the House?—They would all be in the same position, with this difference, that they would go to Parliament without having the advantage which might result under the Bill. Supposing the local authority objected strongly, and supposing, for instance, at Manchester the inhabitants were all against it, and the Board of Trade granted a certificate, we should no doubt feel that in a case like that we should be justified in coming before the House, petitioning against the Bill, and going before a Select Committee. We should expect that if we showed that the inhabitants were really against tramways, that the Bill would not be imposed on us.

482. *Chairman.*] If a system of Provisional Orders were adopted instead of a certificate, as proposed in the Bill, and an appeal to Parliament, do you think that the local authorities would have ample opportunity of presenting their cases, and that no hardship would be inflicted?—In any case where there was a decision given hostile to the local authority, I think it important that an opportunity should be given them of being heard by Parliament. On the other hand, there might be cases where the opposition of a little district through which a tramway might have to pass would render it nugatory.

483. For instance, a single bridge company might prevent the operation of the whole scheme by refusing to allow the tramway to cross their bridge?—Yes; in fact, anybody might.

484. Mr. *Loch.*] You want to guard against a capricious and vexatious objection?—We simply want to make the Bill workable. The town clerk of Liverpool is a little more rigid than I am in insisting on the veto of the corporation; I propose

propose that the veto shall not prevail in the case suggested by the clause. I believe our clause is very much to the same effect, because I do not believe it would have any operation except in such a case as is really contemplated by that clause. The objection to that clause on the part of Liverpool and Leeds is that it is really overriding the large towns. We do not propose that by our clause to override anybody, it is applicable to all alike. What the Committee have to determine is simply this, whether the Bill, which professes to be for a certain object, is to go out of their hands, with power, in any case, for anybody, by simply refusing their consent to make the Bill nugatory.

485. Mr. *Ayrton.*] The difference between your clause and the clause proposed by the town clerk of Liverpool is, that everybody can be overridden alike by the Board of Trade, whereas by the Liverpool clause, Liverpool can never be overridden, but everybody else can be for the benefit of Liverpool?—At any rate, as Liverpool happens to be a terminus, the termini must be agreed upon. If the termini are agreed upon, half-a-dozen small districts, such as are suggested by the honourable Member, may be overridden.

486. Liverpool is a terminus, therefore, practically, it does reserve to Liverpool power which it does not reserve to anybody else?—It must always be a terminus.

487. There is nothing beyond Liverpool to go to except the river?—No; I hope the Committee will allow the town clerk of Liverpool to say a few words because we have gone through the clauses together, and we wish to save your time as much as possible.

488. Mr. *Cawley.*] I wish to ask you one question with regard to rating; I think you stated that you had not heard the clause that was asked for yesterday, as to rating on behalf of the railways; it was stated that in respect of any payment arising from the tramways, they were to be rated one-fourth?—As far as I understood it, I own it seemed to me to be so remote, that I did not think the clause had anything to do with this Bill. There is power given, under certain circumstances, for the corporation or the local authority to borrow money, and to secure that money upon the rates. I think the suggestion was, that in any rates that might become necessary in consequence of that borrowing, in some way or other the clause in the Local Government Act, which provides that railways are only to be rated to a certain amount, should be brought into operation. As far as we are concerned, we object strongly to the extension of that class. It only applies to certain rates of a particular kind, and does not apply in any case to a borough rate, which would be the only security that could be given, or would be given. In some cases the borough rate would be the security for any money borrowed, but we should strongly object to the extension of the operation of that clause. I may say that at this very moment there is an agitation going on amongst the local authorities for the repeal of that clause of the Local Government Act, as being a very unfair clause with reference to the ratepayers.

489. *Chairman.*] Have you anything else to add?—There is a clause that is proposed, "Saving of powers of the Liverpool Tramways Act, 1868. Nothing in this Act contained shall take away, abridge, prejudice, or affect the powers, rights, and privileges, vested in, or conferred upon, the mayor, aldermen, and burgesses of the borough of Liverpool, or the Liverpool Tramways Company (Limited), by the Liverpool Tramways Act, 1868, with respect to the tramways by that Act authorised to be constructed."

490. There is nothing in this Bill which interferes with any actual powers that they have?—No; then this clause is proposed: 53B. "Where in any district the local authority shall have already obtained power under an Act of Parliament to lay down tramways in their district, such power shall entitle such local authority to a certificate under this Act, which certificate shall be final and conclusive, without the necessity of confirmation by Parliament."

491. The effect of that is to give them a great deal more than they have got under their Local Act; under their Local Act they have power to lay down the tramway, but not to charge toll for it?—I must say that that is a clause for which the town clerk of Birmingham is entirely responsible, and it would save time if you would allow him now to say what he has got to say upon it.

Mr. *E. J. Hayes*, called in; and Examined.

Mr. *E. J. Hayes.*
30 March 1870.

492. *Chairman.*] YOUR case is simply this: that you have power to lay down tramways under your Local Act, and you wish that to be interfered with in no way?—Further, we have the power also by bye-laws to make regulations for the prevention and removal of obstructions in the street, regulating all the traffic, the regulating of taking up and setting down of passengers, and the loading and unloading of carriages, and regulating the use of towing-paths. What we want is, that those powers should be continued, but that we should also have the power of taking toll, which this Act confers.

493. You want that power without the confirmation of Parliament?—We have already been to Parliament, and we consider it most unjust that Birmingham should be bound to go a second time; we thought it proper that that application should be made to Parliament, but we think it very unjust that two applications should have to be made by Birmingham; it is very costly.

494. Mr. *Ayrton.*] You got what you applied for?—Yes.

495. *Chairman.*] There is nothing in the Bill which is now before the Committee, which prevents your exercising your powers under your Local Act of laying down a tramway, but not of charging tolls for it?—The reason that the corporation of Birmingham have felt themselves unable to lay down tramways has been that there is no power to take tolls or to borrow money for the construction of tramways.

496. You have got your Private Act, and you can work under it, and if you do not think fit to do so, you can apply for a Public Act?—We say that, having once had to expend money in order to obtain money to lay down tramways, and having got that power, we are an exceptional case, and ought not to be obliged to go to Parliament a second time.

497. You can use the powers you have got; there is nothing in this Act to prevent your using the powers which you have got?—We have no power to take tolls.

Sir *Joseph Heron*; further Examined.

Sir *Joseph Heron.*

498. Mr. *Cawley.*] THERE is one question I should like to ask you with reference to the bye-laws; is it not necessary in any regulations or bye-laws to be made under this Act, that they shall apply not only to the traffic on tramways, but also to the traffic using the streets generally?—With respect to the bye-laws, that is a point on which the town clerk of Liverpool wishes to speak. By Clause 36, the promoters have power by the Bill to make bye-laws, but the bye-laws are confined to these matters, "for preventing the commission of any nuisance in or upon any carriage, or in or against any premises belonging to them; for regulating the travelling up, the user and working of such tramway, and generally for the protection of such tramway, and the prevention of any injury to or interference with the authorised user of the same." But then the clause adds, "No such bye-law shall have any force or effect until two calendar months after a true copy of such bye-law shall have been laid before the Board of Trade, unless the said Board shall, before such period, signify their approbation thereto. Then all the power that the local authority possesses with reference to the regulation of the traffic of the streets, is preserved, or intended to be preserved by, I think, Clause 50. The only question about which we had a difference of opinion was, whether the bye-laws to that limited extent should be made by the local authority, or whether they should be made by the promoters.

499. Bye-laws made by the local authority are at present confirmed by the Secretary of State for the Home Department?—Bye-laws made by municipal corporations are confirmed by the Secretary of State for the Home Department.

500. Then there might be a clashing of one set of bye-laws, to be confirmed by the Board of Trade, with another set to be confirmed by the Home Office?—There are no bye-laws proposed by the Bill to be made by the local authority.

Sir *Joseph Heron.*

30 March 1870.

authority. At present, what is proposed by the Bill as it stands, with reference to bye-laws is, that the promoters may be the local authority, and they may have power to make bye-laws with reference to certain matters.

501. Mr. *Ayrton.*] In the same manner as the present Railway Acts authorise railway companies to make bye-laws with reference to certain matters?—No doubt; but there is this difference between them, and it is a great difference, that railways are within their own land, and quite distinct from the public, where, as in this instance, they are in the middle of the streets. No doubt there would be a convenience if all the bye-laws were made by the local authority. I will leave the Town Clerk of Liverpool to say what he thinks necessary upon that point. There are many local boards, and if they were all to make bye-laws, different bye-laws might be made for each district.

Mr. *Joseph Rayner,* called in; and Examined.

Mr. *J. Rayner.*

502. *Chairman.*] You are, I believe, the Town Clerk of Liverpool?—I am.

503. Have you any amendments to propose in this Bill?—The first point is a minor point, that some of the corporations think that the same principle should be observed in giving a consent as is required by the Municipal Act for bye-laws, and under some local Acts for other matters, which is, that two-thirds of the members shall be present.

504. Otherwise you agree with what Sir Joseph Heron has stated?—Yes. I think the next point in order is the question of certificates; that is a point on which some of the corporations attach very great importance. Clause 36 enables the promoters to make bye-laws, "For preventing the commission of any nuisance in or upon any carriage, or against any premises belonging to them; for regulating the travelling upon the user and working of such tramway, and generally for the prevention of such tramway and the preventing of any injury to or interference with the authorised user of the same." What we propose instead of that is this: "It shall be lawful for the road authorities from time to time to make regulations as to the rates of speed of and the distances to be observed in travelling between and the stopping of carriages using the tramways, and for regulating the travelling upon or using and working of the tramways and carriages running thereon, and the street traffic in the streets, in which the tramways are laid, and for better enforcing the observance of all or any of such regulations, it shall be lawful for the road authority to make bye-laws for all or any of the aforesaid purposes, and from time to time to repeal or alter such bye-laws and make others, provided that such bye-laws be not repugnant to the laws of that part of the United Kingdom where the same are to have effect, or to the provisions of the Act. No such bye-law shall have any force or effect until two calendar months after a true copy of such bye-laws shall have been laid before the Board of Trade, unless the said board shall before such period signify their approbation thereof. And a copy of all such proposed bye-laws shall, within seven days after same have been sent to the Board of Trade, be delivered to the local and road authorities." That is following a clause in the Liverpool Tramway Act.

505. Have you found any difficulty arising in the working of tramways?—We have only recently opened the tramways, but they submit themselves to the corporation.

506. Have you power to make bye-laws for the tramways?—Yes.

507. Is that part of the Liverpool Tramway Act?—Yes, it is Clause 64, which is as follows: "It shall be lawful for the corporation from time to time to make regulations for fixing the times of departure and arrival, and the rates of speed of and the distances to be observed in travelling between and the stopping of carriages using the tramways and for regulating the travelling upon or using and working of the tramways and carriages running thereon, and the street traffic in the streets in which the tramways are laid; and for better enforcing the observance of all or any of such regulations, it shall be lawful for the corporation to make bye-laws for all or any of the aforesaid purposes, and from time to time to repeal or alter such bye-laws and make others: providing that such bye-laws be not repugnant to the laws of that part of the United Kingdom where the same are to have

Mr. *J. Rayner.*

30 March 1870.

effect, or in the provisions of this Act; and any persons offending against such bye-law shall forfeit for every such offence any sum not exceeding 5 *l.*, to be imposed by the corporation in such bye-laws as a penalty for any such offence; and every such penalty shall go and belong to the corporation."

508. *Chairman.*] According to your experience of Liverpool, there was a necessity for such powers?—Certainly there was a necessity for them.

509. Are there any other points which you wish to bring before the Committee?—There is a saving clause in the Liverpool Act which was assented to by the solicitor of the Liverpool Tramway Company; it is a saving clause.

510. Is there anything in the Liverpool Tramway Act which affects this Bill?—Yes, there are two clauses; first of all, there is the absolute power to take up the tramway within a limited time, namely, five years. That is clause 72 of the Liverpool Act, and is as follows, "If the corporation within five years from the completion of the tramways respectively, or of such parts thereof as shall be completed within the respective times limited by this Act, shall at any time, or from time to time, by resolution determine that all or any of the tramways of the company, or any part thereof, respectively, shall be discontinued and ought to be removed, the corporation may give notice to the company requiring them to remove such tramways, or tramway, or part of a tramway, as is specified in the notice; and the company shall within three months after the notice so given remove the same tramways, or tramway, or part of a tramway, and make good the street to the satisfaction of the engineer of the corporation; and if the company do not within such three months remove such tramways or tramway, or part of a tramway, and make good such street as aforesaid, the corporation may (without prejudice to any other remedy against the company) remove the tramways or tramway, or part of a tramway, and make good the street as aforesaid; and may sell all or any part of the materials removed, and out of the proceeds of such sale reimburse themselves their expenses relative to such notice, removal, and sale, and making good the street and consequent thereon (rendering the overplus, if any, to the company), and the unpaid residue of such expenses shall be paid by the company to the corporation, and shall be recoverable from the company by proceedings in any court of competent jurisdiction: Provided always that as regards any tramway, or any portion of a tramway, which prior to the giving of such notice shall have been opened for traffic, no notice of removal shall be given by the corporation before the expiration of 18 months after the opening thereof: Provided further, that if at any time hereafter the Company shall discontinue the reasonable working of any tramway, or part of a tramway, for six calendar months, the corporation shall be at liberty to remove such tramway, or part of a tramway, without notice to the company, and the expense of removing such tramway, or part of a tramway, and reinstating the street, or streets, shall be made good by the company to the corporation, in like manner as is hereinbefore provided with respect to the removal of a tramway, or part of a tramway, within five years from the completion of the lines respectively, and that if any difference shall arise between the corporation and the company as to whether the company have discontinued the reasonable working for the period aforesaid, the difference shall be settled by arbitration, under the provisions of the Railway Clauses Consolidation Act, 1843, with respect to the settlement of disputes by arbitration."

511. Mr. *Ayrton.*] Would this Act override the Act already passed?—Yes. In consequence of the clause put in in compliance with the Standing Order, which is Clause 75 of the Liverpool Tramways Act, and which is to this effect: "Nothing herein contained shall be deemed or construed to exempt the tramways from the provisions of the general Act relating to tramways now in force, or which may hereafter pass during this or any future Session of Parliament." I would refer to those two clauses as applicable to this Bill.

512. *Chairman.*] On what terms had they the power to buy up the tramways?—The Town Council had the power without any premium upon a compulsory sale, and without reference to any prospective value.

513. What was the premium?—It was 30 per cent.

514. And no money for the good-will?—No money for the good-will; they are simply negative words.

515. How soon was the purchase; was it after 11 years?—It was within 11 years. The clause with reference to the purchase by the corporation is Clause 70 in the Liverpool Act. "In case the corporation shall at any time within

11 years

11 years after the passing of this Act desire to purchase the tramways, and the roads and materials connected therewith, and any lands or building acquired for the purposes of this Act, and shall apply to Parliament for powers so to do; and to enable the company to sell the same, the company shall not object to or oppose such application, and shall assent thereto and do all things necessary and render all needful facilities for obtaining such powers; and in the event of such power being obtained shall accordingly sell the said tramways and premises to the corporation, and the terms of every such purchase shall, failing agreement between the corporation and the company, be determined by arbitration in manner provided by the Lands Clauses Consolidation Act, 1845, for the settlement by arbitration of questions of disputed compensation: Provided always, that in determining the amount to be paid by the corporation for such purchase, the then actual *bonâ fide* value of the purchased property (exclusive of any compensation for good-will, premium, compulsory sale, or other consideration whatever) shall be ascertained in the first instance, and to such value there shall be added as compensation for good-will, premium, compulsory sale, and every other consideration, 30 per centum on the value so ascertained: Provided also, that if the corporation so purchase the company's tramways the company shall be entitled to require the corporation also to purchase all the carriages and rolling stock of the company for the time being used by them on the tramways so purchased; the terms of such purchase, failing agreement between the corporation and the company, to be settled by arbitration under the said Lands Clauses Consolidation Act, 1845."

516. And the capital was raised on those terms?—Yes. There is only one other point I wish to draw the attention of the Committee to, and that is with regard to the consent. Perhaps you will allow me to read the first clause in the petition of the Corporation, which I think it is my duty to present to you, "That the provision of the said Bill, which makes the consent of the local authority a condition precedent to the laying down of tramways, is, in the opinion of your petitioners, a sound principle, and will give general satisfaction." A clause which proposes to get rid of the local authority, is in opposition to this principle, and a hardship to the ratepayers.

517. Therefore, the difference between you is, that Sir Joseph Heron's clause enables the Board of Trade to dispense with such consent where the refusal appears to them to be unreasonable, leaving their assent necessary as a general condition to the working of the Act?—Yes.

518. Mr. *Ayrton.*] Does not your clause say that if all the terminal towns or authorities agree, all the intermediate towns might be over-ruled?—Yes; but our tramways do run; I think the lines now laid down run into three, and with the exclusion now sought, would run into five.

519. You think there should be a dispensing power in certain cases?—Yes. In some cases I can understand that tramways may be considered beneficial in the town, and in other cases, in the suburban parts, not beneficial; and I can very well imagine a case where it might be a good thing for the town part, and an extremely bad thing for the suburban part.

520. Will you explain to the Committee what has been done at Liverpool under that Act?—I may read an extract from a letter which I received, dated the 19th March, from the solicitors to this effect: "We are further instructed to say that our clients are prepared to withdraw from their Bill all lines within the borough, and to oppose the Street Tramways Bill, if the corporation will withdraw their petition against our Bill, and undertake to oppose the Street Tramways Bill." There is an inner circle, and from that two lines fly off, something like a Catherine wheel. The inner circle is always worked in one direction, and then the carriages shoot off to the north side.

521. Radiating from that inner circle?—Yes.

522. How has the tram been laid down upon the roads that are formed of pitched granite?—They are chiefly paved roads; there are some lengths of macadam, and where there was macadam the company have themselves laid down paving-stones of the requisite width as prescribed by the Act.

523. How far on each side from the rails?—Eighteen inches outside each single pair of rails; the double pair four feet.

524. What is the gauge?—Four feet eight and a half inches, which is the ordinary railway gauge.

525. Is it a case rail or is it a tram plate?—It is a grooved rail; it is corrugated

Mr. *J. Rayner.*

30 March 1870.

gated partly outside, and then there is a little groove, and then there is a flat surface.

526. Mr. *Loch.*] They are unconnected with any railway, are they not?—Yes.

527. Mr. *Ayrton.*] Do you mean that there is a flat surface for the wheel to go upon, with a groove for the flange of the wheel?—Yes.

528. It is not a broadheaded rail?—It is not an edged rail in any sense.

529. What is the thickness of the groove for the flange?—It is very slight indeed. I could furnish the Committee with a section or a model of it.

530. It is paved with stone between the rails?—Yes.

531. So that it presents a uniform surface of solid paving-stone, over which any cart or carriage could travel?—Yes.

532. Without the risk of injury to the horses?—I do not say that by any means. I say that the risks of injury are considerable.

533. Is the company responsible under this Act to make good all damage which arises to carriages and horses?—I believe so.

534. Can anyone practically travel along the rails without using the flange?—Yes; there is a suit now in Chancery with reference to that very point. Some of the omnibuses run with a rather flat-tired wheel on the same gauge as the tramway. The question in the suit is whether that is an ordinary wheel.

535. Of course anybody can drive along the rails if the wheels are of the proper gauge?—Yes.

536. Mr. *Sclater-Booth.*] Are you aware that it has been proposed to put in a clause to make that lawful?—I think we are all agreed that it would be advantageous if you could define an ordinary wheel.

537. What I wish you to understand is, that although there is a suit pending in Chancery upon the point, it is proposed by the town clerk of Manchester that it shall be rendered lawful for anyone to drive along the trains?—With ordinary wheels.

538. Even when they are plying for hire?—I believe that is proposed.

539. Are you clear which side you take in the controversy?—I am not prepared to speak on behalf of the corporation; but, so far as my own opinion goes, I should say that all carriages with the ordinary flat-tired wheels, of whatever gauge, should be allowed to run on the trams.

540. *Chairman.*] Even if they are carrying passengers?—If they are carrying passengers.

541. Mr. *Ayrton.*] Your view is that there should be no impediment placed in the way of the public using the surface of the road by means of these trams?—Certainly not; not in the slightest degree. I do not think the public should in any way whatever, either in the case of passengers or horses, be prejudiced in the slightest degree with regard to the use of the roads by the tramways?—I am in favour that tramways, if they are laid down at all, should be laid down by the local authority.

542. *Chairman.*] Then you agree with the opinion of Sir Joseph Heron upon that point?—Yes.

543. Mr. *Ayrton.*] In fact, it is a private highway?—Certainly.

544. You think that a toll should be taken in the same way as any ordinary toll rate?—I do not go that length. I think so long as they use wheels with a fixed flange that they may allow other parties to use it. In order to keep a control over it I would grant licenses either for short traffic, or in some other way which would be most advantageous to the public.

545. Still, if other people can drive upon it, you would give them a right to do so?—Yes, I think the flange is the great security; the flange keeping the wheel in the exact proper position is a saving power.

546. If the wheel is curved and the tram-plate is flat you arrive at precisely the same conclusion, if you make the groove flat and the rail curved, do you not?—I do not think so at all. In the first place, you have to turn out of the road for heavy traffic, and you have to use the rails of the road, but a tramway carriage may keep the rail having a flange wheel; in fact, it runs down everything if you do not get out of the road.

547. Then everybody has to get out of the way of a carriage which has got a flange wheel?—Yes, that is the advantage which it possesses over omnibuses with ordinary flat wheels without a flange.

548. Or rather a disadvantage, because it cannot go on the other line?—In whatever point of view you regard it.

549. Mr.

549. Mr. *Hibbert.*] Supposing there was a heavy waggon on the rail, would that be run down by the omnibus of the tramway?—I do not think, except in Salford, that it is contemplated to put carriages carrying goods upon rails.

550. Supposing a heavy waggon to make use of the rails, would that be run down by the omnibus with the flange wheels?—The police regulations would compel the heavy traffic to keep either on one side of the road or the other, so that they would never come directly into contact. There would be no difficulty of that sort.

551. Mr. *Dent.*] Have you had any experience as to injury which has been done to roads owing to the construction of tramways?—No, except that of the ordinary obligation to repair and to keep the paving up to the level of the road.

552. A witness who gave evidence before this Committee spoke in favour of making three feet on each side of the rail, which would be repaired in case of subsidence; have you any personal experience of that?—No; we make a bargain for 18 inches; I should think that, assuming you are not taking the whole of the road into your own hands, that probably 18 inches would be reasonable, but, of course, that is a matter of bargain.

553. Have you formed any opinion as to whether the road authority should be responsible for the repair of that part of the road which is occupied by the tramway?—I differ upon that point from Sir Joseph Heron; I think, as the Bill stands, that the Tramway Committee would be actionable and the local authority would be indictable, and I think that is the best way of leaving it, because you have to get rid of liability for accidents. I think the right way of putting it is to leave the company liable to an action and to leave the local authority liable to an indictment.

554. *Chairman.*] That is your view of the Bill as it stands?—Yes; I think it is as it should be.

555. The local authority would still be liable to an indictment, and they would have their remedy by action against the tramway company?—Yes. Further than that, any individual would have a right to an action against the tramway company, but they could have no right to an action against the road authority.

556. Mr. *Dent.*] But with respect to the state of the roads, which is the point upon which I was asking you the question, as the Bill stands it appears to me that the authorities would be liable for the repairs of the roads, that is the present road authority; do you not think it would be better to leave them responsible for the part occupied by the tramway, so far as the repair of the roads is concerned?—Yes, subject to the exceptions of individuals sustaining injury; I quite agree that it would be better that the local authority should repair the paved part, and charge the company with the cost of it as a matter of convenience.

557. And to be responsible if the road is out of order?—Yes.

558. You think that they should be responsible for it, rather than the promoters of the tramway company?—The difficulty I see is in interfering with the tramway rail by the local authority in the matter of surface paving.

559. Mr. *Ayrton.*] Would you meet that by making the tramway company contract that they would keep the whole road in repair?—Yes, independently of the local authority.

560. As if they were contractors?—It might be done in that way.

561. Have you made any such arrangement with the tramway company?—The fact is, that we allowed them to do the paving originally, and now they are doing their own repairs; we used to do it and charge them with it.

562. You made no special arrangement with them for the repair of the surface?—No.

563. You say that some accidents have occurred already?—Yes.

564. Are those accidents arising out of the groove being too wide to admit the wheel, or are they accidents from slipping?—I am not speaking as regards injury to wheels; I am speaking from an affidavit filed in the suit I have referred to by a coachbuilder, who mentions the number of carriages that have been brought to him to be repaired in consequence of being wrenched, that is, carriages with narrow tires.

565. Do you know, as a matter of fact, whether the groove of the Liverpool tramway is of the same width as the grooves that were sanctioned in the Act last Session?—I really could not undertake to say that; the rail is, in fact, prescribed

Mr. *J. Rayner.*

30 March 1870.

by the corporation for Liverpool. I wish to correct a misapprehension about the dock railways in Liverpool; it is a mistake altogether to suppose that they run luggage waggons in the street; that is simply done round the docks, and not on the streets at all.

566. Mr. *Sclater-Booth.*] You have said that the tramway is now complete; have you seen it in work?—I think the second part is not quite open. Part of it has been open since November; about four miles.

567. Is that within the circle?—It is in the inner circle.

568. How many horses do they run with the carriages?—Three.

569. Are there any complaints from the owners of private carriages?—Not so many as might be expected.

570. But there is dissatisfaction?—There is dissatisfaction.

571. Is that because they have to get out of the way of the tramway omnibuses?—Not so much for that, as on account of the wrenching of the wheels and the liability to collision.

572. The groove is too wide for private carriages, is it not?—There are other objections, which I am not able to speak to positively. I can state that gentlemen driving into town have taken another route altogether on purpose to avoid the tramway.

573. Are the carriages upon four wheels?—Yes.

574. Do you know of the weight of the carriages?—No, I do not.

Sir *Joseph Heron.*] I am anxious that my evidence should not be contrary to what I really intended to say: the difficulty we found with regard to Clause 24, was simply not to define it as a clause with reference to flange wheels. The words of the clause are, "The promoters of tramways and their lessees may use on their tramways carriages with flange wheels specially adapted to run on a grooved rail; and subject to the provisions of this Act, the promoters and their lessees shall have the exclusive use of their tramways for carriages with flange wheels, or other wheels specially adapted to run on a grooved rail." Those are the words which require an enlarged sort of wheels than otherwise, but I did not propose to interfere in any way with the rights of the public. They are reserved, in fact, by the 51st Clause, which is distinct: "Nothing in this Act shall take away or abridge the right of the public to pass along or across every or any part of any road along or across which any tramway is made, whether on or off the tramway, with carriages having ordinary wheels." I do not propose in any way to alter the effect of this clause.

Chairman.] What I understood you to say was, that if that clause, as brought up, was passed, there would be an end to the Chancery suit?—No, not at all; the question in the Chancery suit is, whether they are ordinary wheels.

[Adjourned till To-morrow, at Twelve o'clock.

Thursday, 31*st March* 1870.

MEMBERS PRESENT:

Mr. Ayrton.	Mr. Hibbert.
Mr. Cawley.	Mr. Shaw Lefevre.
Mr. Dalglish.	Mr. Loch.
Mr. Dent.	Colonel Wilson Patten.
Lord George Hamilton.	Mr. Sclater-Booth.

GEORGE JOHN SHAW LEFEVRE, Esq., IN THE CHAIR.

Mr. *Alexander Monro*, called in; and Examined by Mr. *Clerk*.

575. I BELIEVE that the Act of 1861 has never been brought into operation as far as you are aware?—Not at all.

576. That Act has been in existence for nine years, has it not?—It has been in existence for nine years; there are practical difficulties in the way of working it.

577. *Chairman.*] What are those difficulties?—In the first place, you must have the consent of a certain number of the creditors of the road. If a railway company happens to be a creditor, as is the case near Glasgow, where a competing tramway might be established, as a matter of course, they will not give their consent.

578. Mr. *Ayrton.*] Are there creditors on all the roads?—On almost all the roads round Glasgow they are in debt, and most of the Scotch roads are in debt.

579. Mr. *Clerk.*] I think railways are large creditors in Scotland?—Yes; and near Glasgow one of the railways has an absolute veto.

580. Mr. *Ayrton.*] Has any attempt been made to gain their consent?—No; there is another difficulty, that they cannot pay the interest of their debt.

581. You mean that they have no credit?—No.

582. *Chairman.*] There is no application of the toll specifically for that purpose?—Not specifically for that. The maintenance of the roads must come before it, and the consent of the auditors would be required.

583. No action, then, has been taken under that Act?—None whatever. So far as this Act can be made available, the first clause that we propose enables us to agree with the road trustees in carrying it out. We take powers to agree with them, so that there may be a uniform line of tramways upon the same gauge and worked as one system.

584. Mr. *Clerk.*] It is the case, is it not, that in several of the large cities of Scotland the country roads run into the city, and the road trustees have the control of those roads?—Yes.

585. Mr. *Ayrton.*] How do you propose to deal now with the creditors of the roads under the proposed measure?—If we deal with the road trustees under this Act, the road trustees must deal with the creditors, and so they would have the power of stipulating for certain conditions; but if we came for a Provisional order without the consent of the road trustees, the creditors would then be heard before the Board of Trade, or before Parliament if they desired it.

586. You would leave the creditors to appear to object, without making any particular provision for their protection?—Precisely so. As a rule, the tramways would probably increase the value of the debt without any stipulation whatever.

587. Mr. *Clerk.*] You look to their concurrence, in the first instance, in the

Mr. *A. Monro.*

31 March 1870.

establishment of a tramway, under those circumstances, partly over your streets and partly over their roads?—Yes.

588. In that agreement probably you would take into consideration the amount of the debt, and some terms of arrangement to be obtained in the provisional order or certificate?—The creditors must be consulted if it is a matter of agreement between the corporation and the road trustees, because the road trustees would have no power to agree without it under the Act of 1861.

589. Mr. *Ayrton.*] But supposing that you proposed to proceed under the Bill instead of under that Act, what provision would you introduce as equivalent to that which is to be found in the Act of 1861, or how would you propose particularly to protect the creditors of the road?—I think that they should be dealt with the same as any other interest by appearing before the Board of Trade. They would have notice of the application for the provisional order, and their interest should not go before any other interest.

590. Mr. *Clerk.*] There was a question raised by the honourable and gallant Member for North Lancashire as to why you object to the power of resale; having purchased the tramway from the undertakers you say that the local authorities should not have power to resell, but should either work or lease it?—Yes, it is desirable that the whole of the arrangements of the tramway should be under the control of the local authority. It seems to be admitted on all hands to be desirable that they should be under the control of the local authority as much as possible. In the case of the burghs in Scotland, where the streets are to a large extent the property, and are under the control of the corporation, it would save any trouble arising from two managements. If the corporation once acquired it, it should not be made a source of dealing with it so that they might part with it again to the detriment of the interests of the city at large.

591. Mr. *Dent.*] You would not then give the local authority the power to sell?—No, I think they should not have it.

592. Having obtained the tramways, you would not give them the power to sell that concession?—No, I think that they should have the power of leasing it or of working it themselves, and buying carriages and horses, and buying rolling stock, or having a contractor under them to do it. We found that particularly useful in Glasgow, for instance, in the case of the cleansing of the city, there was power to contract or to take it into their own hands, and, as it were, to become manure merchants.

593. *Chairman.*] There is no power under the Bill for the local authorities to work the tramways in that sense, is there?—There is a provision against it in the Bill, but if it was not for that provision we should be at the mercy of two or three parties in Glasgow, who would never pay such a sum for the use of the tramways as they would be if we could compete with them.

594. Mr. *Dent.*] Then you would like that provision struck out of the Bill?—Yes, unless we have the power of competing we should be placed at a very serious disadvantage, and we should not get for the public the benefit of low fare, as we should get otherwise,

595. There is no case at all, I suppose, in Scotland, where local authorities have become the owners of carriages?—No, there is not; but in Glasgow we supply the water, we supply the gas, and manufacture the gas, in every way. The Clyde Trust is the collector of the dues, which were formerly farmed, but a different system was adopted, and the dues now collected by the corporation produce nearly three times the amount that they did when farmed. There is also the other instance, of the manure, which requires the employment of, I think, about 120 horses.

596. Mr. *Ayrton.*] If you have power to lease for a time, however short, that is virtually the same as having a contract, is it not?—It would not be so, because we should have, perhaps, only three competitors who would do, perhaps, with the tramways as they did with the slaughter-houses. They met before the public sale, and fixed what should be offered, and one offered, and it was divided between the three.

597. Colonel *Wilson Patten.*] You are an advocate for the sole control and management, and everything being in the hands of the corporation?—I am; I think it is the most beneficial way in which the tramways can be worked.

598. Mr. *Clerk.*]

598. Mr. *Clerk.*] All the gas and water-pipes in Glasgow, I think, are in the hands of the corporation?—The whole of them, and they manufacture the gas also.

599. Colonel *Wilson Patten.*] Could you give the Committee any instance where a corporation has had the management of a work of this kind?—The nearest I can give you is, that where we have ourselves a large stock of horses for collecting and selling manure, and a large stock of railway trucks for dispatching it to different parts of the kingdom, under special agreements with the railway companies, and with agents, in all the towns of Scotland for getting as large a price as possible. It is a far larger commercial concern than the management of tramways would be.

600. Mr. *Ayrton.*] Have the corporation any power to keep ferry-boats?—No; that is in the Clyde Trust, which is not the corporation. They keep the boats, and they collect the fares which produce a considerably larger sum than formerly.

601. *Chairman.*] You state that you think the leasing power should be retained?—I think so, because some of the corporations of Scotland might not be able to provide the rolling stock. Some of the Royal burghs in Scotland are poor.

602. Do you understand by that that the corporation should itself lay down the tramway, and then having made it should lease it?—Just so; that they should arrange with a company, or with an individual, for the working of the tramways. In Glasgow we are very much limited in space; our population is far too dense for the area on which the city is built. We are now making arrangements for the purchase of large portions of ground beyond the municipal area, for the erection of houses for the poorer class of citizens; if the tramways were in the hands of the corporation they could be carried to such a distance as to bring the poorer people to their work at low fares, or they could stipulate with the contractor to run certain carriages, at certain hours of the day, at low rates.

603. Colonel *Wilson Patten.*] Might it not create rather a bad feeling in Glasgow, if the corporation were competing with companies for the conveyance of passengers?—I do not apprehend any competition if the tramways were once in operation.

604. Do you think that they would drive off omnibuses and every other conveyance?—Quite so. They have done so entirely in America, and they have nearly done so in Liverpool, and would have done so entirely, but for the contrivance which they have adopted of adapting the wheels to run along the tramways.

605. But do you contemplate that the whole of the cab traffic of Glasgow would be put an end to?—Not the cab traffic.

606. But would not the corporation come into competition with the cab traffic?—I do not think that omnibus traffic comes much into competition with cab traffic; it is a different class of people. They would drive the omnibuses off all the leading roads where the tramways would be laid down, I should think.

607. Mr. *Clerk.*] I suppose that the great stream of omnibus traffic of Glasgow is along the leading thoroughfares from the suburbs and through Glasgow?—Yes, just the leading lines of omnibus roads along which one company propose to lay tramways this season; they are always laid along omnibus roads.

608. Of course there must always be a large amount of cab traffic in lateral directions to different parts of the city?—Yes, and along the same road; I have no doubt there will be a large amount of cab traffic.

609. You have the clauses there which you propose for the purpose of carrying out the arrangements with the road authorities?—Yes; the first clause, as I said, gives power to make agreements. The next gives power to the corporation or the local authority to apply for a Provisional Order, without the consent of the road trustees, either within the burgh or for such distance beyond the burgh as is necessary for supplying the suburban districts. There are eleven different road trusts within that area, all of which we should have to deal with; and there are five different parishes who would be the local authorities.

610. *Chairman.*] Within the limits of Glasgow?—Within the surburban district of Glasgow; within the city itself there are a considerable number of

Mr. *A. Monro.*

31 March 1870.

road authorities, and taking the larger area, there are 11 different authorities, and five parishes; it would be almost impossible to get those parties to agree, unless there were some compulsion upon them; for instance, take a road trustee who is a large creditor as well as a road trustee; he has quite a different interest from the road trustees in general.

611. Mr. *Clerk.*] Is there a very large amount of building going on beyond the municipal limits of Glasgow?—A very large amount.

612. With regard to what was put forward by Sir Joseph Heron, and the gentlemen representing other corporations in England; do you think that those provisions would suit Scotland?—Yes; Sir Joseph Heron and the gentlemen representing the other corporations differ as to the power of working the tramways, which we think we should have; we think also that some alteration should be made as to the maintenance of the road, but the road authorities are of opinion that the tramway companies should maintain the roads within the tramways, and 18 inches beyond the outside rail of each tramway, subject to the control of the road authority to see that it is properly done.

613. The same was in the Metropolitan Tramway Bills of last year?—Yes.

614. With regard to the confirmation of bye-laws, I think that you have a clause in which you propose that they shall be subject to the revision or review of the sheriff?—Yes, almost all bye-laws in Scotland are subject to the review of the sheriff; a large number of them come into operation as soon as the sheriff approves of them; others come before the Secretary of State or the Board of Trade. The parties are more readily heard before the sheriff in Scotland than they could be heard before the Board of Trade.

615. He is the local judicial officer?—He is the local judicial officer.

616. And he can hear the parties?—He hears the parties. He gives notice of a day and the parties are heard, and the bye-laws are frequently altered to meet the convenience of parties who are affected by them.

617. Is there any other matter, as the Bill now stands, upon which you have anything to say?—There is the proposed power of deviation; I understand the Tramway Companies themselves are to propose such provision that when the street is altered they shall be allowed to deviate vertically, so as to maintain the level of the street as it exists. Where the street is widened it would be of importance to enable the Tramway Company to alter the line of their rails, so that they should not be further distant from the centre of the line of the street than formerly.

618. *Chairman.*] So as to enable always to occupy the centre of the street?—To enable them always to occupy the centre of the street without coming back for an alteration of their power; there are several parts of the Bill where Scottish terms would be required instead of English terms. That could be very easily done.

619. Mr. *Clerk.*] Certain alterations would be required in some of the clauses to meet the special circumstance in Scotland?—Just so. We concur as to the ratepayers' consent and various other things.

620. *Chairman.*] Did I understand you to say that it would be necessary if the corporation are to carry out any scheme of tramways at all that they should have power to lay down tramways beyond their district?—To carry out an efficient scheme it is absolutely necessary. For instance, there is the district of Govan, and the Botanic Gardens district, and the Queen's Park, all of which are beyond the municipal boundaries. If we were only allowed to carry the rails to the exact boundaries of the City, the lines would be comparatively useless. The omnibus roads would exactly tell us where we should go.

621. Mr. *Ayrton.*] What is there to prevent you from arranging with the next local authority to continue it, and coming to an agreement with them?—Supposing that they had not funds sufficient to lay down the tramways, how could we arrange with them? There would be the 16 different parties with whom we should have to arrange; five different parishes, and 11 different road trusts. Then you see at once that if there was a large body of creditors, the creditors being also trustees, their interest would be to make us pay enormously for the privilege.

622. *Chairman.*] You have named the parishes and the road trustees; it would be impossible for the parish authorities to make a tramway without the consent of the road trustees; but you are now proposing that the local authority should extend

extend to the district of another local authority, if necessary, and make a tramway there without its consent?—In the case of royal burghs, that affects all the large important towns in Scotland.

623. Mr. *Ayrton.*] Does the municipal authority of Glasgow undertake the supply of water and gas to Glasgow?—Yes, it supplies not only the city, but the whole of the suburbs with gas and water.

624. How do you arrange there with the local authorities or road trustees to lay down the gas and water-pipes?—We have to come to Parliament to compel them to be reasonable in their demands, and to arrange terms with them and the consumers and the other authorities.

625. Then you have statutory powers over the roads to break them up for the gas and water-pipes?—Yes, beyond the municipal limits, and beyond the limits which we should require for tramways.

626. Are those statutory powers the same as are ordinarily granted to companies when they undertake the supply of gas and water?—They are rather stronger.

627. In what sense?—The corporation have generally strong clauses against companies, so that the local authority may have a control over what they do, but being in the hands of the local authority in Glasgow, those clauses are all omitted.

628. Do you mean that the local authority, who will disturb the road, is the judge whether the road is made good?—The road trustees are, of course, the judges as to that; but as regards notices and many things, we are not so hampered as many joint stock companies are.

629. But still they have the same power over you in dealing with the road as they would ordinarily have over a joint stock company in dealing with the road, as regards the breaking of it up, and the replacing it and keeping it in proper order?—Yes, they have that power, undoubtedly.

630. *Chairman.*] I understand you that you supply water to those parishes beyond your own district?—We do; it is their only source of supply.

631. Do you supply gas also?—Yes.

632. Mr. *Clerk.*] As I understand, you propose to do it in the first instance by agreement with those outlying districts or the authority managing them; and if they do not agree, then that you should have the authority obtained from the Board of Trade for the purpose?—Just so. If you prevented us from coming to the Board of Trade without the consent of the road trustees, you would place us in a much worse position than we are in at present, because at present we can come to Parliament and ask Parliament for what we consider right, while that would be giving the road trustees an absolute veto against our stating our case.

633. Mr. *Ayrton.*] If it was by Provisional Order, all that would be necessary would be to give them a *locus standi* against the Provisional Order?—Certainly, and it is provided in the clause.

634. Have you any private Act to regulate the administration of the affairs of Glasgow, or is it by common law?—We have about a dozen private Acts.

635. I suppose that all the functions of the municipality, in respect of roads, and lighting, and general control, is regulated by statute?—Yes, excepting so far as it is regulated by the Royal Charter of the burgh. That comes in for a portion of Glasgow. It does not extend over the whole municipal limits.

636. Are the other burghs for the most part regulated by private Acts, or by special charter, or by common law?—All the royal burghs have special charters, and some have regulations different from others; but they were all brought under the common municipal Government by the Reform Act of 1832.

637. Mr. *Clerk.*] In Edinburgh there was a royal part of Edinburgh, and a great deal of the municipality beyond that?—Yes; there are some taxes which are leviable within the royalty which are not leviable beyond it. Edinburgh and Dundee have asked me to speak for them. I think Glasgow is the only burgh in Scotland which has a road authority distinct from the town council: but in the greater number of cases of royal burghs the road trustees have roads within the burgh on which they exact toll.

638. Colonel *Wilson Patten.*] And that, you think, is general throughout Scotland?—I believe that you may say it is universal. There are 15 counties in

Mr. *A. Monro.*

31 March 1870.

Scotland where tolls have been abolished, and where, of course, that does not exist.

639. But are there burghs which are not royal to which this Act might apply?—There are one or two.

640. Mr. *Ayrton.*] How is the debt charged where the tolls have been abolished?—There are different arrangements. In Haddingtonshire they have charged the interest of the debt upon the reduced toll for a certain number of years. In Banffshire, I think, they have abolished the tolls entirely and made a common rate, half upon the landlord and half upon the occupier; but there are different provisions in a great many of the counties; they are not uniform; Edinburgh, Glasgow, and Dundee are the three towns which are principally affected by this Act. I brought it under the notice of Aberdeen about three weeks or a month ago; but I had a letter from the town clerk saying that on looking into it they did not think it necessary to interfere, as they were not likely to be affected by it.

641. *Chairman.*] It is not likely to be carried out there?—I should think not, or to a very small extent.

642. I suppose that the royal burghs would include a large number of places of small population?—They would include a large number of burghs in Fife, but they could not exercise the power.

643. It is only the very large places which would be likely to exercise, or could exercise those powers, I presume?—Yes; I do not think that there are any other places besides Edinburgh, Dundee, and Glasgow, which would require the powers.

644. That is to say, powers extending over other than their own districts?—Yes, or within them.

645. Mr. *Dent.*] Has your attention been turned at all to that part of the Act which provides for the repair of the roads where the tramways are laid?—Yes, I asked our road surveyor his opinion upon it, and he says that he would prefer that the Tramway Company should be bound to maintain it to the satisfaction of the surveyor 18 inches on either side.

646. He prefers the clause as it stands in the Bill, to the clause as proposed by the road trustees?—Yes.

647. Mr. *Cawley.*] I think you said that the Board of Police has the control of the roads in Glasgow?—It has.

648. Do you represent them as well as the corporation?—I do.

649. Mr. *Clerk.*] It is a sort of statutory committee of the corporation, is it not?—It is.

Mr. *Andrew Hoggan*, called in; and Examined by Mr. *Davidson.*

Mr. *A. Hoggan.*

650. Are you joint clerk along with your partner of all the turnpike roads in the county of Renfrew?—Yes.

651. Are you also clerk of some of the turnpike roads in Lanarkshire?—Yes.

652. Are you also clerk of the great road between Glasgow and Carlisle?—Yes.

653. Then I need scarcely ask you whether you are intimately acquainted with the working of road law in Scotland, and with the management of the roads?—Yes.

654. As a general rule, who are the road trustees in Scotland?—In the case of the county of Renfrew, the road trustees are, I think, eight or ten of the magistrates of Glasgow, as many magistrates of Paisley, and Port Glasgow, and Greenock; and the county gentlemen have a certain qualification, 100 *l.* Scots, which is about 400 *l.* sterling; so that there is a very large representation of municipal bodies on the board of trusteeship.

655. Do I understand you to say that the municipal authorities are largely represented on the road trust?—Yes.

656. I suppose that the money required for the making of the roads was borrowed principally from the county gentlemen through whose properties the roads pass?—Not from the county gentlemen; it was borrowed upon the security of the tolls, with the personal obligation of the county gentlemen, and in no case that I am aware of, have any of the county gentlemen advanced funds.

657. On the trusts of which you are clerk, are or are not the county gentlemen personally

personally liable, to a great extent, for the debts affecting the roads?—Yes, they are.

658. I suppose there is still a considerable debt upon many of your roads?—Yes.

659. But some, I have been told, have been paid off?—Yes; we have been gradually paying off the debts of many of the roads; upon the whole of the roads, with the exception of two, we are in the habit of paying interest on the debt.

660. The funds derived from your tolls are first applied to the maintenance of the roads, are they not?—Yes, in all cases.

661. And then the surplus goes to pay the interest of the debt?—Yes.

662. And then if there is any remainder, you pay off the principal of the debt?—Yes.

663. And as you pay off the debt you reduce the tolls?—Yes.

664. Has that ever been done?—In many cases. Some of the tolls in Glasgow are remarkably low in consequence of the debts being paid off.

665. Of course in no case do the trustees derive any pecuniary profit from the tolls?—In none; the public get the entire benefit of it.

666. Why is it, so far as you know, that this Tramway Act of 1861, has not been actively brought into operation?—About 1860 or 1861 there was a very strong desire in some parts of the country to have tramways, and we waited until we saw some of the tramways set going in the neighbourhood of London, and at Birkenhead. We did not think at that time that the form of rail was a good one, and we have been waiting from year to year to see whether some better form of rail, or mode of using the tramways had been adopted, but I believe that if we have now arrived at such a point, is to say that the best rail has been found, there would be no hesitation in laying the rails on the turnpike roads, and the Act of 1861 would soon be put into operation.

667. Do you consider, or is it the opinion of the road trustees in your part of the world, that if power is given to lay down tramways upon the country roads it should be the road trustees who should have the first power to do so?—No doubt.

668. That merely carries out the Act of 1861?—Yes.

669. And under that Act, I believe, nobody else has any right to do so?—None.

670. At this moment you have the sole and exclusive right of laying down tramways, have you not?—Yes.

671. I believe you were rather taken by suprise by my learned friend, Mr. Clerk's proposal, that the consent of the road authorities should not be necessary for the laying down of tramways upon your own roads?—Yes, we think it essentially necessary that the consent of the road authority should be first obtained.

672. Would not all the road trustees very strongly object to the omission of such an important qualification in the Bill?—I have no hesitation in saying that they would.

673. You see the last district mentioned in Schedule A; the only corresponding place to that would be, I suppose, the district included in your roads?—Yes.

674. Is there in Scotland anybody answering to "The vestry, select vestry, or other body of persons, acting by virtue of any Act of Parliament," who have ever had anything to do with the roads?—None.

675. The Poor Law Boards and vestries have never in the history of Scotland had anything to do with the roads within their boundaries?—Nothing.

676. Do you think that instead of that the road authority ought to be the authority?—Clearly.

677. I suppose you have no wish to interfere with the municipal authorities within their boundaries?—Not so far as regards their streets, but so far as regards the portions of our turnpike roads within the municipality.

678. But all those streets which are maintained and repaired by the magistrates and town councils of burghs, you think, ought to be under the local authorities described in the schedule?—Quite so.

679. If you were to make the local authorities under this Act the road trustees, it would simply be preserving their rights under the Act, 1861?—Certainly.

Mr. *A. Hoggan.*

31 March 1870.

680. And doing nothing more?—Doing nothing more.

681. With reference to the objection that the consent of the road trustees would sometimes be necessary within the municipal bounds, in consequence of roads belonging to the road trustees existing within the municipal bounds, let me refer you to the Glasgow Police Act, 1862; will you read that?—Under the Glasgow Police Act there is a Clause 318, to the effect that the board (that is, the Glasgow authorities) may lay, or continue in any portion of a turnpike road within the city, with the consent of the trustees of such road, and in any of the public streets, iron tramways or railways for the purpose of facilitating the passenger traffic along the same, and may from time to time remove, alter, and repair such tramways, and make bye-laws for the use thereof.

682. Mr. *Loch.*] Is that the Act, 1862?—It is.

683. Mr. *Davidson.*] So that, really, when the town clerk of Glasgow wishes to get rid of this obligation, he is repudiating their own Act of 1862?—Exactly.

684. And the consent of the road trustees, which would be necessary under the present Bill, is nothing more than is rendered necessary by the Glasgow Police Act, which is in operation at present?—Quite so; and I think, with a very few amendments, the Glasgow Police Act and the General Act of 1861 would be quite sufficient for Scotland to enable both parties to make tramways.

685. Mr. *Ayrton.*] What are those amendments in the Acts of 1861 and this Act?—In the Police Act they have no power to charge tolls, which is a vital matter; so that the authorities of Glasgow would not make tramways to be used by all and sundry without some power of obtaining tolls or granting licenses.

686. You think they ought to have power to take tolls and to grant licenses?—The town authorities ought to have that as well as the road trustees; but I differ from Mr. Monro in this respect, that, so far as the road trustees are concerned, we ought not to have anything to do with the working of tramways.

687. Are there any other amendments which you would propose to the Act of 1861?—I would wish the Act of 1861 to be amended in this way: that the road trustees should have the power to lease to parties the power of making the tramway; at present the trustees are the parties to make it. The road trustees would wish power to enable them to treat with third parties, who might come forward and say, "We wish to lay down these tramways."

688. *Chairman.*] Have they power under the Act of 1861 to sell?—No, to lease.

689. You think they should have power to lease?—Yes. The clause which I have prepared is this: "That nothing in this Act shall alter, prejudice, affect, or diminish the powers and provisions contained in the 'Tramways (Scotland) Act, 1861,' but that Act and this Act shall be read together as one Act, and the road authority in Scotland may let on lease to any person, corporation, or company all or any of the powers conferred on them by the 'Tramways (Scotland) Act, 1861,' for such periods and on such pecuniary and other terms and conditions as may be agreed on: Provided always, that any sums received by the road authority under or in respect of such lease shall be applied by them to the same uses and purposes as any tolls, rates, or duties at the time leviable and receivable by them."

690. Under the Act of 1861, you have power to levy tolls, have you not?—We have power to levy tolls.

691. But you have no power to lease?—We have no power to lease.

692. And you proposed that you should have power to lease, if it was thought desirable?—Yes; and with this power given to both the local authorities of Glasgow and to us, I think that we should have no difficulty in making tramways in the west of Scotland.

693. Mr. *Ayrton.*] Does it strike you as being difficult to read this Act of 1861 and the Bill as one Act?—The phraseology in connection with English law is considerably different from that of Scotland.

694. I mean having reference to the difference of the provisions?—We object to

to the local authority in Scotland, because there is really no such authority landward.

695. But considering that all the provisions of the Bill differ from the provisions of the Act of 1861, how would you read them as one Act?—We think that we are better under the Act of 1861, in this respect: that we are the parties to decide whether tramways should be laid upon our roads or not; whereas in this Bill it is proposed that that matter should be referred to the Board of Trade.

696. But how do you intend to read the two Acts together?—If this clause were put in here then we should have the benefit of the Scotch Act, in this respect: that we should either make the tramways ourselves, or if we did not choose to do that, we should lease them, and we should then act entirely on the Scotch Act, taking the benefit of the English Act in connection with any regulations which might be necessary.

697. If you take part of the English Act, would you not read the whole Act?—We should certainly prefer taking the benefit of the Scotch Act with such clauses in the English Act as might be necessary.

698. You mean that some of the clauses in the English Act should be deemed to be incorporated with the Scotch Act, and that to that extent it should be amended?—Exactly. There are a great many clauses in the English Bill that I do not object to.

699. And that would read in harmony with the Act of 1861?—Yes, with the addition of the clause which I have put in just now, and we have prepared clauses in those terms.

700. *Chairman.*] Then, is it your opinion that the consent of the Board of Trade is not necessary?—It is.

701. Or the assent of Parliament?—No. At present the municipal authorities have a sufficient representation in the road trust to enable them to come forward with any proposal, if they wish to be the parties to lay down the tramways outside of Glasgow, and it would then be considered by the road trustees and others. With a view to putting the county gentlemen into a position not to to be taken unawares in matters of that kind, there is a special provision put into the General Police Act that any matters of that kind shall require a confirming meeting, held after a month's notice.

702. At present, under the Act of 1861, any tolls derived from the use of tramways go to the general purposes of the trust, do they not?—Yes.

703. Supposing the debt of the road is paid off, what happens?—Then instead of the road trustees asking a halfpenny, they would ask a farthing. The road trustees in Scotland are not allowed by law to accumulate money; they have no object in accumulating money.

704. Therefore, any receipts from that source would go either for improvement of the road or a reduction in the tolls by arrangements with the company?—Quite so. Some of our tolls were sixpence from Glasgow, and now they are twopence, and consequently their debts have not been paid off.

705. Did you hear the evidence given by the town clerk of Glasgow, as to the necessity of the corporation having power in districts beyond their own district?—Yes; we do not object to that, but if they are to have such powers, they ought to come forward to the road trustees as the proposers of the scheme.

706. You think it ought to be with the consent of the road trustees?—Quite so; I have no hesitation in saying so.

707. Do you apprehend that there would be any difficulty in the two bodies coming to some agreement?—None; I am quite satisfied from what I know of the county gentlemen, that, where the locality required it, they would be very happy and willing to go into such measures.

708. Do any of those roads under the management of the road trustees, go into the burgh of Glasgow?—Yes, a considerable portion of them.

709. Some of the main streets?—Some of the leading streets.

710. Streets through which tramways would naturally be laid?—Yes.

711. Mr. *Loch.*] And it is in reference to those streets that this Clause 318 is applicable?—Yes.

712. And even with regard to those streets within the burgh, the consent of the road authorities is necessary before laying down tramways?—Yes.

713. How many miles of those streets within the burgh are under the control of the road trustees?—There are about 18 miles of turnpike roads within the municipal burgh.

Mr. *A. Hoggan.*

31 March 1870.

714. Are you aware also that Mr. Monro's suggestion went beyond that, and that he proposed that there should be a power to the local authority of Glasgow to lay down tramways under certain contingencies, without the consent of the road trustees, beyond the limits of the burgh?—I heard him state that.

715. Did you understand at all from what he said, what mileage of roads would be embraced within such a power, should Parliament concede it to them?—I did not hear him state the specific number of miles, but I think the road trustees would have no objection that the Bill should contain powers to enable the authorities of Glasgow to lay down tramways both inside and outside the municipal boundaries to any extent they might like to go, the consent of the road trustees being always had and obtained.

716. To what extent would you think it is justifiable to give the local authorities of Glasgow power to do that without the consent of the road trustees?—I would not give them any power over turnpike roads at all without the consent of the road trustees.

717. *Chairman.*] If it were subject to Parliament by Provisional Order should you see any objection to it?—We think that we are ourselves the best judges of what tramways ought to be laid down.

718. But supposing that any road trustee was so unreasonable as to refuse his consent?—Then the parties should come to Parliament

719. But would it not be better to avoid the necessity of a direct application to Parliament?—I am instructed by the trustees to say that they would prefer that, if they are not to be the parties to give their consent, Parliament should be the party.

720. But under the Bill, if it is by Provisional Order, Parliament would itself have the opportunity of deciding?—We desire to have an opportunity of being heard.

721. If you had an opportunity of being heard, would you then be satisfied?—It might be held that by a Provisional Order we might not have so strong a case as before a Committee of Parliament.

722. This machinery for going to the Board of Trade is in your opinion unnecessary if the parties consent?—Yes.

723. But if they do not consent, you think that some application is necessary?—Yes.

724. But supposing an opportunity is given you of being heard before a Committee through the Provisional Order would not that suffice?—Yes; it would so far.

725. And you would not then object to the tramway being made without the consent of the road trustees, in cases where it is unreasonable that they should refuse their consent?—If Parliament said, after having heard the road trustees and the creditors, that tramways should be laid down upon those roads, of course we should submit.

726. You have the power, under the Act of 1861, of laying down tramways through some of the principal streets of Glasgow, have you not?—Yes.

727. Is that without the consent of the local authorities?—No, we cannot do it without the consent of the local authorities, by Clause 16, of the Act of 1861.

728. That makes the consent of the local authorities necessary?—Yes.

729. Do you also consider that the road trustees, if the framework of this Bill before the Committee is adopted, should be the promoters?—Yes; with a power in the event of their not choosing to do the thing themselves, that they should apply, if possible, for a Provisional Order, and lease it out.

730. Mr. *Davidson.*] I suppose in some cases, the introduction of tramways might very materially diminish the security of your debts?—No doubt of it.

731. Do you think that that is a question of which the road trustees ought to be the best judges?—I think there are very important interests to be looked at. It might be that the trustees might be taken unawares, and that great injury done to the creditors.

732. Mr. *Ayrton.*] Do you see any objection to persons who wish to lay down a tramway, making an application under the Act for a Provisional Order, notice being served on the trustees, and the trustees being heard, and if the Provisional Order is adverse to them, leaving them an appeal to Parliament against it?—If we have an appeal to Parliament.

733. *Chairman.*] Provided you had that opportunity, you would not object?—I have been instructed to say that our road trustees would prefer that there should

should be an ordinary Private Bill, unless we give our consent; but I do not think that that would be in the least necessary, because I think our road trustees would agree to it.

734. Mr. *Loch.*] You do not see any probability of there being collisions between the two authorities?—None at all. The road trustees, and the municipal authorities of Glasgow would deal liberally, as they always have done, with a desire to accommodate the public.

735. Your road trust is rich is it not?—It is rich in respect of being free from debt.

736. Therefore, in representing the interests of this rich trust; you say that your views might be satisfied if you had the power of appealing to Parliament?—Yes.

737. But supposing the case of an embarrassed and poor trust; would they be sufficiently protected in having an appeal to Parliament, they incurring all the expenses of the appeal?—The road creditors would be put in this position: that if they found any Act was done which would interfere with the credit of the tolls, they would call up their money, and the county gentlemen who are personally liable would have to pay it, and hence the necessity for being very guarded.

738. Mr. *Ayrton.*] Would it not seem that it would give facilities for opposition, because, in the first place, you would have the evidence taken locally by the inquiry of the referee, and therefore you would be able to come to Parliament with your petition without the expense of bringing your evidence to London?—If full opportunity was given us of being heard, possibly we ought not to object to that course.

739. The only effect of a Private Bill would be, that the applicant would be put to further expense, but the opponents would be rather benefited, would they not?—That any private person should come forward and apply for a Provisional Order, and should be put in the position of us, looking after our interests.

740. The only difficulty would be as regards the promoter; that he would be put to the same expense as in a Private Bill?—Quite so.

741. Do you see any reason for putting him to that expense?—Of course I have been mentioning these matters as regards the creditors.

742. *Chairman.*] What is the mileage of the roads which you represent?—I should think between 300 and 400 miles of turnpike roads. We take charge of the great road leading from Glasgow on to Carlisle.

743. Do you take charge of all the leading roads out of Glasgow?—Not of all the leading roads; we have between 30,000 *l.* and 40,000 *l.* collected for tolls upon the roads of which we have charge.

744. Mr. *Ayrton.*] Will you explain to the Committee what is the peculiarity of the trustees of a statute labour road as compared with the trustees of another road?—Trustees of statute labour roads are pretty much, in Scotland, the same parties as turnpike-road trustees. The only difference in the case of statute labour roads is, that factors for absent gentlemen are more generally allowed to attend.

745. Are the statute labour roads free from tolls?—Yes.

746. Are all the roads, except municipal burgh roads, to be divided into statute labour roads and turnpike roads?—Attempts have been made in connection with that for some years past, but they have not been successful. It would be a most difficult matter to arrange the points.

747. Is there any other class of roads?—There is no other kind of roads; there are just the turnpike roads and the statute labour roads.

748. And then there are no other roads?—Not that I am aware of.

749. Then all the roads of Scotland are virtually in the hands of the trustees, except those which are under the administration of the municipal burghs?—Yes; except that in the new portion of Glasgow, there are portions of building ground which are maintained by the feuars themselves by some arrangements with the superior. Those are private roads, in point of fact.

750. Mr. *Davidson.*] With reference to Mr. Monro's evidence, he said that there were 11 different trusts within the boundaries of Glasgow, of which the consent would be required for any system of tramways; I suppose that all those trusts lead in different directions?—They do; and he would not require the consent of all those trustees. If they wanted to lay down a tramway upon a

Mr. *A. Hoggan.*

31 March 1870.

particular road it would only be the trustees of that particular road whose consent would be required.

751. It means that there are 11 different roads leading out of Glasgow practically?—Yes.

752. How many sets of trustees are there?—There would be all those different sets of trustees.

753. Mr. *Loch.*] Entering Glasgow on different sides?—Yes; I did not think there were so many as 11.

754. Mr. *Dalglish.*] Were that system of tramways laid down at Glasgow, how many of those trusts do you suppose would require to be represented?—There are six represented in this room who were affected by local acts, which were applied for this year.

755. But there may be more than six, I suppose?—Yes, there might be more than six.

756. Mr. *Davidson.*] Will you hand in the different amendments which you propose?—I will (*handing in the same*).

757. *Chairman.*] Are the road trustees opposing parties to the Bills before Parliament?—Yes.

758. Upon what grounds?—We object to private companies having those powers; they would not put clauses in the Local Bills which we thought necessary to protect the roads.

759. Not because you object to tramways altogether?—No, our road trustees generally are favourable to tramways, but we think we ought to be the parties to make them.

760. Mr. *Ayrton.*] Do you know whether it is the opinion of the trustees that all tramways should be laid down so as not to interfere with the ordinary use of the road by conveyances of the ordinary character?—Yes, if our trustees had any idea that tramways were to interfere with the ordinary use of the road, we would not consent, I think; the great matter is to get those tramways put upon the road so as not to interfere with the ordinary traffic of the roads.

761. That any person may be able to ride or drive over it without impediment or injury?—Yes, I may mention that I went to Liverpool and saw the tramways. I think those are an immense improvement upon those which were adopted by Mr. Train.

762. Mr. *Sclater-Booth.*] Did you hear that there was any objection on the part of the public to that tramway, as now worked?—Not at the time. Indeed we were told that the shopkeepers who at first objected to it were then in favour of it.

763. Did you hear of any accidents happening to carriage wheels?—I did not.

764. Mr. *Loch.*] Is there much coal traffic upon your roads in Renfrewshire?—Upon our roads in Renfrewshire we have the greatest traffic I should fancy of any roads in Great Britain. We have carts drawn by one horse coming down with three tons, and three tons and a-half of stone, from the quarries.

765. In considering the subject of tramways have you thought of their operation as regards both passengers and goods?—I do not consider it possible to make tramways for all traffic to use them. Possibly the time may come when heavy traffic may go along tramways at night, or at certain special hours; but I do not see how it is possible to allow traffic of stone and coal to go on in the daytime.

766. Would it be possible practically to combine the stone and coal traffic of which you speak with the passenger omnibus traffic?—Quite impossible.

767. Mr. *Ayrton.*] Have there been any steps taken to lay down tramways under the Act of 1861?—There have been no steps taken, but that has arisen entirely in consequence of our not being made aware of what was the best mode of tramway to make.

768. Are you aware whether any tramways are laid down upon roads in Scotland under that Act?—None. There is a clause which I was going to mention that we are anxious should be introduced. If you will allow me I will read it, and mention under what circumstances we wish it to be inserted: "In case any road authority shall, at any time, resolve to alter the line or level of any portion of any road along or across which any tramway is or shall be laid, the promoters shall from time to time be bound, on receiving one month's notice of such intended alteration, and at their own expense, to lift such tramway, and to relay the same on

on the road as altered, to the satisfaction of such road authority and their surveyor, or in case of difference in such position and manner in all respects as may be determined in England by two justices of the peace, and in Scotland by two justices of the peace or the sheriff of the county." I may mention that in all the General Acts, and in the General Telegraph Act, there is the same clause put in for the protection of the roads.

769. Mr. *Davidson.*] Is that, word for word, the same clause as was introduced into the Telegraph Act?—It is.

770. Mr. *Loch.*] You have put in a clause, 4A, for which I should like to hear any justification that you may think proper; upon what ground should you lay claim to a per centage of tolls?—On none of the roads in Scotland are we in a position to allow parties to use those roads, without getting tolls from them. By the General Act of 1861 we have power to levy tolls for the use of the tramway, and if instead of laying down tramways ourselves, we contract with other parties, then those parties must pay us some wayleave or license, or toll duty for the general purposes of the trust.

771. As a price for the permission granted to them to put down the tramways?—There is a large debt affecting some of those trusts, and it would not be a proper thing that a private company shall be allowed to lay down a tramway upon a road without some contribution towards the maintenance of the trust and the extinction of the debt.

772. Then, in your view, would the existence of a tramway upon your road, interfere with the revenue arising otherwise from your road?—It would, no doubt.

773. Mr. *Sclater-Booth.*] Could you not charge the vans as they pass through the turnpikes?—But we have not turnpikes upon some of the roads that they were to lay tramways upon. If they were to go through a toll-bar upon every occasion it would necessitate the putting up of a toll-bar; it is better, I think, for the public that there should be a wayleave

774. Mr. *Loch.*] Then you contemplate this per centage as compensation for that loss of income, which would arise to you from the presence of tramways on your turnpike?—Exactly.

775. Mr. *Sclater-Booth.*] How could there be any loss by reason of the people going on those tramways instead of other conveyances?—Because at present on some particular roads we have portions of the road within the municipality, upon which there is no toll-bar; we have been gradually going out, as we found that we were able to do that from the state of the tolls; but many of the tramways proposed to go through toll-bars, and we would get tolls in that case.

776. But if they do not go through the toll-bar, I do not see how you are damnified in that respect?—But then we should have power to bring the traffic upon them for tolls, and it would be better to have a power of this kind than for the trustees to have to put down a toll-bar.

777. But why should you have a toll-bar to catch the people going on the tramway if you do not place it now to catch them going in their private carriages?—We should be obliged if they were going to the toll-bar to charge a very high toll; we propose to give them the benefit of charging a certain sum per passenger, or per annum annual, or whatever it may be.

778. Your clause would enable you to charge a special toll, would it not?—Yes.

779. Why?—By the Act we have a special clause to the effect that a cart passing over the tramway for any distance exceeding 100 yards is liable for toll. It would be a very hard thing to charge a cart for only a quarter of a mile the same duty as if we were putting up a toll-bar which we charge to all the traffic.

780. *Chairman.*] The clause to which you refer contemplates the making of the tramway by the trustees of the road, does it not?—Yes.

781. Therefore you are charging a toll for the use of a roadway made by yourselves?—Yes.

782. Admitting that the thing might be done at all, would it not be reasonable to limit it, at any rate, to turnpike roads?—I mean that to be limited to turnpike roads.

783. Mr. *Ayrton.*] Where there is a debt to be paid, you wish to keep the fund for the payment of the creditor?—Yes.

784. I suppose that you have the power to compound for the tolls now?—For

Mr. *A. Hoggan.*

31 March 1870.

one year at a time. Under the General Turnpike Act for Scotland, and under the Act of 1861, we have only power to compound for 12 months at a time.

785. You wish to be able to compound for the length of the lease?—Yes.

786. *Chairman.*] If the tramway were made by some company or third party upon your road, then, I suppose, they would also relieve you from the expense of maintaining a portion of the road?—Yes.

787. In that case, why should you charge any toll?—Because there is a debt upon the road.

788. Mr. *Sclater-Booth.*] Why should you charge any more toll upon a tramway than you would upon an ordinary passenger?—We do not propose that we should charge more.

789, Is not that a part of the clause?—It is not.

790. Then, should you not modify the clause, and say that it should only come into operation when the tramway passes through a turnpike gate?—But that would necessitate the putting up of too many toll-bars.

791. How are those people going to avoid your tolls; you will be at no loss by having the tramways laid down, will you?—Not upon the roads; when they do not go through the toll-bars.

792. Therefore, your clause ought only to apply to cases when they do go through a toll-bar, ought it not?—If we found that there was great traffic upon those roads, and that it would necessitate further expense, we might have to put a toll-bar up, which would be a nuisance to the public.

793. But you have a right to make a special bargain with the parties?—Yes; and that is the reason why we wish for that clause. It would be a hard thing, I think, to charge the cars upon the tramways the same tolls as we charge other parties, because the companies have been at the expense of forming the tramways.

Mr. *Thomas Coates* called in; and Examined.

Mr. *T. Coates.*

794. *Chairman.*] You represent Messrs. Shoolbred?—I do, Sir. First of all, I am much obliged to the Committee for having permitted me to take the case now; I represent Oxford-street and the Messrs. Shoolbred. First of all the petitioners desire me to say that they wish for that amendment with respect to the Provisional Order; next, if you will remember in the amendments that I made for railway companies, among the parties to be heard are the parties who have frontages towards the tramway. I mentioned at the time that I brought in this clause that the railway companies are very little interested, and those petitioners are content with that amendment if the Committee are kind enough to adopt it.

795. What amendment is that?—That is the amendment to Clause 53, as to the persons to be heard before the Referee. Now, Sir comes another matter which is really an important matter of principle, and entirely different from anything which has yet been discussed. If you will observe, the 4th Clause prescribes that certificates authorising the construction of tramways under the authority of this Act may be obtained in any district by the local authority, with the consent of the ratepayers in such district, or by any other person with the consent of the local authority; then it goes on to say that they should be promoters, and then that the consent of the ratepayers in the district to the making of the tramway should be testified by a resolution of a majority of such ratepayers, assembled in meeting for the purpose of considering the tramway, and that when there is a road authority distinct that they should consent; I am not going to interfere with those consents at all. Whether they will work or whether they will not work, is a matter about which these petitioners take no interest at all. But they say this (and they say it I am satisfied with perfect truth) that the persons really interested in the construction of these tramways are the persons along whose street the tramway will be constructed, that the persons outside the streets may perfectly well consent to the construction of a tramway; their trade will not be interfered with, it is a mere question with them of the payment of rate, and it may perfectly well happen that the rates may be compensated by the tolls upon the tramway. But the persons who are deeply and immediately, and personally interested, are the persons before whose doors these tramways are to be made, and with respect to Oxford-street they have experience upon this matter. About four or five years ago (I can prove this by a witness,

a witness, if it is thought fit, but I dare say the Committee will assume that I have tolerably well made myself acquainted with the facts), a main drain was constructed down Oxford-street; Oxford-street was in that way blocked up for about six months. Here six months is not permitted; it is a smaller date I admit. But I can bring evidence to show that some of the small tradesmen in Oxford-street were absolutely ruined by that stoppage, and that even the more affluent had a very sensible difference made in their receipts during that time. What I propose on their behalf is that they likewise should be consenting parties, not that each should consent, but that two-thirds of the inhabitants of a street, two-thirds of the owners, and two-thirds of the occupiers of the property in a street in which the tramway is to be constructed shall assent to the construction of the tramway before it is so constructed; it seems to me to be at least reasonable that persons whose property is to be immediately effected shall not have that property injured by the votes of persons who will not be in any way themselves affected excepting by the payment of rates. There is this reason likewise: the street does not belong to the local authority, to the ratepayers; all that belongs to the local authority is the control over the street. The street belongs to the landowner, and the landowner gives up the street to the public for a specific purpose, namely, for the use of it as a thoroughfare. But the street itself belongs to him, the soil belongs to him, and that is demonstrated by this: that underneath the streets of London there are cellars and sometimes vaults (call them by the larger or by the smaller term) which belong to the owners of the property. Therefore it seems to me, at all events, a very strong proposition that the ratepayers shall interfere with that property (modified, I admit), take possession of it, injure the property for which the street was constructed, namely, the houses by the side of the street, and that the owner should have no voice in the matter, neither he nor any of his tenants. I do not know what the view of the Committee is, and perhaps I may be met by this kind of thing, that the Act will not work. I am not responsible for the working of the Bill at all. All I am responsible for is that there shall not be, by this Bill what seems to be a gross injustice involved ostensibly for public purposes, but which, perhaps, may be the ruin of private individuals. For that purpose I have prepared a clause to say that, with the consent of the parties, the corporations may squabble for power, and the vestries for protection, or whatever it may be, as they think fit; all I say is, that the parties whom I represent ought to have a voice in dealing with their own property; if shopkeepers for keeping their shops open, and if private individuals for access to their houses. This seems to me to be perfectly manifest.

796. Mr. *Ayrton.*] In what way do you think the parties are to be injured in the laying down of a tramway, provided that a tramway is laid down so as not to interfere with the general use of the road?—If that hypothesis is founded upon fact, I am content; but, supposing that it does obstruct the road, the provisions of the Bill are these, if you will be kind enough to look at page 8 of the Bill: "They shall not, without the consent of the road authority, open or break up at any one time a greater length than 100 yards of any road."

797. Is the observation which you have made to be applied only to the power of breaking up the road for the making of the tramway, or to the use of the tramway?—It applies to both the one and the other.

798. Will you kindly keep them separate?—By the Compensation Clause, I do keep them separate; that is to say, that supposing the trade of a shop can be proved to have suffered by the construction of a tramway, namely, that the opening of 100 yards of a road, and the keeping it open during six weeks (for if you look at line 10 you will see that six weeks is the time specified), really did injuriously interfere with the shopkeeper's business, he is entitled to compensation. These are apparently small matters, but they are not, in fact, small matters to individuals, and the Committee are here, I take it, to protect both the small and the great; and supposing it can be shown that the takings of a shop have been manifestly interfered with by the opening of a street for 100 yards for six weeks, I take it that there ought to be a compensation.

799. Mr. *Sclater-Booth.*] Even if the owner of the shop had been one of the consenting parties?—I admit that I have not provided for that; if he is one of the consenting parties, I think he ought to be precluded entirely.

800. Mr. *Ayrton.*] They would consent to terms of compensation that they thought fit?—Quite so.

Mr. *T. Coates.*

31 March 1870.

801. Then their consent upon that hypothesis would not be necessary if they were entitled to compensation?—I would modify my clause even to that, but I think in the first place they ought to be asked to consent. The mere fact of a tramway being laid down ought not to give a right to compensation; there should be a proof of injury, and if there is proof of injury, then I take it that according to all analogy, where private property is affected for public purposes, there ought to be compensation; in fact, I know of nothing in anywise approaching to this: that private property can be injuriously affected for a public purpose, without compensation to owners and occupiers.

802. Excepting the laying down of water-mains, for example; you would say in that case that the time during which the road is open is not sufficient to create an injury?—No, Sir; and here it is a question whether even the tramway itself will be beneficial; that a street should be supplied with water and gas is quite unquestionable.

Mr. *Ayrton.*] Now you are going to another ground.

803. *Chairman.*] You say you know of no case of the same kind; but are you aware that in Scotland an Act has been passed enabling the road trustees to lay down tramways?—That is upon public roads, but I am only talking of streets in a town.

804. But those public roads pass through the streets of the town of Glasgow, and, in fact, they are the streets?—I hope it is not improper for me to say that that Act took us all by surprise.

805. Whether it took you by surprise or not, are you aware also that the town of Birmingham has power to lay down tramways without the consent of the shopkeepers?—I do not know, Sir, what evil has crept into our legislation.

806. Mr. *Ayrton.*] What power have gas and water companies now to break up the roads?—It is to be done under the superindence of the authorities, and with all reasonable dispatch. I do not think there is any time limited at all. It is a general power to open the streets as long as may be necessary under proper superindendence.

807. You were going to give us the other head, as to the use of the tramways?—During the construction it may be that a very small injury is done; but I will suppose that a tramway goes along each side of Oxford-street, there is nothing which prescribes that it should be done in the middle of the street. Then there is a provision in the Bill that it shall be penal to obstruct the passage along that tramway; it is a penal act; a carriage goes up to a shop door; I do not know who is to have precedence. It is my firm conviction, that certainly according to the provisions of the Bill, the tramway carriage will have precedence, and the other carriage cannot drive up to the shop-door. I will assume that there is really an impediment towards drawing up a carriage at a shop-door. That will undoubtedly interfere with the custom of that shop, and will induce people to go to some other shop where there is no such impediment. I do not want the mere fact of a tramway going along the side of a street to be a ground of compensation; all I ask is, that supposing it can be proved that the custom of the shop has been diminished by this means, the promoters should pay compensation for that injury. That seems to me to be consistent.

808. *Chairman.*] Supposing it to be proved after the tramway has been laid down, then you would give them a term within which claims should be made?—I am content that there shall be such a time.

809. Say one or two years after the line has been laid down?—Yes.

810. If damage is proved, then that the owners or occupiers of houses should have compensation?—Quite so. I am content with two years. There is plenty of analogy; there is analogy in the case of bridges. Where, for instance, a bridge has been built near a ferry, the owner of the ferry has had compensation awarded to him. Supposing that after keeping accounts he can prove that the ferry has been injured by the coincidence of the bridge existing.

811. Mr. *Ayrton.*] Assuming that there is a prohibition for putting tramways in front of peoples' houses, so as to prevent carriages standing there, there would seem to be no difficulty in that respect?—In that case there would be no impediment to the business of the shop; but then the claim to compensation would not arise.

812. You do not think, therefore, that the inhabitant of the house ought to have any right to appear unless it is proposed to lay the tramway along the front of

of the pavement, so as to prevent his getting to his house?—Yes, I think he must be able to show that the position of the tramway will be an impediment to the access to his house.

813. Mr. *Dent.*] Supposing that there is any particular scheme of tramways laid down the centre of a street; you want to make it requisite that two-thirds of the householders residing in that street should consent?—Within a town, I think it is clear that it ought to be so. Oxford-street is a wide street, and it is a case rather against me, I think, than in my favour; but the traffic along that street is so great that anybody who has to cross it knows that it is not too wide for its present purposes. Take away from it, say 14 feet, and the whole use of the street will be greatly obstructed.

814. Mr. *Hibbert.*] Take a case like the Liverpool tramway, which consists of a rail on each side, there being sufficient room for two carriages to pass. You do not suppose, that in a case of that kind, it is necessary for the occupiers to give their consent?—I think, that if you could measure the streets, that would be a very rare case.

Mr. *Hibbert.*] That is the case at Liverpool. There is only one line of tram there.

815. *Chairman.*] Are you aware whether any compensation was given to the shopkeepers or occupiers of houses at Liverpool?—I cannot tell at all, but I should think it was very unlikely. But it is a serious principle that individuals should suffer for some special public good, assuming this to be a public good.

816. You assume that they will suffer by it?—Unless they suffer, they will have no compensation, for they will have to prove their sufferings.

817. But is it likely that anybody will lay down a tramway, with the prospect of claims against him by shopkeepers two years afterwards?—I think so. The notion of promoters will always be, that there will be no injury inflicted upon anybody. Their notion is, that the shops will be most frequented, where there is access by tramway.

818. You must have great experience in schemes of this kind, though not perhaps of tramways; do you think it probable that anybody would promote a scheme for a tramway, if two years after it was laid down there was a prospect of a claim for compensation from every owner and occupier along the street?—Indeed I do. I have great faith in the sanguine views of promoters.

819. Mr. *Sclater-Booth.*] Especially if they have power to sell their concession before the two years have expired?—Certainly.

820. Mr. *Cawley.*] I should like you to point out how an arbitrator is to judge, or to found his decision as to whether the property is injuriously effected, or whether the shopkeeper's trade is interrupted by the tramway?—I perfectly understand the difficulty which the injured man will have. It is one of the objections to the scheme. He must overcome that difficulty as best he may, and the way in which it would be done would be probably this: he would have to prove his average receipts during a certain number of years beforehand; and he must prove the receipts he has had during the succeeding two years.

821. Precisely so; but does not that involve also the question of the question as to what had been the cause of the falling off in the receipts?—No doubt if he can show that he has invested the same capital, that he has kept up the same establishment; that he has been guilty of no neglect in his trade, and that, nevertheless, the loss has occurred. I take it that an arbitrator will be very apt to give him compensation.

822. But would it be fair and just for the arbitrator to assume that the falling off had been a necessary consequence of the making of the tramway in ignorance of all the other circumstances?—It would not be in ignorance of all the other circumstances, because the same establishment, and so on, would have been maintained.

823. But I apprehend that it would not be in their power to bring evidence as to the circumstances of competition with other traders, or as to the mode in which he has carried on his own business?—I know of nothing which is to exclude all kinds of evidence before an arbitrator. If a man claims compensation he has to prove his case, and those from whom the compensation is claimed have to disprove that case.

824. But how are they to disprove that case when the affirmation is simply,

Mr. *T. Coates.*

31 March 1870.

"I have lost so much money, and I have done nothing different from what I did before?—That can be rebutted by other evidence.

825. You know the cases which have already been decided in reference to the effect of the Charing Cross Railway Station, in which the Court of Exchequer Chamber lay down the rights of parties in a public highway. That was where a claim was made by a man who was a baker on the other side of the Charing Cross Railway Station, for the injury done by the alteration of the roadway, and putting up that flight of steps down which you go to pass under the railway. The Court of Exchequer Chamber decided there that he was not entitled to compensation?—The words "injuriously affected," I think, in the 68th clause of the Lands Clauses Act may, or may not, have reached his case. I hope that the words that I have put in my clause will reach my clients' case.

826. Lord *George Hamilton.*] I suppose your assumption that the mere fact of tramways being laid down in a crowded street would affect the trade of those who had frontages in that street is founded upon the experience of those who have frontages in Liverpool and Manchester, where tramways are laid down?—I do not know whether in those places they have been injuriously affected or not. All I do know is, that my clients believe that it will be, if not ruinous, certainly extremely injurious to them, and then I say, speaking with great deference, that the legislature ought not to pass any Act whereby any injury may be inflicted upon any individual without giving that man some means of redress.

827. *Chairman.*] Your clients say that they believe that if these tramways are laid down in front of their houses it will be ruinous and injurious to them. Is that on the supposition that the tramway is immediately in front of the houses, without an interval between the tramway and the shops.—Not necessarily; but it may be that the tramway forms such an impediment to the traffic of the street, the people will go down another street.

828. Is that founded upon experience, or is it merely a supposition?—So far as my clients go it is a supposition. They say, "This is what we apprehend will happen to us."

829. But have they any evidence to show that in any places where tramways have been laid down such injuries have followed?—I do not believe they have, nor, as the honourable Member behind me suggests, would it be very easy to prove, because it might be met by the suggestion that it might arise from other causes.

830. But there are many places where tramways have been laid down, not perhaps in England, but elsewhere; and I presume it would be possible to bring experience to bear upon the result?—Scarcely within the last 10 days. The only people that I have come into contact with are promoters of tramways, and they all vow that it produces advantage to every shop where it passes.

831. You propose that where any tramway passes along any street the consent in writing of two-thirds of the owners and occupiers of the street should be required. What do you mean by the word "street" there? Do you mean along the whole length of the line upon which it is proposed to lay down a tramway?—No, each specific street.

832. So that if one street out of several objects, the scheme may be prevented?—It may be turned down another street.

833. But what is your definition of a street?—I am not at all sure that there is not a judicial definition. Street is a space bounded by houses on each side.

834. Without any street at right angles coming into it; is not that so?—No.

835. I was under the impression that that was the legal definition; what do you propose by that clause?—This: that supposing (which is the most unlikely thing in the world) that the promoters shall desire to lay a tramway down Oxford-street, they shall get the consent of two-thirds of the owners and of two-thirds of the occupiers in Oxford-street to their scheme.

836. But supposing that it is proposed to go down only a portion of Oxford-street?—Then I must amend my clause to that end, "or so much of the street as the tramway is intended to go down."

837. Mr. *Ayrton.*] Is it your view, that if the tramway is laid down under the Bill in a manner specifically injurious to the inhabitants of the street either by obstructing the access to their houses or by obstructing the thoroughfare, their

their consent ought to be required ; but that if they are prohibited from laying down the tramway in that manner, and are required to lay it down in a way that is not obstructive to access and to the use of the thoroughfare, then the consent of the inhabitants need not be obtained ?—I do not go quite to that, because I do not quite see who is to determine the primary question that there is to be no injury to the inhabitants.

838. You have taken two objections ; one is, that if the tramway is laid along the side of a street it will obstruct the access to the houses ; and you have said also that keeping the thoroughfare closed for six weeks would be a great injury. You have also told us that gas and water companies are allowed to take up the road, and that it has never been found yet to be any injury requiring compensation ?—I do not say that.

839. Do you know any case in which compensation has been given to the inhabitants of a street for the taking up of the road for the purpose of laying down a gas or water main ?—No ; nor do I believe that any compensation would be obtained.

840. Is it not obvious to anyone that you can lay a tramway on the surface of a road much quicker than you can take up the road and lay a gas-pipe and make the road up again ? If the same power were given to the tramway there would be rather less ground for compensation in the case of the tramway than in the case of a gas and water company, would there not ?—The difference is this, that the gas and water are necessaries of life ; but we have been going for many years without tramways, and they are not necessaries of life.

841. But you opened with the case that the compensation was to arise from the obstruction of the thoroughfare ?—Quite so.

842. I am pointing out to you that it is an obvious fact that less time is required to lay down a tramway on the surface of a road than to dig up the road and to lay down a water-pipe, and fill up the diggings and replace the road ; and, therefore, as it can be done in less time, it is not obvious that it can be done, if Parliament imposes conditions in such a way as not to give rise to any claim for compensation ?—If it can be done so as not to give rise to any claim for compensation.

843. So as not to give rise at all events to any greater ground for compensation than would arise in the case of a gas or water main ?—I fully admit that the analogy is against me, but the motive is different.

844. Because one is for the benefit of the Gas Company, and the other is for the benefit of the Tramway Company ?—No ; the one is for the supply of a necessary of life to the inhabitants.

845. Is gas a necessity of life ?— It has become so, and water undoubtedly is.

846. Has not locomotion become a necessity of life ?—It has ; but locomotion upon a tramway, in a groove, has not become a necessity of life.

847. Is it not as much a matter of necessity to ride in a cheap carriage as to have cheap light ?—I think not.

848. Mr. *Sclater-Booth.*] May it not be that the shopkeepers may be more interested in the private carriage traffic than in the omnibus traffic ?—Just so.

849. Mr. *Cawley.*] I suppose you are aware of this : that in the repair of Fleet-street for instance, the entire traffic has been stopped for two or three days, and the shopkeepers have been deprived of a large portion of their custom during that time ; and you are also aware that they have no compensation for that stoppage ?—I quite admit it ; but the existence of this evil, and of this great private injury in one case, does not seem to me to justify it in another.

850. Mr. *Ayrton.*] Does it not rather point to the fact that there should be a provision that there should be no greater injury in this case, seeing that no greater injury is necessary than in any other case ?—Yes.

851. *Chairman.*] Supposing the shopkeepers are fully heard before the referee, and afterwards before Parliament, do you not think that their interests will be fully preserved ?—No ; a landowner has full opportunity of being heard, not before this thing that they call a referee, but before Parliament ; but still he is entitled to be heard, not merely in respect of the taking of his land, but in respect of the injurious affection of his land. The words being "heard," though very consolatory, are not consolatory as compensation.

852. But if damage is proved in a particular case, either before the referee or before

Mr. *T. Coates.*

31 March 1870.

before Parliament, some clause can be inserted to meet his particular case?—That is all I require. All I desire is, that supposing injury is proved, that injury shall be compensated in money.

853. Then that will arise in each individual case, and not in the general Bill?—And so it ought.

Mr. *Ayrton.*] Provided you get a reservation sufficiently extensive.

854. Mr. *Sclater-Booth.*] You mean to carry into tramway legislation the same provision that there is in railway legislation for compensation?—Quite so; and not only in railway legislation, but in all legislation.

855. Mr. *Cawley.*] Are you not aware that the measure of the title to compensation as laid down by the Courts under the Lands Clauses Act, is for injuriously affecting, for which a party would have had a right of action at common law if it had followed the Act of Parliament?—I had the satisfaction of reading before I came here this morning, the judgment of the House of Lords upon the case which is now the leading case, and I hope I have protected my clients against the imperfect wording of the Lands Clauses Act Consolidation Act.

856. That may be; but is not that so at this moment?—At this moment it is quite clear that there has been a different opinion in all the courts as to the meaning of the words "injuriously affected."

857. But the House of Lords has not, I think, upset that particular point, that it must be an injury for which the party would have had a right of action had it been done without the authority of an Act of Parliament?—That is so.

858. Then the question here, I take it, would be this: supposing that the shopkeepers are injured by the use of the street by traffic, and there is no railway down it at all, but the injury merely arises from the traffic passing along, which obstructs the use of the street, they would not be entitled to compensation?—Clearly not.

859. Lord *George Hamilton.*] Your argument was founded upon the supposition that the majority of persons who use tramways will only experience the benefits, and not the disadvantages of the system, as they will not reside in the street in which the tramways are laid down?—There are those who say so.

860. Can you tell us anything about the profits of the companies that have tramways?—Indeed I cannot; I have never heard them stated.

861. But I suppose it is fair to assume, from the great anxiety to get permission to lay down tramways, that they will be considerable?—I take them to be very large indeed.

862. And that they will so far monopolise the traffic as to drive all the omnibuses now in use off the streets in which they are laid down?—Yes.

863. And that, therefore, the more crowded the streets were, the greater would be the profits which they would derive?—No doubt.

864. And therefore you think there would be greater attempts made to lay tramways in the crowded thoroughfares in London than in others?—No doubt.

865. And consequently the interests of all who have frontages in those streets would be more affected than the interests of those who have frontages in other streets?—Quite so.

866. And that they are not sufficiently protected by this Bill?—That they are not in any way protected by this Bill, because beyond all question they would be out-voted by those whose property is not all affected by the construction of the tramway in the street, and who may get benefit from the toll.

867. Perhaps you are aware that in Broadway, New York, which is the only street in that city similar to Oxford-street, where the traffic is excessive, tramways are not permitted?—I did not know it, but it is a very pregnant fact. I am here likewise for omnibus companies, and I am tempted to say something by what the Town Clerk of Glasgow said exultingly, that the omnibuses were all driven away. I do not see my way precisely to the protection of this interest which has become a great interest, and therefore I will not trouble the Committee about it.

868. Mr. *Ayrton.*] They can themselves take up the system of tramways and put their omnibuses upon them?—It is to be hoped so.

Mr. *Walpole Eyre Greenwell*, called in; and Examined by Mr. *Granville Somerset*.

Mr. *W. E. Greenwell.*

31 March 1870.

869. You are the vestry clerk of the parish of Marylebone, are you not?—I am.

870. When did you first hear of what was proposed by the Metropolitan Board of Works before this Committee?—On Tuesday last; the day before yesterday.

871. And I dare say that since that you have read the speech of my learned friend Mr. Rodwell, the Counsel for the Metropolitan Board of Works?—I have.

872. In that speech to the Committee did you see that Mr. Rodwell introduces an address from a body of gentlemen, claiming to act on behalf of all the vestries in London, from a meeting held the 17th March 1870, Mr. Clement George in the chair; do you know anything of those gentlemen, and do they in any way represent your vestry?—A committee of that sort was appointed some 18 months ago upon some particular subject which had been discussed at the vestries, and they had met occasionally since that time; but they in no way represent our vestry, nor a great many vestries in the metropolis. Of course they could not represent the vestry upon any subject which had not been brought before the vestry.

873. Then you entirely disclaim their right to state that they represent you in this matter?—Quite so. Their opinion may be very valuable as coming from individuals, but they do not represent anything but themselves.

874. Certainly they do not represent Marylebone?—Certainly not.

875. Will you tell the Committee shortly, the number of parishes with which you have communicated, and what their replies are, whether negative or affirmative, as to being represented by those gentlemen?—I communicated with all the vestry clerks and clerks of district boards in the metropolis, as to whether any resolution or deliberate opinion had been recorded in their vestry upon the subject of the Bill introduced by the Government, with regard to tramways. The question I put to the vestry clerks and clerks to the district boards, after stating what had been proposed, was this: I asked in conjunction with a gentleman, the clerk of the district board of Whitechapel, this question, "Whether any resolution or deliberate expression of opinion has been passed or recorded by your board, approving of the alteration of the Bill by the substitution of the Metropolitan Board of Works for the vestries and district boards of the metropolis?" That was the question that was asked. The original answers are here with an epitome, and I will read them if you please.

876. You passed a resolution in Marylebone, unanimously I believe, dissenting from the view of the Metropolitan Board of Works?—Yes, last Thursday and to-day, a petition was presented to the House, stating that they dissent from that view. At Lambeth vestry, there has been no resolution, and the vestry clerk believes that the vestry will strenuously object to the Metropolitan Board of Works being substituted for the local authority.

877. Have you written to the different vestry clerks, and what answers have you got, negative or affirmative, as to any resolutions by the vestries in favour of or against this measure?—As to any resolution giving authority to that deputation or committee to represent the vestry as a representative body,—Lambeth vestry, no resolution; St. George's, Hanover-square, no resolution approving of the alteration, but a resolution approving of the Bill; St. Leonard's, Shoreditch, no resolution; I must not go further; Paddington vestry, not authorised any committee to report them as favourable to the Metropolitan Board having control of a street tramway; St. Mary, Newington, passed a resolution in favour of the change, as they were led to believe that the majority of vestries and district boards were desirous of the substitution; they are not represented upon the United Metropolitan Vestry's Committee; Camberwell, no resolution; Bermondsey, no resolution, not represented; St. George's, Southwark, no resolution; St. Mark, Islington, no resolution; St. Luke's, Old-street, no resolution; St. Martin-in-the-Fields, no resolution; Mile End Old Town vestries, not expressed any opinion; Whitechapel district, no resolution; Greenwich, no resolution; Wandsworth district, no resolution; Holborn district, no resolution; Poplar district, no resolution; Woolwich district, no resolution; St. Olave, no resolution;

Mr. *W. E. Greenwell.*

31 March 1870.

resolution; Fulham, no resolution; Westminster Board of Works, no resolution; Hackney, no resolution; Bethnal Green, no resolution; St. Luke's, Chelsea, a resolution since the deputation (that is on March 29th) attended Mr. Shaw Lefevre, but no resolution at the time of the deputation; St. James, Westminster, a resolution approving of the resolutions of that committee.

878. If I gathered rightly from that paper, there were resolutions from two of the vestries and boards in favour before the deputation waited on the honourable and learned Chairman, and there has been one resolution in addition since?—Yes, quite so; that is three; but I should explain that the resolutions with regard to a central authority do not say distinctly the Metropolitan Board of Works, even the resolutions in favour.

879. You, appearing for Marylebone, greatly object to having your jurisdiction ousted, and that of the Metropolitan Board of Works substituted in this respect?—That was the unanimous feeling of the vestry after discussion.

880. Will you tell the Committee, as shortly as you can, their reasons for that view?—The paving is under the authority of the vestries and district boards and they consider that the construction, or the management of the tramways after their construction, should be under the same jurisdiction; that they should go together.

881. They think, if I understand it rightly, that the conflicting interest would be very prejudicial?—They consider so.

882. In fact, I suppose that I may take it that they consider that the local authority will be better able to take care of the interests of the district than the Metropolitan Board of Works?—They consider that they know the wants and feelings of their district better than the Metropolitan Board of Works would do.

883. You were in favour of the Bill originally, I believe?—As introduced by the Board of Trade.

884. You presented a petition against this Bill?—There was a second petition against the alterations.

885. "That so long as such consent was necessary," that is, as the Bill was originally introduced, "your petitioners had the power of determining whether or not the laying down of tramways within their parish should be sanctioned. That your petitioners have been informed that the Metropolitan Board of Works have applied to your honourable House for an alteration in the said Bill, so as to make them a local authority for the giving of such consent within the Metropolis, and thus ignoring altogether your petitioners and the other metropolitan local authorities. That your petitioners submit that this is inexpedient and ought not to be sanctioned, but that your petitioners ought to have a control over the construction of tramways within their parish, subject always, so far as may be necessary, to an appeal to the Board of Trade, in the case of the views and decisions of your petitioners being antagonistic to the public interests;" that is what you wish to place before this Committee as the feeling of the vestry?—It is.

Cross-examined by Mr. *Rodwell.*

886. You are aware of the resolution passed at the Metropolitan Board of Works, on the 25th of March, with regard to this Bill; are you aware that it was resolved that so much of the Report as relates to the Tramway Bill introduced by Her Majesty's Government, be approved, and that the board do concur in the view expressed by the Committee, to the effect that the board should be constituted the local authority for exercising all the powers as to the tramways?—Last Friday.

887. Do you know that all those persons (*handing a paper to the Witness*) were present on that occasion, and did not utter any protest against that resolution?—No, I am not aware of that at all; I do not know who were present.

888. They did not tell you that?—No; no notice was given of that resolution previous to the Friday.

889. Is it not a fact that the vestries, with regard to roads, with regard to raising funds, with regard to their bye-laws, with regard to stopping up streets, with regard to naming streets, with regard to the placing of roadways where roadways run into two parishes, and putting them into which parish they please, and

and with regard to various other matters, are, so to speak, under the control of the Metropolitan Board of Works?—I know the Act.

890. Is that correct?—I do not hear you say anything about the construction of streets.

891. Yes?—I am not aware that they are.

892. That is section 73 of the Metropolitan Local Management Act (*handing a paper to the Witness*)?—That is the bye-laws.

893. Do you differ from me in the statement that the vestries and districts are obliged to have the consent of the Metropolitan Local Board for the carrying out various improvements in dealing with their roads, buildings, and various other matters of a similar character?—That depends upon the specific power given to the Metropolitan Board of Works. The Metropolitan Board of Works have certain powers with regard to particular matters, but not as to the construction and paving.

894. But you cannot stop up a road, can you?—No; that requires the approval of the Metropolitan Board of Works.

895. And the numbering of streets, and the naming of streets?—Yes; there are specific powers given.

896. What is the conflict of authority which you think there would be?—If the vestry has the sole construction of the paving and the mode of paving, and the Board of Works has the construction of the tramways, there are two authorities in one street, and therefore no doubt a conflict would arise.

897. In repairing the street?—In the general repair and cleansing, and the whole system of the managing of the street, there will be two authorities having one jurisdiction.

898. Are you aware that that was the resolution of St. James's parish (*handing a paper to the Witness*)?—Yes.

899. "That in order to secure to the metropolitan community the utmost advantage that can arise from the formation of tramways in the streets for facilitating intercommunication, and at the same time reducing to the utmost the inevitable obstruction and inconvenience which will be occasioned to other traffic by their introduction, as also to the householders on the lines, it is desirable that the necessary routes should be laid out, and the trams constructed on one well-considered comprehensive scheme for the whole metropolis, and also worked under the direction of one central authority; that the Metropolitan Board of Works, constituted as it expressly was for promoting and effecting improvements in the metropolis, is the body on which that duty should devolve; that it be respectfully urged upon the Metropolitan Board of Works to seek from Parliament the concession of the privilege to construct tramways, and to direct the traffic management of the same, and to apply the accruing profits for the public improvements of the metropolis in relief of the rates"?—Yes, that is an exception to the rest of the metropolis which I have given.

900. Now there is Newington; I will give you Newington again, "The vestry approve of the scheme that the local authority for the whole metropolis should be your board, who should have power given to make the tramways; the consent of the ratepayers ought not to be required"?—Yes, I mentioned Newington; but that was believing that the majority of the vestries were in favour of the scheme, but they were not represented at the vestry committee appointing the deputation.

901. About this united vestry; Mr. Clement George is a name with which I am familiar in the public journals, but those, I suppose, are gentlemen of position in their own parish who constitute this united committee?—I have nothing whatever to say against the position of Mr. George or of any other gentleman constituting that committee; but what I say is, that they are not the representatives of the vestry for this purpose.

902. However, those gentlemen have expressed an opinion *quantum valeat* in favour of our view?—Of course any gentlemen meeting together may express an opinion, and it is good *quantum valeat*, but I say that those gentlemen do not express the views of the vestry, nor had they the authority to do so; and if the matter is discussed in the vestries, an overwhelming majority of the vestries would emphatically dissent from their views.

903. You know that those representatives at the vestries voted in favour of the Metropolitan Board of Works?—They are not representatives of the vestries for that matter.

Mr. *W. E. Greenwell.*

31 March 1870.

904. Mr. *Ayrton.*] Though they are elected by the vestry, they represent the whole parish for certain purposes?—Quite so with 118 other gentlemen.

905. Mr. *Cawley.*] Are you speaking of the United Vestry Association as distinguished from the Board of Works?—There was some particular subject of metropolitan interest (I forget for the moment what; some Bill in Parliament) some 18 months ago, and the vestries did appoint certain members of their body to discuss it, and they came to an opinion upon that particular Bill (I forget the object of it; some Gas Bill, or some matter of that sort), and there, of course, their functions ought to have ended; but instead of that, they have occasionally met upon other subjects from time to time as the St. Pancras Vestry possibly wished to call them together. But in the origin of the matter the Marylebone Vestry passed a resolution repudiating that body as representing them with regard to general matters, and a great many vestries have never sent deputations or gentlemen to represent them at the Committee at all.

Re-examined by Mr. *Granville Somerset.*

906. Then, in fact, however valuable their opinions may be as private gentlemen, they in no way represent the petitioners?—Of course not; it would be perfectly irregular and perfectly unconstitutional, if I may say so.

Mr. *C. S. Grundy*, examined by Mr. *Newall.*

Mr. *C. S. Grundy.*

907. I BELIEVE that, as Deputy Chairman of the Manchester Carriage Company, you wish to make a statement to the Committee?—There are one or two points upon which I should be glad if the Committee would allow me to say a word or two. With regard to the notice, the tramway referred to runs through about a mile and a-half of district, two-thirds of that distance, or about a mile, is within the borough of Salford, the other half mile is under the management of the Pendleston Road's Trust. The portion which we have had a notice to remove is that portion which is under the jurisdiction of the irresponsible body of gentlemen constituting that trust, and the notice has only been given since the agitation in favour of tramways has taken place in the district. There can be no moral doubt whatever that it has been given with the express view of prejudicing the question when it came before Parliament. As to that portion of the tramway which is within the jurisdiction of the borough of Salford, which is, of course, a popularly elected body, we have received no notice from them; and neither by one body or the other has any official complaint been received as to that tramway during the whole of the eight years during which it has been down. Just one word to compress our case into a very short space. Whatever may be the effect of tramways upon other parties, as far as being beneficial or otherwise, we are about the only parties whose interests could be seriously affected; in fact, who could be vitally affected by the Bill as it at present stands, for this reason: we are an omnibus company doing a large business in the district. If we had been parties who had absolutely set our backs against any improvements of this kind, we should have deserved, like other old-fashioned people, to have gone to the wall; but we have thrown ourselves abreast of this movement, and have endeavoured to meet public demands by promoting Bills in Parliament; and, therefore, we think that we ought not to be put on the same footing as any company or person who might come to the local authority under this Bill, because we have spent large sums of money in complying with the Standing Order of last year's Committee, and in preparing plans, and having surveys made, and so on.

908. Mr. *Ayrton.*] Is the road along which your tramway goes, both within and without the town of Salford, a paved one?—Mostly. The part under the trustees is macadam.

909. And then you have put a piece of paved road with the macadam road?—No, I believe not.

910. Then you have laid down a tramway in macadam?—Yes, that is so.

911. And in the Salford district there is a paved road?—Yes.

912. And that is the difference?—That is the difference.

913. Do you think that is not sufficient to account for what you have stated without

without imputing motives?—It is very difficult to say anything about it without imputing motives. We entirely concur that the clause in the General Bill restricting the wheel to a flanged wheel ought, by all means, to be struck out if the Bill is not to be made entirely inoperative as far as Manchester and Salford are concerned. A flanged wheel, to work satisfactorily, requires a double line of rails, because you cannot so form the omnibus that they can hit a particular point at one moment of time. I just want to point out to the Committee that there are no less than 20 streets or roads in the neighbourhood of Manchester or Salford along which it is proposed to lay tramways which are distinctly too narrow for a double line of rails. Therefore the Bill would be positively inoperative so far as Manchester and Salford are concerned, unless the condition pointed out by the town clerk of Manchester were adopted. That is a point which I am most anxious to impress upon the Committee, because I am convinced that if the Bill is to be at all operative that condition must be adopted.

Mr. C. S. *Grundy.*

31 March 1870.

[Adjourned to Monday next, at Twelve o'clock.

Monday, 4th April 1870.

MEMBERS PRESENT:

Mr. Ayrton.	Mr. Sclater-Booth.
Mr. Cawley.	Mr. Shaw Lefevre.
Mr. Dalglish.	Colonel Wilson Patten.
Mr. Dent.	Mr. Loch.
Mr. Hibbert.	

GEORGE JOHN SHAW LEFEVRE, Esq., IN THE CHAIR.

Mr. *Joseph Rayner*, recalled; and further Examined.

Mr. *J. Rayner.* 4 April 1870.

914. *Chairman.*] Do you wish to make any statement in correction of the print of your evidence as given on Wednesday last?—Yes; the following letter should be inserted upon the notes of the evidence at page 61, Answer 520, instead of the letter which is there inserted:

"Liverpool, 454, Castle-street, 19th March 1870.

"Dear Sir, Public Tramways Bill.

"We are authorised by our clients to assent to the insertion of the clause annexed to your letter of 17th instant. We would, however, beg to suggest the addition of the words 'rights and privileges,' after the word 'powers,' in the third line.

"Yours faithfully,

"*J. B. Lloyd, Garnett, & Lloyd.*"

Mr. *John Layton*, called in; and Examined.

Mr. *J. Layton.*

915. *Chairman.*] WHAT statement do you desire to make to the Committee?—I am the Vestry Clerk of St. Mary's, Islington. The vestry of Islington represent a population of 400,000 persons, with roads under its jurisdiction 80 miles in extent, and a rating of nearly a million a year. They desire to express their approval of the Government Bill: and at a meeting held on Friday last they passed the following resolution: "That this vestry strongly approves of the principle of the Government Bill, and is of opinion that the provision which defines the 'local authority' in the Metropolis to be the vestries and local boards is a proper and convenient one, inasmuch as the last-named bodies have the control of the streets, and are in a better position to judge of the convenience, or otherwise, of tramways being constructed in their respective districts than the Metropolitan Board of Works can be. That the vestry clerk be instructed to attend the Select Committee of the House of Commons on Monday and submit the above resolution for their consideration. That Mr. Layton be instructed to state to the Select Committee, that this vestry never gave its sanction to the principle of the Metropolitan Board of Works be substituted for vestries and district boards as the local authority in the Metropolis."

916. Then the vestry of Islington is satisfied with the Bill as it stands?—Yes.

Mr.

Mr. *John Morris*, called in; and Examined by Mr. *Thomas*.

917. I BELIEVE that you are a solicitor, having now, and having had for a great many years, a large practice in London?—Yes, in the City.

918. Have you practised for some time in the line of joint stock companies' business?—Yes.

919. Especially, I believe, joint stock companies' business under general Acts of Parliament?—Yes.

920. I think that you are also interested in tramways?—Yes.

921. And that that interest has caused you to acquire considerable knowledge of the tramways generally as laid down on the Continent and in America, as well as in this country?—Yes.

922. And I believe that you and your friends and relations are also considerably interested as investors in tramways?—Yes, considerably.

923. And for those reasons you have been asked to give evidence here (it being desirable to shorten the inquiry, and the number of witnesses) as a selected witness to represent the tramway interest?—Quite so.

924. As regards the Government Bill, is it the fact that the tramway interest is anxious that that or any other Bill to facilitate the construction of tramways should pass?—Certainly.

925. So far, therefore, as it will facilitate their construction or save expense in that construction, you are anxious to support it?—Decidedly.

926. Are you in a position to know that large amounts of capital will be invested in the construction of tramways in England if facilities are given for it?—Yes, I know that there is a large amount ready to be invested if it can be done upon business principles, that is to say, without any unnecessary obstruction.

927. Mr. *Sclater-Booth*.] In what sense do you mean money invested in tramways?—I mean street tramways.

928. For what purpose?—For omnibus traffic.

929. Mr. *Thomas*.] Street tramways worked by horse-power for omnibus traffic?—Yes.

930. As regards the general scheme of this Bill, so far as it applies to consent cases, and gives facilities for those cases, does it meet the views of the tramway interest?—Yes.

931. Do you think that it is possible, by a general measure, to provide for cases other than consent cases?—I am afraid not.

932. If you could have one general tribunal without appeal, and whose judgment would be satisfactory in the interest of the tramways, you would desire that such a tribunal should be established?—Certainly.

933. But do you fear that in the attempt to establish new tribunals, greater complications, and a greater number of appeals would arise, and in the end a greater expense would be incurred than under the present system of private Bills?—I am very much afraid of it.

934. You remember, I dare say, the Preliminary Inquiries Act, and its working?—I had no personal experience in it, but I have made inquires.

935. You remember that there was a machinery worked by a referee appointed by two Government Departments, the Admiralty and the Woods and Forests, that he made an inquiry in the country, and that then there was practically an appeal to both Houses of Parliament, and a Private Bill afterwards?—Yes.

936. Was the effect of that altogether that a very large amount of increased expense was entailed upon the promoters?—So I am told; I have no experience in the matter, but I have inquired, with regard to the Preliminary Inquiry Act, of a gentleman very well known at this bar, Mr. Webster the Queen's Council, and he tells me that he was one of the referees, and that the effect of the preliminary inquiry was practically nugatory, although the expense was something enormous. I have by me what he has been kind enough to lend me, a volume containing some of the preliminary inquiries under that Act, and I see that this enormous volume contains, as to one half of it, one case only, and the expense of this preliminary inquiry must have been something frightful.

937. Would it not be the fact that the judgment of the referee would not be acquiesced in in matters involving large amounts of money, such as many thousands of pounds?—Of course, I am speaking now of my own opinion only; if the referee was a man of high standing and held the inquiry openly, and was answerable to public opinion, I should have thought that his decision in the

Mr. *J. Morris.*

4 April 1870.

matter of a tramway might have been acquiesced in, but I am quite certain that if it is to be tried in any sense in the nature of a preliminary inquiry, or anything which is subject to appeal, the double expense cannot possibly be borne by tramways, because tramways are not like railways, or even large works like waterworks or gasworks, where very large capital is expended on the works. The success of a tramway depends upon small capital, an economical working, and those two things combined may produce a remunerative and satisfactory result to capitalists; but if we are to import into tramways anything in the nature of that to which I have referred, as the very heavy expenses connected with the authority to lay down tramways, then it is quite certain that tramways will not be commercially a success.

938. If it were contemplated first to have a preliminary inquiry, and then to have it appealed against through both Houses of Parliament, would it not in your opinion, be most likely that the parties promoting it would rather take their proceedings by way of Private Bill, as they do now?—I think so, if the option is open to them, decidedly. So far as my experience goes (which is not a very large one in Parliamentary practice) I believe that the tribunal which is provided by a Private Bill is, upon the whole, the best, and that one investigation and one inquiry is less expensive than any attempt to ameliorate it by a preliminary inquiry; unless, as I said before, the preliminary inquiry is final and subject to appeal.

939. And although it is said that there would be an appeal from his decision, practically there would be no appeal on some points from that decision; as, for instance, on all questions which we call questions of *locus standi*, and questions as to who should have it; if there were two or three candidates for the concession the referee would necessarily exclude all but one, and the concession would go to that one, so that he would be exercising a jurisdiction from which there would be no appeal?—I am afraid that that would be so, but it seems to me that that is only one of the consequences following from giving to any tribunal a jurisdiction subject to appeal.

940. In complete jurisdiction?—In complete jurisdiction; if it is a preliminary inquiry we object to it; if it is complete jurisdiction not subject to appeal we consent to it. That is the short form of it.

941. You are anxious that a cheaper tribunal should be established?—If possible.

942. But you do not think that for such cases or contested cases, the tribunal beginning with the referee and then giving an appeal to the two Houses of Parliament, will be cheaper or as cheap as the present tribunal?—I am certain that it will not.

943. Whilst it would necessarily give to the referee the power of deciding without appeal on a good many matters?—Yes.

944. Of course he would have to decide as to who should be heard; the whole question therefore which is called *locus standi* before Parliament would have to be decided absolutely by him?—I suppose that that would be so.

945. The only remedy would be that those who had not been heard before him should petition against the Provisional Order?—Just so; I should like to say that I am satisfied that the Government Bill, if it is passed substantially as it is before the Committee now, will notwithstanding the practical difficulties of applying it to contested cases be very extensively used.

946. *Chairman.*] In consent cases?—In consent cases. I might mention in illustration the case of two of the Bills this year on the south side of the Thames, the Metropolitan Street and the Pimlico, Peckham, and Greenwich; there were two Bills passed last year on the south side, in which in one case particularly large extensions are being applied for this year by Private Bill. In that case the local authorities are, without exception (I think it passes through some eight or 10 local authorities), all consenting to the principle of the Bill, and there are only some small questions on clauses, all of which could be settled before a Committee of the House of Commons at a very small expense, and the Bill would practically pass through as an unopposed Bill on private grounds, subject to any public question which might arise.

947. Those cases would come under this Bill, would they not?—Quite so. If we were proceeding under the Government Bill we could have gone for it without applying for a Private Bill at all; and I believe myself that it might be done in that case, and in a great number of cases of that class, especially in extensions.

extensions. I do not think that it would be very well applicable to a new tramway going into a new district, especially in a large town like Glasgow, Manchester, or Birmingham, where there may be a difference of opinion as to the policy of it; the corporation are necessarily a Conservative body, and may hesitate to try what they may consider to be an experiment. A great number of people may desire a tramway, and conflicting interests may be at work, and in that way I think that it is very likely that for the purpose of tramway or no tramway in a given district, it may have to be decided in the first instance for some time to come upon investigation by a tribunal like a Committee of the House of Commons. But when the question is once settled, and tramways are existing in the districts and appreciated by the people, extensions here and there, for many reasons which it would be difficult and tedious to go into, will be promoted, and facilitated by the general concurrence of the inhabitants and the local authorities. My experience of tramways is this: in every town where I have been connected with tramways, Genoa, Copenhagen, and Brussels, prejudices disappear as soon as the tramways are at work; therefore I conclude from that, that what has happened elsewhere will happen here, and that tramways once being introduced and prejudice overcome by the result of practical working, we should find that tramways would be extended without the necessity of applying to Parliament under the consent clauses. I should be very happy to extend the Bill to contested cases, but for the difficulties which are attendant upon it. Protesting as we do that we are desirous to facilitate in every possible way any cheaper tribunal, we should hail with delight any means by which our wishes might be carried into effect.

948. Mr. *Thomas.*] As regards the important question of the amount of authority to be entrusted to local authorities in the case of a tramway, you have heard the evidence given by local authorities almost amounting to a suggestion that this Bill establishes the principle that no tramway is to be made without the consent of the local authority; do you read the Bill as going so far as that?—I think not; I think it would be a great misfortune if it did.

949. And still more, it has been suggested that the town council represents the borough absolutely, and that practically the town council should have a veto upon any tramway being made in its town; do you think that that would be advisable?—I think not.

950. That is to say, that a bare majority of the town council elected for other purposes, and without reference to the issue, should have the power of practically vetoing any tramway in a town?—It is quite certain that that would not facilitate, but it might obstruct tramways.

951. You think it would be a great obstruction to the spreading of tramways generally?—Yes.

952. And I suppose the incidental effect of such a veto would be necessarily that it would practically come to a vast amount of advantage, or money, in some shape or other, being given to the town council for the concession?—I think that it would come to that in the worst possible form.

953. And the amount in money, or in aid, so given, would be a burthen upon the tramway for the time for which the concession was granted?—Yes, if it assumed that form; but I understand tramways to mean this: that they are to aim at two objects, the one is cheap fares, and the other is good service; and I do not understand how you can have those objects kept as the two essential points, if you are to be bargaining with local authorities, each one of whom will be more exacting then the other, as to the terms to be paid to them. In other words, I look upon it that tramways are to be for the benefit of the public, and not for the benefit of the particular locality in which they are laid out.

954. And the granting of a concession in consideration of a sum of money or an equivalent advantage to a town council would be giving an advantage to the present generation at the expense of the next, would it not?—I do not see how you could work it. I think it would be almost impossible for private capitalists. I do not in the least object to any town council or corporate body electing whether they will lay down tramways themselves or let private companies do it. That is a fair open question, but I think they must divide that question; they cannot act the part of the dog in the manger. When they have decided that question they must act upon it, and they cannot consistently with the true principles of tramways according to my experience of them go and sell the tramway as a matter of profit; in fact, I do not

Mr. *J. Morris.*

4 April 1870.

not think that any private capitalists would care to compete on those terms. In the first place a corporate body is a most difficult thing to deal with. All my experience of them is that, with every desire to accomplish the object for which they exist, you cannot negotiate with them, and therefore for all matters of bargaining I think they are a most difficult body to deal with. I would therefore strongly urge that while I would not in the least degree obstruct, as the Government Bill desires to facilitate, the laying down of tramways by local bodies, yet that they should either be determined to do it on their own account, or at their own risk, of course leasing it afterwards, or that they should let private capitalists do it upon terms of giving the public reduced fares, good service, and the very best provision which can be given.

955. *Chairman.*] Do I understand you that the consent of the local authority should not be requisite?—Not in contested cases.

956. But who is to contest them if not the local authority?—Take, for instance, the case of an application for a Private Bill. Supposing we want a consent case where tramways are either designed by the local authority, or where they are established and extensions are desired, then I would facilitate their construction with consent.

957. But supposing there is only one company making an application for a tramway and the local authority does not consent, would you give power to the Board of Trade under this Bill to authorise the construction?—No; I would give no power to the Board of Trade without consent.

958. Then you do think that the consent of the local authority should be given?—Decidedly, under the Bill.

959. Do you wish to reserve to yourself the right of going to Parliament if you do not get the consent of the local authority?—Quite so.

960. Colonel *Wilson Patten.*] What do you mean by the town council not having a veto?—I mean that the town council should have a veto in all cases of consent. Take the case of any given corporation, we will assume that the promoters desire to put down a tramway in a given town; they apply to Parliament by a Private Bill to lay it down; the corporation oppose; I can easily understand that a corporation may oppose and believe it to be for the public interest that it should be done. Therefore I would rather that a tribunal, such as a Committee of the House of Commons, should decide that question. In other words, I would give jurisdiction to the Board of Trade to deal with all consent cases, and to a Committee of the House of Commons jurisdiction to deal with all contested cases.

961. *Chairman.*] Supposing that there are two companies applying to lay down tramways within the same district, and that the local authority consent to the tramways, but have, perhaps, an objection to one of the plans which are laid before them; would you allow such a case as that to be dealt with by the Board of Trade, or would you have it go before Parliament?—I should like to have it dealt with by the Board of Trade; but if the Board of Trade are going to deal with it in the nature of a preliminary inquiry, then I think that the result of it would be that great expenses would be incurred in those cases, and it would not prevent a rehearing before Parliament, and the whole of the evidence being gone over afresh, precisely as was done under the Preliminary Inquiries Act, so that, in point of fact, the real contest would be in Parliament, and the expenses would be doubled without any use. If the Committee could, in their wisdom, provide some tribunal, such as the Board of Trade, which we would willingly accept, which can fairly deal with such cases, I for one should be delighted to see it done; but I say that the very nature of a contested case will lead people to Parliament, and will lead to a renewed inquiry before Parliament.

962. Mr. *Thomas.*] In the case which has been put by the honourable Member, if it were dealt with under this Bill, one of the companies would be selected and the other would oppose the Provisional Order before Parliament practically?—Yes.

963. Mr. *Cawley.*] With regard to the Provisional Order and the Act to which you have referred, the Preliminary Inquiry Act, are you acquainted with the working of that Act?—No, I said I was not.

964. It was only in force for one year, and I apprehend that you will find that it is a totally different thing from this Provisional Order, and that there is no analogy between them?—Very possibly.

965. Mr.

965. Mr. *Thomas.*] I think that the analogy which you suggested was rather between the class of gentlemen who would form the referees in the present case and those who did form the referees in that case?—Quite so. I am assuming that they would be the same. If I understand the honourable Member, it would mean this: that the Provisional Order would be subject to appeal, and there would be a difference between an appeal and the original hearing. I do not know whether that is so, but I assume that the evidence would have to be gone into again before Parliament on the investigation of the Provisional Order, and, if that is so, my remark applies.

966. I believe that you have no desire to take any part in the contest which rages between the vestries and the Metropolitan Board of Works as to their jurisdiction?—Certainly not.

967. Do you think it desirable that if there could be in the metropolis one authority for all purposes, that is to say, a street authority and a local authority, and but one for the purposes of tramways?—Yes, I think it would, certainly. It would facilitate matters, no doubt, if you had one authority, and but one authority if you could give the streets over to that one authority for all purposes; but if it means the creation of an authority for tramway purposes, as distinct from other street purposes, then it would be adding to the complications instead of subtracting from them, and it would be an immense addition to our difficulties.

968. Unless, therefore, the Metropolitan Board of Works can become the street authority for all purposes, you think that the suggested change in the Bill would be undesirable?—Clearly most undesirable and most obstructive.

969. I think, as regards your own case, you had a Bill last year for the parish of Lambeth?—Yes.

970. If the Metropolitan Board of Works had been the local authority there, and had had the power to veto that Bill, they would have done so, for they opposed it, did they not?—Yes, they opposed it.

971. But you applied to Parliament, and Parliament gave you your Bill, notwithstanding the opposition of the Metropolitan Board of Works?—Yes. My experience of large bodies like the Metropolitan Board of Works, as distinct from local vestries, is not very encouraging as to the practicability of the working power of a large body.

972. *Chairman.*] That is to say, you find the vestries more favourable to tramways than the Metropolitan Board?—Not exactly; what I mean is this: If I am dealing with the vestry I am dealing with the party interested in the district. If I go to the Metropolitan Board, it is subject to the infirmity of all large bodies; that you do not know how to address them; you cannot get at them. Last year the Metropolitan Board, to whom we addressed a communication at a very early period of our proceedings, never sent a reply until, I think, the day when the Committee was sitting; and they wanted just to limit our experiment, as they chose to call it, to a certain district, where it turned out, two or three months afterwards, they were going to construct a sewer which would actually prevent the experiment from being tried for something like two years. I do not mean to say that they did it intentionally, but it shows that, in a large body like that, you have not the same personal interest influencing the parties as you have in dealing with local bodies; and, though I do not at all mean that local bodies have given us undue or great facilities, yet they have not obstructed us. We have always found them accessible, and always open to discuss the question, though keenly alive to their own interests.

973. Mr. *Thomas.*] So that, as far as your experience of the Metropolitan Board is concerned, they appear already to be too large to manage their own business successfully?—I should think that one side does not know what the other side is doing.

974. There were two parties last year, one endeavouring to confine you to a particular mile, whilst the other department had, in the meantime, let a contract for the sewer over the same piece of road?—That is about what occurred, so far as I remember.

975. At all events they opposed your Bill last year, and desired to confine you to a mile of that road?—Yes, and they oppose the Bill this year on the ground that the Bill of last year was an experiment; and they charge us now with a breach of faith for coming to Parliament again.

976. So far as they are concerned, if any body could be constituted which would

Mr. *J. Morris.*

4 April 1870.

would take the whole power, you, at any rate, think that that would be a facility given to the tramway construction of the metropolis?—I think it would be. It is a large question; of course it is merely matter of opinion as to whether one governing body is better than a lot of local bodies. Our experience is against the Metropolitan Board of Works, and favourable to the vestries as being interested. My own opinion is, that if you have one body interested in the streets, and not a mere party looking on like the Metropolitan Board of Works and having no interests in the streets and not being responsible to the ratepayers, a body of that kind is most obstructive and does really more harm than good. On the other hand, I am inclined to think that one central authority having an entire control of the streets would, in the tramway aspect of it, be an advantage than otherwise.

977. Do you think that considerable power should be given to local bodies to overlook tramways, and to have the supervision of tramways made by private companies?—Yes, my experience of tramways is that they are best laid down and worked by private companies responsible, even in the strongest manner, to the local authority, or the governing body of the streets, whatever that may be.

978. Your experience has led you, I think, to the opinion that whoever may construct them, they should be maintained and managed by a company?—Yes, that is our experience, decidedly.

979. What is your opinion as to the desirability of what may be called unity of management in tramway enterprise?—I think it most essential that the tramway should be managed and repaired or maintained by the same body.

980. Do you think it essential that maintenance and management should go together in order that the management and the maintenance shall be effective?—Yes: that is not a mere matter of opinion; that is the result of all experience.

981. You say that that is the result of all experience in the working of tramways?—Yes.

982. Mr. *Sclater-Booth.*] You do not say construction, maintenance, and management, but maintenance and management?—Maintenance and management; I did not say construction.

983. Mr. *Cawley.*] What do you include in the word "management"?—I mean maintenance and working.

984. Mr. *Thomas.*] As regards maintenance, taking that first, and that brings us to the question of repair, do you think it possible to work tramways efficiently if the repairs of the tramway are to be done by anybody but the tramway company?—I am afraid not; that is the result of experience.

985. Is it on account of their interest in the repair of the slightest defect that you say that?—I say this, that any local authorities, if they have to repair the road by the aid of officials, will not do it with that care and constant daily, and perhaps hourly, attention with which the officials of the company interested are bound to maintain it, not only because of their obligations, but because of the enormous use they make of the road, sending, perhaps, in some cases, hundreds, or it may be thousands, of horses over the road in the course of the day. The result of my experience has shown this, that every conductor of a tramway car becomes a sort of officer or surveyor to bring notice to the head office of the slightest defect in the line, so as to keep it in perfect order, on the one hand to prevent accidents to the horses, and also to keep the gauge perfectly right, so that a car, which otherwise might run off the line is kept on the line. In point of fact, for their own selfish purpose, apart from obligation, a tramway company would keep the road in perfect order.

986. As to the mode of doing it, I suppose it would be practically done at night?—It is, in fact, done at night; that is the result of experience, because the tramway company not only does the work from day to day and from hour to hour, but it does it at the night time in order to avoid the enormous expense which might be occasioned to them by stopping that traffic.

987. Mr. *Thomas.*] This is as to the tramway itself, and as to the 18 inches on each side, which the tramway companies are to be required to repair?—Yes.

988. Mr. *Dent.*] Then you approve of the 19th Clause of the Bill, in which the responsibility is put upon the tramway company to repair?—Quite so.

989. Mr. *Thomas.*] Then you say that for their own purposes, a tramway company

pany will repair the road from the pressure of self interest, effectually and quickly?—Yes, and properly.

990. Supposing an agreement were made between the tramway company and the parish, whereby the parish were to do the whole, then whenever any special repairs were wanted, there would have to be the ordinary notice to the parish surveyor, would there not?—Yes.

991. And supposing he did not attend to it, then there would be a summons?—Yes, all kinds of disputes would arise.

992. And the effect would be that the roads might not be repaired for some time?—They might not be.

993. And the tramway company would not be able to insure that perfection of road upon which their commercial success depends?—Quite so; that is so.

994. Therefore you say that independently of any question of money, even if they got a cheaper contract with the parish, yet in working it would not answer their purpose?—I should think so; that is the result of experience so far as we have been able to ascertain.

995. And you consider it therefore essential that the tramway company should be the actual repairers of the road for their own purposes?—Yes.

996. You see no objections to agreements being made between them and the parish, for their repairing, if so agreed, the rest of the roads also?—Not the least; we have introduced a clause to that effect.

997. And you would propose that the fullest power of agreement should be given in this Bill for that purpose?—Yes.

998. Mr. *Sclater-Booth.*] Have you put clauses into this Bill for that purpose?—Yes.

999. Mr. *Thomas.*] It has been suggested that if a local board laid down a tramway it might be desirable for public interests that it should be let like turnpike tolls every year; I think that was suggested by Mr. Scott in a report; do you think that that would practically widen the area of competition?—I think it would be certainly wholly impracticable.

1000. It would involve, of course, tenders for it?—Yes.

1001. Then there would be the stables and coach-houses necessary for working the traffic, would there not?—Yes; I should like to explain to the Committee that the bulk of the capital, or at least the larger proportion of the capital of tramways is required, not for the mere laying down of the road, but for providing machinery for working that road, that machinery being shortly, horses, carriages, stables, car-sheds, and things of that kind, those stables and car-sheds being very extensive indeed in area, in a large business, and most difficult to be obtained in suitable sites, and the obtaining of them would, as far as land alone is concerned, involve a very large outlay of capital. Therefore, even in ordinary cases, the larger proportion of the capital is really required for the ordinary working, and not for the mere laying down.

1002. *Chairman.*] What proportion is required for the laying down of a tram as a general rule?—Speaking generally, I think about half, though I am not a practical man on the subject, but I think that where the land is difficult to get, it will be proportionably higher as against the stabling and car-shed portion.

1003. Competition, of course, under those circumstances, could not exist, and there would not be a number of bodies in a position to put on those horses and so on?—Quite impossible, competition is out of the question. Of course it is a question of opinion and experiment, but experience is against it, so far as my experience goes. If you assume that the tramway is not to be worked by one company, but by a number of people, I say that there are many reasons against it, and all experience, so far as I know, is against it; but assuming that they are not to do it, and that it is to be worked by one or two persons at the outside, I say that competition is out of the question, because before you can compete, you must have all this paraphernalia. In other words, if the authorities of London were at this moment to lay down tramways, and to offer them for public competition, I know of one body in London who would compete for them, and that is the London General Omnibus Company, because they have probably the nearest approach to the paraphernalia for carrying it on. I will take any capitalist you like, but capitalists will not form themselves together to buy stables upon the mere chance of being able to tender for a tramway, nor, on the other hand, will they do it if they succeed in getting it.

Mr. *J. Morris.*

4 April 1870.

1004. Does not that depend upon the terms which the local authority can offer if they can offer an absolute concession for 30 years, subject to the terms of this Bill; would not that enable persons to tender?—No doubt, supposing the local authority could offer a term sufficiently long, parties would compete, but even then it would be an unfair competition, for this reason: supposing I was concerned for parties who were competing, they would have to compete upon the speculation that they would have to provide land for stabling, and all the paraphernalia, after they had got their tender.

1005. You say that it would be unfair to others than the omnibus companies that the tender should be made in this way?—I did not mean that. What I meant to say was this: supposing the tenders were to be taken in that way, there would not be that area of competition which has been assumed. There would not be equality of competition, though probably there would be competition; I cannot tell that, but if I was concerned for capitalists at this moment who were thinking of tendering under such circumstances, they would not tender upon equal terms with the omnibus companies, because the omnibus companies have the paraphernalia, and they know exactly what they have got.

1006. But the tramway would drive the omnibuses off the line, I presume, altogether?—I do not think so; that is not our experience.

1007. Have you found that the omnibuses run along a road where a tramway is?—Yes, the experience is not that it drives the omnibuses off. In Copenhagen the omnibuses increased 20 per cent. after the tramways had been established.

1008. But acting as feeders to the tramway, and not running on the same line?—Acting as feeders to some extent, but actually running over the same line, too. The omnibus service in Copenhagen increased 20 per cent. after the tramway carried four millions of people in a year.

1009. You say the omnibus companies have already stables and rolling stock to a certain extent, and they have horses, why should they not be in a position to offer upon better terms than other persons?—No doubt, I think they would be.

1010. Why should they not?—If it is thought in the public interest that the area of competition should be confined to the existing parties, and that they should have a practical monopoly, not only of the omnibus service but of the tramway service, there is not a word to be said against it, of course.

1011. Is it not the best way of meeting the opposition of the omnibus service by telling them that they are in a better position?—If the object is to conciliate the omnibus companies, I should say yes; if the object is to get the best public service, I should say no.

1012. That assumes that they would be unequal to the work?—I am not suggesting that they are unequal to the work.

1013. Mr. *Loch.*] You think that the element of competition might be lost in the event of its all falling into the hands of the omnibus companies?—I should have thought it rather a dangerous policy to have handed over the whole passenger traffic of this large city to an existing interest. I should have thought that the better plan would have been to have a tramway interest and an omnibus interest, and that they might be worked in conjunction with each other. I would not shut out the omnibus company, but I think that by having tramway companies acting upon the principle of private companies, the tramway companies and the omnibus companies so acting, the two would stimulate each other, and that the result would be a better public service.

1014. Mr. *Thomas.*] To return for a moment to the question of repairs, I think that in Mr. Train's system one of the causes of that failure was that the road there was repaired by the parish?—Yes.

1015. And the consequence was, I think, that the roadway was suffered to wear away, and that increased the tendency of the rail to be an obstruction?—Yes, it exaggerated the defects of the rail, no doubt, by the defective state of the road, which was in the hands of the parish.

1016. I think that the Salford Tramway is laid along a turnpike road by arrangement with the Salford Corporation, is it not?—Yes.

1017. And the corporation undertake the repairs?—Yes.

1018. And practically the road is in very bad repair?—Yes, and I believe that there is always a dispute between the omnibus company and the corporation as to the repairs; I believe that the omnibus companies, though I do not know this of my own personal knowledge, have gone so far as to offer to do the repairs, but there have been disputes about it.

1019. It

1019. It is repaired by the local authority and it is in bad repair?—It is.

1020. Do you think that there would be a convenience in having the repairs on the hands of the tramway company in case of accident?—I think in the public interest there would be.

1021. Because the responsibility would not be divided?—Yes, and the tramway company would be responsible in all cases of accident without dispute or controversy; the question would be certainly open to discussion if there was division of responsibility.

1022. I will call your attention very shortly to the amendments which we propose; in Part I. the amendments are simply verbal "District or Districts;" as the clause stood it would have required a certificate for each district, would it not?—Yes.

1023. And the suggested alteration would prevent that?—Yes, the alteration is merely to facilitate the construction of tramways with the consent of several local authorities where there are several all concurring.

1024. It is simply to render unnecessary a certificate for every district?—Yes, I think that as the clause stood it rendered a separate certificate necessary for every separate district. It is a mere suggestion to facilitate what I mentioned in the beginning, that where several authorities concur it can be carried out by consent.

1025. You concur in the view that was suggested by Mr. Coates for the railway companies, as to turning the certificate into a Provisional Order?—Yes, I see no objection to that.

1026. Then as to Clause 5, I think you propose that that should be omitted?—I think so; I am afraid that it would be very difficult for private companies to have anything to do with tramways if it was maintained.

1027. You think that the legalisation of the sale of a concession obtained from a Government Department is bad in principle?—I object to it *in toto*. As regards any private promoter obtaining a concession and selling it, that, I think, is decidedly objectionable. I think also that as regards corporate bodies it would be objectionable. I can see many reasons why it would be found to be unworkable, and would conflict with what I would venture to suggest is the true principle of tramways, namely, to get in the fullest possible extent, cheap fares and good service.

1028. Mr. *Ayrton.*] When you say "corporate bodies" do you mean municipal corporate bodies?—I was speaking of local bodies.

1029. Mr. *Thomas.*] The tolls would be higher, and the facilities would be less, in proportion to the amount of purchase money?—Not only so, but it seems to me that it comes to this: that a tramway is a trading concern, and you cannot expect anyone to embark in a trading concern which is subject to all the risks to which a business of this kind is subject, without getting a substantial return upon the capital. And, therefore, as regards any capital which was paid to a local corporation, supposing 1,000 *l.* was paid, that money probably would not be worth more than 4 per cent. to them, but the tramway company would have to pay a much larger rate upon it, because it is a part of the capital which they risk in the enterprise. Therefore, it seems to me from a public point of view, that it would be objectionable as a mere monetary objection; but, at the same time, it would be unworkable, and extremely humiliating to capitalists to be discussing and bargaining with local bodies, and I do not think that men of any position would care to embark in a business of that kind.

1030. *Chairman.*] Do you mean for getting the concession?—For buying it from the local authority.

1031. Mr. *Thomas.*] Then you suggest that if it is thought expedient to put in this clause, there should be a right of pre-emption given to the owners of an existing tramway joined by it?—I think so; that seems but fair.

1032. But your suggestion is, that that clause should be omitted; it is only in case that suggestion is not adopted, that you suggest a right of pre-emption?—Yes.

1033. Then in Clause 3 there are some verbal amendments at the bottom?—Yes.

1034. Then at page 4 you concur in Mr. Coate's suggestion for that being altered?—Yes.

1035. As to Clause 10, I understand that you do not object to that deposit on the part of the tramway interest?—No, I do not object.

Mr. *J. Morris.*

4 April 1870.

1036. If it is thought desirable that there should be that security?—Quite so.

1037. But you point out that if a tramway is authorised by a private Act of Parliament, no such securities are given?—A deposit is made upon the application for a Private Bill, but it comes under the second class, and therefore the money is released at the end of the Session, and is not retained as a security for the performance of the works. I understand this clause to provide that the money should be retained as security for the works; I do not object to that, on the contrary, we rather applaud it as an additional security to secure substantial parties coming forward.

1038. But you point out that it is a security which they would give in addition to that which Parliament would require them to give?—Yes, it is an additional security.

1039. Under Standing Orders 64 and 11, I think 4 per cent. of the estimate in the case of a Tramway Bill is deposited, and so soon as the Act passes it is paid out without being impounded?—Yes.

1040. Whereas in the case of railways it is impounded as a security?—Yes.

1041. This clause proposes to impound according to such condition as may be prescribed a deposit of per cent., which would therefore be an additional security under this Act, beyond that provided by Parliament in the case of railways?—Yes.

1042. Then in the next clause there is another Lands Clauses Act put in; in Clause 11 the alteration is merely the inserting the Lands Clauses Act with regard to the cost of arbitrations; then we get to Part II. of the Bill; as regards Part II and Part III, do you suggest that this should be turned into the form of a Consolidation Act?—Yes, it seems to me desirable for many reasons, if you make that alteration.

1043. If they are passed in the form of a Public General Act, will it not be contrary to the practice to amend them in any respect by any Private Bill?—So I understand, or by certificate.

1044. Neither House will allow a Private Bill to alter the clause of a Public General Act?—So I understand.

1045. Those provisions in Parts II, and III., if they remain as they are now, would constitute a hard and fast line, and would not allow of adaptation in different districts to the local circumstances of the case?—Quite so; I think it very desirable indeed, whether by Provisional Order or by Private Bill (because I presume one object would be to enable those clauses to be incorporated in every Private Bill) that it should be in the nature of a consolidation, so that the certificate or the Private Bill, in a few words, subject to exceptions as to the circumstances in each case may incorporate it, and that would very much facilitate the practical working of it.

1046. Mr. *Ayrton.*] Then it would be a Clauses Consolidation Act?—Quite so; it would be a Clauses Consolidation Act to that extent.

1047. Mr. *Thomas.*] Then there is Clause 15 A, at page 7, as to the incorporation of Part II.; that follows the exact words of the Consolidation Act of 1847?—Yes; in that very Clause 16, where the gauge is defined in accordance with the Acts of last Session as a flanged wheel, and so on. It certainly seemed to us desirable that there should be power in special cases to the Board of Trade in granting a Provisional Order, or for Parliament in passing a Private Bill to modify that in adapting it to the special circumstances of each case, or it may be recasting the whole thing. If you have a hard and fast line no doubt that could not be done.

1048. As regards the certificates or Provisional Orders themselves, would not this facilitate your incorporating in the Provisional Order itself any exceptions or variations which the Board of Trade might think requisite?—I think so.

1049. Instead of making it necessary to put in substantive clauses as is done in the Local Government Acts for conforming the Provisional Orders?—I cannot form an opinion of the relative value of the two modes. All I know is that a hard and fast line would be extremely inconvenient, whereas plastic provisions, such as have been suggested, would be extremely convenient in the practice and adaptation of it in each case, because I cannot imagine a case in which you might not have some exceptional circumstances.

1050. Now we come to Clause 16A; at page 7, with the necessary power of deviation, "If any street authority or road authority shall hereafter alter the level of, or widen or alter any road along or across which any tramway is laid, or authorised to be laid, the promoters may, and (if required by the street authority or

or road authority) shall from time to time alter, or (as the case may be) lay their rails so that the uppermost surface thereof shall be on a level with the surface of the road as altered, and so that the tramway shall be as nearly as may be in the same position with relation to the centre line of the street as widened or altered, as before the widening or alteration;" I believe that no power of vertical deviation has been hitherto recognised for tramways in any way?—It has been impossible to recognise it, as I understand the Standing Orders are so strict.

1051. Neither vertically nor horizontally?—No.

1052. Consequently you wish this clause to be inserted?—Yes; I think a power of that kind should be given, because it would very much facilitate the carrying out of the works without any substantial difference from what Parliament has sanctioned.

1053. It is obvious that there might be a difficulty if the level of the streets was raised by the local authority after the construction of the tramway?—Quite so.

1054. Then Clause 19A, page 9, is the clause to which you referred in your evidence, giving power to make contracts?—Yes, giving power to the road authorities to make contracts; that is the clause to which I referred.

1055. In Clause 19, to which I should have called your attention, there is an alteration. As the clause stands, it is proposed that the promoters shall at all times pave all tramways?—Yes.

1056. You propose an alteration there that "they shall at all times maintain, and, if so directed by the Provisional Order or special Act, pave and keep paved;" do you anticipate that in rural districts it will be necessary in all cases to pave a road where a tramway is laid?—I think decidedly not; I think that it would be entire distinction to tramways in poor districts, and not only in poor districts where it could not be necessary to pave; for instance, in Brussels we have a tramway where part of the road is paved and part is not paved. Then, again, with regard to gradients, it might be utterly impossible, in some cases, to pave where you have a very steep ascent; it might be destructive to the horses. Therefore, I would make the rule to be to pave it, but entirely on the discretion of Parliament or the Board of Trade to adapt it to the special circumstances in each case.

1057. All you propose here is to pave it whenever so directed by the Provisional Order or special Act, but that it shall not be made compulsory for all tramways?—Quite so.

1058. Then, we come to Part III., Clause 24, as to the question of the carriages to be used; you propose that it shall run, "subject to the provisions of this Act the promoters and their lessees shall have the exclusive use of this tramway for carriages with flange wheels, or other wheels specially adapted to run on a grooved rail;" now, you propose to add these words, "and for carriages licensed to carry for hire any number of passengers exceeding five;" and you propose to settle the question in that way as regards omnibuses running on the tramway rail?—Yes; I respectfully suggest it to the Committee as a matter of very vital importance to the tramway, that on the one hand there should be the utmost freedom of use of the road to all carriages of every description, with the one exception of omnibuses. The proper gauge of an omnibus, I should say, is 6 feet. I think, certainly, considerably more than this gauge; but it has been found in Liverpool that the omnibus company are trying by the aid of mechanical appliances (I do not know that they have quite succeeded in doing it yet to their entire satisfaction) to run omnibuses with wheels so constructed as to run directly upon the rail.

1059. *Chairman.*] Without the flange?—Without the flange.

1060. So constructed as really to run on the rail habitually, but without the flange, which brings it within the special terms of the Act?—Yes, quite so. What we suggest is that if tramways are to be a commercial success, and they are to be privileged for a term in the way suggested by the Government Bill, at all events they should be protected to the extent that no other conveyance running for hire should run upon the rails.

1061. That there should be a monopoly of omnibus traffic at all events?—Quite so, so far as the rail is concerned, bearing in mind that that is not the proper gauge for an omnibus.

1062. That is to say not the usual one?—Four and a half feet is not the proper one; six feet I think is the proper gauge for an omnibus; in fact I

Mr. *J. Morris.*

4 April 1870.

believe there was an affidavit made in the Chancery suit by the Secretary of the London General Omnibus Company that they never have an omnibus of that gauge.

1063. Then your amendment is for the purpose of clearing up that doubt which exists in the Liverpool Act as to whether the habitual use of the rail by omnibuses, not specially adapted for the rail, is legal or not?—Quite so. What I respectfully submit to the Committee is this, that if capitalists are to invest money in tramways for a short term, unless they are protected in the use of the rails by omnibuses in that way, in the first place you will not get the capital, and in the second place the effect of allowing it will be that the omnibus wheels constantly running off and on (although no doubt of necessity the horse, as has been proved at Liverpool, will hug it vertically) will cause rucks on the side of the rail. It will be seen at once that the number of omnibuses running in any given district is so much in excess of any other conveyance, that if they all had to run on and off the rail they would make very sad work with the pavement. Then again, another objection is that unless there is some protection of that kind, a great deal of the present omnibus objections will be perpetuated in that form, because supposing a tramway starts from Brixton-road, an omnibus can very easily be put before it or after it, and would be able to go a very long way without offending the law, and without bringing themselves distinctly within the police regulations so as very much to obstruct the working of it, and probably to carry it on at a loss for a time.

1064. And at the same time to derive considerable advantage from the tram in the saving of labour?—An enormous advantage; in other words, the tramway company would be taxed by not only having to bear the cost of the rail and the cost of maintaining the pavement, but that the tax will be immensely increased by the addition of a large omnibus traffic upon the rail, and not upon the rail only, but upon the pavement.

1065. Mr. *Ayrton.*] When did the dispute arise with reference to the use of the tramway in Liverpool by some carriage which had not flange wheels?—It arose almost immediately after the opening of the tramway.

1066. When was that?—About October last.

1067. Are you aware that the question was very much mooted before the Act was passed last Session, as to whether people could run a carriage without a flange along a tramway?—Yes, I have no doubt it was.

1068. And those who took the Acts of last Session took them with perfect knowledge that such was the opinion of a great many people?—No doubt; and I venture to answer the right honourable Member by saying that we took it with that knowledge, and that we are quite content to retain it, and to take the risk if we have what the Act of last Session gave us, namely, a perpetual right to the tramway, because we believe in time we shall kill the opposition; but if we are to have mechanical skill applied to carry out the object which they are trying to effect in Liverpool on the one hand, and the short term on the other, it will be very easy for the omnibus companies so to arrange the opposition as to make it difficult for us within our term to make it pay.

1069. You say that the Acts were taken last Session with the full knowledge that such a question would be raised, or that such a plan might be adopted; and those who took the Act took the risk upon themselves?—That is so as regards last Session.

1070. *Chairman.*] Are they upon the same terms as the Liverpool Act upon that point?—No, they are not; they are different; I do not think that under the Act of last Session the same question as was raised in the Chancery suit would probably arise; it would be open to question.

1071. That is to say, that it would be clearly against the tramway company?—No doubt.

1072. Mr. *Ayrton.*] The clauses were expressly framed to give parties the right if they chose, of running wheels of a gauge that would suit the tramway, provided they did not use flanges to keep them on?—That is so.

1073. As a matter of fact that was so, was it not?—That was so with this one exception. It was put forward as a strong argument in favour of tramways that ordinary conveyances could use them, and that in some towns in America they had been adapted to the tramways. We certainly were not aware last year that omnibuses could do it. We assumed that omnibuses requiring and having a gauge of something like six feet, never could run upon such a narrow gauge; but

but the Omnibus Company of Liverpool are a very enterprising body, and no doubt they are trying to make that a fact which we never supposed could be done.

1074. You assume the present state of things, but there was full notice given to the parties that another state of things would probably be attempted if those tramways were laid down; that carriages would be constructed to run upon them; during the passing of this Bill last Session was not that very question mooted, and full intimation given that parties would endeavour to adapt carriages to the tramway?—Yes, speaking of other carriages, not of omnibuses. We never supposed omnibuses could be adapted to the tramway.

1075. You mean carriages generally?—Yes, there was no exception.

1076. *Chairman.*] But, in your proposed amendments, you are speaking rather with reference to future concessions than with reference to the Acts of last year, are you not?—Yes, quite so; I am not at all suggesting for one moment that the Act of last year was a compact, and we took it with that risk.

1077. And you are content with it; but what I understand you to say is that the terms in this Bill under which the concession would be made are so much less favourable to the companies that, without this further protection, you do not think the capital would be raised?—Quite so.

1078. Whereas the terms of the Act of last year were, on the whole, more favourable to the companies?—Much more so.

1079. Mr. *Loch.*] Were the Acts of last year for terms, or in perpetuity?—In perpetuity.

1080. *Chairman.*] The terms of this Bill are much more restricted than those contained in the Acts of last year, are they not?—Quite so.

1081. Mr. *Ayrton.*] Is the Liverpool Railway the same in form and section as that which is now being laid down in London?—Quite so.

1082. Mr. *Hibbert.*] Have you considered that your amendment, if carried, would considerably limit the rights of the public over the use of the highway?—Our experience is just the other way; that, so far from limiting the rights of the public, it increases the facilities of the public.

1083. But if you say that no carriage carrying passengers, exceeding five in number, shall go upon the tramway, do you not limit a right which they have now?—Not in the least, because what I say is this, that every omnibus in London may run over our tramway on the Brixton-road if they like; but we do object to their entirely revolutionising the omnibus system, and having carriages constructed on purpose.

1084. But have you any right to say that omnibuses shall always be made of this width of gauge?—If it was suggested for one moment that omnibuses should be altered *quâ* omnibuses, of course there is not a word to be said; but that is not suggested at all. I have already mentioned in the Chancery suit the secretary of the London General Omnibus Company has made an affidavit that they do not know such a case, in all their experience, as a gauge of anything approaching to 4 feet 8½ inches. Therefore what I say is, that they will have entirely to revolutionise the omnibuses, not because it will be beneficial or desirable for them or for the public, but simply because they want to take advantage of this new tramway.

1085. Still it is limiting the rights of the public, is it not?—Of that class of the public.

1086. *Chairman.*] I presume if omnibuses could be constructed so as habitually to use the tramway without the flange, they would practically derive as much advantage from it as the tramway omnibus?—I do not admit that. The whole theory of the tramway system is this, that we get economy of power; we get straight lines for the traffic, and we say, therefore, that, whether regarded in a public point of view or in a private point of view, the tramway company will ultimately beat the omnibuses. It is a question of time and of means, and if we have a limited time it will be extremely difficult to do it. If we had been aware last year of this possible adaptation of omnibuses, of which we never dreamed, we probably should have ventured to have taken the opinion of the Committee upon that question.

1087. Mr. *Ayrton.*] Has it not been held up as the particular merit of the section of ironwork that you use, that any carriage can drive along it and on it, and can get off it without the least inconvenience, and that, therefore, you do not

Mr. *J. Morris.*

4 April 1870.

not obstruct the general use of the highway?—Quite so; I am bound to admit that that is so.

1088. Mr. *Sclater-Booth.*] Still, speaking on behalf of companies or private persons promoting what is expected to be a public convenience, you say they cannot be expected to do it if the whole of the capital which they lay down upon the road may be wasted by the use of the rails being taken in opposition to their omnibus traffic?—Not only with respect to the capital laid down, which is one branch of the question, but the obligation to maintain, and the expense of maintenance, of those pavements being immensely increased by their being used by heavy omnibuses so constructed.

1089. In point of fact, something in the nature of a monopoly is absolutely necessary, in order to enable you to look forward to a return upon your capital?—I think so.

1090. *Chairman.*] You have no objection to the casual use by omnibuses, or by other traffic?—Not the slightest.

1091. But you object to the habitual use?—Quite so. I have no objection to the habitual use by ordinary carriages, but what I object to is a carriage like an omnibus being so organised as to use it habitually.

1092. You said just now that you believed in time you would kill the omnibus companies off?—Yes.

1093. I think you stated some little time ago, did you not, that in Copenhagen the omnibus companies had increased notwithstanding the tramways being laid down?—What I said was that we should kill the omnibus companies so far as they attempted to imitate the tramways; so far as they attempted to run with those narrow wheels. You see if they have the narrow wheel while they are on the rail, they are as good as the tramway carriages no doubt, but directly they run off, the friction is immensely increased.

1094. In other words you do not think that this experiment will succeed ultimately?—I think it will be very difficult for it to succeed permanently; I think they may succeed for a time. I think if I was an omnibus company, and I wanted to render it impossible for a tramway company to be a success, I would put omnibuses on, as they are practically doing in Liverpool at this moment, and work, it may be for seven years, not at much profit.

1095. By the expression that you will "kill" the omnibus companies, you merely mean that the experiment now being made by the Liverpool Company will not succeed, and you would prevent any omnibuses, especially adapted to your tramways, from running?—Yes, quite so.

1096. Mr. *Ayrton.*] Is not your evidence rather a reason for separating the construction of the tramway from the business of a carrier on the tramway; and in order to carry out your views would it not be necessary that the construction of the tramway should be separate from the business of carrying along the road, the same as the construction of the high road?—Theoretically that might appear to be so, but practically it seems to me that the working of a tramway is in itself a very complex and difficult thing, and the maintenance of the road for instance, as I mentioned before, will have to go with it; therefore I do not see how you can ever make it a commercial success unless it is in the hands of private companies, working it with the economy and power which a private company can bring to bear, both in carrying along and maintaining the road.

1097. Would not the construction of the tramway be much more economical in the hands of the local authority, than in the hands of a joint stock company?—I do not think so.

1098. Would not the capital be much more easily found by a municipal corporation than by a joint stock company?—No doubt, but my experience is, that if they would get it easier, they would spend it quicker.

1099. But would they not be able to make it by contract just as well as a joint stock company?—I quite admit that a local authority may lay down tramways, but I was rather speaking of the maintenance of them. They may lay them down entirely.

1100. Mr. *Thomas.*] As to the exclusive use of the tramway you do not suggest for a moment, I believe, that as regards the paved road itself, made by the tramway company, there should be any exclusive use of it?—None whatever.

1101. That is made as a benefit to the public, and all carriages are to use it, are they not?—Quite so.

1102. And

1102. And practically it is found, is it not, that they do so?—Yes, quite so.

1103. That the paved road of the tramway is used to a very great extent by all carriages, as making the traction easier?—You may see it every day in the Brixton-road now.

1104. Consequently, that would be a great advantage, would it not, to everybody using this road, by reason of their having this paved road made at the expense of the tramway company, irrespective of the use of the rails?—Quite so, and they may use the rails too.

1105. You ask for no exclusive user of the rails, except as regards carriages with flanged wheels, or other carriages specially adapted, or carriages licensed to carry more than five persons?—Yes.

1106. With regard to Clause 31, you suggest there an alteration making the clause more general, and enabling other neighbouring tramways to enter into contracts for through working, practically is not that so?—Yes.

1107. Do you think that very essential?—It is very desirable, I think, so long as it is to be subject to the sanction of the Board of Trade.

1108. Every such contract, or agreement, or arrangement, is to be subject to the sanction of the Board of Trade?—Yes, and we have so altered it that it shall not affect competition between different classes of carriers.

1109. As that clause stood, it would have enabled the promoters to make a special and exclusive agreement with a corporation or another company, would it not?—Yes.

1110. And now you make it a general power between the owners of neighbouring tramways, to agree for through working, and for the use of each others' lines, but every agreement to be subject to the sanction of the Board of Trade?—Quite so.

1111. Then we come to Clause 32, the purchase clause; practically the alterations which you suggest in that are, that the terms of the Liverpool Clause shall be adopted, except that the time instead of being 11 years shall be 21 years?—Yes.

1112. If the principle is to hold that it is to be 30 per cent., it would still be more favourable to the tramway if it was five years, would it not?—I think it should be a moderate term, or esle people will not invest their capital.

1113. But, however, you suggest, for the purpose of raising the capital, that 21 years should be inserted; you propose to alter the clause, so as to make it an option of purchase by the local authority in 21 years, on terms of giving at that time 30 per cent. beyond the actual value for goodwill, and so on?—The only difference as between that and the Bill before the Committee is this: that the Bill before the Committee does not provide for any premium to be paid in lieu of goodwill; but we have adopted the Liverpool Clause of 30 per cent. upon the actual structural value.

1114. *Chairman.*] With this difference, that the Liverpool Act is only for 10 years, whereas this proposes a concession for 21 years, practically?—Yes, we should not object to that.

1115. Mr. *Ayrton.*] Are you aware that there is another important distinction; that the Liverpool Company is only bound to purchase the tramway and works connected therewith, and any lands or buildings required for the purposes of this Act; whereas, in your Act, the company is to buy all your horses and tramways, and carriages, and hay, and everything else?—The Liverpool Act provides for that, as I think the Committee will see at once, in whatever form the clause is passed.

1116. That is only the rolling stock and carriages, and not the provender?—We do not care about the provender, but the horses they must take. I do not know whether the rolling stock would include the horses. The stabling, I think, in the Liverpool Act, would include them, but I would suggest that it is perfectly clear that it would be utterly impossible for capital to be obtained and laid out upon, perhaps thousands of horses and carriages and carriage-sheds, and all that, unless the party buying it was bound to take it, if required; and they would want it all.

1117. Are you aware that companies exist for the purpose of making railway carriages and letting them out, and that there is not the least difficulty in hiring railway carriages or locomotives when you want them, and buying or selling them?—That is so, but I also know that commercially no prudent company

Mr. J. Morris.

4 April 1870

would ever think of hiring their carriages under such terms, that is to say, that the parties letting them would expect very exorbitant rates. Every prudent company would keep their own carriages, and not only that, but very often they would have the appliances for constructing them.

1118. *Chairman.*] Is the 30 per cent. to be upon the value of the tramway or upon the rolling stock and everything else?—Upon the tramway, with the obligation for the purchasing party to take the rolling stock and horses if required at a valuation, if he requires.

1119. If he requires?—If the tramway company requires.

1120. But the 30 per cent. is only upon the value of the tramway, is it?—That is all.

1121. Mr. *Thomas.*] It is not suggested, is it, that the promoters should have any power of requiring the local authority to sell?—It is an option merely.

1122. The option is with the local authority, it is not reciprocal?—Yes.

1123. The clause authorises the local authority to purchase, I believe, does it not?—Yes.

1124. But it does not authorise the promoters to require them to purchase; if they purchase the tramway, do you require them also to purchase the rolling stock, and so forth?—Yes.

1125. Mr. *Ayrton.*] Do you understand that the value of the tramway would mean the cost incurred in laying down the tramway in the condition in which it was at that time?—Yes, that is all; the then value as a structural work. Supposing the tramway company has laid it down under difficult circumstances, it may be that the valuation and the 30 per cent. together would not amount to any very great catch.

1126. *Chairman.*] But in one respect the proposal contained in this Bill is more favourable to the companies than the Act of last year, I think, namely, that there is no limitation of dividend?—There is no limitation of dividend in the Act of last year.

1127. Is there no power given to the Board of Trade as to that?—Not in the least.

1128. As I read the Acts, I understand that there was a certain power to the Board of Trade to reduce the fares under certain circumstances?—Not to reduce the fares, but to grant licenses. The Committee were particularly careful that nothing of that sort should be put in because we pointed out to them at the time that it would deter capitalists from looking at it unless they saw that no person could interfere as to maximum.

1129. Then under the proposal contained in the Bill, for the 21 years they may charge what fares they think fit within the limits laid down in the Bill?—Quite so.

1130. And irrespective of any dividend they may be making?—Quite so.

1131. So that they may be making 20 or 30 per cent. in the 21 years, and be under no obligation to reduce their fares?—Quite so.

1132. And in 21 years the local authority would have a certain power over them to compel them to reduce their fares?—Quite so.

1133. Mr. *Thomas.*] As regards the difference between this Act and the Acts of last year, in the Acts of last year there was no power to the local authority to purchase at any time, was there?—Yes, there was power to purchase by paying the actual value of the tramway with the condition of goodwill at the end of 21 years.

1134. Then this clause, as it was proposed, was a limitation of those privileges?—Yes, it is a restriction of that power.

1135. And you propose to alter it in the way it stands now?—I suggest the alteration of the Government Bill in this way.

1136. I suppose you look to the question of the certainty of raising the capital as being a most important element?—Yes, I think that is a most important thing; I think there is a large amount of capital in the country seeking an investment now which must not be deterred.

1137. Mr. *Ayrton.*] I suppose you would not think that anybody would be deterred from running a carriage, if he had not put upon him the obligation of making the tramway itself; if the tramway itself was made by the local authority, you do not suppose that anyone would be deterred from running a carriage on it if he could do it at a profit, because the capital required would be very small?—Quite

Quite so, and the only question then would be, whether in the public interest, it would be desirable to allow the indiscriminate use of it.

1138. But whether it be used indiscriminately, or whether it would be convenient to use it by one person only, it is not likely that either party would be deterred from using it, if they had not the heavy obligation of making the tramway?—The obligation of making the tramway is not the heaviest obligation.

1139. Is not the proposed cost of it 5,000 *l.* a mile?—Yes, quite that; but the cost of stocking it with horses and carriages, and all the paraphernalia of the concern, would be quite equal to that per mile.

1140. It would be no greater than the cost of running the present omnibuses, would it?—It would be a great deal more than that.

1141. Not relatively to the number of passengers?—I know from our experience at Brussels, that five times the amount required for an omnibus company is required for a tramway.

1142. Mr. *Loch.*] Are you well advised in saying that the cost of a tramway is 5,000 *l.* per mile?—Where the road is paved; it depends upon the character of the pavement; if it is paved with granite, I think the rail and the construction and all that, would considerably exceed 5,000 *l.* a mile.

1143. But that is the price of a single line of railway?—Yes, but the pavement is very expensive.

1144. Mr. *Cawley.*] Do you mean a single line or a double line?—A double line.

1145. *Chairman.*] What is the difference of cost in the construction of a tramway when laid down on a macadamized road, and a paved street?—That again depends a good deal upon the character of the pavement; but I should think something like 3,000 *l.* a mile.

1146. That represents the expense of the paving then?—That represents the expense of the paving.

1147. Mr. *Thomas.*] At page 13, line 11, we propose to insert the words, "and no such carriage shall exceed in extreme width seven feet;" it is suggested that the width should be defined, and that I believe is the actual width now of a tramway carriage?—Yes; Lord Redesdale suggested that the Bill should provide for that.

1148. And that is the actual width of the carriages at present running, is it not?—It is.

1149. Then at Clause 48A, page 18, is a suggestion for the limitation of rating; that they shall not be rated "in any greater proportion of the net value of the tramway than the proportion of net annual value in which the occupier of any land used only as a railway constructed under the powers of any Act of Parliament for public conveyance, is for the time being, liable to be assessed"?—Yes.

1150. You have heard it stated in evidence here that possibly the existing rule may be changed, and you suggest a clause not confined to the existing rule, but that there shall be a limit; that it shall not be rated in any greater proportion of the net value than the rating of a railway for the time being may be?—Quite so; I am not practically acquainted with the practice as to rating; I do not know much about it. Probably Mr. Rees could tell you that.

1151. Then in Clause 45, which is the penalty clause, there is the same question as has been already before the Committee with regard to the omnibuses?—Yes.

1152. If the words came in in the first clause they will come in here, of course?—Yes, it is the same principle.

1153. Then we come to Clause 50A, in which you suggest that inasmuch as there must be crossings and places for getting to your coach-houses and so on, not shown upon the deposited plans, "it shall be lawful for the promoters, with the consent of the local authority from time to time to lay down in any street under the control of the local authority, crossings, passing places, sidings, junctions, and other works, in addition to those described in the Act, or, as the case may be, the Provisional Order of the Board of Trade;" you think that is necessary do you not?—Yes, I think a clause of that kind would very much facilitate the practical carrying out of tramways, because it is almost impossible in the varied circumstances of the streets to lay out a tramway strictly according to the rigid plans and sections. Therefore, I think, a power of that kind given to the local authority and the Board of Trade where they both concur, can lead to no mischief,

Mr. *J. Morris.*

4 April 1870.

mischief, and certainly so far as the public interest is concerned it would very much facilitate the carrying out of the tramway. We have found that very often when you come to lay down a tramway it is necessary to shift a siding or carry out some minor matter of that kind, and we suggest, therefore, that where that can be done with the clear concurrence of the local authority on the one hand, from the local point of view, and of the Board of Trade on the other, from the public point of view, it should be done without the expense of going to Parliament for a small thing of that kind, or even without the expense of a Provisional Order.

1154. How do you provide for giving notice to the public?—I admit the difficulty which the honourable Member has suggested; but these are minor matters with reference to sidings. I quite admit that; I cannot alter that; I did not propose to do it; I rather assume that if the local authority and the Board of Trade both concur in carrying out these details, such as a siding, the public must be presumed not to object to it.

1155. *Chairman.*] That is to say, where tramways have already been authorised on that road or in that district?—Quite so.

1156. Mr. *Hibbert.*] But you give the public no notice to enable them to go before the Board of Trade?—I am assuming, of course, that there is really nothing in that practically, though I am bound to admit that theoretically it may be open to objection.

1157. *Chairman.*] I presume the Board of Trade would give that opportunity?—Quite so.

1158. Mr. *Thomas.*] You would be content that this should be confined to sidings and crossing places and passings and junctions with existing works?—Yes, quite so.

1159. Of course you must get to your coach-houses at different places; how are you to get your carriages from your coach-houses on to your tramway?—It is extremely difficult.

1160. How will you manage if you change your premises again?—You cannot do it legally; you have to do it without any legal sanction at all; and therefore I suggest that you should do it in this way without having to take the law into your own hands; you must do it; you cannot help yourself; you often cannot get into your station without crossing a footpath.

1161. Then there is Clause 50 B; that is the same as one of the clauses in the Liverpool Act?—It is quite the same in principle.

1162. *Chairman.*] I understood you to say in the early part of your evidence that the tramway ought to be for the benefit of the public, and not for the benefit of the town?—Quite so.

1163. Did you mean by that the local authority should not derive any profit from it?—No pecuniary profit.

1164. Did you mean by that that they should not derive any profit in the way of relief to their rates?—No, I meant that the tramway company should repair the road which they go over, and as I have before explained to the Committee they do it really for their own sake and self-interest: but the practical effect of their doing it is very materially to assist the rates.

1165. Then whenever a tramway is laid down, the rates for the repair of the road are relieved to a very considerable extent, are they not?—Quite so.

1166. You have found that already in London, have you not?—That is so.

1167. And that acts as a very great natural inducement to vestries to give consent to tramways?—Yes.

1168. And, I believe, you have also explained to the Committee that there is a very considerable difference in the expense in laying down tramways on a pavement and on a macadamized road, namely, 3,000 *l.* per mile?—I may be wrong, but I believe it is something like that.

1169. That is to say, you already find material of that value laid down?—Yes.

1170. I think the tramways authorised last year were to be laid down wholly on macadamized roads?—Yes.

1171. And the companies had, therefore, to lay down the paving themselves, at their own expense?—Yes.

1172. In the Bills proposed this year, on the other hand, you propose to lay down the tramway upon paved roads?—Some are upon paved roads.

1173. But to a very great extent upon paved roads?—To a very great extent.

1174. What

1174. What was the arrangement which you had with the vestries upon that point?—At first we did not foresee that the question would arise, but it was raised with the St Pancras and other vestries, and we at once gave in upon the principle that we could not resist their requirement that we should pay them the amount which we were saved by finding a paved road instead of a macadamized road; in other words, that it should be an open question to be decided by reference, in case we should not agree. Some of the parishes, I think, believed that there was a saving of 8,000 *l.* by that means.

1175. But was not the arrangement which you made with the vestries that you should repay to the vestries the expense that they had been put to in paving the roads?—No, whatever we saved by finding pavement instead of macadam it was agreed that we should pay over to the vestries. Supposing that it was old worn-out pavement, it might be that we should really save nothing by finding a pavement there. It would all depend upon the character of the pavement, the age of the pavement, and other circumstances.

1176. But supposing that the pavement were in a good condition, then you were to pay to the vestry the expense incurred by them in laying it down practically?—No doubt, for that portion of the road, supposing it was newly laid down; it would be open to us that we should have to take it up again. We said, therefore, we will not recognise the principle of what it has cost you at all, but we will refer it to a referee to say how much we have saved by finding pavement here, taking into account the circumstance that we shall have to take up this pavement and put it down again, and incur expense of that kind, but we will pay you everything we save by finding paving before us there, and whatever we save by that we will pay you.

1177. The effect of the arrangement would be that the vestries would not only be relieved of the expense of repairing the roads in future, but they would have repaid to them the expense they had been already put to in paving the roads; is not that so?—A very considerable portion of it. Supposing the pavement is perfectly new, it would come very near to the present value in this way: that I should still have to take it up and put it down again, and therefore it would, practically, merely be the cost of the material that would be saved. Now, the laying down of the pavement would be very expensive. The principle to be settled was this, that whatever we saved by finding the pavement there we would pay the parish.

1178. That would amount to a very considerable sum in many cases, would it not?—No doubt.

1179. And you were driven to that, I suppose, by the difficulty which you found in altering the fares. I presume that the fares which you were able to charge under your Act of last year had reference to the expense of laying down the tramway?—Quite so.

1180. This year when you proposed to lay your tramways upon roads already paved, the alternative was presented to you either of reducing the fares or of paying to the parishes the expense of maintaining the roads?—Yes, we said that we would either agree to a limitation of dividend, and give the public the benefit of reduced fares, or that we would pay them a sum equivalent to the sum we should have had to pay in excess, if the tramway had been laid down on a macadamized road.

1181. In other words, the vestry has derived the benefit rather than the public in those cases?—Yes, to the extent of the principle of the tramway company undertaking the construction and repair of the tramway. Of course we start with that, and, starting with it, I say we must not go one inch beyond it.

1182. But may there not be also exceptional circumstances of the same character the difference of which would not be measured in fares, and where it would be only reasonable that the local authority should derive the benefit?—In the case of pavement?

1183. I do not know; but circumstances of the same kind; for instance, one street may be much more profitable for laying down a tramway than another, and yet it may not be possible to measure the difference in the fares?—That is so, no doubt. Of course, I quite understand that, supposing a tramway were permitted by the local authority in a certain street, like some very populous street, it would be quite competent for them to say, Either pay us something a year for it, or we will take care that you shall not make more than a fair return upon

Mr. *J. Morris.*
4 April 1870.

upon your capital, and the fares shall be reduced, and the service shall be of an exceptionally good character.

1184. When it is proposed in the concession to give no power of reducing the fares from time to time, according as the returns are more or less, then, that being the case, and supposing one set of streets should be more profitable to the tramway than another, would it not be fair that the local authority should derive the benefit from that?—It is impossible to predict that. If we start with the proposition that the local authority is to sell the concession, of course that is one way of providing for some payment which will interfere with the question of fares. If, on the other hand, you say you must take the entire district, I take it, in any given town, according to my theory, that district would be under the control of one body and not under several bodies, and, therefore, you must take the thing as a whole. If you take Manchester, the people, by reason of the dense population, can be carried at a farthing a mile, there is no reason why there should not.

1185. Provided one company or corporation is to lay down one tramway over the whole district; but supposing the town is divided into districts and let out to different companies, one company may have a more profitable district than another, and yet it may not be possible to measure that distance by difference in fares, would it not be reasonable then in such a case that the local authority should derive what benefit there is in the difference between the conditions of the two districts?—Quite so. I have not the least objection to say that if the local authority likes to take the risk of the tramway and lease it, it may do so.

1186. But take the case of Oxford-street; I presume Oxford-street would be an exceedingly profitable street down which to lay a tramway as compared with some of the streets which run parallel to it, and yet it may not be possible to measure that difference in the fares?—It might be measured in this way: if you had a limitation of dividend upon the principle now so many years recognised in the case of Gas Companies.

1187. But the principle of limitation of dividend is not admitted in your Act of last year, is it?—No, it is not admitted in our Act of last year; but I am now discussing the general question.

1188. But do you think it reasonable that there should be a limitation of dividend?—I see no objection to a limitation of dividend.

1189. Do you think it would be fair in principle that it should be introduced?—The tramway must either be looked upon upon the principle of a limitation of dividend, or upon the principle of a term, and I rather understand that the Bill before the Committee was based upon the term.

1190. There is no limitation of dividend proposed in this Bill, but there is a limitation of time; but assuming there is only a limitation of time, I think you have already admitted that there may be districts varying very much in their conditions of probable profit to the tramway?—Quite so.

1191. And yet which cannot be measured in difference of fare?—Quite so.

1192. Then if you are not to adopt the principle of limitation of dividend, would it not be proper that the local authority should derive that advantage by way of asking a higher payment from the company for one system of tramways as compared with another?—Quite so, as between the tramway company and the local authority; of course it is quite clear that the local authority as having the right to the road, and representing the ratepayers of that district has the right to make any profit out of it, but what I say and respectfully submit is, would not that matter be more effectually reached in the public interest by having (if it were so arranged) a limitation of dividend, whereby the entire public would be benefited by it; for instance, I have as much right to go into Oxford-street as any ratepayer of Oxford-street has; I may go there with my carriage every day.

1193. Still although you have laid down that general principle that the tramways ought to be for the good of the public, and not for the good of the town, you have not introduced that general principle in your Acts of last year or this year with the limitation?—No, it was only the year before last that the Tramway Bill was rejected in the second reading in the House of Commons without even a word of discussion, and now that the subject has become ripe, I think that it would have been impossible to have done that last year. The question has now become very strongly matured, and capital could be obtained upon easier terms than it could have been before.

1194. But

1194. But in your Bills this year you did not introduce that principle?—The Bills of this year were prepared some six months ago, and the subject has ripened immensely during the last three or four months.

1195. And you did not carry that principle out when you made the bargains with the vestries on the subject of paved roads, did you?—No, we made that bargain: we said either there shall be a reduction in the rates, or we will pay you so much for the road.

1196. They preferred to have a substantial return of money representing the value of the paving already on the streets, did they not?—Quite so.

1197. And in that way you have got the consent of the vestries?—It was not in that way that we got the consent of the vestries, because it is only in one vestry that the question has ever been raised, and I think we have said to one other vestry, that whatever we have done in one case, we shall do in the others; but we had the consent of all the vestries before this question was raised. St. Pancras is the only vestry with which we have had to discuss the question. That is the only vestry, so far as we are concerned, where they have raised that question.

1198. I presume that the principle once conceded to St. Pancras would be extended to all the others?—Quite so. The other vestries have been influenced by the belief that tramways are desirable. I should like to mention also to the Committee that tramways are not always paying investments. In many cases of tramways in this country and abroad they have been anything but that.

1199. Mr. *Ayrton.*] Can you lay before the Committee a copy of any resolutions or agreements come to by you with any vestry?—Yes, I could lay before the Committee the resolution of the St. Pancras Vestry.

1200. And any others?—I think you may take it generally. They did not convey to us resolutions; we are not before the vestries, but we know as a matter of fact, by communication with the officials, that the vestries in all the lines of the south of London are favourable.

1201. Have you brought them to any formal arrangements in writing?—I am not prepared to answer that question distinctly.

1202. Let me call your attention to Clause 21 in the Act of last Session in which you have indirectly obtained power to use locomotive engines on those tramways?—I do not think so.

1203. "The company may use on their tramway, carriages with flange wheels, or wheels specially or particularly adapted to run on a grooved railway, but such carriages and all carriages used on the tramway by persons other than the company, shall be moved by animal power only;" that applies to all, does it?—I do not think that that was intended.

1204. With regard to fares and rates have you obtained for yourselves power to carry goods on the tramway without any restraint as to the rates to be charged under the Act of last Session?—I think the Act of last Session was limited to passengers and their luggage only.

1205. Mr. *Sclater-Booth.*] You were expressly protected against being obliged to carry goods, were you not?—We were so.

1206. Mr. *Ayrton.*] But you have the power to carry goods, have you not?—I do not think so; I know that it was the intention of the Committee not to let us do so. One of the vestries raised the question distinctly, and said "We object to your having power to do it, because it may be extremely inconvenient to our neighbourhood to find you carrying goods all night long."

1207. It says, "The company shall not be bound to carry, unless they think fit, any parcel, goods, articles, or things other than passengers' luggage, not exceeding the weight in this Act in that behalf mentioned;" it would be a great surprise upon the parishes if they found that you had the power to carry goods, and still more so if you are unrestrained in the amount of charge that you would make for them?—I think that it would; my impression is that there is something in the Act as to that.

1208. Upon what principle was it that the toll was fixed for passengers; was any computation made as to the rate of remuneration, or how was it arrived at in the Act of last Session?—Evidence was given as to the rates charged in other cities under similar circumstances.

1209. You mean in other places abroad?—Yes

1210. But was there any investigation as to the tolls charged upon turnpike

Mr. *J. Morris.*

4 April 1870.

roads in this country when that rate was fixed at one halfpenny per mile?—Yes.

1211. I think it was rather fixed upon this principle, that the promoters asked for certain fares; it was discussed with the parishes, and the Committee felt that this was a new matter, and that the fares were reasonable, having regard to the evidence brought forward from almost all parts of the world as regards the fares charged elsewhere, particularly in Copenhagen.

1212. Then what would be the relative rate with reference to the turnpike tolls on an ordinary carriage plying for hire?—I am not practically acquainted with it.

1213. Mr. *Sclater-Booth.*] The rates charged by the omnibus companies had something to do with it, had they not?—Yes, they had.

1214. Mr. *Ayrton.*] Assuming that an omnibus carried 24 persons, it would be at the rate of a shilling a mile, would it not?—Quite so.

1215. Have you any idea what proportion that bears to the rates charged in the Commercial-road, where there is a tramway laid down?—I have not; the Commercial-road tramway I do not think is very extensively used for passenger traffic, it is only for goods.

1216. But still may not anybody use it?—Quite so; the subject of fares was very carefully considered by the Committee, it was not hastily decided. The Board of Works were there by counsel; the London General Omnibus Company was represented, and the thing was thoroughly discussed.

1217. Do you know what is the rate charged on a carriage drawn by two horses plying for hire?—I do not know.

1218. Colonel *Wilson Patten.*] I believe that you are a shareholder in the foreign tramways at Copenhagen and Brussels?—Yes.

1219. What is the system of fares there, is it from end to end or by distance?—By distance.

1220. Is it in no case from end to end?—I do not think so; I am very largely interested in the Brussels tramway. There we charge a penny from the park to the boulevard, a penny more on to the King's Palace, and so on.

1221. What is the distance from end to end in Brussels?—About three miles and a-half, and it is a penny a mile the whole way.

1222. Is it the same in Copenhagen?—It is less in Copenhagen, I think.

1223. What is it in Liverpool?—It is a penny a mile.

1224. How do you propose in case there is a tramway through London to regulate the fares?—A penny a mile.

1225. If you started from Hyde Park Corner and went to the other end of London, it would come to about 6 *d.*, I suppose?—About 6 *d.*

1226. *Chairman.*] But it is a penny a mile with the option of charging threepence?—Yes.

1227. Colonel *Wilson Patten.*] Will you state exactly what you propose with regard to the fares in London?—They shall charge not exceeding a penny per mile, but the company may charge for any less distance than three miles any sum not exceeding 3 *d.*; the intention was undoubtedly to carry out the idea of uniform fares not exceeding 3 *d.*

1228. What would be the utmost power of charging that you would have according to your plan, from end to end?—Only 1 *d.* per mile.

1229. What is the largest sum that you could charge for one mile?—For any distance under three miles we may charge 3 *d.*

1230. What is the omnibus charge now?—This was applied to a single district, and I believe that the lowest fare at that time was 3 *d.* I think it was shown that the omnibus company, whilst this discussion was going on, were reducing their fares from 4 *d.* or 6 *d.* It was reduced, I know, but it was considered that this being a new matter for some time, it might be convenient until the officials got accustomed to it, to charge one uniform fare; but the intention was when the system had been extended to charge a penny a mile uniformly, without regard to distance.

1231. I observe that you object very strongly to the Metropolitan Board of Works having a control in London; you propose according to the Bill, do you not, that the vestries shall have a control in the districts through which you go, which are not within the City?—Yes.

1232. What is the amount of control which you propose that they shall have with regard to the breaking up of the roads, or stopping your tramway traffic?—They

—They have very large control and supervision by the Act. It is difficult to explain all the points as to which they have control. They have a most arbitrary power to do the repairs if we do not.

1233. Supposing it is thought desirable to alter a street, and stop it for a certain time, would that be done without any remuneration to the tramway company?—Certainly.

1234. Would they have the sole power of doing that?—We are bound to divert it at our expense.

1235. But to stop it?—Yes.

1236. Supposing that it should be necessary to stop a road altogether, Oxford-street, for instance, and that you could not divert it, should you consider that you had any claim upon the local authority?—None whatever.

1237. And you would be stopped to the loss of your company without any remuneration?—Quite so.

1238. Mr. *Sclater-Booth.*] With reference to the question of rates of a penny a mile proposed to be charged in the Bills of last year, was it considered to be a reasonable charge and something lower than the omnibus fares at the time?—Quite so; it was considered by the parishes and others I know to be a very moderate charge.

1239. Then it was shown that there would be a necessity for what is called a short distance charge, was it not?—Yes.

1240. And there was a proposal I think on the part of the Committee that the short distance charge should be less than 3 *d.*?—Yes.

1241. That was objected to by the promoters, and the Committee were satisfied that it would be unreasonable to insist upon a lower charge than 3 *d.* at first?—Yes.

1242. I think there was some arrangement in the Bill that the short distance charge should be liable to revision, was there not?—Quite so; there is a proviso that the Board of Trade may if they think fit reduce that short distance clause to 2 *d.*

1243. Mr. *Hibbert.*] With reference to Clause 19; under that clause the promoters are to keep the road in order for 18 inches on each side of the tramway; but it has been stated here that that is not a sufficient distance; that at Liverpool the roads are affected much beyond 18 inches; from your experience of the working of tramways, what is the distance for which the road is likely to be affected by the laying down of the tramway?—I do not pretend, of course, to be an engineer, or to be practically acquainted with the working of the road; but my general inquiries and experience have tended to show that the 18 inches is a fair compromise, and does fairly represent the existence of possible injury even which the tramway can do to the road, and it is accepted universally on the Continent and almost universally in America, and is the recognised standard.

1244. And you think that 18 inches is sufficient for a pavement; supposing that it is sufficient upon a macadamized road, is it sufficient for a paved road?—I think so.

1245. Do you know anything of the streets in Liverpool where the tramways are laid?—I do not know.

1246. Mr. *Dent.*] We have had it suggested here that power should be given to the local authority to make bye-laws for the regulation of traffic and the licensing of drivers and conductors as they do for the present omnibuses; would you see any objection to a clause of that nature being introduced into this Bill?—I do not see very much objection to it; it seems to me that it would be more convenient that it should be done by the company with the consent of the Board of Trade, because the Board of Trade would look at it from an entirely public point of view. In the case of London with a great number of local authorities it would be practically inconvenient and difficult to apply it. That is the reason why it was decided by the Committee, after a good deal of discussion last year, that the power of approving of bye-laws should rest in a Government Department.

1247. With respect to the licensing of drivers and conductors, of course I am not speaking of the metropolis at this moment, but in other cities and boroughs, that power rests with the local authorities I suppose?—Quite so.

1248. Do you not think that it would be necessary that the local authorities should have that power with regard to the tramway company?—I think so; in

Mr. *J. Morris.*

4 April 1870.

a corporation like Manchester where it could be conveniently done, I certainly would give them that power; I see no reason against it.

1249. Mr. *Ayrton.*] Are there not several fares now charged by the omnibus company in London of 2 *d.*?—Yes, there are.

1250. Are there any 1 *d.* fares?—I do not know any 1 *d.* fares.

1251. And you have the power under the Act of last Session, to charge for the use of the tramway, 1½ *d.* as toll merely, have you not?—I do not understand it.

1252. Is there not a clause in the Act by which you are to take a toll of a ½ *d.* on other persons using the tramways?—A ½ *d.* and a ¼ *d.*

1253. But you may charge a ½ *d.* per mile?—Yes.

1254. And you may charge three miles?—Yes.

1255. And therefore you may charge 1½ *d.* for the toll of the tramway, though the whole fare is only 2 *d.*?—Yes, but that is the maximum, the minimum is only a ¼ *d.*

1256. But you have that right, have you not?—Only with the sanction of the Board of Trade; the minimum being fixed by the Committee merely to prevent arbitrary power being vested in any department. If the Board of Trade like to fix it at a ¼ *d.*, they can; the license is to be granted by the Board of Trade, and the Board of Trade can fix the tolls within the maximum of a ½ *d.*, and with the minimum of a ¼ *d.*

1257. Mr. *Sclater-Booth.*] Was it intended that tolls of that kind should be put in at all unless on account of misfeasance?—Quite so; it would be utterly impossible for a tramway company to work if they were subject to that rate.

1258. Mr. *Ayrton.*] Is there no power on the part of the public to use the tramway upon paying tolls?—No, for this reason: that the theory that was established last year by all the evidence was, that it is the public interest that tramways should be worked by one company; and I think that some of the evidence this year of some of the local corporations has gone to that; that it would be extremely difficult for several parties to use the tramways beneficially for themselves or beneficially for the public.

1259. Then the license is to be for not less than one year or more than three years?—Yes.

1260. Then, is it the opinion of the company that people would use a tramway if they had only a term of three years?—First, we start with the proposition that it will not be done excepting on account of some misfeasance on the part of the company. If that is done, the principle would be admitted that two people can use it; and you would at once get several people.

1261. Is it your opinion that there would be a sufficient inducement to people to use a tramway if they had a right to use it for three years?—I do not think so.

1262. That must have been so represented to the Committee last year, or they could not have restrained the Board of Trade from granting a license for a longer period than three years?—It was considered, as regards opposite parties who invested no capital and ran no risk, that if they came forward as volunteers to say that they could do it better than the tramway company, they should, at all events, be restricted as regards time.

1263. I am supposing that it is a sufficient inducement to the carrying company to use the tramway if they have a license to use it for three years; that must have been so represented to the Committee last Session, or why did they restrain the Board of Trade from granting a license for only three years?—The Committee were not legislating, as I conceive, for the benefit of the licenses, but they were rather providing for an exceptional case; and, therefore, that if the misfeasance should arise and parties should come forward to do it better than the tramway company, they should be, at all events, put under certain restrictions.

1264. Then that would be an illusory proceeding, would it not, if the time was so short that nobody would or could take advantage of it?—I say that it would be very difficult for them to do it, but I do not say that it would be impossible.

1265. Then, if in the case of a tramway, it is admitted that the company is not doing justice to the public, ought not the license to be granted under conditions, not of great difficulty, but of great facility?—No doubt that might be open to question, but then this is the theory, that there are two parties at least using it;

it; there may be a dozen parties; and then that is an exceptional state of things which should only continue as short a time as possible. If we start with the principle, which we submit is the true principle, that it should be in the hands of one party, that should not be perpetuated longer than is necessary to correct what is wrong. Mr. *J. Morris.* 4 April 1870.

Mr. *George Hopkins*, called in; and Examined.

1266. *Chairman.*] I BELIEVE you wish to say something in explanation of some evidence which has been given?—There are several points upon which it seemed to me that there was a little confusion; for instance, the Committee did not seem to know that the same rail had been used in Liverpool as is being used in London, nor that the tramways were all upon the same gauge; in speaking about the estimates, a mistake was made in stating the price per double mile of tramway; it ought to have been 5,000 *l.* per single mile of tramway, I think that one honourable Member asked the weight of a carriage, and it could not be answered; two tons is the weight of a carriage. Mr. *G. Hopkins.*

1267. Mr. *Ayrton.*] That was on four wheels?—Yes.

1268. Colonel *Wilson Patten.*] How many persons will those carriages carry?—Twenty-two inside, 11 on each side.

1269. *Chairman.*] What is the gauge of the tramway at Liverpool?—Four feet eight and a half inches.

1270. Is that the same as under the Act of last year?—Exactly the same, and exactly the same form of rail.

1271. Is it your opinion that there should be a uniform guage laid down in the Bill?—It is desirable that there should be a uniform guage laid down in the Bill.

1272. And that there should be no power to the Board of Trade to alter the gauge in any case?—I think there ought to be a uniform gauge at least for every town, because I think the tramway system of Manchester will probably never be connected with the system of tramway in Birmingham or London. Each centre ought to be confined to one gauge.

1273. Mr. *Loch.*] Was the 4 feet 8½ inches gauge adopted in reference to a possible communication with railways?—Not at all. It is the gauge of the Birkenhead line, which has been in existence some years, and all the American lines are of that gauge. It arose rather in this way in England: when we first applied to Parliament we were obliged to apply as for a railway, the word "tramway" was not to be found in the Standing Orders, and the only gauge allowed then was one of 4 feet 8½ inches.

1274. Mr. *Cawley.*] With reference to the gauge, does not the 4 feet 8½ inches necessitate the wheels being under the omnibus?—It does.

1275. And therefore it renders them not so adaptable for omnibuses which are to run on the road as well?—The 4 feet 8½ inch gauge is not suitable for omnibuses as at present constructed.

1276. Nor for any omnibus which, having gone on the rail wants to go a mile off the rail?—No, there would not be room with the wheels outside the body.

1277. Mr. *Loch.*] What is the width of the trams near Paris?—I do not know; I should be glad to have an opportunity for setting things right with reference to the state of the tramways in Liverpool, as to which there is a false impression abroad. I beg to state that the corporation, under an arrangement with the company, did the paving themselves, and thereby exonerated the company as to any inequality between the level of the rails and the paving. The company excavated the roads and laid the sleepers of the rails, and then the corporation came and paved up to them. In the first instance, thinking that the rails would subside, they kept the paving below the level of the rails, but it was found that the rails did not subside, and they then kept the paving above the rails, and it is still above that level; the roads so formed are the roads alluded to by the town clerk in his evidence the other day.

1278. *Chairman.*] Was the tramway laid in Liverpool upon a macadamised road or upon paved roads?—Nearly all upon macadamised roads. On what we call the circle probably there is rather more paved road than macadamised road, but the roads out into the suburbs are almost all macadamised roads; as a rule we pave very close to the pavement at the side.

Mr. *G. Hopkins.*

4 April 1870.

1279. Have you found any difference between the paving and the macadamised road?—None at all.

1280. Is it possible to keep the two on a level?—It is.

1281. In your opinion is 18 inches sufficient margin beyond the tramway?—I think so. We have no works belonging to the tramway, which are beyond the outside of that rail: we have no works projecting beyond the rails, it is only for the purpose of putting the 18 inches of pavement that we have to remove anything beyond the rail; and in the line which we are constructing, now called "The Scotland-roads Line," we are adopting the same principle, and it is answering very well.

1282. Colonel *Wilson Patten.*] What is the whole distance, from end to end, of your line at Liverpool?—The one that is open is a little over two miles, and then we have what is called the circle quite in the centre of the town, which is a mile-and-a-quarter long.

1283. What is the fare?—The fare is 3 *d.* inside and 2 *d.* outside for the circle.

1284. Mr. *Sclater-Booth.*] Or any part of the circle?—Or any part of the circle, and one of the radiating lines.

1285. Colonel *Wilson Patten.*] If you get into the carriage at all you pay 3 *d.* for any distance, however short?—However short.

1286. Mr. *Loch.*] Is that the full extent of your Parliamentary powers; the two miles which you have laid down, and the mile and a fraction?—No; we have another line in the opposite direction for about two miles, which is now about three-quarters constructed, but not yet opened.

1287. Colonel *Wilson Patten.*] Have you the same fares there?—The same fares.

1288. What is the utmost fare which you have?—Threepence. I do not think it is a mileage toll at all; it is a lump sum. The mileage toll is not less than 3 *d.*, but any person can ride upon the tramway. It is a little less than a penny a mile if you ride the whole length.

1289. Mr. *Rayner.*] Will you be good enough to give the Committee an analysis of the cost, showing how much of that is for tramway and sleepers, and how much for paving?—The 5,000 *l.* per mile only applies to tramways in London. The cost is not so much in Liverpool. I think that the Parliamentary estimate was about 3,500 *l.* for a single mile in Liverpool. The rails and sleepers cost about 1,000 *l.* per mile. In Liverpool the cost would be about 2,500 *l.* per mile, and in London from 4,000 *l.* to 5 000 *l.* That is the paving and the foundation to the road.

1290. Mr. *Ayrton.*] That is always assuming that it is a pitched paving?—Yes, always with the cubes. We did that in Liverpool throughout, whether the road was macadamised or whether it was paved; we took up the old paving and put down new paving. I am afraid of wearying the Committee, but the town clerk of Glasgow is not correct in saying that we have thrown nearly all the omnibuses off the road; on the contrary, we have attracted a large number in addition.

1291. *Chairman.*] On the same road?—On the same road.

1292. Colonel *Wilson Patten.*] Not upon the same line?—Yes, upon the same line of road. The two miles of road on which we have laid down a tramway was, up to the time of our opening, served by eight omnibuses. The omnibus company have put on twelve extra ones, so that they have 20 omnibuses, *plus* the tramway carriages.

1293. Mr. *Sclater-Booth.*] That has not gone on long, I suppose?—Those new carriages are made with wheels suitable to run on the tramway, the wheels being under the carriages.

1294. Mr. *Ayrton.*] Do they run well upon the tramway?—Very well indeed. They get almost as much benefit out of the tramway as we do.

1295. Then perhaps there is no advantage in having a flange if they do quite as well without it?—They do not do quite so well without the flange. The same thing is found on the dock tramway at Liverpool. The wheels are underneath, and they are obliged to have a flat tire five inches wide, in order to overlap the rails, and, not having a flange, the line is not rigid, and there is considerable oscillation sideways.

1296. How broad would the tram-plate have to be to enable them to drive on it

it without a guide?—Those rails are three inches, and the omnibus tires are now being made to three inches, and they run very nicely to that. Mr. *G. Hopkins.*

1297. You think a four-inch tram-plate would be sufficient to enable a person to drive along it?—It is sufficient in this particular case. They substitute a driver for the flange of the wheel. 4 April 1870.

Mr. *Benjamin Boothroyd,* called in; and Examined by Mr. *Thomas.*

1298. Are you a Director of the Staffordshire Potteries Street Railway Company (Limited)?—I am. Mr. *B. Boothroyd.*

1299. Have you laid down a tramway for some years?—For nine years.

1300. You have no Parliamentary powers?—We have none.

1301. What is the length of your tramway?—One and three quarter miles.

1302. And I believe it runs between the towns of Burslem and Hanley, in the Potteries?—Yes.

1303. Do you carry a very large number of passengers?—We do.

1304. Something like 200,000 a year, I think?—Yes.

1305. What you desire is to have three clauses which are here inserted?—That is part of our wish.

1306. I think the Committee have them. The first one is: "Applications may be entertained if a certain majority of road authorities are consenting. Where in any district a tramway is intended to be constructed along roads which are under the jurisdiction of more than one road authority, and of the road authorities some are consenting and others are not consenting to the application for the Provisional Order, the Board of Trade may proceed with the application, and may make the Provisional Order, upon proof being given to their satisfaction that the consent of a majority of the road authorities to the application has been obtained, such majority to consist of three-fourths in number of the road authorities under whose jurisdiction or control the roads affected are vested, or (as the Board of Trade may determine) of road authorities representing three-fourths in length of such roads"?—Yes; although we have put that clause in we should prefer the clause proposed by Sir Joseph Heron.

1307. *Chairman.*] Then you are satisfied with the clause proposed by Sir Joseph Heron?—Yes.

1308. It is suggested by the experience of tramways already laid down without any Parliamentary sanction?—Yes; I may say that we have four local authorities within one mile.

1309. Mr. *Ayrton.*] Who gave you leave to lay down the tramway?—The local authorities.

1310. Under what power?—The only formal concession which we had was from the turnpike trustees, and they said they granted us powers so far as they possessed powers.

1311. They had no special powers under any particular Act?—No special powers whatever.

1312. Is it a tramway in a road or a mere tram-plate laid down on the surface of the road?—We originally put down the American rail, the flat rail, but we found that dangerous owing to accidents, and we devised a rail of our own, a grooved rail, and substituted that for our rail; one is grooved and one is flat.

1313. Then it is all level with the surface of the road except the groove?—Yes, except the groove.

1314. And anybody can go on it who pleases?—Yes.

1315. And anybody can run a flanged carriage upon it who pleases?—We have nothing to prevent that.

1316. *Chairman.*] Has anybody done that?—Not at present.

1317. Mr. *Ayrton.*] In fact it is an ordinary highway, subject to all the laws of an ordinary highway?—Yes.

1318. And no difficulty has arisen from that?—When we were constructing the tramway a drunken commercial traveller came to grief and brought an action against us; every precaution was taken, such as lights and guards; he brought an action at Stafford, and the very first objection made by the judge was that all our precautions were of no use whatever, that we had no right there; that we were there as trespassers, and our position now is no better.

Mr. *B. Boothroyd.*

4 April 1870.

1319. With regard to your position, how many years have you been there without any difficulties?—Nine years.

1320. Has anybody who used the road for general purposes complained of it?—I do not know that they have.

1321. Has anybody used the tramway with a flange wheel?—No.

1322. You use it only for passengers?—For passengers only.

1323. *Chairman.*] Is there anything to prevent a person putting a vehicle with a flange wheel upon it?—Not that I am aware of.

1324. Mr. *Loch.*] What did your road cost you?—We were unfortunate in that matter. I think the actual cost of the undertaking would not have been above 1,500 *l.* or 1,600 *l.* a mile, and the stocking of it was perhaps about 1,000 *l.* more; but we fell into bad hands. We gave a concession of 500 *l.* a mile to Mr. Train for a presumed royalty, and I think we were indeed cheated in the experiment by the constructor, who was an American also. It could have been put down for 1,500 *l.* a mile. It was put down contract. The capital of our two miles now, including everything, is 6,000 *l.*

1325. *Chairman.*] Is it paved at all?—It is not paved; it is macadamised.

1326. Mr. *Loch.*] Are the rails laid upon stone sleepers?—No, upon the ground.

1327. *Chairman.*] Are you anxious to obtain the sanction of this Bill for your tramway, and for any extension which you may make?—We are.

1328. But in consequence of the numerous local authorities through whose districts you would have to run you wish for some clause which would enable the Board of Trade to dispense with their consent in certain circumstances?—We do.

1329. Mr. *Ayrton.*] What has prevented you extending your tramway hitherto?—The first reason was our insecure condition; that was the principal reason.

1330. Did any of the local authorities refuse to give you permission?—No; we found that we were liable to actions, to which we had no answer.

1331. Was that your insecurity?—That was one insecurity.

1332. What is the other?—Actions for damages; we were constantly liable to litigation.

1333. Is there any other insecurity than that?—We have only the concession from the turnpike authorities for a very limited time.

1334. How long?—Five years.

1335. Then if they have the power to concede for a longer time that would obviate the difficulty, would it not?—It would be an advantage, certainly.

1336. Mr. *Loch.*] Are you working the line now?—We lease it; but it is at work now.

1337. Has it been profitable as a speculation?—It has not.

1338. Mr. *Sclater-Booth.*] You want to have a preference in case this Bill passes in your own locality?—We want to place ourselves under the provisions of this Act, because we presume that it would enable us to obtain Parliamentary sanction for any extension of this undertaking at less cost than by a Private Bill.

1339. *Chairman.*] The other clause is to enable you to come to terms with the road trustees as to tolls, is it not?—Yes. "Where previously to the passing of this Act any company or persons shall have laid down a tramway upon any road with the consent of the road authority, such company or persons may maintain, use, and work such tramway in accordance with the terms and conditions, if any, of the consent so given." We ask that clause to be inserted in the Bill also.

1340. Mr. *Ayrton.*] Do you pay a toll to the trustees of the turnpike road?—We do.

1341. The ordinary toll?—Not the ordinary toll.

1342. But a composition?—Yes, in fact the ordinary toll would extinguish us.

1343. Mr. *Thomas.*] I think your gradients are very steep, are they not?—They are very steep.

1344. And you would not be able to put down paving there?—It is 1 in 25, and I think a paved road with a gradient of 1 in 25 would be highly dangerous for ordinary use.

1345. *Chairman.*] You think there should be no restriction in the Bill upon that point?—We think not. We propose also the following clause: "The promoters

moters and any road authority may, from time to time, compound and agree for the payment by the promoters to the road authority, of any sum either monthly, quarterly, or yearly, or a longer period, in lieu of the tolls, rates, and charges, which the road authority are, or would otherwise be entitled to demand and take for the use by the promoters of the road, or any part of the road, belonging to or under the control of the road authority."

Mr. *B. Boothroyd.*
4 April 1870.

1346. You acquiesce in the amendment already put?—Yes, and I may say with respect to a few other matters, that in the first place we approve of the amendments of Sir Joseph Heron. The only substantial objection that we have is the conversion of the certificates into the Provisional Order contemplated by Mr. Coates. We want the certificate, and if it be converted into a Provisional Order at all, we think that it ought to be surrounded by some restrictions which would not give a petitioner a right, as a matter of course, of converting the Provisional Order into a Private Bill, and exposing us to the cost of appearing here.

1347. Mr. *Sclater-Booth.*] This is subordinate to your other proposal, that you should have a priority in your own locality?—It is so.

1348. Mr. *Ayrton.*] Have you had any disputes with the local authority respecting the repairs of the road?—We are now at difference with them as to what we should do in the way of paving it; but I believe that that matter is arranged, and we are deferring doing it now on account of the gas-pipes being taken up.

1349. How much do you pay them yearly in lieu of tolls?—£. 300 a year in lieu of tolls for the whole length. We have an idea with respect to the Provisional Order, that it should not be in the power of any petitioner to send the Provisional Order at once to a Select Committee of the House. We think that anyone having cause to complain of the report of the referee should petition Parliament, and that Parliament itself should determine upon the report of the referee and the complaints of the objector whether it was desirable that it should be remitted to a Select Committee or not. I think that Parliament should not be passed by in the manner in which it appears to be by the contemplated alterations.

Mr. *Barron Emmanuel*, called in; and Examined by Mr. *Thomas.*

1350. Do you appear on behalf of the Portsmouth Street Tramway Company?—I do.

Mr. *B. Emmanuel.*

1351. Would the effect of the clauses which you have handed in, be to do what the company want as regards the existing tramways, without the necessity of their going on with the Bill?—Yes.

1352. Otherwise the fact of their joining an existing tramway would oblige them to go on with their Bill, and they desire to avoid that?—Yes.

1353. Mr. *Cawley.*] Would those clauses at all affect the existing Landport Act?—None of those clauses are touched.

[Adjourned till Thursday next, at Two o'clock.

INDEX

TO THE

REPORT

FROM THE

SELECT COMMITTEE

ON

TRAMWAYS BILL.

Ordered, by The House of Commons, *to be Printed,*
2 *May* 1870.

I N D E X.

[*N.B.*—In this Index the *Figures* following the Names of the Witnesses refer to the Questions in the Evidence; and the Numerals following *Rep.* to the paging of the Report.]

A.

ABERDEEN. Improbability of Aberdeen being affected by the proposed Tramway Act, *Monro* 640, 641.

Accounts. Suggested clauses, making it obligatory to render an account, *Part* 266, 267.

Arbitration. Inability of witness to comprehend paragraph 9 in Clause 52, as to the referee being deemed an arbitrator between the parties; absence of any definition of the word "parties," *Coates* 139–142.

B.

Birmingham. Power of the corporation of Birmingham to lay out tramways, but not to sell nor to take tolls, *Sir J. Heron* 345, 346——Clause proposed on the part of Birmingham, giving certain further powers to local authorities, which shall have already obtained Parliamentary power, to lay down tramways, *ib.* 490, 491.

Explanation, on the part of Birmingham, that the corporation merely want power under the Bill to take tolls, and that, having gone to Parliament for a Private Act, they demur to be compelled to go a second time, *Hayes* 492–497.

Board of Trade. Restrictions suggested as regards the power of the Board of Trade to make rules and regulations, *Coates* 11–21. 71–76——Suggested removal of Clause 35, as regards the power of the Board of Trade, by certificate, to vary the tolls, charges, and regulations specified in the schedule to the Act, *ib.* 103——Grounds for objecting to the system of a preliminary inquiry by the Board of Trade, *Coates* 104 *et seq.*; *Morris* 931–945. 961–965——Satisfaction expressed with the Board of Trade, as the tribunal to decide in consent cases, *Morris* 960, 961.

Resolution of the Committee that the Board of Trade, after considering objections, shall have power to proceed with a provisional order, notwithstanding that certain of the local or road authorities refuse their consent, and shall report to Parliament their reasons for the same, *Rep.* x.

See also *Preliminary Inquiry.* *Provisional Orders.*

Boothroyd, Benjamin. (Analysis of his Evidence.)—Represents the Staffordshire Potteries Street Railway Company, 1298——The tramway of the Company, which runs between Burslem and Hanley, and carries a large number of passengers, was laid down merely under the sanction of the turnpike trustees, 1299–1304. 1308–1311——Clause suggested enabling applications to be entertained, if a certain majority of the road trustees are consenting, 1305–1308. 1327–1328——Form of rail used; exceptional instance of complaint, 1312–1323——Unduly large cost of the tramway; it has not been profitable, 1324. 1336, 1337.

Suggestion with a view to the tramway coming under the sanction of the present Bill, 1327, 1328. 1339——Want of increased security and facility in carrying out extensions, 1329–1335. 1338——Arrangement as to the payment of tolls to the road trustees, 1340–1342. 1349——Objection to compulsory paving where the gradients are steep, 1343–1345——Clause proposed on the subject of compounding for tolls, 1345, 1346——Disapproval of the suggestion for converting the certificate into a provisional order; suggestions on this point, 1346, 1347. 1349——Difficulty between witness's Company and the local authority respecting the paving of the road, 1348.

Branch Tramways. Additional clause proposed on the subject of branch tramways or sidings, with a view to facilitating the public use of the main tramways, *Part* 261–265.

Report, 1870—*continued.*

Bye-Laws. Suggested alteration in Clause 36, with a view to there being a publication and notice of the bye-laws, *Part* 269, 270——Alteration proposed, on the part of Manchester and Salford, in Clause 36, on the subject of bye-laws, *Sir J. Heron* 452——Explanatory statement as to the different views put forth by Manchester and by Liverpool on the subject of bye-laws; the town clerk of Liverpool is prepared to speak on this point, *ib.* 452. 498-501——Amended clause proposed by Liverpool and other towns, with reference to the making of regulations or bye-laws by the road authorities, *Rayner* 504——Convenience in the bye-laws in Scotland being subject to the review of the sheriff, *Monro* 614-616.

Resolution of the Committee, that power be given to local authorities to make bye-laws for regulation of traffic, and for licensing drivers and conductors of vehicles, *Rep.* xi.

See also *Rules and Regulations.*

C.

Cabs. Doubt as to cab traffic being much affected by tramway competition, *Monro* 605-608.

Canals. Circumstance of all kinds of traffic being, as a rule, admitted on canals, *Part* 250-252. 259——Proposed amendment in order to prevent the promoters of tramways having power, without the express authority of Parliament, to lower the headway of a bridge over a navigation, or to diminish the waterway, *ib.* 271.

Capital. Expectation that under proper facilities a large amount of money will be invested in street tramways for omnibus traffic, *Morris* 926-929——Impracticability of raising the required capital for tramways, unless protected against the unfair use of the rails by omnibus companies, *ib.* 1060. 1063, 1064. 1088-1091——Inexpediency of such restrictions as shall have the effect of deterring investment of capital in tramways, *ib.* 1136. 1193.

Certificate. Unfairness of the proposal in the Bill that the certificate is to have the force of law, if not objected to when laid upon the Table of both Houses of Parliament, *Coates* 22——Practically, certificates are never objected to by either House, *ib.* 22. 158——Conclusions favourable to the substitution of provisional orders for certificates, *Coates* 22, 23. 77-80. 103. 152-184; *Morris* 1025; *Rep.* x.

Consideration of the question whether the certificate system may not be altered so as to give parties the same full opportunities to be heard that witness advocates by means of provisional orders, *Coates* 152-184——Statement in favour of "provisional certificates" in lieu of "certificates," *Sir J. Heron* 373-376——Amendment suggested in the Bill in order ro render unnecessary a separate certificate for each district where there are several districts consenting, *Morris* 1022-1024.

Dissent from the proposed conversion of the certificate into a provisional certificate; suggestions on this subject, *Boothroyd* 1346, 1347. 1349.

See also *Provisional Orders.*

Coal and Iron Traffic. Sundry amendments suggested in the Bill for the protection of coal and iron interests in Lancashire and Cheshire, *Part* 186 *et seq.*——Great inconvenience which might arise as regards coal traffic and other heavy traffic in Lancashire, &c., if not entitled to the use of the tramways, *ib.* 213 *et seq.*

Coates, Thomas. (Analysis of his Evidence.)—On the part of certain railway companies and other petitioners against the Bill, witness has carefully examined the Bill, and proposes to introduce important alterations under four distinct heads, 1-10——Alteration proposed in the third clause to the effect that the Board of Trade, before proceeding with the Bill, shall make the rules and regulations, and that these shall form part of the Act, or be scheduled to it, 11-19. 57-59——Explanation as to witness not proposing any schedule of regulations in lieu of Clause 53, which he proposes to strike out, 14. 57-59. 150-152——Objection to any discretionary power in the Board to make additional regulations, which go to the rights of parties, 20, 21.

Important amendment proposed in the fourth clause, by striking out the word "certificate" and substituting the words "provisional order;" contemplated amendment of the Bill throughout in this respect, 22, 23——Very mischievous effect apprehended if the fifth clause, conveying powers of sale, be passed; grounds for recommending the total removal of this clause, 22-33. 185——Aggravation of the evil of the proposed right of sale, by the condition that the Board of Trade shall consent, 23. 28.

Evidence in support of the conclusion that Clause 7 should be amended as regards the power proposed to be given to the local authority or promoters to lease the tramway after they have made it, 34-70——Contemplated grant of licenses by the local authority relative to the use of the tramway by carriages belonging to any public company; explanation hereon, that witness approves of the tramways being thrown open for the use of the public, 41-56. 60-64——Witness very much doubts whether tramways can be worked at all in crowded towns, except for heavy traffic, 52.

Report, 1870—*continued.*

Coates, Thomas. (Analysis of his Evidence)—*continued.*

Amendments suggested in clause 8 as regards the large discretion proposed in the Bill to be given to the Board of Trade in respect of rules and regulations, 71–76——Further statement as to the proposed substitution of the provisional order system for the certificate system, 77–80. 103. 153–184——Explanation of the views of the railway companies in favour of an uniform gauge being prescribed, 81–86——Provision suggested as a supplement to Clause 22, with a view to reasonable satisfaction being given to railway companies where their bridges, &c., are affected by tramway works, 87–89.

Proposed insertion of a proviso in the case of clause 31, in order that all railway companies in any place may be on terms of equality as regards the use of any tramway, 89–100——Objection to the requirement in Clause 32 as to the approval of the Board of Trade before the purchase of a tramway by the local authority, 102, 103——Suggested removal of Clause 35, as regards the power of the Board of Trade, by certificate, to vary the tolls, charges, and regulations specified in the schedule to the Act, 103——Objection by the omnibus companies to the provisions in Clause 41, as to obstruction to carriages using the tramways, 103.

Important amendments proposed in Clause 52 upon the subject of the preliminary inquiry made by the Board of Trade, 104 *et seq.*——Claim of railway companies to be heard before the referee upon the question of unfair competition, or of interference with access to stations; proviso suggested hereon, 105–116——Expediency also of a right in owners or occupiers of shops and warehouses to be heard before the referee, 116——Expediency of a right to be heard not only before the referee, but against the Bill for confirming the provisional order; approval, however, of opponents being shut out in the latter case, unless they had asked to be heard before the referee, 117–129.

Effective check to petitions against Private Bills through the power of Committees to give costs, 133–135——Strong objection to the proviso in Clause 52 that opponents before the referee may be compelled to pay the promoters' costs as well as their own, 136–139——Inability of witness to comprehend paragraph 9 in Clause 52 as to the referee being deemed an arbitrator between the parties; absence of any definition of the word "parties," 139–142——Suggestion that railway companies be exempted from paying more than one-fourth of the rate for the purposes of tramways; similar exemption under the Board of Health Acts, 143–149.

Consideration of the question whether the certificate system may not be altered so as to give parties the same full opportunities to be heard that witness advocates by means of provisional orders, 152–184——Main object of witness's appearance before the Committee to represent that his clients shall have an ultimate appeal to Parliament, 152–168——Exception taken to referees as the persons who virtually decide under the certificate system, they not being persons of eminence, 155. 177——Respects in which inquiries before the Board of Trade are very unsatisfactory; disapproval of their assuming a judicial character, 177–184.

[Second Examination.]—On the part of Messrs. Shoolbred and certain petitioners in Oxford-street, witness submits that certain protective amendments are required for those having frontages in the streets, 794 *et seq.*——Suggested amendment of Clause 53, as to the persons to be heard before the referee, 794, 795——Proposition that two-thirds of the owners and two-thirds of the occupiers in a street where a tramway is proposed shall be consenting parties, 795–797. 803–806. 813, 814. 831–837. 859–867.

Evidence in support of the conclusion that shopkeepers, as in Oxford-street, should have a claim to compensation for injury or loss of custom, caused during the construction of the tramway, 798–806——Statement in support of claims to compensation, if injury or loss of trade can be proved to have resulted from the operation of the tramway and the obstruction of the traffic to and from the shops, 807–830. 838–858.

Difficulty as to the precise means desirable for protecting the omnibus interests, 867, 868.

Compensation. See *Shops.*

Competition. Expediency of tramways being worked by tramway companies as distinct from omnibus companies, each stimulating the other in the public benefit, *Morris* 1006–1013.——*See* also *Omnibus Traffic.*

Consents. Approval of the general scheme of the Bill so far as it applies to consent cases, *Morris* 930. 945–947——Expectation that the Bill will be extensively used in consent cases, more especially when tramways are once established and extensions are required, *ib.* 944–947.——*See* also *Board of Trade. Local Authority. Ratepayers.*

Consolidation Act. Proposition for passing the provisions in Part II. and III. of the Bill, in the form of a Consolidation Act, rather than of a public General Act, *Morris* 1042–1049.

Copenhagen. Marked increase of omnibus service in Copenhagen after the tramways were established, *Morris* 1007, 1008.

Report, 1870—*continued.*

Cost of Tramways. Explanation relative to the cost, respectively, of making the tramway, and of stocking it with horses and carriages, &c.; enhanced cost in the former case when the rails are laid in paved roads, *Morris* 1001, 1002. 1137–1146. 1168, 1169——Statement as to the larger portion of the required capital being for horses, rolling stock, &c., *ib.* 1001, 1002——Relative cost per mile of tramway in Liverpool, and in London; much greater cost in London, *Hopkins* 1266. 1289, 1290.——*See* also *Paving.*

Costs. Effective check to petitioners against Private Bills through the power of Committees to give costs, *Coates* 133–135——Strong objection to the proviso in Clause 52, that opponents before the referee may be compelled to pay the promoters costs as well as their own, *ib.* 136–139——Opinion that parties who have appeared before the referee should be liable to costs if they oppose before Parliament, *Sir J. Heron* 376, 377.

D.

Deposit. Approval of the requirement in Clause 10, as to a deposit being made and being retained as security for the works, *Morris* 1035–1041.

Deviation of Works. Clause proposed with reference to the vertical deviation of tramways, in the event of alterations by the road authorities, *Morris* 1050–1053.

See also *Widening of Roads.*

Dividend. Absence of any limitation of dividend in the Act of last year, *Morris* 1126 1127——Non-objection to a limitation of dividend on certain conditions, *ib.* 1186–1192 ——Several instances of unprofitable tramways, *ib.* 1198.

Drivers. Expediency of a power in the local authorities in Manchester to license the drivers and conductors of tramways omnibuses, *Sir J. Heron* 452, 453——Approval of corporations having power in regard to the licensing of drivers and conductors; in London the control should be in the Board of Trade, *Morris* 1246–1248.

Resolution of the Committee, that power be given to local authorities to make bye-laws for licensing drivers and conductors, *Rep.* xi.

E.

Edge Rail. Objection to the provision as to an edge rail; expediency of the tramway being level and flush with the rest of the road, *Sir J. Heron* 454. 464, 465.

Emmanuel, Barron. (Analysis of his Evidence.)—Submits certain clauses on behalf of the Portsmouth Street Tramway Company; these clauses do not affect the Landport Act, 1350–1353.

Existing Tramways. Explanation of a proposed alteration in Clause 51A, for the protection of tramways already made with the sanction of the road trustees, *Part* 288, 289——Anxiety of the tramway interest for the passing of a Bill facilitating the construction of tramways, *Morris* 924, 925.

Extensions. Want of increased security and facility in carrying out extensions, *Boothroyd* 1329–1335. 1338.

F.

Fares. See *Tolls.*

Flange Wheels. Amendment suggested in Clause 45, as regards the penalties for the use of the tramways by carriages of the public having flange wheels, *Sir J. Heron* 454—— Advantage of the principle of a flange wheel, together with arrangements for keeping waggons with heavy traffic out of the way, *Rayner* 544–550——Decided objection, as regards Manchester and Salford, to the restriction in the Bill as to the use of flanged wheels, *Grundy* 913——Statement as to the general power under the Act of last Session, of using tramways so long as flange wheels were not adopted; counterbalancing provisions in the Act to the advantage of the tramway companies, *Morris* 1067–1080. 1086.

Foreign Tramways. Result of witness's experience abroad, that as soon as tramways are at work, prejudices disappear, *Morris* 947.

Form of Tramway. Decided objection to the form of tramway, &c. being defined by the Bill, *Sir J. Heron* 377, 378. 380–382; *Morris* 1047. 1049.

Report, 1870—*continued.*

G.

Gauge. Explanation of the views of the railway companies in favour of an uniform gauge being prescribed for tramways, *Coates* 81–86——Objection to an uniform gauge being defined by the Bill, *Sir J. Heron* 380–382——Great inconvenience of a hard and fast line, as to gauge, &c., *Morris* 1047. 1049——Approval of an uniform gauge, at least for every town; origin of the 4 feet 8½ inches gauge adverted to, *Hopkins* 1271–1276.

See also *Omnibus Traffic.*

Glasgow. Statement that no action has yet been taken in Glasgow under the Tramways (Scotland) Act of 1861, owing chiefly to the necessity of getting the consent of a certain number of the creditors of the roads, *Monro* 575–583——Clause proposed on the part of Glasgow, enabling the corporation to agree with the road trustees, it being open to the creditors to object before the Board of Trade, or before Parliament, *ib.* 583–589——Proposed power in the corporation or local authority to apply for a provisional order, without the consent of the road trustees, either within the burgh, or for such distance beyond the burgh, as is necessary for supplying the suburban districts, *ib.* 606–622. 634–644.

Numerous road trustees and several local authorities within the suburban limits of Glasgow, some compulsion being necessary in order to carry out an efficient tramway scheme, *Monro* 609, 610. 620–622. 632——Statement as to the corporation supplying the suburban districts with gas and water, and having power to break up the roads, *ib.* 623–631——Worse position of the corporation than at present, if prevented from coming to the Board of Trade without the consent of the road trustees, *ib.* 632, 633.

Necessity of the consent of the road trustees under the Glasgow Police Act of 1862; advantage if there were power under this Act to charge tolls for tramways, *Hoggan* 681–686. 701——Approval of the corporation of Glasgow taking tramways into the suburban districts, provided they first obtain the consent of the road trustees; doubt as to much difficulty on this score, *ib.* 705–715. 733, 734. 750–755.

Goods Traffic. Belief as to there not being power under the Act of last year to convey goods, and to do so without limit of rates, *Morris* 1202–1207.

Greenwell, Walpole Eyre. (Analysis of his Evidence.)—Statement showing that neither Marylebone vestry nor the metropolitan vestries and district boards generally, were represented by the committee or deputation which recently approved of the alteration of the Bill, by the substitution of the Metropolitan Board for the vestries and district boards of the metropolis, 869–878. 898–906——Unanimous feeling of the Marylebone vestry in disapproval of the Metropolital Board as the local authority, 876. 879–888——Conflict of jurisdiction if the construction of tramways be under the Metropolitan Board, whilst the paving and other matters are under the vestries, 880–882. 889–897.

Grundy, C. S. (Analysis of his Evidence.)—Explanation relative to, and comment upon, the notice recently given to the Manchester Carriage Company by the Pendleston-road Trustees, to remove that portion of the company's tramway within the jurisdiction of the trust, 907——Satisfaction given in Salford by the working of the tramway, which has been down for eight years, *ib.*——Peculiar claim of the company as to their interests not being prejudiced by the present Bill, *ib.*

Circumstances of the tramway in the Pendleston trust being laid in macadam, 908–913——Decided objection, as regards Manchester and Salford, to the restriction in the Bill as to the use of flanged wheels, 913.

H.

Hayes, E. J. (Analysis of his Evidence.)—Explanation, on the part of Birmingham, that the corporation merely want power under the Bill to take tolls, and that having already gone to Parliament for a Private Act, they demur to be compelled to go a second time, 492–497.

Heron, Sir Joseph. (Analysis of his Evidence.)—Represents the corporations of Liverpool, Birmingham, Leeds, Salford, and Manchester, and also the Hundred of West Derby, 315——Suggested amendment of Clause 4 of the Bill, by providing that in corporations or local board districts, it may be left to the council or local board to determine as to applying for a certificate, 315, 316. 342–344. 427——Proposed alteration of Clause 5, by withdrawing from promoters, other than the local authority, the power of disposing of the certificate; power of such promoters to sell to the local authority, 316, 317.

Necessity of power in the local authorities to transfer the tramways to other parties, as they are prohibited by the Bill from working them themselves, 316–337——Evidence

Report, 1870—*continued.*

Heron, Sir Joseph. (Analysis of his Evidence)—*continued.*

in support of the conclusion that the local authorities should have power, with the consent of the Board of Trade, to sell the concession for making and working the tramways to private companies or other parties, 318–367——Doubt as to the necessity of any check, on the part of the ratepeyers, to the sale or transfer of the concession to a private company, 324–330. 342–355. 427.

Assumption that the Bill contemplates tramways for omnibus traffic rather than for anything else, 338–341. 358——Power of the Corporation of Birmingham to lay tramways, but not to sell nor to take tolls, 345. 346——Belief as to the impracticability of two or more competing omnibus companies using the same tramway, 359, 360——Doubt as to tramways for passenger traffic in Manchester being much improvement upon the present arrangements there, 360——Opinion that there is no ground for apprehending that a power of sale would lead to jobbery, 364–367.

Principle on which the Salford tramway works; objections to which open, 368, 369——Proposed omission from Clause 7, as to the local authority not themselves using the carriages for public traffic, and taking tolls in respect thereof, 369–373——Suggested amendment of Clause 8, to the effect that the clause should apply in all cases where the tramway is practically not used for six months, 373——Proposed substitution of the words "provisional certificate," for the word "certificate" in Clause 8, *ib.*——Necessary interruption to the working of tramways, without compensation, when bridges have to be repaired, or pipes in the road have to be dealt with, 374, 375.

New clause proposed to be substituted for Clause 9 of the Bill, with a view to requiring the provisional certificate to be confirmed by Parliament, 375, 376——Opinion that parties who have appeared before the referree should be liable to costs if they oppose before Parliament, 376, 377——Suggested amendment of Clause 16, by leaving it to the local authority, with the consent of the Board of Trade, to decide upon the form of tramway and the sort of wheels to be used in each case, 377, 378——Evidence in favour also of the local authorities and the Board of Trade settling the question of gauge, 379–388.

Consideration of the question of the repair of the road, and the difficulties likely to arise through the tramway promoters maintaining one part of the road and the road authority the other part; great advantage of some arrangement by which the repair of the whole road was borne by one party, 387–408.

Proposition, on the assumption that the Bill contemplates omnibus tramways only, for excluding heavy traffic; belief as to its being impracticable to convey passenger traffic and goods traffic on the same line, 409–423——Necessity of amendment of the clause relating to licenses, the tolls proposed being altogether prohibitory; the tolls should, in fact, be left to the Board of Trade to determine, 424–426——Explanation relative to the amendments proposed in Clause 33 relative to the purchase of tramways from promoters or companies, and the principle of valuation, 427–450.

Suggested provision that each passenger may take 28 lbs. of luggage without charge, 451——Proposal for placing a list of the tolls and charges inside each carriage, 451, 452——Alterations proposed in Clause 36 on the subject of the bye-laws, 452——Expediency of a power in the local authorities in Manchester to license the drivers and conductors of tramway omnibuses, 452, 453——Amendment suggested in clause 45 as regards the penalties for the use of the tramways by carriages of the public having flange wheels, 454.

Objection to the provision as to an edge rail; expediency of the tramway being level and flush with the rest of the road, 454. 464, 465——Contemplated facility to carriages having ordinary wheels in going along or across the tramway; dispute hereon at Liverpool, 455–462. 464, 465——Suggested alteration of Clause 49 by empowering the road authority to alter the position of the tramway when necessary for the widening of the road, 464.

Clause proposed enabling the road authority to get rid of the tramway if after three years they are found to be an absolute nuisance, 466–469——Objection to the proposed introduction of a clause on the subject of non-payment of full rates; expediency of its being clearly stated that the tramways shall be liable to all rates, 469–476. 488——Explanation relative to clauses proposed on behalf of Manchester and of Liverpool, respectively, with a view to the Board of Trade dispensing with the consent of the road authorities, or of the local authorities, in certain cases, 477–487.

Clause proposed with a view to the saving of powers of the Liverpool Tramways Act of 1868; 489, 490——Proposed clause on the part of Birmingham, giving certain further powers to local authorities which shall have already obtained Parliamentary powers to lay down tramways, 490, 491.

Explanatory statement as to the different views put forth by Manchester and by Liverpool on the subject of bye-laws; the town clerk of Liverpool is prepared to speak on this point, 498 501.

Report, 1870—*continued.*

Hoggan, Andrew. (Analysis of his Evidence.)—Is clerk of several important turnpike roads in Scotland, 650-653. 742, 743——Large representation of the municipal bodies on the road trusts in Scotland, 654, 655——Considerable debt upon many of the roads, steps being, however, constantly taken both to reduce the tolls and to pay off the debts, 658-665—— Hesitation hitherto on the part of the road trustees to lay down tramways, on account of the difficulty as to the form of rail, &c.; belief that the Act of 1860 would now be soon put in operation, 666. 767, 768.

Evidence in support of the conclusion that the road trustees are the proper authorities to have power to lay down tramways; circumstance of this power belonging to them exclusively under the Act of 1861; 667 *et seq.*——Necessity of the consent of the road trustees under the Glasgow Police Act of 1862; advantage if there were power under this Act to charge tolls for tramways, 681–686. 701——Suggested amendment of the Act of 1861, by empowering the road trustees, and also the local authorities, to lease to other parties, 687-692.

Proposition, on the part of the road trustees in Scotland, for a continuance of the powers, under the Act of 1861, conjointly with the adoption of certain clauses in the present Bill, 689–699——Necessary reduction of tolls by the trustees, after being enabled by the receipts from tramways to pay off the debt, 702–704——Approval of the Corporation of Glasgow taking tramways into the suburban districts, provided they first obtain the consent of the road trustees; doubt as to much difficulty on this score, 705-715. 733, 734. 750–755.

Statement to the effect that the road trusts represented by witness, prefer that the mode of proceeding should be by Private Bill, if it be decided that their consent should not be necessary in the first instance, 716–741——Explanation of the division of roads in Scotland into statute labour roads and turnpike roads, 744–749——Approval of tramways by the road trustees, provided they are the parties to make them, 757–759.

Objection to tramways interfering with the ordinary traffic, 760, 761——Belief as to the satisfactory working of the Liverpool tramways, 761–763——Impracticability of combining heavy mineral traffic with omnibus traffic, 764–766——Suggested clause requiring the promoters of a tramway to take it up and re-lay it at their own expense, when it is necessary to alter the line or level of the road, 768, 769——Statement in explanation and support of a clause empowering the road trustees to levy tolls, or way-leave, when a tramway is laid on a turnpike road, 770–793.

Hopkins, George. (Analysis of his Evidence.)—Similar form of rail and similar gauge in Liverpool as in London, 1266. 1269, 1270——Relative cost per mile of tramway in Liverpool and in London; much greater cost in London, 1266. 1289, 1290——The weight of the Liverpool carriages is two tons, and they hold twenty-two passengers, 1266–1268——Approval of a uniform gauge, at least for every town; origin of the 4 feet 8½ inches gauge adverted to, 1271–1276.

Explanation of the arrangements between the Corporation of Liverpool and the Tramway Company as to paving; facility of keeping the rails on a level with the paving, 1277–1280——Sufficiency of a margin of eighteen inches outside the rails, as the extent of road to be repaired by the Tramway Company, 1281——Charge of a fare of 3 *d.* inside, and 2 *d.* outside, irrespective of distance, 1282-1288——Large increase of omnibuses along the route taken by the tramway; special construction of the omnibus wheels so as to utilise the tramway, 1290–1297.

I.

Islington. Strong approval of the Bill by the vestry of Islington, *Layton* 915, 916——Full approval by the vestry of the provision which defines the local authority in the Metropolis to be the vestries and local boards, *ib.* 915——Objection by the vestry to the Metropolitan Board of Works as the local authority in the Metropolis, *ib.*

J.

Junctions, Sidings, &c. Statement in favour of power in the Tramway Company, with the consent of the local authority and of the Board of Trade, to construct junctions, sidings, &c., *Morris,* 1153–1160.

L.

Lambeth. Comment upon the opposition by the Metropolitan Board in the case of the Lambeth Tramway Bill, *Morris* 970–975.

Lancashire See *Coal and Iron Traffic.*

Report, 1870—*continued.*

Layton, John. (Analysis of his Evidence.)—As vestry clerk of Islington represents that the vestry strongly approves of the Bill, 915, 916——The vestry fully approves of the provision which defines the local authority in the Metropolis to be the vestries and local boards, 915.

Lease of Tramways. Evidence in support of the conclusion that Clause 7 should be amended as regards the power proposed to be given to the local authority or promoters to lease the tramway after they have made it, *Coates* 34-70——Amendment proposed as regards the power of leasing being for a limited term, *Part* 190, 191——Proposed alteration of Clause 7, with a view to a lease of any tramway being confined to a lease of the tolls, *ib.* 246-249——Suggestion providing for the insertion of a condition of re-entry in every lease of a tramway, *ib.* 255.

Necessity of power in the local authorities to transfer the tramways to other parties, as they are prohibited by the Bill from working them themselves, *Sir J. Heron*, 316-367——Grounds for concluding that a fair competition could not be secured if a local board made a tramway and let it by tender to omnibus companies and others, *Morris*, 999-1013.

Licenses. (*Use of Tramways.*) Defence of the restriction as to licenses being limited to a term of three years, *Morris*, 1259-1265.

Liverpool:

Witness has inspected the tramway at Liverpool, and supplies particulars relative to the injury to the road at each side of the tramway, such injury reaching much further than eighteen inches on each side, *Vaughan* 290-314.

Explanation relative to clauses proposed on behalf of Manchester and of Liverpool respectively, with a view to the Board of Trade dispensing with the consent of the road authorities, in certain cases, *Sir J. Heron* 477-487—— Clause proposed with a view to the saving of powers of the Liverpool Tramways Act of 1868, *ib.* 489, 490.

Sundry amendments suggested in the Bill, on the part of the Corporation of Liverpool, *Rayner* 503 *et seq.*——Powers of the Liverpool Corporations under the Liverpool Tramway Act, on the subject of bye-laws; necessity for these powers, *ib.* 505-508——Reference to Clause 72 of the Liverpool Act, and to the power therein of the Corporation to take up the tramways within five years, under certain conditions, *ib.* 510——Clause 75 of the Liverpool Act adverted to as showing that the present Bill should override the Act, *ib.* 511.

Particulars as to the powers of the Corporation in regard to purchase of the tramways within eleven years, *Rayner* 512-516——Difference of opinion between Liverpool and Manchester in regard to consents being dispensed with, *ib.* 517-519.

Letter recently received by witness from the solicitors of the Liverpool Tramway Company upon the question of opposition to the Street Tramways Bill, *Rayner* 520, 521——Corrected letter handed in, from the solicitors of the company, *ib.* 914.

Particulars relative to the construction of the Liverpool tramway, the width of gauge, form of rail, &c., *Rayner* 522-531. 565-568—— Risk of injury to carriages, through the wheels being wrenched by the groove of the tramway, *ib.* 532. 563, 564. 569-572——Belief as to the liability of the company to make good all damage to carriages and horses, *ib.* 533——Suit now pending in Chancery upon the question whether carriages at Liverpool with ordinary wheels may travel along the rails, *ib.* 534—— Use of four-wheel carriages with three horses by the Liverpool Company, *ib.* 566-568. 573, 574——Dissatisfaction at Liverpool on the part of owners of private carriages, these avoiding the tramway route as much as possible, *ib.* 569-572.

Belief as to the satisfactory working of the Liverpool tramways, *Hoggan* 761-763——Similar form of rail and similar gauge in Liverpool as in London, *Hopkins* 1266. 1269, 1270——The weight of the Liverpool carriage is two tons, and they hold twenty-two passengers, *ib.* 1266-1268——Explanation of the arrangements between the Corporation of Liverpool and the Tramway Company as to paving; facility of keeping the rails on a level with the paving, *ib.* 1277-1280——Charge of a fare of 3*d.* inside and 2*d.* outside, irrespective of distance, *ib.* 1282-1288——Large increase of omnibuses along the route taken by the tramway; special construction of the omnibus wheels so as to utilise the tramway, *ib.* 1290-1297.

Local Authorities. Suggested amendment of Clause 4 of the Bill, by providing that in corporations or local board districts it may be left to the council or local board to determine as to applying for a certificate, *Sir J. Heron* 315, 316. 342-344. 427——Proposed omission from Clause 7, as to the local authority not themselves using the carriages for public traffic, and taking tolls in respect thereof, *ib.* 369-373——Suggested amendment of Clause 16, by leaving it to the local authority, with the consent of the Board of Trade, to decide upon the form of tramway and the sort of wheels to be used in each case, *ib.* 377, 378.

Opinion of Liverpool and some other corporations, as regards the consent of local boards, that two-thirds of the members should be present, *Rayner* 503, 504——Approval by

Report, 1870—*continued.*

Local Authorities—continued.

by the Liverpool Corporation of the provision of the Bill which makes the consent of the local authority a condition precedent to the laying down of tramways, *ib.* 516.

Grounds for concluding that the local authority, as in Glasgow, should have complete control over the tramways, *Monro* 590–600——Decided objection to the town councils on local authorities having a veto upon the construction of tramways, *Morris*, 948–956——Approval of town councils electing whether they will make tramways themselves or will let private companies make them, *ib.* 954.

Resolution of the Committee that the consent of the ratepayers be not required in boroughs governed by a municipal council, and that the decision of such council should be given at a special meeting at which two-thirds of the members should be present, *Rep.* x.

Resolution that the Board of Trade shall have power to proceed with a provisional order, notwithstanding that certain of the local or road authorities refuse their consent, *Rep.* x.

See also *Bye-laws.* *Road Trustees.* *Sale or Purchase of Tramways.* *Scotland.*

Local Inquiry. See *Preliminary Inquiry.*

Luggage. Suggested provision that each tramway passenger may take 28 lbs. of luggage without charge, *Sir J. Heron* 451.

M.

Maintenance. Amendment proposed in Clause 33 upon the subject of the tramway and the road connected with it being kept in good order, *Part* 268——Great importance of the management and maintenance resting with the companies instead of with the local authorities; all repairs should, in fact, be undertaken by the companies exclusively, *Morris* 977–995. 1014–1021——Further statement as to the importance of the repairs and maintenance resting with private companies, *ib.* 1096–1099.

See also *Roads, Repair of.*

Manchester and Salford. Doubt as to tramways for passenger traffic in Manchester being much improvement upon the present arrangements there, *Sir J. Heron* 360——Principle on which the Salford tramways works; objections to which open, *ib.* 368, 369——Explanation relative to clauses proposed on behalf of Manchester and of Liverpool, respectively, with a view to the Board of Trade dispensing with the consent of the road authorities in certain cases, *ib.* 477–487.

Explanation relative to, and comment upon, the notice recently given to the Manchester carriage company by the Pendleston Road trustees to remove that portion of the company's tramway within the jurisdiction of the trust, *Grundy* 907——Satisfaction given in Salford by the working of the tramway, which has been down for eight years, *ib.*——Peculiar claim of the company as to their interests not being prejudiced by the present Bill, *ib.*——Circumstance of the tramway in the Pendleston trust being laid in macadam, whilst the portion in Salford is in paving, *ib.* 908–913.

Disadvantage in the case of the Salford tramway through the corporation undertaking the repairs, *Morris* 1016–1018.

Marylebone. Dissent of Marylebone from the proposition that the Metropolitan Board, rather than the vestries, should be the local authority in the Metropolis, *Greenwell* 869–874. 876. 879–888.

Metropolis. Resolutions adopted at a meeting of the United Metropolitan Vestry Committee held on the 17th March 1870, in favour of an uniform gauge, and of the construction and management resting with some central authority, *p.* 19.

Non-representation of the metropolitan vestries by the committee or deputation which recently approved of the substitution of the Metropolitan Board as the local authority, *Greenwell* 869–878. 891–906——Conflict of jurisdiction if the construction of tramways be under the Metropolitan Board, whilst the paving and other matters are under the local boards or vestries, *ib.* 880–882. 888–897.

Great obstruction apprehended in the Metropolis if the Metropolitan Board of Works had charge of the tramways, unless they were at the same time the street authority for all purposes, *Morris* 966–968. 976——Less accessibility of the Metropolitan Board than of the vestries, *ib.* 972, 973——Approval of tramways by the vestries in the south of London, *ib.* 1200, 1201.

Report, 1870—*continued.*

Metropolis—continued.

Resolution of the Committee that the Metropolitan Board be the local authority in the Metropolis (except the City), but the consent of vestries be necessary as road authorities, under certain conditions, *Rep.* xi——Rejection of proposed amendment excluding the Metropolis from the operation of the Act, *ib.*

See also *Islington.* *Lambeth.* *Marylebone.* *St. James's Parish.*

Mines. Statement in support of a clause protecting the owners or occupiers of mines from making compensation in respect of damage to tramways through the working of such mines, *Part* 272-287.

Mineral Traffic. See *Coal and Iron Traffic.*

Monopoly. Evidence strongly opposed to the Bill in so far as it provides for an exclusive use of the tramway for any particular kind of traffic, *Part* 212 *et seq.*——Practical monopoly of traffic in the case of railways, *ib.* 253-255.

Monro, Alexander. (Analysis of his Evidence.)—Statement that no action has yet been taken in Glasgow under the Tramways (Scotland) Act of 1861, owing chiefly to the necessity of getting the consent of a certain number of the creditors of the roads, 575-583——Clause proposed on the part of Glasgow enabling the corporation to agree with the road trustees, it being open to the creditors to object before the Board of Trade or before Parliament, 583-589.

Grounds for concluding that the local authority, as in Glasgow, should have complete control over the tramways, 590-600——Objection to a power of sale in the local authorities, though they should have a power of leasing, or of working the tramway themselves, 591-596. 601, 602——Expected removal of omnibuses from tramway routes, 603-607——Doubt as to cab traffic being much affected by tramway competition, 605-608.

Proposed power in the corporation or local authority to apply for a Provisional Order, without the consent of the road trustees, either within the burgh or for such distance beyond the burgh as is necessary for supplying the suburban districts, 609-622. 634-644——Numerous road trustees and several local authorities within the suburban limits of Glasgow, some compulsion being necessary in order to carry out an efficient tramway scheme, 609, 610. 620-622. 632.

Approval by the road authorities at Glasgow of the provision as to the tramway companies maintaining the road within the rails and for eighteen inches outside, 612, 613. 645-649——Convenience in the bye-laws in Scotland being subject to the review of the sheriff, 614-616——Expediency of a power of deviation of the line of tramway in the event of the road being widened, 617, 618——Statement as to the Corporation of Glasgow supplying the suburban districts with gas and water, and having power to break up the roads, 623-631.

Worse position of the Glasgow corporation than at present if prevented from coming to the Board of Trade without the consent of the road trustees, 632-633——Majority of the royal burghs in which the road trustees still exact tolls; varying arrangements where the tolls have been abolished, and the debts not paid off, 637-640——Improbability of any other places in Scotland besides Edinburgh, Glasgow, and Dundee being affected by the proposed Act, 640-644.

Morris, John. (Analysis of his Evidence.)—Explanation as to the selection of witness to represent the tramway interest before the Committee, 917-923——Anxiety of the tramway interest for the passing of a Bill facilitating the construction of tramways, 924, 925——Expectation that under proper facilities a large amount of money will be invested in street tramways for omnibuses, 926-929——Approval of the general scheme of the Bill so far as it applies to consent cases, 930. 945-947.

Grounds for objecting to the system of a referee, or of a preliminary inquiry, subject to appeal to both Houses of Parliament; great expense apprehended, fatal to any extensive construction, 931-945. 961-965——Advantage of proceeding in contested cases by Private Bill, rather than by preliminary inquiry, subject to appeal; less expense in the former case, 937-943. 947. 960, 961——Expectation that the Bill will be very extensively used in consent cases, more especially when tramways are once established and extensions are required, 944-947.

Result of witness's experience abroad that as soon as tramways are at work prejudices disappear, 947——Decided objection to the town councils or local authorities having a veto upon the construction of tramways, 948-956——Approval of town councils electing whether they will make tramways themselves or will let private companies make them, 954——Contemplated jurisdiction of a Committee of the House of Commons in cases where the local bodies do not consent, 955-960——Satisfaction expressed with the Board of Trade as the tribunal to decide in consent cases, 960, 961.

Great obstruction apprehended in the Metropolis if the Metropolitan Board of Works had

Report, 1870—*continued.*

Morris, John. (Analysis of his Evidence)—*continued.*

had charge of the tramways unless they were at the same time the street authority for all purposes, 966-968. 976——Comment upon the opposition by the Metropolitan Board in the case of the Lambeth Tramways Bill, 970–975——Less accessibility of the Metropolitan Board than of the vestries, 972, 973——Advantage of tramways being laid down and maintained by private companies, directly responsible to the local bodies, 977, 978.

Great importance of the management and maintenance resting with the companies instead of with the local authorities; all repairs should in fact be undertaken by the companies exclusively, 979–995. 1014–1021——Approval of agreements whereby the tramway companies should repair the whole of the road, 996–998——Grounds for concluding that a fair competition could not be secured if a local board made a tramway and let it by tender to omnibus companies and others, 999-1013.

Expediency of tramways being worked by tramway companies as distinct from omnibus companies, each stimulating the other in the public benefit, 1006–1013——Marked increase of omnibus service in Copenhagen after the tramways had been established, 1007, 1008.

Amendment suggested in the Bill in order to render unnecessary a separate certificate for each district, where there are several districts consenting, 1022–1024——Concurrence in the suggestion of Mr. Coates as to turning the certificate into a Provisional Order, 1025——Proposed omission of Clause 5, witness strongly objecting to the local authority selling the concession for a tramway, 1026–1032——Approval of the requirement in Clause 10 as to a deposit being made and being retained as security for the works, 1035–1041.

Proposition for passing the provisions in Part II. and III. of the Bill in the form of a Consolidation Act rather than of a Public General Act, 1042–1049——Clause proposed with reference to the vertical deviation of tramways, in the event of alterations by the road authorities, 1050–1053——Suggested clause empowering the road authorities to make contracts for repairs, 1054——Proposed alteration in Clause 19, so that it may not be compulsory in all cases to pave the road, 1055–1057.

Amendments suggested in the Bill in order to exclude omnibuses from an unfair use of the rails, as by an alteration of wheels and of gauge, 1058 *et seq.*——Belief as to six feet being the proper gauge for an omnibus, 1058. 1061, 1062. 1084——Reference to the dispute in Liverpool upon the question of the use of the tramway by omnibuses, without gauge wheels, but with wheels specially constructed, 1058–1060. 1065–1073——Impracticability of raising the required capital for tramways unless protected against the unfair use of the rails by omnibus companies, 1060. 1063, 1064. 1088–1091.

Statement as to the general power, under the Act of last Session, of using tramways so long as flange wheels were not adopted; counterbalancing provisions in the Act to the advantage of the tramway companies, 1067–1080. 1086——Further statement as to the importance of the repairs and maintenance resting with private companies, 1096–1099——Facility to the public by the use of the paved road made by the tramway companies, 1100–1104.

Suggested alteration of Clause 31, so as to enable adjoining companies, with the consent of the Board of Trade, to make contracts for through working, 1106–1110——Evidence in favour of altering the purchase clause in the Bill by a substitution of the Liverpool purchase clause, and by adopting twenty-one years as the term within which the local authorities may purchase, 1111–1135——Explanation as to the arrangements proposed on the subject of fares, and as to the regulations on this point in the Act of last Session, 1126–1132. 1179–1230. 1238–1242.

Inexpediency of such restrictions as shall have the effect of deterring investment of capital in tramways, 1136. 1193——Explanation relative to the cost, respectively, of making the tramway, and of stocking it with horses and carriages, &c.; enhanced cost in the former case when the rails are laid in paved roads, 1137–1146. 1168, 1169——Proposed limitation of the width of the carriages to seven feet, 1147, 1148——Approval of a certain suggestion for a limitation of rating, 1149, 1150.

Statement in favour of power in the tramway company, with the consent of the local authority and of the Board of Trade, to construct junctions, sidings, &c., 1153–1160——Material benefit of tramways as tending to diminish the local rates for the repair of the roads, 1162–1178——Important advantage to some of the local authorities or parishes in London, through the arrangements under the Act of last year, as to the expense of paving; question hereon whether a limitation of dividend would not be desirable under certain conditions, 1170–1201.

Belief as to there not being power under the Act of last year to convey goods, and to do so without limit of rates, 1202–1207——Extensive power of vestries in stopping roads, &c., without the tramway companies having any claim for suspension of business, 1231–1237——Opinion as to the fairness of the proposal to repair for eighteen inches on each side of the tramway, 1243–1245——Approval of corporations having power in regard to

Report, 1870—*continued.*

Morris, John. (Analysis of his Evidence)—*continued.*

the licensing of drivers and conductors; in London the control should be in the Board of Trade, 1246–1248.

Information relative to the power under the Act of last Session to charge tolls for the use of the tramway, 1249–1257——Absence of power in the general public to use the tramway upon paying tolls, 1258——Defence of the restriction as to licenses being limited to a term of three years, 1259–1265.

O.

Omnibus Traffic. Objection by the omnibus companies to the provisions in Clause 41, as to obstruction to carriages using the tramways, *Coates* 103——Assumption that the Bill contemplates tramways for omnibus traffic rather than for anything else, *Sir J. Heron* 338–341. 358——Belief as to the impracticability of two or more competing omnibus companies using the tramway, *ib.* 359, 360——Expected removal of omnibuses from tramway routes, *Monro* 603–607——Difficulty as to the precise means desirable for protecting the omnibus interests, *Coates* 867, 868.

Amendments suggested in the Bill in order to exclude omnibuses from an unfair use of the rails, as by an alteration of wheels and of gauge, *Morris*, 1058 *et seq.*——Experience does not show that a tramway drives the omnibuses off, *ib.* 1006–1008——Belief as to six feet being the proper gauge for an omnibus, *ib.* 1058. 1061, 1062. 1084——Reference to the dispute in Liverpool upon the question of the use of the tramway by omnibuses, without flange wheels, but with wheels specially constructed, *ib.* 1058–1060. 1065–1073.

See also *Competition. Liverpool. Public Use of Tramways.*

P.

Parliamentary Jurisdiction. Main object of witness's appearance before the Committee to represent that his clients shall have an ultimate appeal to Parliament, *Coates* 152–168——Contemplated jurisdiction of a Committee of the House of Commons, in cases where the local bodies do not consent, *Morris* 955–960.—— *See* also *Provisional Orders.*

Part, John. (Analysis of his Evidence.)—Representation by witness of large coal and iron interests in Lancashire and Cheshire, 186–188——Suggested alteration of Clause 5, by providing that the purchaser of a tramway shall be subject to the same restrictions and obligations as the original promoters, 189——Expediency of the tramways being as far as possible open to the use of the public, after the promoters have been reimbursed their capital and interest, 190——Amendment proposed as regards the power of leasing being for a limited term, 190, 191.

Great advantage of tramways being kept in the hands of the local or public authorities; approval hereon of a removal of Clause 5, giving the power of sale, 192–210. 239——Approval of private parties being empowered to obtain concessions for tramways, and being permitted to sell to the local authorities, 204. 211.

Evidence strongly opposed to the Bill in so far as it provides for an exclusive use of the tramway for any particular kind of traffic, 212 *et seq.*——Great inconvenience which might arise as regards coal traffic and other heavy traffic in Lancashire, &c., if not entitled to the use of the tramways, 213 *et seq.*——Conclusions as to its being feasible that both heavy and light traffic may use the same tramway, 216–235——Suggested power in the Board of Trade, or the local authority, to regulate what classes of traffic should use each tramway, 217, 218. 232. 236–238. 243.

Proposed alteration of Clause 7, with a view to a lease of any tramway being confined to a lease of the tolls, 246–249——Circumstance of all kinds of traffic being, as a rule, admitted on canals, 250–252. 259——Practical monopoly of traffic in the case of railways, 253–255——Suggestion, providing for the insertion, in every lease of a tramway, of a condition of re-entry, 255.

Alteration suggested in Clause 24, in order to secure the tramway for the use of the public, on the payment of tolls and the observance of bye-laws, 256–260——Additional clause proposed on the subject of branch tramways or sidings, with a view to facilitating the public use of the main tramways, 261–265——Suggested clauses for making it obligatory to render an account, 266–267——Amendment proposed in Clause 33 upon the subject of the tramway and the road connected with it being kept in good order, 268.

Suggested alterations in Clause 36, with a view to there being a publication and notice of

Report, 1870—*continued.*

Part, John. (Analysis of his Evidence)—*continued.*

of the bye-laws, 269, 270——Proposed amendment in order to prevent the promoters of tramways having power, without the express authority of Parliament, to lower the headway of a bridge over a navigation, or to diminish the waterway, 271——Statement in support of a clause protecting the owners or occupiers of mines from making compensation in respect of damage to tramways through the working of such mines, 272-287——Explanation of a proposed alteration in Clause 51A, for the protection of tramways already made with the sanction of the road trustees, 288, 289.

Paving. Proposed alteration in Clause 19, so that it may not be compulsory in all cases to pave the road, *Morris* 1055–1057——Important advantage to some of the local authorities or parishes in London through the arrangements under the Act of last year as to the expense of paving; question hereon whether a limitation of dividend would not be desirable under certain conditions, *ib.* 1170-1201——Objection to compulsory paving where the gradients are steep, *Boothroyd* 1343–1345.

Petitions. List of petitions against the Bill, or for amendments therein *Rep.* iv–vi.

Portsmouth Street Tramway. Witness submits certain clauses on behalf of the Portsmouth Street Tramway Company; these clauses do not affect the Landport Act, *Emmanuel* 1350–1353.

Preliminary Inquiry. Important amendment proposed in Clause 52 upon the subject of the preliminary inquiry made by the Board of Trade, *Coates* 104 *et seq.*——Respects in which enquiries before the Board of Trade are very unsatisfactory; disapproval of their assuming a judicial character, *ib.* 177–184——Suggested amendment of Clause 53 as to the persons to be heard before the referee, *ib.* 794, 795.

Grounds for objecting to the system of a referee, or of a preliminary inquiry, subject to appeal to both Houses of Parliament; great expense apprehended fatal to any extensive construction, *Morris* 931–945. 961–965——Advantage of proceeding in contested cases by Private Bill, rather than by preliminary inquiry, subject to appeal; less expense in the former case, *ib.* 937-943. 947. 960, 961.

Resolution of the Committee that local inquiries by the Referee of the Board of Trade be at the discretion of the Board, *Rep.* x.

Private Companies. Advantage of tramways being laid down and maintained by private companies, directly responsible to the local bodies, *Morris* 977–995. 1014–1021.

Provisional Orders. Important amendment proposed in the fourth clause, by striking out the word "certificate," and substituting the words "Provisional Order"; contemplated amendment of the Bill throughout in this respect, *Coates* 22, 23——Further statement in favour of the proposed substitution of the Provisional Order system for the certificate system, *ib.* 77-80. 103. 152–184——Expediency of a right to be heard not only before the referee, but against the Bill for confirming the Provisional Order; approval, however, of opponents being shut out in the latter case unless they had asked to be heard before the referee, *ib.* 117–129.

Proposed substitution of the words "provisional certificate" for the word "certificate," in Clause 8, *Sir J. Heron* 373——New Clause proposed to be substituted for Clause 9 of the Bill, with a view to requiring the provisional certificate to be confirmed by Parliament, *ib.* 375, 376.

Concurrence in the suggestion of Mr. Coates as to turning the certificate into a provisional order, *Morris* 1025.

Disapproval of the suggestion for converting the certificate into a provisional order; suggestions on this point, *Boothroyd* 1346, 1347. 1349.

Resolution agreed to by the Committee, that provisional orders be substituted for certificates, *Rep.* x.

See also *Board of Trade.*

Public Use of Tramways. Contemplated grant of licenses by the local authority relative to the use of the tramways by carriages belonging to any public company; explanation hereon that witness approves of the tramways being thrown open for the use of the public, *Coates* 41–56. 60–64—— Expediency of the tramways being as far as possible open to the use of the public, after the promoters have been reimbursed their capital and interest, *Part* 190——Tramways should be in the position of ordinary turnpike roads, as regards their use for all kinds of traffic, *ib.* 244, 245——Alteration suggested in Clause 24 in order to secure the tramway for the use of the public, on the payment of tolls and the observance of bye-laws, *ib.* 256–260.

Contemplated facility to carriages having ordinary wheels in going along or across the tramway; dipute hereon at Liverpool, *Sir J. Heron* 455–462. 464, 465——Evidence in

Report, 1870—*continued.*

Public Use of Tramways—continued.

favour of its being made clear that all carriages with ordinary wheels may go along the rails, *Rayner* 535–545——Explanation by Sir Joseph Heron that he does not propose to interfere in any way with the rights of the public to pass along tramway roads, *p.* 56.

Facility to the public by the use of the paved road made by the tramway companies, *Morris* 1100–1104.

Purchase Clause. See *Sale or Purchase, &c.*

R.

Railways. On the part of certain railway companies and other petitioners against the Bill, witness has carefully examined the Bill and proposes to introduce important alterations under four distinct heads, *Coates* 1–10——Provision suggested as a supplement to Clause 22, with a view to reasonable satisfaction being given to railway companies where their bridges, &c. are affected by tramway works, *ib.* 87–89——Proposed insertion of a proviso in the case of Clause 31, in order that railway companies in any place may be on terms of equality as regards the use of any tramway, *ib.* 89–100——Claim of railway companies to be heard before the referee upon the question of unfair competition or of interference with access to stations; proviso suggested hereon, *ib.* 105–116——Suggestion that railway companies be exempted from paying more than one-fourth of the rate for the purposes of tramways; similar exemption under the Board of Health Acts, *ib.* 143–149.

Ratepayers. Grounds for recommending that the consent of the ratepayers should not be necessary before application is made for a certificate, in the case of corporations and local district boards, *Sir J. Heron* 315, 316. 342–355. 427.

Resolution agreed to by the Committee, that the consent of ratepayers be not required in boroughs governed by a municipal council, *Rep.* x.

Rating of Tramways. Approval of a certain suggestion for a limitation of rating, *Morris* 1149, 1150——Material benefit of tramways as tending to diminish the local rates for the repair of the roads, *ib.* 1162–1178.

Objection to the proposed introduction of a clause on the subject of non-payment of full rates; expediency of its being clearly stated that the tramways shall be liable to all rates, *Sir J. Heron* 469–476. 488.

Rayner, Joseph. (Analysis of his Evidence.)—Is Town Clerk of Liverpool, 502——Opinion of Liverpool and some other corporations, as regards the consent of local boards, that two-thirds of the members should be present, 503, 504——Amended clause proposed by Liverpool and other towns with reference to the making of regulations or bye-laws by the road authorities, 504——Powers of the Liverpool Corporation under the Liverpool Tramway Act, on the subject of bye-laws; necessity for these powers, 505–508.

Reference to Clause 72 of the Liverpool Act, and to the power therein of the corporation to take up the tramways within five years, under certain conditions, 510——Clause 75 of the Liverpool Act adverted to, as showing that the present Bill would override the Act, 511——Particulars as to the powers of the corporation in regard to purchase of the tramways within eleven years, 512–516.

Approval by the Liverpool Corporation of the provisions of the Bill, which makes the consent of the local authority a condition precedent to the laying down of tramways, 516——Difference of opinion between Liverpool and Manchester in regard to consents being dispensed with, 517–519.

Letter recently received by witness from the solicitors of the Liverpool Tramway Company upon the question of opposition to the Street Tramways Bill, 520, 521——Particulars relative to the construction of the Liverpool tramway, the width of gauge, form of rail, &c., 522–531. 565–568——Risk of injury to carriages, through the wheels being wrenched by the groove of the tramway, 532. 563, 564. 569–572——Belief as to the liability of the Company to make good all damage to carriages and horses, 533.

Suit now pending in Chancery upon the question whether carriages at Liverpool with ordinary wheels, may travel along the rails, 534——Evidence in favour of its being made clear that all carriages with ordinary wheels may go along the rails, 535–545——Advantage of the principle of a flange-wheel, together with arrangements for keeping waggons with heavy traffic out of the way, 544–550.

Opinion as to the reasonable character of the arrangement at Liverpool, whereby the tramway company is bound to repair the road for eighteen inches on either side of the tramway, 551, 552——Considerations as to the best mode of providing for the repair of the roadway, including the portion occupied by the tramway, 553–562——Use of four-wheeled

Report, 1870—*continued.*

Rayner, Joseph. (Analysis of his Evidence)—*continued.*

wheeled carriages with three horses, by the Liverpool Company, 566-568. 573, 574—— Dissatisfaction at Liverpool on the part of owners of private carriages, these avoiding the tramway route as much as possible, 569-572.

[Second Examination.] Corrected letter submitted on the part of the Liverpool Tramway Company, in lieu of that previously delivered in by witness, 914.

Referees. Exception taken to referees as the persons who virtually decide under the certificate system, they not being persons of eminence, *Coates* 155. 177.

See also *Arbitration.* *Preliminary Inquiry.*

Removal of Tramways. Clause proposed, enabling the road authority to get rid of the tramway, if after three years they are found to be an absolute nuisance, *Sir J. Heron* 466-469.

Resolution of the Committee that power be given to local authorities to remove tramways found injurious or disused, *Rep.* xi.

Road Trustees. Witness who represents a large extent of turnpike-road trusts in Renfrewshire, submits that the road trustees are the proper persons to make the tramways, and that their consent should in any case be necessary, *Hoggan* 650 *et seq.*——Statement to the effect that the road trusts represented by witness, prefer that the mode of proceeding should be by Private Bill, if it be decided that their consent should not be necessary in the first instance, *ib.* 716-741——Approval of tramways by the road trustees, provided they are the parties to make them, *ib.* 757-759.

Clause suggested, enabling applications to be entertained, if a certain majority of the road trustees are consenting, *Boothroyd* 1305-1308. 1327, 1328.

See also *Glasgow.* *Local Authorities.* *Scotland.* *Way-leave.*

Roads, Repair of. Grounds for the suggestion that where tramways are laid down upon macadamised roads, the promoters should be liable for the expense of paving the roads three feet on each side, instead of eighteen inches, as at Liverpool, *Vaughan* 294-314.

Evidence in favour of the local authorities and the Board of Trade settling the question of the repair of the road, and the difficulties likely to arise through the tramway promoters maintaining one part of the road, and the road authority the other part; great advantage of some arrangement by which the repair of the whole road was borne by one party, *Sir J. Heron* 387-408—— Suggestion, that for six months after laying the tramway, the promoters should keep the whole of the road in repair, *ib.* 387-390—— Objection to the road authority, at the expense of the promoters, keeping the whole of the road in repair, *ib.* 391. 406—— Statement as to the extent of responsibility in the road authority, under the Bill, to see that the portion of the road occupied by the tramway is properly repaired, *ib.* 392-405.

Opinion as to the reasonable character of the arrangement at Liverpool, whereby the tramway company is bound to repair the road for eighteen inches on either side of the tramway, *Rayner* 551, 552—— Considerations as to the best mode of providing for the repair of the roadway, including the portion occupied by the tramway, *ib.* 553-562—— Approval by the road authorities of Glasgow of the provision as to the tramway companies maintaining the road within the rails, and for eighteen inches outside, *Monro* 612, 613. 645-649—— Suggested clause requiring the promoters of a tramway to take it up and relay it at their own expense, when it is necessary to alter the line or level of the road, *Hoggan* 768, 769.

Approval of agreements whereby the tramway companies should repair the whole of road, *Morris* 966-998—— Suggested clause empowering the road authorities to make contracts for repairs, *ib.* 1054—— Opinion as to the fairness of the proposal to repair for eighteen inches on each side of the tramway, *ib.* 1243-1245—— Sufficiency of a margin of eighteen inches outside the rails, as the extent of road to be repaired by the tramway company, *Hopkins* 1281.

See also *Paving.*

Rules and Regulations. Alteration proposed in the third clause to the effect that the Board of Trade, before proceeding with the Bill, shall make the rules and regulations, and that these shall form part of the Act, or be scheduled to it. *Coates* 11-19. 57-59—— Explanation as to witness not proposing any schedule of regulations in lieu of clause 53, which he proposes to strike out, *ib.* 14. 57-59. 150-152—— Objection to any discretionary power in the Board to make additional regulations which go to the rights of parties, *ib.* 20, 21—— Amendments suggested in Clause 8 as regards the large discretion proposed in the Bill to be given to the Board of Trade in respect of rules and regulations, *ib.* 71-76.—— *See* also *Bye-laws.*

Report, 1870—*continued.*

S.

St. James's Parish. Resolution of St. James's parish in favour of the Metropolitan Board as the body to control the laying out and construction of tramways in the metropolis; exceptional character of this approval, *Greenwell* 877. 898, 899.

Sale or Purchase of Tramways. Very mischievious effect apprehended if the fifth clause, conveying powers of sale, be passed; grounds for recommending the total removal of this clause, *Coates* 22–33. 185——Aggravation of the evil of the proposed right of sale, by the condition that the Board of Trade shall consent, *ib.* 23–28. 102,103.

Suggested alteration of clause 5, by providing that the purchaser of a tramway shall be subject to the same restrictions and objections as the original promoters, *Part* 189——Great advantage of tramways being kept in the hands of the local or public authorities; approval hereon of a removal of clause 5, giving the powers of sale, *ib.* 192–210. 239——Approval of private parties being empowered to obtain concessions for tramways, and being permitted to sell to the local authorities, *ib.* 204–211.

Proposed alteration of clause 5, by withdrawing from promoters, other than the local authority, the power of disposing of the certificate: power of such promoters to sell to the local authority, *Sir J. Heron* 316, 317——Evidence in support of the conclusion that the local authorities should have power, with the consent of the Board of Trade, to sell the concession for making and working the tramways to private companies or other parties, *ib.* 316–367——Doubt as to the necessity of any check, on the part of the rate-payers, to the sale or transfer of the concession to a private company, *ib.* 324–330. 342–355. 427——Opinion that a power of sale by private promoters would lead to jobbery, *ib.* 364–367.

Explanation relative to the amendments proposed in clause 33 relative to the purchase of tramways from promoters or companies, and the principle of valuation, *Sir J. Heron* 427–450——Suggestion for making it perfectly clear that goodwill is excluded from the valuation, *ib.* 427–430——Objection to a power of sale in the local authorities, though they should have a power of leasing, or of working the tramways themselves, *Monro* 591–596. 601, 602.

Proposed omission of clause 5, witness strongly objecting to the local authority selling the concession for a tramway, *Morris* 1026–1032——Evidence in favour of altering the purchase clause in the Bill by a substitution of the Liverpool purchase clause, and by adopting twenty-one years as the term within which the local authority may purchase, *ib.* 1111–1135——Proposal in regard to thirty per cent. upon the value of the tramway being paid for good-will, *ib.* 1112, 1113. 1118–1120. 1125——Necessity of the rolling stock, &c. being purchased if the tramway be purchased *ib.* 1115–1117. 1121–1124.

Resolution of the Committee that the clause conferring powers of sale upon promoters be omitted, *Rep.* xi.

Salford Tramway. See *Manchester and Salford.*

Scotland. Majority of the Royal burghs in which the road trustees still exact tolls; varying arrangements where the tolls have been abolished, and the debts not paid off, *Monro* 637–640——Improbability of any other places in Scotland besides Glasgow, Edinburgh, and Dundee, being affected by the proposed Tramway Act, *ib.* 640–644.

Large representation of the municipal bodies on the road trusts in Scotland, *Hoggan* 654, 655——Considerable debt upon many of the roads, steps being, however, constantly taken both to reduce the tolls, and pay off the debts, *ib.* 656–665——Hesitation hitherto on the part of the road trustees to lay down tramways, on account of the difficulty as to the form of rail, &c.; belief that the Act of 1861 would now be soon put in operation, *ib.* 666. 767, 768.

Evidence in support of the conclusion that the road trustees in Scotland are the proper authorities to have power to lay down tramways; circumstance of this power belonging to them exclusively under the Act of 1861, *Hoggan* 667 *et seq.*——Suggested amendment of the Act of 1861, by empowering the road trustees, and also the local authorities to lease to other parties, *ib.* 687–692——Proposition, on the part of the road trustees in Scotland, for a continuance of the powers under the Act of 1861, conjointly with the adoption of certain clauses in the present Bill, *ib.* 689–699——Necessary reduction of tolls by the trustees, after being enabled by the receipts from tramways to pay off the debt, *ib.* 702–704——Explanation of the division of roads in Scotland into statute labour roads and turnpike roads, *ib.* 744–749.

Resolution of the Committee that the Bill be extended to Scotland, *Rep.* xi.

See also *Glasgow.*

Report, 1870—*continued.*

Shoolbred, Messrs. On the part of Messrs. Shoolbred and certain petitioners in Oxford-street, witness submits that certain protective amendments are required for those having frontages in the streets, *Coates* 794 *et seq.*——*See* also *Shops* (*Street Frontages*).

Shops (*Street Frontages*). Expediency of a right in owners or occupiers of shops and warehouses to be heard before the referee, *Coates* 116——Evidence in support of protective clauses suggested on the part of shopkeepers in Oxford-street, *ib.* 794 *et seq.*——Proposition that two-thirds of the owners and two-thirds of the occupiers in a street where a tramway is proposed, shall be consenting parties, *ib.* 795–797. 803–806. 813, 814. 831–837. 859–867.

Conclusion that shopkeepers, as in Oxford-street, should have a claim to compensation for injury, or loss of custom, caused during the construction of the tramway, *Coates* 798–806——Statement in support of claims to compensation if injury or loss of trade can be proved to have resulted from the operation of the tramway, and the obstruction of the traffic to and from the shops, *ib.* 807–830. 838–858.

Resolution of the Committee that a *locus standi* be reserved for the owners and occupiers of property fronting a street or road through which it is proposed to construct a tramway, to appear both before the referee and afterwards before Parliament, *Rep.* xi.

Staffordshire Potteries Street Railway. This tramway, which runs between Burslem and Hanley, and carries a large number of passengers, was laid down merely under the sanction of the turnpike trustees, *Boothroyd* 1299–1304. 1308–1311——Form of rail used; exceptional instance of complaint, *ib.* 1312–1323——Unduly large cost of the tramway; it has not been profitable, *ib.* 1324. 1336, 1337——Suggestion with a view to the tramway coming under the sanction of the present Bill, *ib.* 1327, 1328. 1339——Arrangement as to the payment of tolls to the road trustees, *ib.* 1340–1342. 1349——Difficulty between witness's company and the local authority respecting the paving of the road, *ib.* 1348.

Suspension of Working. Necessary interruption to the working of tramways, without compensation, when bridges have to be repaired, or pipes in the road have to be dealt with, *Sir J. Heron* 374, 375——Extensive power of vestries in stopping roads, &c., without the tramway companies having any claim for suspension of business, *Morris* 1231–1237.

T.

Through Working. Suggested alteration of Clause 31, so as to enable adjoining companies, with the consent of the Board of Trade, to make contracts for through working, *Morris* 1106–1110.

Tolls. Necessity of amendment of the clause relating to licenses, the tolls proposed being altogether prohibitory; the tolls should, in fact, be left to the Board of Trade to determine, *Sir J. Heron* 424–426——Proposal for placing a list of the tolls and charges inside each carriage, *ib.* 451, 452.

Explanation as to the arrangement proposed on the subject of the fares, and as to the regulations on this point in the Act of last Session, *Morris* 1126–1132. 1179–1230. 1238–1242. 1249–1257——Proposal that the fares shall not exceed a penny a mile, or for any distance under three miles, three-pence, *ib.* 1227–1230. 1238–1242——Absence of power in the general public to use the tramways upon paying tolls, *ib.* 1258——Clause proposed on the subject of compounding for tolls, *Boothroyd* 1345, 1346.

Resolution of the Committee that the maximum tolls be inserted in the Provisional Orders, *Rep.* xi.

Town Councils. See *Local Authority.*

Traffic. Witness very much doubts whether tramways can be worked at all in crowded towns, except for heavy traffic, *Coates* 52——Conclusions as to its being feasible for both heavy and light traffic to use the same tramway, *Part* 216–235——Suggested power in the Board of Trade, or the local authority, to regulate what classes of traffic should use each tramway, *ib.* 217, 218. 232. 236–238. 243——Contemplated payment of tolls by heavy traffic, if entitled to use the tramways, *ib.* 229. 240.

Proposition, on the assumption that the Bill contemplates omnibus tramways only, for excluding heavy traffic; belief as to its being impracticable to convey passenger traffic and goods traffic on the same line, *Sir J. Heron* 409–423——Objection to tramways interfering with the ordinary traffic, *Hoggan* 760–761——Impracticability of combining heavy mineral traffic with omnibus traffic, *ib.* 764–766.

Resolution of the Committee that the Provisional Orders shall specify the nature of traffic for which the tramways are sanctioned, *Rep.* xi.

See also *Coal and Iron Traffic. Goods Traffic.*

Report, 1870—*continued.*

Train, Mr. Disadvantage in the case of Mr. Train's tramway, through the repairs of the road resting with the parish, *Morris* 1014, 1015.

Turnpike Roads. See *Way-leave.*

Uniform Gauge. See *Gauge.*

V.

Vaughan, John Lingard. (Analysis of his Evidence.)—Has inspected the tramway at Liverpool, and supplies particulars relative to the injury to the road at each side of the tramway, such injury reaching much further than eighteen inches on each side, 290–314 ——Suggests that where tramways are laid down upon macadamised roads, the promoters should be liable for paving the roads three feet on each side, 313.

W.

Way-leave (*Turnpike Roads*). Statement in explanation and support of a clause empowering the road trustees to levy tolls or way-leave, when a tramway is laid on a turnpike road, *Hoggan* 770–793.

Widening of Roads. Suggested alteration of Clause 49, by empowering the road authority to alter the position of the tramway when necessary for the widening of the road, *Sir J. Heron* 464——Expediency of a power of deviation of the line of tramway in the event of the road being widened, *Monro* 617, 618.

Width of Carriages. Proposed limitation of the width of the tramway carriages to seven feet, *Morris* 1147. 1148.

INDEX
